INDEX OF CONTENTS

TO

THE VOLUME FOR 1842.

A.

Aberthaw lime, 726
Abies, distinct from the genus Pinus, 697
Abutilon striatum, its treatment, 793
Acacia, a work on, announced, 128; cause of its scarcity, 496; its treatment, 668, 693, 709; platyptera, 271; armata, adv., 801; biflora, 871
Acer campestre, 305
Achimenes longiflora, adv., Mountjoy, 82; notes on, 176, 239; pedunculata, 455; grandiflora, 697; adv., Mountjoy, 785; to propagate, 497
Acorns, metamorphosed from leaves, 767; to sow, 745; their germination in water, 755
Acrostichum aureum, 252
Adiantum, 252
Advertisements, remarks on, 143; gardeners', 206
Aerides Brookii, 559; crispum, 711
Affghanistan, its vegetation, 623, 654
Agapanthus, an aquatic, 409
Agaricus flammula, 252
Agave americana, 496; at Salcombe, 725; to preserve in winter, 809
Agricultural education, adv., 538; fund, in Scotland, adv., 866; labour, remarks on, 867
Agriculture, practical, elements of, adv., 266; prize essays, adv., 818; in Bermuda, 318; in Algiers, 671; in Italy, 679
Aimatic compost, 273; adv., Clarke, 345; noticed, 681
Air plants, 681
Albumen, remarks on, 678; analysis of, 822
Alder-seed, to sow, 561
Algæ, best works on, 321
Algiers, its progress in agriculture, 671
Alkalies of plants, 24
Allcard, Mr., his garden noticed, 271, 855
Allnutt, J., Esq., his garden noticed, 96
Allotment system, remarks on, 867; beneficial effects of, 869
Aloe, curious metamorphosis of, 455; American, at Salcombe, 725; to preserve in winter, 809, 857
Alpaca, adv., 282
Alpinia racemosa, 268
Alstrœmeria nemorosa, 559
Amaryllis Banksiana, 287; Belladonna, its treatment, 822; formosissima, to flower, 680
Amateur's stoves, new method of heating, 267; see also 348, 380, 421
American plants, Waterer, adv., 281; to transplant, 692; border, plants for, 625; to prepare, 652; healing plant, 497
Ammoniacal liquor, quantity used per acre, 155; its application, 203, 221, 238, 654; experiments with, 221; upon slugs, 470; vapour, its effect on Vines, 725, 761
Ammonia, to fix, 51, 251, 257, 712, 856; as a manure, 219, 236; adv., Eyton, 314; substances used in fixing, 604; hydrosulphuret of, beneficial to plants, 635; test for, 742, 776, 853, 868; contained in the atmosphere, 774; not contained in sugar, nor in the breath, 870
Amphicome arguta, hardy, 494
Anemone, adv., Groom, 49; treatment of seed, 113; nemorosa, monstrous, 143; rivularis, 207; its treatment, 808
Ania bicornis, 382
Animalcules, their effect on water, 838
Animal manures, 636, 652, 668, 692, 707
Animals, habits of, 287; peculiar forms of, 640
Anisanth, Plant's, 639
Annuals, adv., Nutting, 1; a selection of, 94, 193, 772; cause of failure, 421; for borders, 219, 772; greenhouse, 225; to support, 286; to transplant, 364; to save seeds of, 492; list of hardy, 509, 772; to bloom in autumn, 694
Anthæum at Brighton, 86
Antholyza æthiopica, its treatment, 495; cunonia, 577
Anthriscus sylvestris, monstrous, 143
Antler Rose Saw-fly, described, 604
Ants, effects of sulphur on, 269, 558; to dislodge, 302, 561
Aphides, described, 3; to destroy, 57, 193, 321, 409, 756; to destroy on wall-trees, 396; on Roses, 777
Apples, adv., Masters, 18; Dillistone, 201; advantage of root-pruning, 22; to train, 41, 804, 820; for a lawn, 57; treatment of dwarf, 73; a selection of, 25, 113, 321, 756; treatment before grafting, 161; double-bearing, 319; dwarf, to graft, 453; to preserve, 588, 638, 805; trees, to protect from rabbits, 605; to renovate, 636; kept in a cellar, 657; in a pit, 697; weight of, 669, 708, 725, 741, 820; gathered when wet, 670; to roast, 693; Flower of Kent, 654; Sweeney Nonpareil, 694; will not grow when grafted with Pears, 697; to prune, 709; stocks for, 776
Apricots, adv., Masters, 18; to prune, 305; to plant in summer, 561; cause of their unfruitfulness, 577
April, instances of heat in, 160
Aquatics, select, 369
Aquilegia Skinneri, 39
Araucaria imbricata, to propagate, 641; account of, 289, 494; disease in, 317; adv., Youell, 105; Skirving, 377; Braziliensis, tender, 457, 470; hardy, 526
Arbor-vitæ, treatment of, 193
Arbour, climbers for, 305, 836
Arbutus, treatment of seeds, 145
Arctostaphylus pungens, 287
Aristolochia, its treatment, 289; gigas, 759
Arnott stoves, unfit for forcing, 305; treatment of, 337; recommended for forcing, 573
Arthropodium paniculatum, 776
Artichoke, contains gallic acid, 857
Arundina densa, 239, 511
Asclepias tuberosa, treatment of, 73
Ashes, soap-boilers', to use, 337
Ash, value of the sexes, 235, 251; disease of, 269, 332, 455; for coppice wood, 285, 758; to renovate, 425; action of wasps on, 332; insects injurious to, 454; remarks on the sexes, 653
Asparagus, treatment of, 97, 159, 187, 269, 283, 577, 593, 777, 809, 857; to cut, 302, 315; its treatment at Nice, 331, 347; in bottles, 369, 425; large, 577, 670, 725; effect of salt upon, 435; to pick the fruit from, 457; grown in tin tubes, 471; to apply salt to, 729, 760; effect of house-slops on, 789
Asphalte coverings at the Hort. Soc. Garden, 8; adv., Creggon, 18; walks, 379; layer of, to prevent the descent of roots, 422; Seyssel, adv., Farrell, 800
Asphodeleous plants, 478
Assam Tea, its first discovery, 55, 67, 70, 155, 157, 607; remarks on, 726; Company, its report, 727
Association, British, at Manchester, 419
Aster seed, adv., Haage, 49
Atmosphere, action of plants on, 571
Auriculas, a selection of, 41; properties of, 159, 271; adv., Groom, 265; Clegg, 666; culture of, 283
Australian Colonies, narrative of a visit to, adv. Backhouse, 850
Azalea indica, treatment of, 284, 441, 793; to cause a good bloom of, 381; altaclerensis, 382; double red, 695; to propagate, 425, 641; adv., Rivers, 801

B.

Babingtonia camphorosmæ, 223
Bagshot Park, noticed, 591
Bainbridge's Guide to the Conservatory, adv. 834
Balantium culcita, 252
Balsams, to grow, 209, 268, 513; experiments on, 741
Bamford Hall, noticed, 872
Bank farm, noticed, 208
Barkeria spectabilis, 455
Barometer, improved, 254; price of, 873
Baryta, sulphate of, 257
Bassano Beet, remarks on, 787; where procured, 825
Bateman, Mr., his garden noticed, 304; Orchidaceæ of Mexico and Guatemala, rev., 512
Baxter's British Flowering Plants, rev., 256
Bayfordbury, noticed, 543
Beans, to produce a second crop, 589; a preventive to the attacks of Caterpillars, 638; denied, 821; kidney, good kinds, 236
Becium bicolor, 438
Beck, Mr., his garden noticed, 128
Beds for lawns, 236
Beech-trees, their effect upon plants, 253, 332; not injurious, 510
Beechwood Melon, 289
Bees, to feed, 173, 223; habits of, 381; hives, adv., Nutt, 234; neglect of, 398; to take their honey, 422, 437, 493, 509, 545, 558; their migration, 640; cause of not swarming, 654; to preserve in winter, 837, 854; query respecting, 837; their treatment in Kashmir, 478; to cure the sting of, 509, 542; to hive, 525, 670; to stupify, 529; leaf-cutter, described, 573; hybernatory for, 837; letters on, adv., Cotton, 850
Beetles, black, not injurious in gardens, 558; to destroy, 621
Beet, sugar, 654; its refuse as a manure, 740; Bassano, remarks on, 787; where procured, 825
Begonia crassicaulis, 543
Belladonna Lily, poisonous, 209
Benevolent Institution for Gardeners, adv., 265
Berberis umbellata, 438
Berlin Royal Garden, 351; intended winter garden at, 791
Bermuda, agriculture in, 318; advantage of emigrating to, 507; Remarks on, rev., 807
Bertha's Journal, rev. 855
Beurré, Spence, remarks on, 713; Bosc, described, 868
Bevan, Mr., his garden noticed, 336
Bicton, noticed, 24, 128
Bignonia radicans, to make it flower, 457; picta, 559; Tweediana, its culture, 593
Birch-seed, to sow, 561
Birds, frightened from seeds, 190; their habits, 237; arrival of, 454; their natural instinct, 653
Bischoff's History of Woollen Manufactures, rev., 320
Bistort, to destroy, 321
Blackwood's Quarterly Journal of Agriculture, rev., 383
Bletting, its derivation, 805, 838, 854
Blight, on plants, cause of, 454; American, to cure, 709, 741, 806
Blood, as a manure, 692, 755
Bodmin, earliness of vegetation there, 288
Bog-earth, adv., Davis, 800
Boiler, adv., Stephenson, 1; Shewen, 18; Rogers's, experiments on fuel for, 96; Stephenson's, described, 175, 654; shape of Rogers's, 681; remarks on, 693, 710; weight and price of Shewen's smallest, 729
Bokhara Clover, 288, 318, 369, 761
Bone-dust, effects of, 126, 158; to prepare, for manure, 425, 652, 668; to detect adulteration in, 641; analysed, 668; machine for crushing, 806
Books, as prizes at Hort. exhibitions, 39; for cottagers, 94; for a gardener, 145; for studying botany, 161, 625, 697, 809, 825; for farmers, 761, 825; on fruit and vegetables, 841; on Arithmetic, 857; on the Cucumber, 873; on drawing plans, 873
Borders for trees, to prepare, 712
Boronia anemonæfolia, 543
Botanical names, English, remarks on, 467; confusion of, 509
Botanic Garden, adv., 361
Botany should be studied by gardeners, 37; Indian works on, adv., Pamplin, 417; questions on, 543; Royle's, 352; works on, 809
Box-edgings, to clip, 177; treatment of, 289; branches of, as a manure, 740
Brachycome, treatment of seeds, 145, 257, 269, 285
Brande's Dictionary of Science, rev., 255
Bread, pharmaceutical, described, 159
Briar, sweet, hedges of, 193
Brickdust, to strike cuttings in, 742
Brindled Beauty Moth, described, 787
British plants, good works on, 577
Broccoli, adv., Farnes, 1; Hammond, 105; club in, prevented, 143; to procure a succession of, 193, 300; sorts noticed, 269, 317; treatment of, 300; Legg's Early White, a good sort, 869
Broughton Gardens, noticed, 560
Brugmansia floribunda, 159; treatment of, 873
Brunsvigia, treatment of, 145, 173
Bryony, described, 555
Buckthorn, its service in fixing loose soils, 427
Budding, described, 89, 451, 452, 526, 541; remarks on, 603, 621
Bug, to cure the bite of, 638
Bulbs, conditions for growing, 3; which bloom in August, 41; for a greenhouse, 825; Cape, 238, 636; treatment of certain sorts, 397, 689, 873; adv., Youell, 537; Ehrard, 585; Marnock, 585; Carter, 601; Forrest, 665; Sutton, 649; Corsten, 753
Bullfinch, its depredations, 221
Bunch, described, 25
Bundle, described, 25
Burnes' Narrative of Cabool, rev., 319
Bushel-sieve, its contents, 788
Butter, bad, 23; to improve, 302

C.

Cabbage, season for sowing, 37, 54; remedy for club, 172, 295; seed preserved, 742; variegated, 207; Portugal, its treatment, 257, 625; effects of soap-suds on, 470; to water, 510; butterflies, to destroy, 657; to boil, 839
Cacalia articulata, treatment of, 305
Cacti, their cultivation, 35, 241, 395, 577, 825; to graft, 495, 725; to pack, 529; Conway's Giant, 367, adv., 721, new, 383
Calamus, or Sweet Cane, remarks on, 744, 757
Calceolarias, treatment of, 113, 161, 177, 337, 513; adv., Catleugh, 201; Major, 233; select, 776; Standishii, 305
Calcutta Botanic Garden, 695
Calico, oiled, its preparation, 177
Calla æthiopica, its treatment, 605
Callcott's Scripture Herbal, rev., 743
Callitriche aquatica, 258
Calycanthus, to propagate, 409, 513; time to prune, 561
Cambridge Bot. Garden, Massachusetts, 560
Camellias, adv., Stewart, 105; Pardie, 121; Chandler, 217; culture of, 123, 125, 139, 239, 497, 729, 857; cause of not flowering, 273; to propagate, 425, 529
Campanula pyramidalis, 225, 289; speculum, 332; lilifolia, 332; grandis, 423; Læflingii, 591
Candollea tetrandra, 423
Canker, cause of, 73, 605; to check, in fruit-trees, 457
Canterbury Bells, double, 471
Cape Bulbs, their treatment, 238, 638, 697, 809
Capsicums, their treatment at Guipuscoa, 452; to dry, 777
Carbonic acid, decomposed by plants, 404, 438; assimilated by plants, 405; its effects on vegetation, 807
Cardoons, their cookery, 143; Puvis, 239
Carnations, adv., Groom, 49; Youell, 65; Twitchett, 81; Tyso, 105; Wilson, 153; Orson, 265; Hogg, 802; Ely, 585; Norman, 585; Ansell, 689; list of, 545, 556; treatment of seed, 113, 513; fancy, in Paris, 190; Twitchett's Don John described, 545; characteristics of the best, 556; Don John v. Martin's Splendid, 589, 621, 638; soil for, 856
Carrot, adv., Farnes, 1; manures for, 57; in unmanured soil, 190; Belgian, its effect on animals, 253; effect of spirits of tar on, 365; to preserve, 693; from wire-worms, 821; early sort, 857
Cart for distributing liquid manure, 758
Casawba Melon, 209
Case for plants, attached to a sitting-room, 657
Castor-oil plant, culture of, 108
Catasetum fuliginosum, 39; Wailesii, 287; abruptum, 287; globiflorum, 352
Caterpillars, to destroy, 161; Negro, 638
Catlow's Popular Conchology, rev., 808
Cats, inimical to hedgehogs, 302; white, to frighten birds, 759, 790
Cattle, Dr. Playfair's lectures on feeding, 822, 838; analysis of their food, 82
Cattleya granulosa, 56; superba, fine variety of, 576
Cauliflower, to produce early, 54; fritters, to prepare, 455; useful to cottagers, 606; to prepare ground for, 641
Ceanothus azureus, how affected in various parts of Britain, 726
Cedar, of Lebanon, disease in, 380; to rear, 436; best time to prune, 545; Bermuda, to raise, 529; nitrate of soda for, 577; used in the temple of Solomon, 825
Celeriac, its treatment, 113, 126
Celery, adv., Lane, 33; Seymour's Superb White, 37; adv., 665; treatment of, 174, 189, 222, 528; large, 624; improved by the application of salt, 693; refuted, 725; to boil, 807
Cement for lining open gutters, 697; adv., White, 790; Keene's patent, 752
Cereus cærulescens, 287; small-flowered Show, 622; truncatus, its treatment, 761
Cesspool, to convert into manure, 457
Chalky soil, plants suitable for, 273

Chamber-ley, to prepare for use, 409
Chamomile, restorative to sickly plants, 349, 497, 606 ; to destroy scale insects, 743, 805
Chandler's Nursery, noticed, 72, 192, 823
Charcoal dust, a preventive to grubs, 173 ; to grow plants in, 591, 605, 741 ; injurious to burn in forcing-houses, 741
Chatsworth, described, 3, 20, 51, 67, 107, 187 ; notes on, 143, 807 ; nearest railroad station to, 481
Chatwin's Catalogue of Potatoes, rev., 424
Cheese, Schabziguer, to flavour, 369, 381
Chemistry, its object, 40 ; lectures on, 219, 286, 302, 318, 350, 365 ; adv., 267, 283 ; Liebig's Organic, rev., 403, 422, 438 ; rural, good works on, 425, 577 ; applied to agriculture, 493 ; horticultural, 635 ; its advance in Scotland, 867
Chermes Pear, described, 156
Cherries, adv., Masters, 18 ; a lost variety, 70, 143 : a selection of, 157, 772 ; grafted on a Laurel, 237 ; Laurel grafted on, 253
Chesnuts, Horse, to sow, 529 ; Spanish, adv., Cattel, 121 ; singular growth of, 557
Chess, good work on, 729
Chickens, to cure crop in, 365
Chicory described, 113
Chimaphilas, medicinal properties of, 873
China, effects of the late peace with, 803 ; collector for, 819
Chironia decussata, its treatment, 761
Chloræas, habit of, 304
Chorozema varium, treatment of, 289
Chou Pommé d'Hiver, 207
Christmas Rose, its duration in water, 205
Chrysalids of silkworms as a manure, 755
Chrysanthemums, good sorts, 221, 804, 809 ; adv., Chandler, 314 ; Salter, 833 ; treatment of, 436, 524 ; dark, 841 ; to force, 527 ; cause of leaves dropping, 825
Chryseis compacta, 425
Chrysosplenium as an edging, 23
Chunk stoves, unfit for forcing, 305
Cicada interrupta, account of, 542
Cider, to make, 71, 727, 823, 855 ; ropiness in, 641 ; refuse, as a manure, 740, 856
Cinder-ashes, as a manure, 441
Cineraria, Webberiana, 511 ; adv., Webber, 665 ; Ivery, 633 ; Ward, 705 ; to sow seeds of, 593 ; cause of their leaves spotting, 841
Cirrhopetalum Medusæ, 223 ; chinense, 382
Cisterns, slate, adv., Beck, 2
Citrus, remarks on, 70
Claremont gardens, noticed, 255, 775, 791
Clay, to improve, 25, 713 ; to plant trees on, 126, 713 ; burnt, for striking cuttings in, 806
Cleanliness, remarks on, 571
Clematis, azurea, not a subject for exhibition, 289 ; to propagate, 457
Clerodendron splendens, 207 ; speciosum, cause of leaves spotting, 761
Cley Pippin noticed, 225
Clianthus, grown on the open wall, 269 ; to protect, 825
Climate, artificial, 367 ; mildness of, 870
Climbers, hothouse, a list of, 57 ; to train, 70, 729 ; for a conservatory, 73 ; for a south aspect, 161 ; sweet, 273 ; account of, 399 ; hardy, 836 ; good greenhouse, 441, 681, 873 ; for a verandah, 577 ; trellises for, 651, 667, 692, 707, 756, 772, 788, 804, 869 ; for verandahs, 869 ; stove, 873
Clintonia pulchella, its treatment, 529
Cloth, for protection, 172
Cloudberry, Tasmannian, 192
Clover, new kinds, 239 ; Bokhara, 288, 318 ; Affghan, 379
Clubbing in cabbages, to prevent, 173, 205
Coal, shale as a manure, 6 ; its constituents, 385 ; animal, as a manure, 707
Cobæa scandens, hardy, 172
Cockroaches, to destroy, 317, 332, 347, 356, 806
Cocksfoot Grass, unfit for lawns, 305
Cœlogyne testacea, 352
Cœsia hirsuta, 439
Colchicum autumnale, 640
Collector, adv., 787
Colours, rule of, 97 ; of flowers, supposed cause of change in, 555 ; adv., Nixey, 266 ; to match, in planting, 301
Coltsfoot, to eradicate, 645, 776
Columnea Schiedeana, 191
Combretum purpureum, propagation of, 129 ; grandiflorum, 654
Commelina cœlestis, its treatment, 545
Compost, to form, 540, 572, 587
Concrete foundations, to form, 571
Conferva fluviatilis, 759
Coniferæ, notes on rare kinds, 52, 652 ; to raise seeds, 83 ; select, 825 ; to propagate, 219 ; new, 319 ; of New Zealand, 477 ; adv., Masters, 170 ; Lawson, 769 ; Himalayan, to procure seeds of, 857
Conservative wall, described, 331, 681
Conservatories, cooling of, 189 ; soil for, 305 ; plants for, 305, 841 ; Bainbridge's Guide to, adv., 834
Cookery, of vegetables, 94, 807, 839 ; problem in, 822 ; solution of, 836, 854, 870
Cooley's Figures of Euclid, adv., 235
Copenhagen Botanic Garden, 727
Coppice-wood, to cut, 753, 789
Coprosma microphylla, 192
Correa Harrisii 209
Corrosive sublimate, destructive to plants, 257
Cottage, mechanic's model, 407 ; criticised, 436, 453 ; plans for, 468 ; model, 470, 492
Cottagers, hints for, 56, 838 ; prizes, remarks on, 83, 86, 453 ; calendar, 87, 453 ; books for, 94 ; recommended to keep rabbits, 142
Cotton, its treatment in India, 454 ; oiled, its preparation, 145
Cotton's My Bee Book, rev., 440 ; adv., 362
Couch Grass, to destroy, 873
Country Shows, remarks on, 525, 542

Horn, as a manure, 692; shavings, their effect on Potatoes, 806
Horse Chestnuts, to sow, 529; their use, 745; food for cattle, 773
Horses, cheap food for, 655
Horticultural Society's garden noticed, 239, 512, 640; means of admission as a member, 609, 857; exhibitions, remarks on, 651, 803, 857; Catalogue of Fruits, adv., 803; rev. 872; privileges of the members, 873
Horticulture of Guipuscoa, 284, 452
Hot-air stove, 723, 741, 757; fuel consumed by, 773
Hotbed at Knight's nursery, 25
Hothouses, on the ventilation of, 188; mode of heating, 348, 380, 421; adv., Watt, 722; regulators for, 761; building, remarks on, 856
Hot-water apparatus, adv., Bailey, 1; Weeks, 1; Stephenson, 1; Baker, 33; Walker, 154; Davis, 186; Shewen, 586; Corbett, 706; pipes injurious to the roots of Vines, 529, 561
Houlletia vittata, 40; Brocklehurstiana, 366
Hovea racemulosa, 382
Howitt's Domestic and Rural Life in Germany, revd., 855
Humus and humic acid, remarks on, 619
Hyacinths, grown in Beet-roots, 5; management after flowering, 107; adv., Youell, 569; select, 625; their cultivation, 740, 756; in Moss, 745; in pots, 868
Hybernia brumata, 254
Hydrangeas, to turn blue, 9; blue, 808; treatment of, 369, 525; influence of soil in changing its colour, 654; experiments with, 667; sporting of, 806, 822
Hydrosulphuret of ammonia beneficial to vegetation, 635
Hydrotænia meleagris, 495
Hylurgus piniperda, remarks on, 857

I.

Icehouse, construction of, 6; to fill, 22, 23, 853; and fruit-room combined, 141
Ice, to pack, 55, 86, 873; to keep out of doors, 888;
Icones Plantarum, remarks on, Hooker's, 593; rev. 576
Illicium religiosum, 270, 639
Impregnation of Cucumbers, 204, 237, 253
India, Transactions of the Agri-horticultural Society, rev., 824
Indigofera dosua, 695
Indigo of Africa, 639
Ink for zinc labels, 189
Insects, injurious to Apples and Roses, 332; to trees, 381; to Ash-trees, 454; to destroy with boiling-water, 509; remarks on their appearance, 509; injurious to the Pine tribe, 709; effect of smell upon, 787
Ipomœa stans, its treatment, 9; Learii, its treatment, 161, 776; in the open air, 589; seeds produced by, 605, 621; Quamoclit, in the open air, 591; rubro-cærulea, to flower, 713
Iris, its treatment, 113; fimbriata, its treatment, 573; good kinds, 590; Chinese, its treatment, 681; bulbous, to plant, 729; tuberous, good, 776; their treatment, 808
Isoetes lacustris, 252
Isopogon roseus, 382
Italian Scientific Association, 439
Italy, state of agriculture in, 679
Itea virginica, 332
Ivory, vegetable, whence procured, 729, 836
Ivy, to cover walls, 241; yellow-berried, 301; its effect on trees and walls, 697; on walls, 726, 742, 758, 773; on water, 808
Ixias, their treatment, 561, 641, 669
Ixora coccinea, its treatment, 481
Jasminum caudatum, 382; to increase, 409; to prune, 761
Johnston's Farmer's Encyclopædia, rev., 8, 56; Elements of Agricultural Chemistry, rev., 272
Jonquils, their treatment, 809
Journal of the Royal Agricultural Society, rev., 456, 544
Judges, remarks on their awards, 509
Junipers, to raise from seed, 593; notes on rare kinds, 652

K.

Kale, Buda, to blanch, 113
Kalmia latifolia, poisonous, 839
Kashmir, floating gardens, 367; fruit-trees and plants of, 479
Kennedyas, soil for, 73
Kenrick's New American Orchardist, rev., 24
Kensington Gardens, to improve, 380, 420
Kew Botanic Gardens, remarks on, 123; notes on, 175, 528, 655
Khelat Lucerne, 379, 481
Kidney-beans, sorts of, 236; synonyms of, 284
Kingston Gardens, noticed, 743
Kirby and Spence's Entomology, rev., 808
Kittens, dead, a manure, 5
Knapp's British Grasses, adv., 538
Knight's nursery, hotbed at, 25; noticed, 160
Knight's (T. A.), horticultural papers, adv., 82
Kotschy, M., his death, 823
Kyan's patent, its value in preserving wood, 839

L.

Labels for pots, 57
Labourers, to employ, 819, 835, 851, 868
Laburnum, adv., Parkes, 705; should not be pruned, 776; described, 347; new, 365; poisonous, 385, 421, 510, 709; considered harmless, 470, 558; purple, sporting of, 397; rejected by animals, 437, 453
Ladakh, climate of, 382; Apricots of, 383; treatment of Rhubarb there, 575
Ladies turned gardeners, 742, 759
Lælia superbiens, about to flower, 679; flava, 774
Lalage Hoveæfolia, 654
Lambert, Mr. A. B., his death, 35; his library, 255, 271; herbarium, sale of, 439
Lammas Wheat, its produce, 910
Land, to inoculate, 161; to crop, 729; necessity of its being broken up, 739; to restore neglected, 776; importance of draining, 789; to double dig, 856; to fork, 869
Lane's Catalogue of Roses, rev., 728
Larch, extraordinary vitality of, 365; its value for timber, 619
Lathyrus grandiflorus, to propagate, 457
Lauder's Essay on Taste, rev., 320
Launceston (Van Diemen's Land), remarks on the weather, 454
Laurel, common, described, 452; destruction of its leaves, 381; berries, to sow, 681; leaves, bruised, to destroy insects, 425; to prune, 73, 129, 467; treatment of, 161; adv., Cattell, 121; Rendle, 121; Cherry grafted on, 237; Portugal, treatment of seed, 145; eaten by cattle, 574; curious growth of, 453
Law of gardens, 126, 681
Lawns, beds for, 236; to prepare, 305, 349; grass for, 776; to improve, 353
Layering, described, 90
Lead, its solubility in water containing carbonic acid, 791
Leather, Russia, its preparation, 838
Leaves transformed into fruit, 587; their value as a manure, 739; their germination, 821
Lee's nursery, noticed, 112; Botanical Looker-out, rev., 456
Leicester, monument to the Earl of, 511
Lemon-trees, cause of ill health, 257
Leonotis Leonurus, its culture, 4, 85; to flower, 545
Leschenaultia biloba, 95; to strike from cuttings, 841
Lettuce, adv., Farnes, 1; Lane, 521; artichoke-leaved, 223; treatment of, at Guipuscoa, 452; best winter kinds, with their treatment, 557; drowsiness produced by, 839
Leycesteria formosa, for game, 713
Library, gardener's foreign, 543, 560, 575, 591, 607, 628, 639
Lichens described, 84; on trees, 177; to destroy, 273, 321
Liebig, critique on, 395; his Agricultural Chemistry, adv., 2; 2d edit., rev., 40; Organic Chemistry, rev. by Dr. Schleiden, 403, 422, 438; remarks on, 469
Light, tendency of plants to seek, 6; its effects on plants, 471
Lilium lancifolium, 225; distinct from L. speciosum, 656; adv., Groom, 361; album, to increase, 497; by bulbs from the axils of the leaves, 526
Lily, of the Valley, situation for, 158, 761; of Scripture, remarks on, 744, 854; Water, to multiply, 385
Lime, water, to mix, 273, 712, 809; dry, its value upon land, 382; kilns, their formation, 435; its effect on the Gooseberry-caterpillar, 494; rubbish as a manure, 545; its application, 620; water, in tanks, 620; not injurious to the growth of the Potatoe, 651, 853; Aberthaw, 726; ash floor, to make, 605; and salt, to preserve, 856
Lingard on the Decay of Timber, rev., 760
Literary Fund, adv., 249
Lobelia gracilis, hardy, 589; pyramidalis, 24
Locust-tree, its treatment, 668
Locusts in England, 807
Loddiges' nursery, noticed, 56, 508
Lodoicea sechellarum, 423, 870
Lonicera flexuosa, its treatment, 697
Logwood as a manure, 840
Lophospermum erubescente-scandens, 254
Loquat, its treatment, 756
Loudon's (Mrs.) Ladies' Flower-garden of Ornamental Annuals, adv., 2; Botany for Ladies, rev., 424; (Mr.) Year-book of Nat. History, rev., 223; Hortus Lignosus, and Arboretum Britannicum, rev., 352; Encyclopædia of Cottage Architecture, rev., 407; Suburban Horticulturist, rev., 775; Encyclopædia of Trees and Shrubs, adv., 800; complete works, adv., 832; Suburban Gardener, adv., 722
Low's nursery, noticed, 240
Lucombe's nursery, noticed, 176
Luculia gratissima, its treatment, 41; to propagate, 793
Lupinus Hartwegii, an annual, 729; albus, as a green manure, 867
Lysimachia lobelioides, 191

M.

M'Intosh's Flower-Garden, adv., 34; Orchard and Fruit-Garden, adv., 34; Greenhouse, Hothouse, and Stove, adv., 34
Macleania angulata, 871
Madia sativa, account of, 255; its value as a green manure, 740
Magazin Botanique, 510
Magazine of Domestic Economy, rev., 456
Magnolia in the open air, 337
Mahonias, their treatment, 385; aquifolium, hardy, 825
Maize, sugar extracted from, 651
Malacca, vegetation of, 638, 790
Manettia bicolor, adv., Veitch, 449
Manganese, black oxide of, for paint, 441
Mango, its treatment, 142
Mangel Wurzel, to dibble in the seed, 190; to preserve, 726, 758; for cattle, 758, 806
Manufacturers, to relieve the distressed, 509, 541
Manure, a new kind, 19; effect of Daniell's, 67, 807; some kinds described, 92, 303; Daniell's, remarks on, 139, 171, 189, 206, 382, 454, 638; not beneficial, 851; of great value, 869; described, 159, 271, 286; adv., Chatwin, 154; Potter, 720; remarks on, 161; its preparation, 187, 219, 241, 257, 808; in Alsace, 191; ammoniacal, 221; Chinese, 255; green, 335; liquid, to make, 177, 332, 808; its value, 379, 654, 856; to apply, 545, 654; injurious to Vine-borders, 273; its waste, 283, 851; to improve, 451, 510; best time to apply, 792; for Potatoes, 455; effects on Fuchsias, 470; organic-mineral, 507, 524, 540, 572, 587; liquid, to apply, 545, 654; animal, 636, 652, 668, 692, 707, 724; green, 803, 820; Boussingault's memoir on, 724, 739, 755; for cottagers, 838; Dutch, 755; table showing the value of various kinds, 756; experiments upon, 771, 839, 853; liquid, cart for distributing, 758; adv., Crosskill, 786; pumps, adv., Fowler, 786
Manuring with green crops, 803, 820, 867
Marchand de Bouquets, 471
March, instances of heat in, 160
Margan, noticed, 679
Marl, its use, 286, 456; to burn, 712
Marmalade, to boil, 870
Marrow, Vegetable, its treatment, 353
Marryatt, Mrs., her garden, noticed, 406
Martagon, its derivation, 777, 790
Martynia fragrans, 423; adv., Marnock, 138
Massachusetts, climate of, 95
Masters' nursery, noticed, 24
Mathews, Mr. A., his death, 319
Matter, organic, decomposed, 347
Maund's Botanic Garden, adv., 832
Maxillaria acutipetala, 654
Mayhew's How to Teach, rev., 208
May, instances of heat in, 112
Measures, of capacity, 669, 691; in the London markets, 788
Medical Life Assurance, adv., 266
Medlars, to ripen, 761
Megachile centuncularis, destructive to the flowers of Pelargoniums, 422; described, 573
Melon, adv., Ferguson, 1; Cuthill, 17; the Ispahan, 22; Cuthill's Early, 23; from cuttings, 38; boxes, adv., Watts, 81; Smith on, adv., 122; cultivation of, 124, 285; to save seed, 177; Casawba, 209; Beechwood, 289; cause of fruit dropping, 409, 776; disease of, 437, 457: grown in open-sided frames, 656; Cantaloupe, adv., Carter, 784; Beechwood, 841
Menzies, Mr., his death, 123
Mercury, how used, 257
Merodon Narcissi, described, 203
Merulius lachrymans, 252
Mesembryanthemum æquilaterale, 192; for planting out, 369; tricolor, 807
Mice, their destruction, 7, 237, 318
Microscope for botanical purposes, 729
Mignonette, cause of its dying, 441; remarks on, 623
Mildew in Peas, 333, 365, 471, 526, 777; to prevent, on Peach-trees, 558
Milk, analysis of, 838
Mills's Treatise on the Cucumber, adv., 754; adv. 834; rev. 872
Mimetes hirta, 331
Mimulus roseus, 271; Maclainanus, 607
Mina lobata, 23, 366
Mines, gardening in, 205
Misconduct at exhibitions, remarks on, 691
Misfortune, great, 478
Mistletoe, to graft, 304; remarks on, 854
Mitchella repens, 332
Mites, not formed by electrical action, 793
Model Mapping, 855
Moles, to destroy, 560
Monster, vegetable, 711
Montreuil, Peaches of, 870
Monument to the Earl of Leicester, 511, 543
Moræa tripetala, 225
Mormodes lineatum, 575; luxatum, 591
Mortar, asphalte, to prevent the descent of roots, 422; for walks, 379
Morton's Nature and Property of Soils, rev. 336
Moss, on gravel-walks, its destruction, 57, 593; on lawns, 129, 825; on trees, 273, 321; spontaneous combustion of, 870
Moth, Honeycomb, its destruction, 193; large, to kill, 657, 694, 806; Brindled Beauty, described, 787
Mould, remarks on, 507
Mount Ophir, its botanical productions, 790
Mouse-trap, described, 126, 237
Mowing-machine, price of, 161; new, 316
Mud from ponds as a manure, 545
Mulberry, to prevent the fruit from dropping, 657; trees, adv., Dennis, 737
Mule plants sometimes seed, 161
Muriatic acid beneficial to vegetation, 667
Musa Cavendishii, its usual size, 825
Museum, Lambert's botanical, adv., 329
Mushrooms, good properties of, 385; remarkable growth of, 425, beds for, 513; spawn, to prepare, 604; cause of failure, 712; 821, 853, 869; their treatment, 793
Myatt's Pine Strawberry, its treatment, 491, 510, 525, 529, 542
Myrtle, its treatment, 873

N.

Names of plants, confusion created by altering, 491; botanica 542
Naming plants, remarks on, 777; fruit, 777
Narcissus-fly, described, 203
Naturalist's Corner, 623, 640, 655, 727, 791, 839
Nature, her works, 640, 791
Neapolitan Violets, culture of, 204, 253
Nectarines, adv., Masters, 18; protection of, 69; to prune in summer, 425; Newington, 625
Negro caterpillar, remarks on, 638
Nelumbium, to raise from seed, 745
Nematus trimaculatus, time to kill, 288
Nerim, its treatment, 873
Netherlands, cultivation of, 270
Netting, adv., Richardson, 202; as a protection for fruit, 299, 332
News, botanical, 239, 367, 760, 774; Indian, 759
New Zealand Comp., adv., 234; Hort. Society formed, 267; coniferous plants and ferns of, 477; prosperous state of the colony, 523; works on, adv., 784
Niger, model farm there, 111
Night-soil, to prepare, 305, 425, 755, 760
Nikita, letter from, 206
Niphæa oblonga, 191
Nitrate, of soda, Lymburn on, 7; its action, 38, 205; its effects, 70, 123, 160, 494, 667, 821; on Onions, 725; for Pine-apples, 193; Potatoes, 806; when applied, 225; to Cedars, 577; to Firs, 254, 289; to use, 257, 305, 385; where procured, 273, 321; on Strawberries, 437; on Roses, 456, 481; destructive to slugs, 456; its adulteration, 603; quantity to apply, 624; on Potatoes, 710; on Cucumbers, 654; on Seakale, 655; on Onions, 712, 775; on Balsams, 741; on corn, 839; of potash, as a manure, 693; test for, 853
Nitre, as a manure for corn, 839
Nitrogen essential to plants, 241
Norfolk Island, its vegetation, 471
Normandy Cress, its treatment, 625
Nuthatch, its habits, 270
Nuts, to preserve, 657; adv., Masters, 18; weevil, described, 108
Nyctanthes arbor tristis, 268
Nymphæa Lotus, its stems edible, 495

O.

Oak, British, remarks on, 5; at Dunmore, 24; of Harreshausen, described, 36; effect of rapid growth on, 67, 83; lungs described, 84; Fulham, noticed, 111; to renovate, 425; cause of degeneracy in, 723; Durmast, 709; separation of the twigs in autumn, 726; to raise, 776; spangles eaten by pheasants, 777; evergreen, adv. Langelier, 833
Oat-tea, 55
Œnanthe crocata, poisonous, 790

Œnothera, biennis, as forage, 8; serotina, 333
Oil-cake, as a manure, 740
Oiled cotton, its preparation, 145
Oleander, its treatment, 209; cause of not flowering, 305
Oncidium Insleayii, 23; longifolium, 95; nanum, 382; sphacelatum, 382; urophyllum, 622; barbatum, 639
Onions, treatment of, 145, 337, 453; seed per acre, 161; remedy for grub, 173, 574, 589, 725, 806, 853; Nocera, 223: Druse, described, 252; to destroy, 385; their treatment at Guipuscoa, 452; to transplant, 457; to bend down their tops, 481; Lisbon, its treatment, 542; thick-necked, 713; underground, to plant, 873
Orange, remarks on some varieties, 5; viviparous, 70; treatment of, 96, 257, 577; adv., Marsano, 217; King, 345; to renovate, 289
Orchard, to plant, 177; select trees for, 641, 681
Orchidaceæ, a list of, 57; treatment of, when imported 97; temperature for, 204; for growing in stoves, 285; treatment of, 380, 472, 625; noticed, 471, 496; adv., Harrison, 330; Stevens, 449; Winstanley, 489; Stevens, 537; Sage, 784
Organic matter converted into manure, 347
Organic mineral manures, 507, 524, 540, 572, 587
Orgyia antiqua, described, 540
Ornithogalum divaricatum, 382
Osborne's nursery, noticed, 240
Otiorynchus tenebricosus, described, 316
Otochilus fuscus, 366
Oxalis crenata, its excellence, 22; its properties, 125; lasiopetala, 271; acetosella as an edging, 333, 422; rubro-cincta, 759; sensitiva, 840
Oxlip, notes on, 171
Oxygen necessary to seeds, 269
Osmazome, defined, 759

P.

Pæonia, tree, treatment of, 156, 193; best sorts of, 241, 589
Paint, to soften, 761; for out-door buildings, 825
Pansy, *see* Heartsease
Papaver bracteata coccinea, adv., Foster, 233
Parasol Gall-fly, described, 852
Paris, exhibition at, 694, 774
Park, St. James's, improvements in, 347
Parlour-case, plants for, 73
Parnell's Grasses of Scotland, rev., 791
Parsley, fine plant of, 708
Parsneps for fattening pigs, 837
Passiflora fragrans, adv., Marnock, 138; Middletoniana, 254 Loudoni, 809; coccinea, a stove plant, 545
Pasture, Grasses for, 161; to renovate, 177
Paulovnia imperialis, adv., Baumann, 65; at Paris, 471; hardy, 681
Paul's Catalogue of Roses, rev., 624
Paxton's Magazine of Botany, adv., 2; Pocket Botanical Dictionary, adv., 2
Peaches, adv., Masters, 18; protection of, 69; cause of the leaves blistering, 289, 333, 349; treatment at Naples, 301; management of, 317; to graft, 512; good forcing kinds, 745; cause of fruit dropping, 513, 657; a preventive of mildew on, 558; unfit for growing with Vines, 657; hardy kind, 681; to wash the trees, 857; of Montreuil, 870
Peach-house, management of, 494
Pear, adv., Masters, 18: Harrison, 185; Langelier, 786; Rivers, 801; Mollet s Guernsey Beurré described, 36, 85; in Stirling Castle gardens, 37; King Charles's, 40; to renovate, 57, 337; Dunmore, described, 85; Knight's Monarch, described, 109, 142, 177; to train en quenouille, 145; Chermes described, 156; Seckel, 708; Hacon's Incomparable, 172, 189; its origin, 869; effects of a bell-glass on its setting, 253; to summer prune, 369, 441, 637, 709; to train as pyramids, 453; to prepare soil for, 577; prolific branch, 543; to ripen late kinds, 588; effects of root-pruning, 637; weight of, 669, 670, 708, 741, 820; espalier, 697; effect of canker on, 707; losing its flavour from root-pruning, 825; stewing, remarks on, 841, 870; a selection of, 25, 113, 145, 157, 161, 577, 593, 772, 776; best late kinds, 225, 841; tree, prolific, 760; kinds for espaliers, 761; to train, 804, 820; Althorpe Crassane, 806; Figue de Naples, 809; Van Mons. Leon le Clerc, 809; remarks on various kinds, 852; to graft on the Quince, 873
Peas, adv., Farnes, 1; their germination at various temperatures, 22; to raise early, 22, 70; preservation from mice, 173; resined, 189; cause of mildew, 333, 365, 471, 526, 621; green, to preserve, 558, 574; Russian method, 574; select dwarf, 620; difference in their boiling, 654, 806; Prince Albert, adv., Cormack, 665
Peat, improvement of, 144, 873; useful in promoting the vegetation of seeds, 558; house for preserving plants, 620
Pedicularis megalantha, 607
Pelargoniums, to bloom in autumn, 9; notes on some new, 36, 68, 140; adv., Groom, 49; Stewart, 105; Conway, 137; Pamplin, 153; Catleugh, 201; Rogers, 201; Adams, 249; Rendle, 361; Pontey, 569; Fuller, 585; Jeffries, 689; Hancock, 705; Gaines, 737; Lawton, 737; treatment of, 161, 177, 469, 636, 761; hints on, 235; Enchantress, 177; good kinds, 257, 441, 697, 761, 776, 873; cause of their leaves spotting, 257, 273; of petals dropping, 425; definition of the term, 425; their treatment after flowering, 457; cause of their seed not swelling off, 481; new, 509; to house, 545; to cut back, 557; scarlet, to propagate, 605; experiments on, 655; cannot be preserved in the open border, 656; to preserve in winter, 656: ardens, to flower, 657; to apply nitrate of soda to, 697; for exhibition, 825
Pencarrow, noticed, 560
Pentstemon speciosum, 209; good kinds of, 481; gentianoides var. splendens, 711; select kinds, 841
Pereira's Materia Medica, 320
Perennials, a selection of, 94; hardy, 225, 807
Perianth, its designation, 641
Petrophila diversifolia, 268
Petúnias, propagation of, 129; adv., Wood, 281; its cultivation, 316
Phædon vitellina, on Willows, 6
Phalæna brumata, 337
Phalangium cancroides, to destroy, 337
Pharbitis ostrina, 639
Philadelphus Mexicanus, 527
Phillips, Mr., his garden noticed, 624
Phlox stolonifera flowered twice, 95; Drummondi for the greenhouse, 527; adv., Wood, 666; picta, adv., Mountjoy, 689; Van Houtte's adv., 849.
Phytologist, adv., Voorst, 362
Picea orientalis, its habit, 206
Pickles, ancient, 711
Picotee, its variability, 5; adv., Groom, 49; Youell, 65; Tyso, 105; Wilson, 153; Ely, 649; list of, 545, 572
Pies, to make, 873
Pigs, to improve, 351; to feed on Parsneps, 837
Pines, to destroy the scale on, 793, 805; at Thornfield, 86, 805, 838; external air upon, 209; growing, 222, 253, 654; large, 624; adv., Whalley, 361; cause of leaves spotting, 441; of turning yellow, 593; weight of, 669, 708, 725, 741, 789, 820
Pinks, adv., Willmer, 393; Brown, 602; treatment of, 396; propagation, 420, 509; select kinds, 713
Pinus, a distinct genus from Abies, 697
Pipes, hot-water, their radiating power, 22
Pitcarnia bromeliæfolia, treatment of, 139
Pitch for the inside of boxes, 513
Pit, construction of, 53; Mill's improved, 349, 453; for growing plants in, 497; covering for, 840, 857; at Heckfield, described, 742
Pitol plant, 561
Plane tree, history of, 108
Plantain, to destroy, 625; tree, remarks on, 655
Plantas Hartwegianas imprimis Mexicanis, adv., Pamplin, 417
Plantations, thinning of, 110
Planting, remarks on, 107, 109, 139, 174; effect of trenching before, 126
Plants, their tendency to seek light, 6; agricultural improvement of, 54; for a parlour case, 73; for vases, 92; for windows, 92; to dry, 161, 527; edible, of Tasmannia, 192; for forcing, 209; for market, 209; for a north aspect, 225; to water, 273, 421; adapted for a chalky soil, 273; indigenous, 333; new, adv., Veitch, 298, 468; fossil, 335; luminous, 351; greenhouse, in the open air, 364; chemical analysis of, 364, 381; nutriment of, 423; for a S.W. wall, 425, 776; for a S.W. border, 425; their excretions, 439; for borders, 604; Asphodeleous, 478; for trailing on the ground, 481; old, sold under new names, 491; to flower in autumn, 605; their action on the atmosphere, 571; ornamental border kinds, 589, 604; for the edgings of walks, 589; their growth in charcoal, 605; not benefited by watering in dry weather, 619; to preserve in winter, 620, 669, 670, 708, 713, 728; for an American border, 625; greenhouse, autumnal, 625; do they breathe? 636; their fertilization, 681; window, their treatment in winter, 681, 804; not injured by poisons, 670; hardy, to prune, 713; for the climate of Devon, 729, 820; Asphalte covering for, 729; dried, adv., 721; herbaceous, adv., 721, 769; growing in a sulphurous atmosphere, 758; to rest in winter, 808; to prepare for microscopical examination, 825; carbonic acid disengaged by, 855; for shady banks, 857; food of, 857; growth of, 857; loss of colour in, 873; stages for, 873
Playfair, Dr., his lectures noticed, 819; reported, 822, 838
Ploughs, their draught, 544
Plums, adv., Masters, 18; management of, 36, 337, 745; selection of, 157, 772; Ickworth Imperatrice, described, 176; to preserve, 638, 821; new American, 639
Plusia gamma, described, 52
Podotheca gnaphalioides, 367
Poinsettia, its treatment, 25
Poison, dangerous to strew about, 364; mineral, certain kinds not injurious to plants, 670
Polyanthus, its culture, 20, 39; select sorts, 841
Pond-mud for manure, 545
Pontederia crassipes, cause of its not flowering, 481; to flower, 493
Poor, to employ, 819, 835, 851, 868; laws, deficiency of, 315
Poplar, its treatment in Ladakh, 591
Port Nicholson Horticultural Society, 267; flourishing condition of, 267
Portugal Cabbage, its treatment, 257
Potash, nitrate of, as a manure, 670
Potato, to raise an early crop, 38; Chapman's new, 40, 221; rot in, 54, 110; adv., Laing, 65; a monstrous, 85; good kinds of, 97; to prevent becoming waxy, 97; adv., Chatwin, 105; Beck, 137; to plant, 110, 155, 253, 638; on producing new, 125, 221, 301; on ripening, 143; Chapman's, remarks on, 158, 173, 188, 235, 238; the Shaw, 173; salad, described, 173; Kidney-bean, 191; to obtain, 193; experiments upon, 221, 710, 806, 838; to prevent failure, 254; cause of failure, 269; to protect early, 286; manure for, 455; good early, 513, 593; in the East, 607; in India, 621; effects of Guano on, 693; not injured by lime, 651; to cook for cattle, 654, 710; salt as manure for, 657; to cook in the Lyons fashion, 727; its value, 728; injured by burning the eyes, 742; for seed, their treatment, 777; to preserve, 789; raw, for cattle, 789; to boil, 791; for clayey soils, 806; heavy crop of, 806, 821; quantity to plant per acre, 841; seed adv., 849.
Potentillas, hybrids produce seed, 5; to separate. 593
Pots, glazed, 23, 507
Potter's Word or Two on Guano, rev., 368
Pottle, its contents, 25
Poultry, weight of, 807, 822, 837, 870; to feed, 239
Prangos, described, 351; to introduce, 365
Price, Sir Uvedale, on the Picturesque, rev., 320
Primrose, Chinese, soil for, 129, 825; to obtain fringed, 129; its habitat, 206; its landing in Australia, 636; Shakespeare's pale, remarks on, 789, 822, 854
Primula, notes on, 143; denticulata, 591
Prize men, Botanical, 655
Privet, Chinese, to propagate, 624
Proceedings of the Geological Society of Yorkshire, rev., 240; of the Horticultural Society, rev., 655
Produce, average agricultural, 513
Propagation, as practised in Paris, 238; in England and France compared, 285, 317
Prophets, vegetable weather, 207
Props, flower, adv., Trudell, 345
Proteas. their treatment, 353
Protecting houses, materials for, 757
Pruning, described, 91, 110, 205; forest-trees, 332, 451, 453, 470, 523, 526, 557, 588; advantage of summer, 437
Prussian-blue, its refuse, as a manure, 755
Pumpkin, its treatment at Guipuscoa, 452
Punch, revd., 872
Punnet, its contents, 25, 788
Puppies, dead, a manure, 5
Putteridge Bury, noticed, 695
Pyrus domestica, in Italy, 301

Q.

Quarterly Journal of Meteorology, rev., 128; of Agriculture, rev., 223, 608, 824
Quick fences, to raise, 86
Quince, to propagate, 825

R.

Rabbits, to protect trees from, 605
Radish, adv., Farnes, 1; Fuller's Hybrid Winter, adv., May, 521; seed, to clean, 625
Rags, woollen, as a manure, 425; to apply, 656
Railroad embankments, to prevent slipping, 70; to embellish, 349
Rain, prognostic of, 807; water, to construct tanks for, 653
Rampion, its uses, 126; treatment of, 364
Ranunculus, adv., Groom, 49; Tyso, 105; selection of, 97; its culture, 420, 469, 509, 809; aquatilis, 300
Raspberries, adv., Masters, 18; double-bearing, 193; neat mode of training, 836; Fastolff adv., Youell, 849; Royal Victoria, 853
Rats, to destroy, 821, 853; new mode of catching, 790
Read's Hydraulic Machines, adv., 82
Red spider, to destroy, 321, 508, 773, 777; by sulphur, 493, 557, 625; by turpentine, 574; effect of sulphur on, 838
Redstart, its habits, 127
Reid's Elements of Astronomy, rev., 424
Rhodanthe, treatment of seeds, 145
Rhodochiton volubile, its treatment, 161
Rhododendron, to flower arboreum at Christmas, 96; treatment of, 177; to prune, 353; Smithii aureum, 352; soil for, 397, 652; adv., Rivers, 801: barbatum, 825; hardy sorts of, 873
Rhubarb, adv., Myatt, 1; Youell, 801; its treatment, 57, 126, 191, 353; in Ladakh, 575; Tobolsk, remarks on, 869
Ribes, new variety, 288; described, 301
Rib-grass, to destroy, 625
Ricauti's Rustic Architecture, adv., 138; rev., 160
Riddle, 854.
Ridging land, described, 724
Rigidella immaculata, 40, 494
Rivers's nursery, notes on, 192, 439; Catalogue of Roses, rev., 711
Rivers, on their wearing, 159, 175
Roads, formation of, 523
Robinia pseud-acacia, unsuitable for planting largely, 606; its treatment, 668
Rock Lily, 841
Rockwork, to form, 868
Roella ciliata, its treatment, 761
Rogers's boiler, experiments on fuel for, 96
Rollison's nursery, noticed, 288
Rondeletia longiflora, 774
Rookery, to establish, 188, 222, 257
Rooks, their use in destroying slugs, 478; to frighten, 222
Root, absorption by, 638; carbonic acid disengaged by, 855
Root-pruning, Hayward on, 6; remarks on, 21, 189, 332, 775 Rivers on, noticed, 86; its value, 142, 821; its effect on the flavour of fruit, 825
Roses, double yellow, cause of not flowering, 23; to strike cuttings of, 41; at Monaltria, 86; treatment of, 205, 353; stocks for, 57; Banksian, 333; to prune, 57, 305, 419, 453, 670; treatment of, 73; Christmas, 205; in pots, treatment of, 123; to bloom early, 125; manure for, 161, 841; to prune, 161, 305, 691, 708; a selection of, 193, 577; as standards, 225; good forcing, 270, 857; lecture on, 304; for a hedge, 305; for a wall, 369; everlasting, 363, 873; hardy, 697; adv., Paul, 377; Rivers, 377; Lane, 377; Wood, 378; Denyer, 786; autumnal, 457, 481, 492; yellow Banksian, to flower, 385; improvements in exhibiting, 396; qualities of, 397; malformation of, 397; increase by cuttings, 409, 457; to check mildew on, 409; Messrs. Lane's, 424; Mr. Rivers, 439; Mr. Denyer's, 440; Moss, 452; to bud, 452; curious instance of vitality, 453; their loss of Moss, 453; Smith's yellow, 481; to entrap injurious insects, 513; stocks for, 742; excrescences upon their branches, 577; good China, 625; double yellow Persian, 729; Devoniensis, adv., Hally, 753; for exhibition, 825; to protect, 836; treatment of seed, 836; to manure, 841
Rosmarinus officinalis, 268
Rove-beetle, fetid, described, 740
Rowland, Mr., his garden noticed, 455
Rucker, Mr., his garden noticed, 496
Russelia juncea, its treatment, 841, 873
Russia leather, its preparation, 838
Rust on Grapes, remarks on, 805, 853
Rye, horned or spurred, 478

S.

Salsify, its treatment, 528; to boil, 774
Salt, Evelyn's opinion of it as a manure, 383; its application, 620; to Potatoes, 657, 792, 853; to Celery, 693, 725; to kill weeds, 712; quantity used for Asparagus, 729, 760; as a manure, 806, 869; cake, as a manure, 222; water, to apply, 225, 241, 273; proportion of, 353; of the alum works, for fixing ammonia, 808; and lime, to prepare, 856
Saltpetre, its effects, 385
Salvia, fulgens, its management, 38; patens, its treatment, 39, 143; not hardy, 254; cause of its destruction, 285; preserved, 301, 318, 680; cause of its withering in the open ground, 529; dropping its flowers, 558; to preserve in winter, 787
Sap, its course in the stem, 707, 761
Sarcinula, notes on, 143
Sashes, to preserve, 205
Saussurea pulchella, 223
Savoy, Yellow, a good sort, 853
Saw-dust as a manure, 824
Saw-fly, antler Rose, described, 604; Turnip, 620
Saxifrage, three-fingered, 252
Scævola scandens, 332
Scald, cure for, 70, 189
Scale, its destruction, 145, 353, 529, 558, 697, 793; on trees, to destroy 713, 841; cured by chamomile 743, 805; on Pines, to destroy, 793
Scarecrow, 759, 790
Schleiden, Dr., criticised by Dr. Gregory, 435
Scions, their treatment, 305
Scotch Farming in the Lothians, rev., 760; agricultural fund, remarks on, 867
Screens for trees, adv., Hulme, 122

Soda, nitrate of, its action, 38, 205, 383; sulphate of, 222, 409
Soil, treatment of stiff, 73: importance of knowing its chemical properties, 471; its influence in changing the colour of Hydrangeas, 654; on Peas, 806; its proper condition at the time of sowing seeds, 542; to prepare, 573
Solanum laciniatum, 192
Sollya heterophylla, its treatment, 593
Solly, Mr., his lectures on chemistry, 283, 286, 302, 318, 350, 365
Sonnets, rural, 304, 759
Soot, its adulteration, 641, 742, 773, 790; its effect on Potatoes, 853
Sophronites grandiflora, 711
Sorrel, Snow, 191
Sparrows, to frighten, 206; their value, 206
Specimens of plants, substances best adapted for preserving, 454; to prepare, 527
Spergula arvensis as green manure, 820
Spider, red, to destroy, 321, 337
Spinach, effects of gas-water on, 397
Spiræa ariæfolia, 492; Lindleyana, adv., 521
Spiral vessels, their peculiar form in the Vegetable Marrow, 774
Spirits of tar on Carrots, 222, 289, 365
Spode's tallies, to write upon, 593
Spooner's Compendium of the Veterinary Art, rev., 256
Sprengel on organic mineral manures, 507, 524, 540, 572, 587; on animal ditto, 636, 652, 668, 692, 707, 724; on green manuring, 803, 820, 867: on mould, 507; its analysis, 508; on the mud of ponds, 524; on sea-mud, 524; on the mud from streets, 524; on rubbish from farm-yards, 524; on the formation of compost, 540, 572; to apply, 587; his remarks on patent manures, 517; on animal offal, 636; carcasses of dead animals, analysis of, 636; entrails, 636; on bones, 652; analysis of, 668; plants most benefited by their application, 669; on blood, 692; on horn-shavings, 692; on hair and wool, 707; on the refuse of glue, 707; on greaves, 707; on animal coal, 707; on refuse sugar, 707; on fish, 708; on feathers, 724; on May-flies, 724; on chrysalids, 724; on cockchafers, 724; on Spurry as a green manure, 820; on Lupines, 867.
Sproule's Treatise on Agriculture, rev., 288
Squirrels, carniverous, 494
Stages for plants, their construction, 635
Standish's nursery, noticed, 528
Staphylinus olens described, 740
Stars, falling, 809
Statice monopetala, var. denudata, 711; arborea, its treatment, 745
Stelis argentata, 639
Stephens' Book of the Farm, rev., 72, 256, 456, 775, 824
Stewing Pears, remarks on, 841
Sticta pulmonaria, described, 84
Stocks, seed, adv., Haage, 49; German, treatment of, 145; cause of their decay, 337
Stocks, affected by the scion, 54; effect of on fruit, 126
Stoves, Amateur's, new method of heating, 267; fit for Orchidaceæ, 285; small, to heat, 380; Chunk and Arnott, injurious in forcing, 305; Vesta for a greenhouse, 385, 857; Arnott's recommended for forcing plants, 573
Stratiotes aloides, 453
Strawberries, adv., Masters, 18; Wyatt, 217; Brewer, 601; treatment of, 25; grown in a pit, 317; Swainstone scarlet, 437; effect of nitrate of soda on, 437; best season to plant, 453, 457, 694; good early sort, 467; to pack, 497; great crop, 574; adv., Princess Royal, Newsom, 281; remarks on, 471, 510, 525; Prince Albert, 457; Myatt's Pine, its treatment, 491, 510, 525, 529, 542; Eliza, 593; for succession, 513, 541, 857; Emperor, adv., 705; to render fruitful, 541; Hautbois, to fertilise with the Russian Alpine, 853
Stylidium ciliatum, pilosum, 527
Succulents, their culture, 4; for a greenhouse, 825
Sugar from the Asphodel, 351; from Maize, 651; from Figs, 654; refuse, as a manure, 707, 740
Sulphate of copper, its action on weeds, 620; iron, to fix ammonia, 625; of ammonia, for Corn, 839; of soda, its effect on Potatoes, 710; on balsams, 741 of lime, adv., Carter, 752
Sulphuric acid, to fix ammonia, 273, 497, 712
Sulphur, its effect on plants, 222; on ants, 269, 286, 558; on red spider, 493, 557; its application, 557; found in plants, 710
Summer, proof of its extraordinary heat, 694; its effect upon vegetation, 742
Sunflower, its treatment, 255; remarks on, 623; following the sun, 637
Swallows, their departure, 653, 790; their use, 791
Sweet-cane of Scripture, remarks on, 757
Sweetmeats, to boil, 870

T.

Tabanus bovinus, 641
Tanks, to line, 605; to construct, 653
Tan, unsuitable for manure, 545, 808; for pits, 824
Tape, used instead of bast in budding, 542
Tariff, as it effects agricultural and horticultural produce, 479
Tar, repulsive to rabbits, 470; spirits of, for Carrots, 222, 289
Tasmannian Journal of Natural Science, &c., rev., 192
Taylor's Inquiries on Foreign Corn, rev., 208
Tea, Assam, its first discovery, 55, 67, 70, 155, 157, 607; of Thibet, 455
Tendril, its definition, 421; remarks on, 821
Tenthredo Cerasi, to destroy, 692
Tettagonia spumaria, described, 508; to destroy, 541
Theory, its nature, 220
Thermometers, on placing, 128, 868; at Chiswick, 593; test for, 841
Thibet, tea of, 455; plums of, 480
Thrips, to destroy, 425, 625; to drive from Dahlias, 593; from Calceolarias, 671
Thrush, remarkable tameness of, 709
Thuja filiformis, 239
Thunbergia coccinea, to flower, 41; aurantiaca, a greenhouse plant, 70; alata, its treatment, 681, 745
Thya or Thyon, noticed, 223
Tillandsia rubida, 759
Timber, its growth, 19, 758; effect of soil on, 37; effect of rapid growth on, 51, 67, 83; shrinkage of, 110; to preserve from the white ant, 223; quality of, 317
Tinakori Cottage, New Zealand, 710
Tipula oleracea, remarks on, 821
Titness, garden, noticed, 304
Toads, inimical to bees, 558
Tobacco, treatment of, 353; effect on Vines, 369; its abuse, 637
Tomatoes, prepared like figs, 95; ketchup, to prepare, 697, 713
Transplanting, season for, 593; evergreens in summer, 638; remarks on, 805
Travellers, Botanical works for, 385
Trees, barked, to heal, 545; to fell for timber, 593; flowering, 593; planted by her Majesty, 612; for a steep bank, 657; ornamental deciduous, 741; their gradual decay in England, 773; to plant, 789; increase of timber in, 789; large, to remove, 792; to prevent their being barked, 806, 857; overhanging law of, 126; a selection of, 129, 161; for walls, 825; adv., Masters, 170; remedy for lichen, on, 177; to transplant, 208, 593, 805; to prune, 253, 363; variations of, 317; wall, to summer prune, 396, 470; to stop their bleeding, 421; their transmission to foreign countries, 539, 755; guards for, 857
Trellises for creepers, 651, 667, 692, 756, 772, 788, 804; to secure to flower-pots, 707
Trenching, described, 6; necessity of, 739
Trevirana coccinea, treatment of, 145
Trichosma suavis, 287
Trifolium, new kinds, 239
Trilliums, hardy, 793
Trimmer's Practical Chemistry, rev., 367
Triptilion spinosum, treatment of, 455
Trollius acaulis, 607
Tropæolum, tricolorum, its treatment, 9; azureum, 591, 671; adv., Veitch, 665; new species of, 301; edule, 349, 495; tuberosum, blooming freely at Holme House, 759
Tropical seeds, to raise, 349
Truffles, their propagation, 22, 287; where found, 809
Tuberose, its treatment, 129; adv., Marsano, 801
Tulipa Clusiana, 209
Tulip, fancy in Paris, 190; good qualities described, 238, 271; adv., Macefield, 297; Lawrence, 297; Groom, 314; Tyso, 601; Pope, 770; new sorts, 351; monstrous price of, 791
Turf, to obtain, 97; to make green, 257; edgings, to make, 7; pits for plants, 710
Turnip, adv., Haines, 1; Purdie, 121; gigantic, 40, 821; purple-topped Aberdeen, 96; saw-fly, remedies for, 144, 406; described, 621; its culture, 289; to preserve in winter, 365, 745; fly, to eradicate, 422, 453, 495, 560; seeds, to preserve from insects, 541; to preserve from the flea, 574; effect of guano on, 789; cause of their running to seed, 873
Turpentine, its effects upon the red spider, 574; upon wasps, 637; upon cockroaches, 806
Tussilago alpina, as an edging, 125
Tussock-moth, brown, described, 540

U.

Urate, its effect on Potatoes, 710; on balsams, 741; on Wheat, 772
Urine, human, as a manure, 755, 824
Utricularia vulgaris, 268

V.

Vallisneria spiralis, in the open air, 694
Vallota purpurea, its treatment, 809
Vanda cristata, 239, 591
Vanilla, account of, 288; palmarum, 639
Varieties of plants, remarks on, 825
Vases for Cottage Gardens, 92
Vegetable-marrow, to raise seeds of, 589; peculiar form of its spiral vessels, 774;—ivory, remarks on, 836
Vegetables, a selection of, 93, 840, 841; cookery of, 94; weather prophets, 207; monsters, 471; self-combustion of, 669; refuse, to convert into manure, 745; to save seed of, 789
Vegetation, effect of sulphur on, 286; of Affghanistan, 654
Veitch's Nursery, noticed, 208
Verandahs, Creepers for, 869
Verbenas, adv., Stewart, 105; Ivery, 153; Catleugh, 201; Dillistone, 201; Knight, 265; Girling, 601; treatment of, 145; good sorts, 273, 588
Veronica hederæfolia, described, 220; officinalis, 268; nivea, 438
Vines, effect of root-pruning, 38, 142; for out-door growth, 657; to stop, 173, 321; adv., Hoare, 753; Buck, 201: Hoare on, adv., 237; Verjus, 209; leaves, cause of diseased, 241, 457; to prevent bleeding, 286, 317, 333, 712; management of, 316, 353, 421, 425, 510, 558; exposure to external temperature unnecessary, 321; to syringe, 589; hot-water pipes, injurious to their roots, 561; treatise on, adv., Roberts, 586; their treatment by Mr. Crawshay, 603, 739; brought into bearing by sawing the stem, 656; to train, 792; benefited by autumn pruning, 691; to renovate, 697, 840; supposed cause of their failure, 709; borders advocated, 739; out-door, to train, 757; border, to improve, 761, 776, 857; remarks upon varieties of, 787, 824; Victoria, 787; adv., Merrick, 786; large, to remove, 792; winter treatment of, 808; to train above plants, 729; tendril of, remarks on, 821; wash for, 841; to water, 857
Vinery, angle of roof, 22
Violets, Russian, treatment of, 73; Neapolitan, their culture, 204, 253, 652, 825; change of colour in, 381; cause of failure in, 841
Vipers, 318; to catch, 365, 381
Vitality of seeds, 525, 526
Vitriol, green, to apply, 385; as a manure, 577; blue, different from green, 657
Vogel, Dr., his death, 319
Voorst's Heraldry of Fish, rev. 320

W.

Wagtail, its habits, 205
Wakeling's Florists' Guide, rev., 256
Walks, to keep clean, 318; asphalte, to make, 379; plants for edgings of, 37, 44, 125, 333, 589
Wallflower, seed, adv., 49; night-smelling, 337
Wall, south east, trees for, 97; remarks on coloured, 161, 177; conservative, described, 331; stone, for fruit trees, 369; a protection to plantations, 419; trees, to train neatly, 421; to prune in summer, 470, 494, 556, 572; fruit, to protect from wasps, 545, 558, 741; trees for, 657, 825; their management, by Mr. Ayres, 556, 572, 621; to prepare borders for, 712; remarks on, 741; naked, to hide, 776; cause of damp on, 857
Walnuts, to raise, 113; to preserve, 693
Ward, Mr., his glass cases adverted to, 299; described, 852; plants for, 852; where procured, 873
Warpur, its vegetation, 606
Wasps, on Ash trees, 332; nest, immense, 543; to cure the sting of, 470, 653, 694; to protect fruit from, 545, 558; their destruction, 545, 589; nests, to take, 560, 574, 637, 837; their sting, not cured by Battley's preparation of Opium, 621; utility of destroying them in spring, 759; their use, 857
Water-cup, described, 300
Waterer's nursery, noticed, 352, 367
Watering in the open air during summer, 421; pot, improved, 470
Water, to keep pure, 745; effect of animalcules on, 838; rain, for greenhouse plants, 177; from iron tanks, not injurious, 193
Wax, for grafting, 286
Weather, statement of, 558, 871; prophets, animal, 128; vegetable, 207, 351
Weeds, to extirpate, 409, 555, 587; to destroy their seeds, 593; action of sulphate of copper on 620
Weevil, nut, described, 108; red-legged, described, 316
Weights, of horticultural productions, 669, 708, 741, 820; in the London markets, 788
Wellington, New Zealand, remarks on, 710
West's Remarks on the Mismanagement of Timber, rev., 592
Whale-oil soap, useful in destroying insects, 575
Wheat, its culture in the West Indies, 20, 36, 53, 238; prevention of smut in, 127; utility of cutting before fully ripe, 608; experiment with, 771; Lammas, its produce, 710; quantity grown in England and Wales, 857; great crop of, 867
White's Natural History of Selborne, rev., 856
Whitethorn, its treatment for a hedge, 35; raised from roots, 54; treatment of, 85, 110, 158, 174
Whitlow Grass, described, 124
Whitmore Lodge, noticed, 575
Widgeon, its habits, 254
Wiers, Mr. Brinsden's, 143
Wighton on Bees, rev., 256
Willow, dedicated to grief, 623; its treatment in Ladakh, 655; new weeping kind, 726
Windows, cultivation of plants in, 92, 348, 804
Windsor, polluted by the effluvia of sewers, 851
Wine, new, 207; of bad quality when made from unripe fruit, 745
Winter weed, described, 220
Wire protector for fruit, 577; leaden, its effect on plants, 825
Wirework, adv., Thompson, 154; Baker, 266
Wireworms, destructive to Dahlias, 365, 381; remedy for, 398, 457, 545, 777, 821
Wistaria Backhousiana, 793, 825
Wither's Treatise on the Acacia, rev., 496
Woodhall, noticed, 711
Wood, kyanised, its effects on plants, 96, 176; its preservation, 207; rendered incombustible, 381, 419; to collect specimens of, 492; to season, 841
Woodlice, to destroy, 273, 425, 777, 841
Wood's Catalogue of Roses, rev., 760
Woodsorrel, as an edging, 23
Wool, as a manure, 707
Words, meaning altered by Act of Parliament, 398
Worm casts, to get rid of, 809, 841, 870
Wrest Park gardens, noticed, 679
Wright's Popular Cyclopædia of Science, rev., 320

X.

Xanthorrhæa arborea, 192
Xylography, hints on, 492

Y.

Yeast, artificial, to make, 823; as a manure, 824
Yews, Irish, adv., Farrell, 737
Young's nursery, noticed, 607

Z.

Zinc labels, ink for, 189
Zingiber officinalis, 268
Zoological Society, terms of admission to, 669
Zoologist, adv., 866; rev., 872

LIST OF WOODCUTS IN THE PRESENT VOLUME.

Acorn, growing in water, 755
Amateurs' stoves, 268
Antler Rose saw fly, 604
Aphides, 4; apparatus to destroy, 396

Beans, support for, 284
Bees, hybernatory for, 837
Bryony, 556
Budding, diagram to illustrate, 89

Cart for distributing liquid manure, 758
Chermes Pear, 156
Climbers, training illustrated, 70
Conservative wall, 331
Cottages, plans of, 407, 468
Cucumber frame, 173
Cynips umbraculus, 852

Designs for creepers, 651, 667, 692, 707, 756, 772, 788, 804, 869
Draba verna, 124

Farmhouse, in Guipuscoa, 284
Flower pot, double sided, 803; stand, 190

Geometra hirtaria, 788
Grafting, diagram to illustrate, 87
Greenhouse, portable, 852

Hawthorn fence, 158
Heating apparatus, 4 diagrams, 723
Hopean apparatus for flowers, 315

Hothouses, 3 diagrams to illustrate the ventilation of, 188; 2 diagrams to illustrate the heating of, 348
Hyacinths, pots for, 868

Icehouse, 6; and fruit-room combined, 141

Layering, diagram to illustrate, 90
Lime-kilns, 3 diagrams, 435

Megachile centuncularis, 573
Melon pit, section of, 124
Moth, Gamma, 52; brown tussock, 541; brindled beauty, 788
Mousetrap, 126

Narcissus fly, 204
Nut weevil, 108

Oak of Harreshausen, 36; lungs 84
Onion-fly, 252

Parasol Gall-fly, 852
Pear, Mullet's Guernsey Beurré, 36; the Dunmore, 85; Knights, Monarch, 109; Chermes, 156; Hacon's Incomparable, 172; Seckel, 708, Beurré Bosc, 868; trained in the pyramidal form, 453; 2 diagrams of, in a state of metamorphosis, 587
Pit, transverse section of, 53
Potato, a monstrous, 85
Pot for cuttings, 238; double sided, 803
Preparation of land, diagram of, 739

Ranunculus aquatilis, 300
Raspberry, 2 diagrams to illustrate training, 836

Saw-fly, antler Rose, 604; Turnip 620
Saxifrage, three-fingered, 252
Shrubbery, diagram to illustrate planting, 69
Slug worm, 692
Stages, diagram of, 635
Staphylinus olens, 740
Sticta pulmonaria, 84

Tettagonia spumaria, 508
Timber, section of, 19
Training fruit trees, 10 diagrams, 820
Trees, 9 diagrams to illustrate the pruning of, 363-4
Trellis, for fruit trees, 421; for plants, 651, 667, 692, 707, 756, 77
788, 804, 869
Trenching, diagram of, 6
Turnip fly, 620; machine to destroy, 454
Tussock moth, brown, 541

Vase, a rustic, 92
Veronica hederæfolia, 220
Vinery, section of, 22
Vines, to show the system of training, 758

Wall, stone, to protect plantations, 419
Ward's Case, 852
Watering pot, improved, 470
Weevil, nut, 108
Whitethorn, hedges, diagram to illustrate the pruning of, 110
Whitlow grass, 124

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.
THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.
No. 1. SATURDAY, JANUARY 1, 1842. Price 6*d*.

FRUITS.—A CATALOGUE of the FRUITS cultivated in the Garden of the Horticultural Society. Second Edition. Price 7*s*. 6*d*.
Ridgway, Piccadilly, and all Booksellers.

D. FERGUSON, Aylesbury Nursery, respectfully informs the public, that he has still Seeds of his Early Green-Fleshed MELON. In packets of Six Seeds, 7s. 6d. Money returned or deducted if not satisfactory, after a FAIR trial.

MYATT'S VICTORIA RHUBARB.

J. AND W. MYATT having a good Stock of Strong Roots raised by offsets from the original Seedling, can supply them at 10*l*. per hundred.—N. B. As various spurious sorts have been sold and are now selling under the name of "Myatt's Victoria," purchasers would do well to require them warranted.—Manor Farm, Deptford, Oct. 23, 1841.

SPLENDID SPECIMEN CAMELLIAS.—An Amateur in the neighbourhood of Exeter has a fine Collection of CAMELLIAS, which he intends to dispose of in one lot, having no longer convenience to cultivate them. It consists of fine large specimens of all the best kinds in the highest health, finely set with flower-buds; many of them are quite unique, and will be sold a bargain.—Particulars respecting them may be had on application to Lucombe, Pince, and Co., Exeter Nursery.
Dec. 29th, 1841.

CHAPPELL'S CREAM BROCCOLI.

CHARLES FARNES, Seedsman, No. 128, St. John-street, London, begs to inform the Public that he has purchased of Mr. Chappell, Market-gardener, Edmonton, the whole of the SEED saved by him this year of that splendid variety of BROCCOLI, which for size and flavour is not surpassed by any kind grown. Also now ready to send out—

Farnes' superior first Early Pea.
Flack's new large Victory do.
Young's do. do. Marrowfat do.
Knight's Dwarf Green do. do.
New Auvergne Pea.
American Dwarf do.
Chappell's Early White Broccoli.
Legg's Early Walcheren Broccoli.
Fine Early Frame Radish.
Ady's fine large Cos Lettuce.
True Brighton do. do.
Black-seed Bath do. do.
Imported Early Dutch Turnip.
Imported Dutch Horn Carrot.

BRACHYCOME IBERIDIFOLIA SEED in small packets at 5*s*., to be had of W. J. NUTTING, Seedsman, 46, Cheapside. Lisianthus Russellianus, 2*s*. 6*d*.; Pink, from fine named flowers, 2*s*. 6*d*.; Calceolarias, from 30 varieties, 2*s*. 6*d*.; Pansies, selected from a few first-rate flowers, 5*s*.; do., from a superior collection, 2*s*. 6*d*.; Dahlia Scapigura Mexicana, 1*s*.; Clintonia pulchella, 1*s*.; Schizopetalon Walkerii, 1*s*.; Phlox Drummondii, 1*s*.; &c. &c.—Packets of the following Cucumbers at 2*s*. 6*d*.: Man of Kent (Barnes'), Victory of Suffolk (Allen's), Prize-fighter, Weedon's Frame, Roman Emperor, and Windsor Prize.

☞ A Catalogue of Seeds to be had on application.

A. LAING and C. M. M'INTOSH beg to announce that they have made arrangements to carry on business as NURSERYMEN, SEEDSMEN, and FLORISTS generally, and trust that by attention, and the opportunity they have of procuring their Stock of Seeds, Fruit-trees, Shrubs, &c. from the most respectable growers, and the facility the situation affords (being within nine miles of Hull) of transmitting such orders as they may be honoured with, to all parts of the United Kingdom and the Continent, will induce gentlemen to favour them with a share of their patronage.

LAING and M'INTOSH beg leave to say that all orders will be punctually attended to, and forwarded without delay.

Beverley, Yorkshire, 1st Nov., 1841.

HUGH LOW & CO. have much pleasure in submitting to the attention of their Friends and the Public the two under-named first-rate DAHLIAS. Strong Plants will be ready for delivery the first week in May at 10*s*. 6*d*. each.

WINTERTON RIVAL (Nelson), Primrose, good form, fine habit, flowers well above the foliage, height five feet. A figure will appear in the March number of the *Florists' Journal*.

DUKE OF CORNWALL, Rosy Ruby, fine habit, well up in the centre, very constant, has all the properties of Le Grand Baudin, with the additional recommendation of being of much dwarfer habit; height four and a half feet.

The last-named was raised by the person who obtained Le Grand Baudin and Conservative, acknowledged to be two of the best Dahlias of 1840, and exhibited in more winning stands than any two of the same season.

H. L. & Co. think it needless to inform those who have hitherto favoured them with their orders as to their way of doing business; but think it right, for the satisfaction of strangers, to state that should the two Dahlias now offered not answer the description given, they will most willingly deduct them.

Roots of most of the leading sorts of last year may be had on early application.

Clapton Nursery, Nov. 24th, 1841.

THE ANNUAL DINNER of the SUBSCRIBERS to, and FRIENDS of, the GARDENERS' BENEVOLENT INSTITUTION, the MEMBERS of the FLORICULTURAL SOCIETY of LONDON, and the NURSERYMEN, GARDENERS, and AMATEUR FLORISTS of GREAT BRITAIN, will take place at the CROWN and ANCHOR TAVERN, STRAND, on THURSDAY, the 13th of January, 1842, at Four o'clock. Professional Singers will attend.

The GENERAL MEETING of the GARDENERS' BENEVOLENT INSTITUTION, the FLORICULTURAL SOCIETY of LONDON, and ANNUAL MEETING of the TRADE, at One o'clock the same day.

Dinner Tickets 12*s*. 6*d*. each (including a bottle of wine), may be obtained of the following Members of the Committee:—

Messrs. Beaton, Shrublands, near Ipswich; Bristow, Knightsbridge; Chandler, Vauxhall; Charlwood, Covent-garden; Gaines, Battersea; Gregory, Cirencester; Henderson, Pine Apple-place; Low, Clapton; Mountjoy, Ealing; Noble, Fleet-street; Osborne, Fulham; Rogers, Eaton-square; Smith, gardener to Lord Tenterden, Hendon; Thomson, Iver; Toward, gardener to H. R. H. the Duchess of Gloucester, Bagshot Park; Warner and Warner, Cornhill; Waterer, Knap-hill, Bagshot.

Of Messrs. Atkins, Northampton; Day, Oxford; Dickson, Acre-lane, Brixton; Flanagan, Mansion-house-street; Garraway and Co., Bristol; Girling, Stowmarket; Mackay, Badmington; Nutting, 45, Cheapside; Ogden, Coventry; Orson, Orange-row, Kennington; Wood & Sons, Maresfield; at the Gardeners' Gazette Office, 320, Strand; of Mr. Wildman, Hon. Sec. of the Floricultural Society, Grove-place, Southampton-street, Camberwell; and of Mr. Bowler, Hon. Sec. of the Benevolent Society, Albany-road, Kent-road.

NEW AND SUPERIOR SEEDLING DAHLIAS FOR 1842.

JAMES EDWARD, Florist, Layerthorpe, York, begs most respectfully to invite the attention of Cultivators of the Dahlia to the following Three Seedling Varieties (raised in 1840, and fully proved in 1841), which are quite distinct from any hitherto produced; of very superior habit, and constant in producing good Show Flowers throughout the season; in proof of which J. E. begs to state that he has shown above 200 blooms of the three, during the season, at various Exhibitions open to all England, and has had nine Seedling Prizes awarded for them, namely,—four 1st prizes, three second ditto, and two third ditto; they have also been shown in the following winning trays:—

In the 1st Tray of 24 at the Horticultural Society, York, Aug. 18,
2d ,, 24 ,, ,, ,,
1st ,, 18 ,, ,, ,,
2d ,, 36 at the Botanical Gardens, Hull, Sept. 2d;
2d ,, 12 ,, ,, ,,
1st ,, 24 at the Horticul. Soc., Scarborough, Sept. 3d;
1st ,, 12 ,, ,, ,,
1st ,, 6 ,, ,, ,,
1st ,, 48 at the Yorkshire Philosophical Soc., Sep. 9th;
1st ,, 36 ,, Botanical Garden, Sheffield, Sept. 15th;
1st ,, 36 ,, Horticultural Soc, Barnsley, Sept. 21st;
1st ,, 24 ,, ,, ,,
1st ,, 48 ,, Botanical Gardens, Leeds, Sept. 22d;
1st ,, 48 ,, Horticultural Society, York, Sep. 24th;
2d ,, 24 ,, ,, ,,

Besides having taken other Prizes in addition to the above.

Premier.—Fine bronze salmon, very superior form, of excellent habit, throwing its blooms well above the foliage, and always to be depended upon in producing good show flowers. This variety obtained the first prize, in its class at the York Ancient Florists' Society, September 20th, and had also the premier prize awarded, as the best Dahlia of any colour.—Height 4 to 5 feet.—Plants 10*s*. 6*d*.

Mary Jane.—White ground, very deeply tipped and edged with purpled carmine—constant throughout the season, well up in the centre, of excellent habit, and never fails in producing good flowers. This variety obtained the first and second prize at Scarborough, as the best light-ground flower tipped or edged, and has justly been pronounced the most distinct and attractive Dahlia ever produced in its class.—Height [illegible] feet.—Plants 10*s*. 6*d*.

Duke of Richmond.—Fine light pink and yellow, colours beautifully blended together, with a light yellow tip at the end of each petal, similar to the Duchess of Richmond, but quite distinct from that variety; very superior habit, always constant, and will prove a noble and excellent show flower.—Height 5 feet.—Plants 10*s*. 6*d*.

Good strong plants will be sent out the first week in May; and for the convenience of parties at a distance, orders will be received, and plants supplied, by Mr. George Charlwood, Seedsman, Covent Garden, London; and Messrs. Henderson, Nurserymen, Brechin, Scotland. No allowance to the trade unless 12 plants are ordered, and a remittance or respectable reference will be required from unknown correspondents. J. E. can also supply plants of all the best Dahlias in cultivation, of which a catalogue is annually printed, and can be had on application.

We the undersigned, members of the Committee of the York Horticultural Society, do attest the correctness of Mr. Edward's description of the above Dahlias; and we strongly recommend them as distinct varieties from any yet sent out, and well worth a place in the most limited collection.

Report of the York Amateur Florist Society, held on Monday, August 9th, 1841.—The Judges and Members of this Society consider it their duty to notice a seedling Dahlia of last year (sent for inspection) raised by Mr. Edward, Nurseryman, of this city. The colour is pure white, with a dark tip of purpled carmine; the form, depth of petal, and above all, good eye, require no consideration to pronounce it one of the best Dahlias yet seen of its class; and from the evident superiority of this distinct variety over such flowers as Glory of Plymouth, Beauty of the Plain, &c., there is no doubt but the year 1842 will cause these flowers to fall in the rear when brought into competition with the seedling exhibited this day, as it may safely be pronounced a gem of the first water, and will reflect the greatest credit on the fortunate raiser, for so long as Dahlias remain in cultivation this flower must form a prominent feature in a stand of six.—*From the York Courant.*

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. Bailey having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. Bailey also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. Bailey were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. Bailey have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

BRITISH SHEET-GLASS for HORTICULTURAL PURPOSES.

NOBLEMEN, GENTLEMEN, and HORTICULTURISTS generally, are respectfully informed that they may be furnished with Lists of Prices, and every particular regarding the above article, which has been adopted so successfully at Chatsworth, upon application to J. DRAKE, Plate and Crown Glass Warehouse, 8, Jermyn-street, St. James's, and 100, Edgeware-road.

Orders for small or large quantities of Glass for Lights or Houses accurately cut to the required size, and punctually executed upon the lowest wholesale terms. Window Lead, Solder, Putty, Prepared Cement, and every requisite for Garden Glazing.

WANTS a SITUATION as SHOPMAN or TRAVELLER to a Wholesale Seed and Nurseryman, a respectable Young Man, who well understands the business in all its branches, and from his connexion could increase the business of his employer. The most satisfactory testimonials could be given. Letters addressed B. L., at the Office of the *Gardeners' Chronicle*, will be forwarded.

WANTED by a first-rate Gardener and Forester, a situation as GARDENER, to take the management of the Garden, Pleasure-ground, Planting, &c. The advertiser has been in constant practice for the last 10 years, and has been equally successful in Fruit and Flower forcing; and, in addition to the above, has carried on an extensive business as Nurseryman and Florist, and now intends to turn his attention to the laying out or general improvement of any gentleman's gardens, and will undertake to renovate old Vineries, or get a crop of Grapes in Fifteen months from the time of planting young Vines,—with every improvement in modern gardening. Can be highly recommended by the first Horticulturists of the day.

Apply (prepaid) to Mr. Jno. Shalders, Secretary to the Holt Horticultural Society, Norfolk.

TO GARDENERS and OTHERS.—TO LET, in the County of Kent, 18 miles from town, a good HOUSE and GARDEN, with about Twelve Acres of Fruit Planting. Rent, &c., moderate. For further particulars apply to Mr. Pawley, White Hart Inn, Bromley, Kent.

TO MARKET-GARDENERS and FLORISTS.—TO LET, on LEASE, at Clapham, Surrey, 4 miles from London, a large GARDEN and FIELD of excellent earth, about 2 acres, on which are 3 Forcing Houses, and 2 Cottages walled in on two sides, and the rest close paling, with choice Fruit-trees. Apply to view the property at Evans's Cottage, middle of Bedford-road, Clapham, and letters to S. W. C., at 54, Coleman-street, London,

---

TO NURSERYMEN, SEEDSMEN, and FLORISTS.—To be disposed of, a NURSERY and SEED BUSINESS, with an unexpired Lease of 18½ Years, containing upwards of 1½ acres of Land, well stocked with Fruit and other Trees, &c. &c., with Dwelling-house, Seed-shop, Cottage, three Greenhouses and Pits well stocked with saleable plants, at a moderate rent. The above Nursery is situated not more than five minutes' walk from the principal squares in the West-end, and may be taken, with immediate possession, by private contract or by valuation.

For further particulars, apply to Mr. Matthews, builder, No. 1, Newman-street, Oxford-street; if by letter, prepaid.

TO BE SOLD for £10 10*s*. 27 SPECIMEN PLANTS, all well-grown, and in excellent health. The Judges at the Exhibitions of the Horticultural Societies have denominated some of them the most perfect of their kinds that have yet been seen, and as such they have had medals awarded to them.

2 plants of Russellia juncea, very large; 2 of Pimelea decussata; 2 Elichrysum proliferum; 2 Grevillea rosmarinifolia; 2 Eutaxia myrtifolia; 2 Kennedya monophylla; 1 Brachysema latifolia; 1 Epacris latifolia; 1 Epacris impressa; 1 Hovea lanceolata; 1 Kennedya Marryattæ; 1 Amaryllis purpurea; 1 Euphorbia splendens; 1 Corræa speciosa; 1 Erica Hartnelli; Do. eximia; Do. carnea; Do. radiata; Do. fulgida; Do. coccinea; Do. cerinthoides.

Apply at 34, Wych Street, Strand, London.

ANNUITIES.—In the AUSTRALASIAN, COLONIAL, and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, Annuitants participate in the Profits of the Company, and receive a rate of ANNUITY much more favourable than can be granted by any Company making its investments wholly in England. The Company is enabled securely to grant these favourable terms from the advantage it possesses of investing a portion of its Funds at a high rate of Interest.

Directors.

J. H. Ravenshaw, Esq.
Capt. Sir Jas. Stirling, R.N.
William Walker, Esq.

Solicitors.—Messrs. Swain, Stevens, and Co.

Prospectuses, with Tables, Forms of Proposal for the purchase of an Annuity or for making an Assurance, and every information, may be obtained by application at the Office of the Company, No. 126, Bishopsgate-street, City.

By order of the Board,
CHRISTOPHER COUSINS, Accountant.

HEATING BY HOT WATER, WITH THE CIRCULATION OF ATMOSPHERIC AIR.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER; see the 3rd and 37th Numbers of the *Gardeners' Chronicle*.

References may be had, and their works seen, at Mr. Perry's Nursery, Banbury; Mr. Green's, Lower Cheam; Messrs. Henderson's, Pine-apple Nursery; Messrs. Rollisson's Nursery, Tooting; Mr. Knight's Exotic Nursery, Chelsea; Messrs. Low's, Clapton Nursery; Mr. Catleugh's Nursery, Chelsea; Mr. Gaines's Nursery, Battersea; Mr. Buck's, Portland Nursery; Mr. Young's, Milford Nursery; Mr. Smith's Nursery, Dalston; Mr. Woodroff's Nursery, Kensall Green; Mr. Hopgood's Nursery, Bayswater; Mr. Willmer's Nursery, Chelsea; and at most of the Nobility and Gentlemen's Seats in the country.

Every particular to be had at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

HOT-WATER APPARATUS, upon the most improved and Economical principles, for Horticultural and other Buildings.—STEPHENSON & CO., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, annex the following list of prices of Hot-water Pipes of the best description, to assist persons desirous of adopting this mode of heating in their calculations of the probable expense, and respectfully solicit an opportunity of tendering their price for the completion of any work required. Socket-pipes for Hot Water, of two, three, and four inches diameter, at [illegible], [illegible], and 4*s*. 3*d*. per yard. Ditto, with Troughs for Orchidaceous-houses, 5*s*. 6*d*. and 8*s*. per yard.

The much-approved Conical Boilers made of strong plate-copper, and which require no furnace or setting in brickwork, from 5*l*. 5*s*. upwards. Also every other description of Boilers of the most approved construction.

Further particulars may be obtained at the Warehouses, Gracechurch-street, where also may be seen a variety of patterns of Iron and Strained-wire Fencing, Hurdles, Brass and Iron Bedsteads, &c. &c.

SLATE CISTERNS, SHELVES, TROUGHS, &c., for Horticultural purposes.—EDWARD BECK, Manufacturer, Isleworth, near Brentford. Orders, Working Drawings, &c., forwarded by post, will receive due attention.

*** Slate Edgings for Flower Borders, &c.

TO SEEDSMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE and MORRIS are instructed by Mr. HENRY CLARKE, of the High-street, Borough, in consequence of his declining a part of his Country Trade, to submit to Public Auction on the Premises, White Hart Inn Yard, High-street, Borough, on Thursday, Jan. 6th, 1842, at 11 o'clock, the surplus Stock of Garden and Flower Seeds, consisting of Onion, Lettuce, Cabbage, Broccoli, Cucumber, Cauliflower, Carrot, Mangel Wurzel, Maw Seed, &c. Also a quantity of Herbs, Nests of excellent Seed-drawers, and other effects. May be viewed two days previously to sale. Catalogues may be had of the principal Seedsmen and Nurserymen; on the Premises; and of the Auctioneers, American Nursery, Leytonstone.

FOR CHILDREN CUTTING THEIR TEETH. STEEDMAN'S SOOTHING POWDERS.—The good effects of these Powders in preserving a healthy state of the constitution during the period of teething have now had 20 years' experience, (the proprietor first gave them to his own children with great benefit,) during which time thousands of children have been relieved annually from all those distressing symptoms which children suffer while cutting their teeth; viz.—FEVERISH HEATS, FITS, CONVULSIONS, SICKNESS OF STOMACH, and DEBILITY, accompanied with Relaxation of the Bowels and Inflammation of the Gums.—Prepared and sold in packets at 1s. 1½d by J. STEEDMAN, Chemist, Walworth, Surrey, and sold by all Chemists and Medicine Venders in the United Kingdom; or any lady wishing to try them, by enclosing a shilling in a letter to the proprietor, will receive a packet by return of post, free of expense.

On the First of January, No. I., price 2s. 6d.,

THE LADIES' FLOWER-GARDEN OF ORNAMENTAL PERENNIALS. By MRS. LOUDON. Each Number will contain Three Plates, demy 4to size, comprising from 15 to 20 Figures accurately coloured from Nature.

London: Published by William Smith, 113, Fleet-street.

Just published, cloth boards, gilt, price 4s. 6d., dedicated by special permission to H. R. H. Prince Albert,

THE HOUSE OF COMMONS, as elected to the Fourteenth Parliament. By WILLIAM ATKINSON WARWICK. Opinions of the Press:—"This account of the House of Commons will prove a valuable companion to every session of Parliament, of which the present members of the lower House shall form a part. It commences with a brief introductory history of the origin of the House, and gives the date of each Parliament, with the names of the Speakers, from the earliest time, and the number of Parliaments held in each reign. After giving the names and titles, the following information as to almost every member is supplied:—his politics, whether Tory or Liberal, whether he voted for or against the Sugar Question, and for or against the last Ministry; and the name of the place for which every member holds his seat, with its population. Then follow the parentage, marriage, and state of the family, with the family seats, &c., &c., and various little pieces of personal history, very pleasant to those to whom they relate, inasmuch as they afford proofs of a successful and honourable ambition, either in the present members or their ancestors. As far as we have been able to test the work from our own knowledge, it is very accurate; and in the forthcoming session, busy and excited as that will probably be, the details which it affords will prove, we doubt not, generally acceptable."—*The Justice of the Peace.*

"This is a most useful edition."—*Exeter Flying Post.*

"Contains much matter of general interest."—*Norwich Mer.*

"There is a good deal of useful miscellaneous information in this work, which is comprehensive and accurate, without being bulky."—*Tait's Edinburgh Magazine.*

"Of the many publications professing to give a true and particular account of the new House of Commons, this appears to us to be, both in plan and execution, the most complete. The design of the publication is to give, at one glance, without any second reference, every important detail connected with the public and private history of the Members of the House of Commons. In addition to this information, which is much more full and complete than in any rival work, Mr. Warwick has given every particular relative to each constituency; the results of the two general elections, the names of the unsuccessful candidates; the official state of the poll; the population; and many other statistical and political facts. We have looked to the names of those Members with whose political and private movements we are best acquainted, and are able to report favourably of the notices which are attached to them. We may therefore venture to pronounce this the most correct and useful little manual of its class which has fallen under our notice during the present year."—*United Service Gazette.*

"This is a very useful manual, embracing more of the personal and political history of the Members of the Lower House than any similar work that has come under our notice."—*The Railway Times.*

"A work in which the personal and historical details connected with each Member of the present House of Commons are more extensive than in any similar publication we are acquainted with."—*Cambridge Chronicle.*

"This is the most complete guide to the present House of Commons which has yet appeared.—*Bristol Mercury.*

"Mr. Warwick has conferred a service on the British public by the issue of this valuable little manual. It presents in a small compass every information connected with the public and private history of the Members of the present House of Commons. Such a work was much wanted; for though several Parliamentary Guides are before the public, we are not aware that any has yet appeared which comprises all the features of that before us."—*Manx Sun.*

"A very useful manual; and as party bias does not appear, we may safely recommend it to the attention of all classes of readers, the arrangement being irreproachable."—*The Archæologist.*

"Containing a large amount of useful information in a well-arranged form, and is one of the best books of reference for particulars connected with the constitution of the present Parliament that we have yet seen. It gives much more than the usual information with respect to the *personnle* of the House of Commons. We beg to recommend the work to those parties to whom information touching electioneering and Parliamentary matters in general is useful. *It has the merit of impartiality, and is therefore suitable for persons of all opinions.*"—*Hampshire Independent.*

"The best manual which has hitherto been published as a Parliamentary Guide Book, or a work of reference."—*Berrow's Worcester Journal.*

"It is one of the most perfect and accurate Parliamentary analyses that has yet been published.—*Gloucester Journal.*

"Contains every information which is necessary to enable the reader to comprehend the components of the present Parliament."—*Lincolnshire Chronicle.*

"Mr. Warwick's work displays much perspicuity of arrangement, and an infinity of labour in its compilation."—*Cambridge Independent Press.*

London: Saunders and Otley. Edinburgh: W. Tait. Dublin: John Cumming.

PAXTON'S MAGAZINE of BOTANY, No. xcvi. for January, which completes the Eighth Volume, contains the following Illustrations—1. Oncidium I'naleayii; 2. Hardenbérgia macrophýlla; 3. Beaufórtia decussàta; 4. Gesnèra zebrina; the usual Operations for the Month; and a copious Index, &c.

☞ Arrangements have been made for executing the Illustrations for the new volume in a very superior manner, and also for introducing other points of general interest and attraction.

London: W. S. Orr and Co. Paternoster Row.

To appear on the 1st of January and to be continued monthly, 8vo, containing 56 pages of Letter-press and 2 Plates, No. 1, price 2s. 6d., of

THE LONDON JOURNAL OF BOTANY; being a NEW SERIES of the "JOURNAL OF BOTANY." By Sir WILLIAM JACKSON HOOKER, K.L., LL.D., F.R.A., and L.S., and Director of the Royal Botanic Garden of Kew.

- H. Baillière, 219 Regent-street, Foreign Bookseller to the Royal Society and the Royal College of Surgeons, London.

LIEBIG'S AGRICULTURAL CHEMISTRY.—NEW EDITION.

This day is published, a much-improved and cheap edition, containing a new chapter on Soils, of

CHEMISTRY in its APPLICATIONS to AGRICULTURE and PHYSIOLOGY. By JUSTUS LIEBIG, M.D., F.R.S., Professor of Chemistry in the University of Giessen. Edited from the Manuscript of the Author, by LYON PLAYFAIR, Ph. D. Small 8vo, 9s. 6d. cloth. Printed for Taylor and Walton, Upper Gower-street.

PEOPLE'S EDITION OF SIR WALTER SCOTT'S NOVELS.

On Saturday, 1st January, 1842, and to be continued each Saturday till the whole is completed, No. 1, Price Two-pence, containing One Sheet Royal 8vo., double columns, of

WAVERLEY OR, 'TIS SIXTY YEARS SINCE. With all the Author's Introductions and Notes. To be immediately followed by GUY MANNERING, The ANTIQUARY, and all the other Novels and Romances of Sir Walter Scott.

The Proprietors are anxious to meet the wishes of many intelligent correspondents among the Working Classes, who represent that, notwithstanding the great circulation and unparalleled celebrity of THE WAVERLEY NOVELS, thousands upon thousands of our industrious countrymen have yet to form acquaintance with the Baron Bradwardines and Fergus M'Ivors, the Meg Merilees and Dominie Sampsons, the Edie Ochiltrees, Old Mortalities, Di. Vernons, Rob Roys, Jeanie Deanses, and numberless other immortal creations of the Prince of Novelists. The Edition now announced will, it is hoped, be allowed to put these marvellous performances within the reach of the masses.

It is expected that the entire Novels will comprise about 260 sheets; and, besides the Weekly Issue, a Monthly stitched Part, price Ninepence, will be delivered with the Magazines.

Robert Cadell, Edinburgh; Houlston & Stoneman, London.

THE NONCONFORMIST, a Weekly Metropolitan Newspaper.—This Paper—commenced on the 14th April, 1841, containing a full digest of News clearly arranged, and more Original Matter than any similar Journal—has already taken the position of an established organ of Liberal principles both Political and Ecclesiastical. The numerous quotations from it by the contemporary press of all parties—its rapidly increasing circulation—and the unsolicited testimony to its character furnished by several of the leading men of the day, have stamped the NONCONFORMIST as a paper worthy the support of all classes interested in promoting the cause of civil and religious liberty.

The NONCONFORMIST contains 16 pages ("Spectator size), Price 6d. Published every Wednesday afternoon at the Office, 4, Crane Court, Fleet-street, and may be had of all News Agents.

THIS DAY, PRICE FOURPENCE,
(*Stamped to go free by post, Fivepence,*)
The first Number for 1842, of

THE ATHENÆUM.—

CONTENTS:

On the 1st of January will be published, the FIRST NUMBER for 1842 of

THE ATHENÆUM JOURNAL OF LITERATURE, SCIENCE, and ART, Price FOURPENCE (Stamped to go Free by Post, Fivepence).

THE ATHENÆUM is the largest Literary Journal published. It is printed in Large Quarto, sixteen pages of three columns each, and Double Numbers are given as often as required, (25 were given in the year 1840, and 22 in 1841.)

IT CONTAINS

Reviews, with copious Extracts, of all important New Works, both English and Foreign.

Reports of all that is interesting in the proceedings of the Learned and Scientific Societies; with abstracts of the more important papers. Also, the Meteorological Table kept by order of the Royal Society, and furnished *exclusively* to this Journal.

Authentic Accounts of all Scientific Voyages and Expeditions—Criticisms on Art—Critical Notices of Exhibitions, New Prints, New Music, the Opera, Concerts, Theatres, &c—Biographical Notices of distinguished Men—Original Papers and Poems—Foreign Correspondence. With Miscellanea, including all that is likely to interest the informed and intelligent.

*** The ATHENÆUM is published on Saturdays, but is re-issued each Month, stitched in a wrapper.

On the 5th of January will be published, with Title-page and Index, bound in Cloth, Price 1*l*.,

The Volume for 1841 of the ATHENÆUM, consisting of One Thousand and Eight Pages, and containing a complete History of the Literature of the Period—an Abstract of the many valuable Papers read before the Learned and Scientific Societies—Report of the Proceedings of the British Association—Authentic Accounts of Scientific Expeditions, and of the Progress of Discovery generally—Foreign Correspondence, relating to the state of Literature and Art on the Continent—Biographical Notices of the distinguished Men deceased during the year, &c., &c., and will be a most acceptable present to friends in the Colonies or on the Continent.

Published every Saturday, price Threepence,

PUNCH; or, the LONDON CHARIVARI! A weekly budget of Wit and Whim, political and satirical, with Cuts and Caricatures.

On the First of January will be published, being the First Number of the New Volume,

PUNCH'S ALMANACK;

Illustrated with upwards of Fifty Humorous Cuts of the World as it is to be in 1842. It will also be enriched with FIVE HUNDRED ORIGINAL JOKES! at the irresistibly Comic Charge of THREE PENCE! Published in Weekly Numbers and Monthly Parts, at the Office, 13, Wellington-street, Strand, and sold by all Booksellers.

In one small volume, price 15s.

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, an Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur or Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. Andrews, Bond-street; Orr & Co., Paternoster-row.

Handsomely bound in cloth, with 93 Wood Engravings, price 6s. 6d.

ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. TAYLOR, LL.D.

From the British Magazine.—"This is an elegant and well-executed little book, on a most interesting subject."

From the Birmingham Herald.—"A valuable and indispensable accession to the library of every Biblical student."

From the Rev. Thomas Hartwell Horne's Introduction to the Critical Study of the Scriptures.—"Nearly three hundred texts of Scripture are more or less explained in this elegantly-executed volume, and in a manner equally curious and interesting."

Post 8vo, price 6s.,

LETTERS FROM PALESTINE, written during a residence there in the years 1836-7-8. By the Rev. J. D. PAXTON.

The more important places in reference to Scripture History, visited by the author, were—

Damascus,
Jerusalem,
Beer,
Beyrout,
Mount Olivet,
Nazareth,
Baalbeck,
Bethlehem,
Samaria,
Mount Lebanon,
Hebron,
The Plain of Esdralon,
Jaffa,
The Valley of the Jordan,
Mount Tabor,
Mount Carmel,
Jericho,
Tiberias,
The Plain of Sharon,
The Dead Sea.

Also may be had, price 7s. 6d. cloth,

THE HISTORY OF FRANCE FROM THE EARLIEST PERIOD. By E. DE BONNECHOSE.

This History has been adopted by the Royal Council of Public Instruction for the use of the Normal Schools of France. The French Minister of War has also just subscribed for a large number of copies for distribution amongst the Regiments in the French service. The English translation of this popular work may be had of all Booksellers, price 7s. 6d., the two volumes of the French edition being comprised in the one of the English.

Price 5s. 6d. cloth,

THE HISTORY OF THE UNITED STATES OF AMERICA. By JOHN FROST, of Philadelphia.

London: Tilt and Bogue, Fleet street.

In cr. 8vo. 4s. 6d. bd. with 220 Diagrams engraved for the work.

EUCLID'S ELEMENTS OF PLANE GEOMETRY; with Explanatory Appendix, and Supplementary Propositions for Exercise. Adapted for the Use of Schools, or for Self-instruction. By W. D. COOLEY, A.B., author of the "History of Maritime and Inland Discovery."

"This is the best edition of the Elements which has yet appeared."—*Athenæum.* "For brevity, clearness, and discerning attention to the wants of learners, cannot be easily surpassed."—*Dublin University Mag.*

II.

Uniform with the "Elements," price 3s. 6d.

COOLEY'S GEOMETRICAL PROPOSITIONS DEMONSTRATED; or a Supplement to Euclid: being a KEY to the Exercises appended to the "Elements," for the use of Teachers and private Students. Upwards of 120 Propositions deduced from the first Six Books of Euclid, are illustrated in it by new diagrams.

"Will be found of considerable value as an aid to Teachers of the Mathematics."—*New Monthly Mag.*

III.

In foolscap 8vo, price 1s. 6d.

COOLEY'S FIGURES OF EUCLID; being the Diagrams Illustrating the "Elements," with the Enunciations, printed separately for use in the Class-room.

*** Orders received by all Booksellers.

IV.

FUN FOR THE FIRESIDE!!

Bound in cloth, price 5s. 6d.,

JOE MILLER'S JEST-BOOK. A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation. But that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiæ.

Extract from the Preface.

"Another strange circumstance connected with this work is that everybody presumes that he himself, and everybody else, is perfectly familiar with its contents . . . . and yet if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."

V.

One Volume, price 7s. 6d.,

THE LIFE AND TIMES OF RIENZI. "Not less interesting than Sir E. Lytton Bulwer's eloquent Romance, and scarcely less romantic, is this historic record of the Conspiracy of Gabrini."—*Monthly Repository.*

"To all who have read Sir E. Lytton Bulwer's 'Rienzi,' its perusal is, in a measure, a duty."—*Spectator.*

"A curious and pleasing volume, and full of matter of historical character and illustration."—*Literary Gazette.*

"The publication of this work is well timed . . . . The Life of Rienzi is to us full of interest."—*Athenæum.*

"Those that wish to become acquainted with the true history of a man who was, in some sort, the *Napoleon* of his own age and country, would do well to consult the extraordinary narrative of the 'Life and Times of Rienzi.'"—*Tait's Magazine.*

Whittaker and Co., Ave-Maria-lane, London.

WANTED, a GARDENER for the Bahama Islands. He must be a steady, well-informed man, who may be married, acquainted with the management of Oranges and tropical fruit trees generally. Wages 50*l.* a year, a house, and garden produce. The expense of his voyage will be paid out. The climate of the Bahamas is good and very healthy.—Apply, by letter only, to Dr. Lindley, 21, Regent street, London.

The Gardeners' Chronicle.

SATURDAY, JANUARY 1, 1842.

MEETINGS IN THE ENSUING WEEK.

Wednesday	Geological	8½ P. M.
Friday	Botanical	8 P. M.
Saturday	Royal Botanic	4 P. M.

FARMING or agriculture is, according to Liebig, beyond all comparison the most important of human pursuits. This may be, because it produces food. In the opinion of the world, Gardening, or Horticulture, stands next among the arts of cultivation; and Foresting, or Arboriculture, last. Here we do not agree with the world. It may be that Gardening produces directly more enjoyment than Foresting, ministering, as it does, to our senses of vision, taste, and smell; but Foresting is the science which a money-getting man should prefer, because it produces wealth, with which all the rest may be procured, and which the public should best love, because it furnishes the setting, without which a diamond is but glass, and a country of gardens but a wilderness.

What is the use of our pretty flowers if we are to wander among their mazes without shade? of what avail our forcing-houses if they are to be mere oases in a desert? and where the beauty of a palace if, like that of Buckingham, its adjuncts are but dirty walls and dingy rows of fireburnt clay, dignified by the name of streets? It is to trees that the great features of natural beauty will be traceable in every country, and which form the difference between the rich and delicious scenery of South Wales, as compared with the craggy savageness of Llanberis.

Where, too, lies the natural wealth of a country, after counting the flocks and herds, the corn-fields and meadows, but in its forests, the source of naval force, of manufacturing power, of all domestic comfort? People talk of the mines of coal and iron, of the verdant fields and the hardy sons of Britain, as the secret of her preeminence among nations; but are her woods as nothing? And people distract themselves about the importance of not having to depend on foreign countries for our corn, as if the preservation of our native timber were not as important a subject of consideration.

To be sure, we hear of vast sums expended in planting; of the thousands of acres covered with forest by the patriotism of one man, or the munificence of another, or the provident investments in wood of the careful trustees of a third. We know that these things are happening daily; but what then? Is our home supply of timber increased thereby? Doubtless it should be; but certainly it is not to anything like the extent that ought to be expected from the outlay incurred; for this simple reason, that to plant is not necessarily to create timber.

An excellent correspondent, whose letters have been too long on our table unused, has stated this in forcible terms. A very great proportion, he truly says, of what are called plantations cannot ever come to maturity, that is, to the noble timber which the original planter, we must suppose, intended. One man buys an estate, reads a book about the patriotism of planting, lays out a good round sum with his nurseryman, sacrifices the rental of his broad acres, and then—leaves the trees to take care of themselves, which they do by fighting like the Kilkenny cats, till each is eaten by the other. Another man takes care of his trees, that is to say, follows Mr. Pontey's directions; strips off all the branches; turns his goodly Oaks and Ashes into hop poles, whip-handles, fishing-rods, or whatever else of that sort the reader may please to imagine—under the sage idea that the more trees he has on a given piece of ground, the more timber he will have. And thus, between ignorant neglect and ignorant solicitude, the natural wealth of the country is frittered away, till we must look to any country rather than our own for supplies of timber.

It may be supposed that these are exaggerated statements, and that no such cases as we have referred to really exist. Alas for those who think so! They know little of the Foresting of England. We have no desire to hurt the feelings of any man, and therefore we shall not point to those spots where all that we have described is to be witnessed. The majority of our readers will, we doubt not, remember such cases within their own vicinity. Certainly some country gentlemen manage their woods extremely well; but most certainly also a large proportion are by no means sufficiently alive to their own interests, whether they consider the acquisition of money, or the beauty of their residences. We will engage to say that, between prejudice and ignorance, a large part of the woodland property of Great Britain is utterly wasted.

How strange it is that while gentlemen will be guided by the men engaged by them in other occupations—as gardeners, land-agents, mining agents, &c.—yet when woodland property is in question, they will not listen to reason, and even allow their ladies to interfere with the sensible observation that they cannot bear to see a tree cut down.

> So few there be
> That choose the narrow path, or seek the right:
> All keep the broad highway, and take delight
> With many rather for to go astray,
> And be partakers of their evil plight,
> Than with a few to walk the rightest way:
> O foolish men! why haste ye to your own decay?

We know how dangerous it is to condemn general practices, and how large a share of odium is likely to be incurred by him who, with whatever motives, shall set about exposing ignorance; nevertheless in this great national object we are content to run these risks, and therefore we shall address ourselves in future Numbers to some at least of the points in which it is most important that common practices in plantations should be corrected—in doing which we must crave the countenance and assistance of our experienced foresting friends, to some of whom, particularly Mr. Hamerton of Hellifield Peel, and Mr. Billington, we are already under obligation.

WE owe our readers some apology for having so long delayed to renew the subject of cultivating BULBS. Now that a new year is begun, we hope to redeem all our promises. For the present we shall confine ourselves to general principles.

One of the commonest questions asked by gardeners, as well as amateurs, is what they are to do with bulbs they have just received from abroad. That they do not treat them rightly is sufficiently shown by the miserable health of those which are saved from the general loss that so often attends upon all such importations. To this point, then, we first address ourselves.

When a bulb has only lain dormant in the earth during its natural period, it is ready to spring into renewed life upon the application of warmth and moisture; and it matters little whether it is suddenly transferred from dryness to moisture, or whether the change takes place gradually; because its powers of life are unimpaired, and like the stomach which has recently digested one meal, it is ready to commence the immediate digestion of another. Not that in nature such sudden changes actually occur: on the contrary, when rain begins to fall, it soaks but slowly into the earth; and when it does reach the bulb, it is still arrested in its action by the numerous dry coats with which this body is invested, and through which it must gradually filter.

But when a bulb has been long out of the earth, its vital energies are much diminished, and it cannot bear even that slow supply of moisture—its food—which is furnished by wet soil, whose humidity penetrates the bulb coats, and is absorbed by the living tissue. To continue the analogy—the bulb is then, like the stomach of a famished man, enfeebled by the prolonged cessation of its natural action, and unable to bear any food whatever except by very slow degrees. If a weakened bulb is suddenly brought in contact with water, it will absorb it, but will be unable to digest it. Then the water will become stagnant and putrid, and destroy the bulb; although, if the bulb could have digested it, it would have been converted into new elements, and have proved its proper aliment.

The rule, therefore, to observe with newly-imported bulbs is, to place them where they absorb moisture very slowly. The driest earth is full of water, which can only be driven off by the application of intense heat. A bulb, therefore, should be planted in what is called dry soil, and placed in a shady part of a greenhouse until it has become plump and begun to shoot; if it has begun to shoot when received, still the same treatment should be observed, and the driest soil used to plant it in. It is only when decisive signs of natural growth can be detected that a very little water should be given, while the temperature is at the same time slightly increased; and no considerable quantity of water should be administered until the leaves are an inch or two above ground, and evidently disposed to grow rapidly. If these precautions are taken, no failures are ever likely to occur; if neglected, no success can be anticipated. We once saw 500 bulbs of one of the rarest and finest of all plants destroyed by an unskilful gardener, who planted them in the wet earth of an open border immediately after their arrival from a fifteen months voyage every bulb of which would have grown had he known what we have now stated.

CHATSWORTH.

I HAVE visited in my time nearly all the noted "residences" on this side of the Tweed, but not one of the entire set—Abbeys, Courts, Castles, Priories, Parks, Halls, or Palaces—lives in my memory like Chatsworth. Nowhere have I found so much to admire, nowhere so little to condemn, as at Chatsworth. Nowhere have I seen a place more favoured by nature, nor, at the same time, more indebted to art! Nowhere have I beheld a place so thoroughly consistent as Chatsworth. Here one is never disgusted by an offensive display of wealth in one quarter, nor pained by an out-peeping of poverty in another. Here is nothing gaudy, nothing shabby; the work is all well done, and the materials good throughout. Here is no artificial stone, no fictitious marble, no imitative wood, no Brummagem plate — nothing, in short, that tends to weaken the legitimate effect, or to lead you to suspect that pomp is produced by illegitimate means. All the magnificence on which you gaze has a sort of reality and dignity about it which makes you feel at once that there is nothing of arrogance or pretension in the case, and that what you see is no more than the natural and becoming exposition of the rank, affluence, and taste of the proprietor. You feel, in fact, a respect for *him*, and thus is attained the only true and proper object which can be supposed to induce the display of an individual's taste or resources—an object, by the way, which never fails to defeat itself when anything spurious is suffered to enter into the composition.

Chatsworth has been called the Palace of the Peak—a very offensive and cockneyfied appellation truly; yet, disdaining "alliteration's artful aid," this noble mansion especially recommends itself, not as a palace indeed, but as the befitting habitation of a British Peer, where the requirements of comfort are never sacrificed to a morbid love of show, and where splendour is in no wise suffered to interfere with the propriety that pervades the whole. To the guide-books I must refer you for an enumeration of the treasures that are to be found within the walls—merely remarking, that art, both ancient and modern, and in *all* its branches, would seem to be appreciated by the Duke of Devonshire, as the galleries of painting and sculpture, the libraries, the mosaic pavements (just laid down), the oak-room (just completed), the Egyptian antiquities, &c. abundantly testify. In his love, however, for the fine arts, the Duke has rivals not a few; but in uniting a keen perception of the various beauties of nature with a high relish for the creations of art, he stands pre-eminent, or rather, he stands alone. There are books at Althorpe; at Dropmore there is a noble Pinetum; at Highclere there are beautiful grounds; the Duke of Northumberland has a rich collection of tropical plants; the Duke of Sutherland boasts his pictures, the Duke of Rutland his sumptuous plate, and Lord Westminster his fine house; but at Chatsworth there are all these, and more. In fact, all the diverse materials which go to make up the separate celebrities of the places I have enumerated, and of others also that I could name, are to be found concentrated here. It is only, however, with the gardens and their contents that I have now to deal; and among these likewise I have good choice of subjects: the water-works, terraces, the great conservatory, the conservative wall, the collection of Orchidaceæ, &c., are all features of great interest, and most of them peculiar to the place. Let me take them *seriatim*.

First, then, the water-works; and of these—first, the *jets d'eau*, or upright fountains. Of all forms in which water can be spouted, this is unquestionably, under ordinary circumstances, the worst; for it has no formal architectural effect to compensate for the violence it does to the laws of gravitation. This objection, however, applies solely to these *jets* when of insufficient altitude; for water, which when thrown only to the height of 20 or 30 feet falls back in heavy and lumpish masses, is dissolved into the most exquisite spray when projected to the height of 60, 70, or even 90 feet, as we see it in the great fountains at Chatsworth. To enjoy these in perfection, a person ought to station himself in the park, a quarter of a mile or more from the scene of action; for thus only can a full view be caught of the beautiful effect of fleecy light produced by the agitated column of water. If the sun shines, so much the better. Another fountain there is, which, I was told, greatly delights the good folks of Manchester and its vicinity when lionising Chatworth; but which, nevertheless, if it were mine, should soon spout its last. I mean the weeping Willow (as by courtesy it is called), made up of copper tubes, from the extremity of which water issues. The idea is unquestionably poetical—a tree in tears. When first named to me, it charmed me much; but the execution is stiff and awkward, and reminds one more of some of the monstrosities that vegetate upon the China cups and saucers than of the graceful tree it is designed to imitate. This *dendritic* fountain, when first approached, does not appear in melting mood, nevertheless it is ever ready to surprise the unwary visiter by a shower of spray, and in this its charm consists; in fact, it is a mere toy, and therefore unworthy of the dignity that reigns around.—*Argus*.

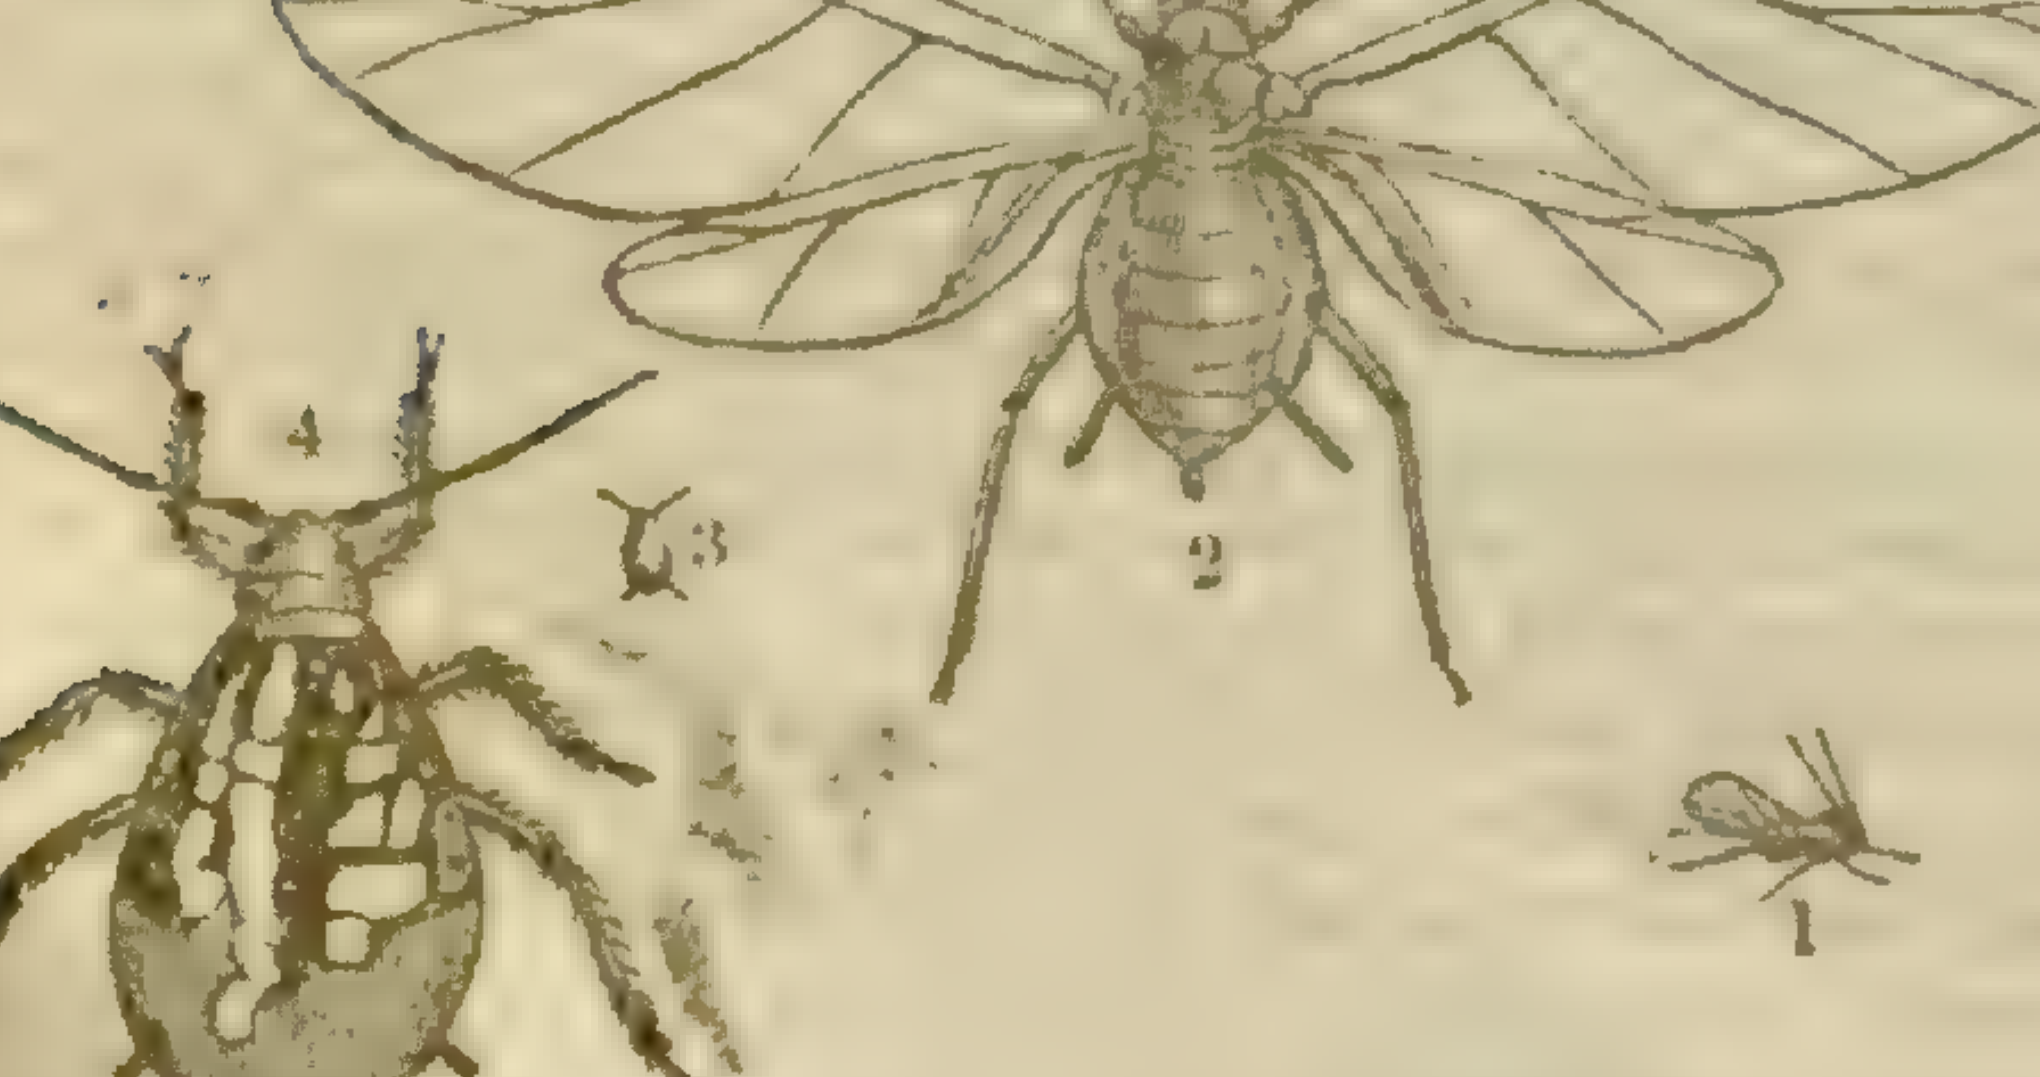
(To be continued.)

ENTOMOLOGY.—No. XXII.

APHIDES, or PLANT-LICE.—It is quite unnecessary to dilate upon the mischief done to the gardener and agriculturist by this extensive tribe of insects; not a tree, shrub, or flower seems to be entirely free from their attacks. We therefore will confine ourselves principally to an elucidation of their economy, which will not prove the less interesting from the valuable observations that have recently appeared in this Journal. There is no family of insects which deviates in its habits more from the general laws of nature than the Aphides; for whilst it is almost a universal rule that this class of animals should progress through the various transformations of egg, larva, pupa, and imago, the Aphides have the power of evading three of these states by the faculty they possess of producing young; for, influenced by natural causes, they are both viviparous and oviparous, bringing forth young at mild seasons, when the temperature is not injurious to their tender offspring, and laying eggs in autumn, which are better calculated to resist the cold of winter. But this is not the most curious anomaly in their history; for a succession of young Aphides can be produced without the presence of the male insects. For instance, as soon as an Aphis is born, if it be taken away and placed upon a plant under a glass where nothing can possibly gain access to it, it will notwithstanding produce young, one of which being also removed, and treated with the same care, will possess the same prolific faculty; and thus Bonnet succeeded in obtaining offspring for many generations, and he believed that the experiment might have been successfully pushed to thirty. The countless myriads therefore that appear in our hop-gardens and greenhouses may be easily accounted for, without having recourse to miraculous causes. Réaumur has calculated that in five generations one female might become the progenitor of 5,904,900,000 descendants. With such an inexhaustible power of fecundity, it is fortunate for man that no insects are subject to the attacks of such a variety of enemies. First, there are the Lady-birds, which feed upon the Aphides both in their larva and perfect states; 2dly, the aphidivorous Syrphidæ, the maggots of which, as we have shown in a former paper[*], are exceedingly useful in diminishing the numbers of the Plant-lice. Then there are the Hemerobii, or Golden-eyes, whose larvæ are called Aphis-lions, a ferocious family nearly related to the Ant-lions. Another set of insects are parasitic, and deposit minute eggs in the old Aphides, which then change to dull ochreous, horny objects, sticking to the leaves on which they had fed, frequently exhibiting a hole in their sides, from whence the parasitic little ichneumon called Aphidius[†] had issued. I find also several other genera of insects which assist in keeping in check these pests of the greenhouse and garden; and even the troublesome Earwigs in some measure make compensation for the mischief they do to our flowers by feeding upon the Aphides in the leaves, distorted and curled by their attacks, in which the Earwigs seek retirement from the light after their nocturnal depredations. The soft-billed birds are likewise eminently serviceable in the spring in clearing off the Aphides, as they hatch from the eggs which had been laid on the buds the preceding autumn.

The mischief that follows the presence of the Aphides arises from their thrusting a hollow proboscis into the leaf or stalk of a plant, through which they imbibe the juices, thus supporting themselves at the expense of the plant; and by thus draining it of its due nourishment, it soon becomes exhausted, droops, and often dies, when the number of the Aphides is very great.

There are three genera of these Plant-lice, Eriosoma of Leach, of which the Apple Aphis, E. lanigera (Ill.), and the Poplar Plant-louse, E. Bursaria (Linn.), belong; and Aphis and Cinara[‡], the former genus comprising the Rose and Cabbage Aphides, A. Rosæ (Linn.) and A. Brassicæ (Linn.), and the latter the Oak and Pine Plant-lice, &c. I shall conclude these remarks by recording a new species. On the 1st of last May a very fine variety of Indian Corn was sown in a garden where probably the Maize had never grown before; and I am not aware that it has ever been cultivated in the neighbourhood. The plants grew very luxuriantly, until one reached the height of eight feet; and in August I discovered clusters of a pretty Aphis beneath the leaves, which struck me as being different from any that I had seen before. I watched them until about the middle of September, when they all disappeared, although the Aphis Rosæ was neither affected by the wet nor by the colder nights which might occasionally intervene. I have since examined the specimens very carefully, and feel convinced that they belong to a species with which I am quite unacquainted. I have no doubt that it is confined to the Maize; but how it could find its way to the plants in this locality is very unaccountable. The seed I took from the spike or ear, which was not left in the garden; I sowed the seeds myself; and I freely confess that I am at a loss to account for the sudden appearance of this species, which I shall name Aphis Zeæ. The females first attracted my notice. This sex is distinguished by a pale ochraceous head and thorax; the back was dark green, curiously marbled with a palish green, and the portion beyond the middle was rosy; the tubes were moderately long, and very remote; the legs ochreous and pubescent, the tips of the shanks and the feet being brown; the antennæ blackish, ochreous at the base (fig. 4). These females were surrounded by little groups of young ones, generally of a blackish-green colour, and eventually a few males made their appearance. They were of a pale rose colour; the head, portions of the thorax, and back of the abdomen, were pale green; the tubes were pale, long, and slender; the antennæ and legs were very pale ochreous; the wings were like those of the true Aphides, with very pale nervures, but in some specimens they were rather darker, with the stigmatic spot pale green (fig. 2). The natural sizes of the sexes are shown at figs. 1 and 3.



As numerous remedies for the destruction of these insects in the various departments of the garden have been frequently published in this Journal, it does not seem to be necessary to repeat them upon the present occasion.—*Ruricola.*

ON THE CULTIVATION OF LEONOTIS LEONURUS.

I HAVE for several years grown this without obtaining satisfactory specimens, the plants having sometimes flowered badly, and always lost all their lower leaves before the flowers expanded, so as to leave bare unsightly stems. I have this year succeeded in producing several fine plants, and one in particular, which is not yet out of bloom. It is about 8ft. high and 12ft. in circumference, and ten days ago was well covered with leaves, and bore on each branch from three to four full and perfect whorls, forming a really splendid sight. This plant was struck from a cutting in May 1840, kept in a 48 pot during the winter; in the beginning of April put into a pot 13in. in diameter, and 11½in. high, and placed in a forcing frame, heated by hot-water pipes covered with sand, and kept at a temperature varying from 75° to 50°, the fire being lighted in general only every other evening for four or five hours; here it remained for about seven weeks, when the branches touching the glass, it was removed to the greenhouse. After the end of June, when the other plants were taken out and the stage removed, it was forced as much as possible by keeping the house shut up during the day, so as to concentrate all the heat which could be obtained from the sun, but no fire was lighted except for about four nights in September and October. The thermometer often stood at 120°, but no heat seemed too great for it, provided it had plenty of water, and in this respect only my treatment has differed from that of previous years; I never suffered the surface of the earth to become dry, and generally kept about an inch of water in the pan. The quantity required in hot weather was nearly three gallons daily. After Nov. 5th a number of other plants being placed in the greenhouse, it was kept quite cool and ventilated, and on the 22d the Leonotis was removed into a room without a fire, as the stage was then required for the rest of the Pelargoniums, &c. Notwithstanding this check, several whorls have expanded in the last three weeks, and very few leaves fell till within the last ten days. Had the weather been ordinarily fine and warm in October, I have no doubt the blossom would have been a month earlier, but in some respects it is preferable to have it at a season when most other flowers are gone.—*P. W. J.*

GREENHOUSE SUCCULENTS.

You requested me a few days ago to give your correspondent *H. L.* some practical directions for the management of Succulent Plants. In his letter to you he says that he has a collection of about 300 plants, consisting of Cacteæ, Ficoideæ, Crassulæ, Aloes, &c.; that they are kept in a small greenhouse, which is heated by a common smoke-flue; and he therefore wishes to know at what temperature the house should be kept—how often the different kinds should be watered—when they should be shifted—and what kind of soil should be used. As I have no doubt the subject may be generally interesting to your readers, I shall endeavour to give a few directions as plainly and concisely as possible.

Succulent plants are very different in their structure and habits from the majority of others which compose the vegetable kingdom. The Almighty Creator, who doeth all things well, has created plants upon the same grand plan which may be observed throughout the whole of animated nature, and by which each individual is fitted for the peculiar circumstances in which it is destined to exist. Thus Ferns delight to grow on our damp walls, in our woods and shaded glens; other plants, having large thin leaves full of evaporating pores, either grow in an atmosphere saturated with moisture, or if they are placed in dry air and exposed situations, have numerous rootlets extending in all directions, capable of supplying the leaves with moisture as quickly as it is extracted from them. But succulents are formed to exist in countries and situations where they are often exposed to intense light and dryness; their skins are thick, they have few evaporating pores, and they have likewise few roots to gorge their tissue with food during the rainy season. Therefore we find the dry sandy plains of the Cape abounding in Aloes and Mesembryanthemums, and the bare volcanic rocks of Mount Etna covered in many places with the common prickly Pear. In Mexico, also, and in many other parts of Central and South America, the extensive race of Cacti, with their curious unvegetable-like forms, are at home, and flourish even in those dry and parched seasons when the whole face of nature besides seems withered and destroyed. I wish particularly to draw attention to the natural circumstances in which these plants are found, because if these are once known, they are sure and certain guides in cultivation.

To be grown well, the whole race of what are called succulent plants requires to be kept in the lightest possible situation in the greenhouse. It is true they may be grown in heavy shaded greenhouses, but their leaves will never acquire that beautful colour which is seen in light situations, nor will they flower so freely. The colouring matter in the leaves of some of these plants, the Echeveria gibbiflora for example, is delicate and beautiful, but this is never seen in perfection unless a light situation is attended to.

In an extensive family of this kind it is difficult to point out the proper soil which ought to be used, as some of the species require it much richer than others. I have generally found the free-growing kinds of Aloe, Crassula, Mesembryanthemum, and plants of like habits, do best in a rich free soil, such as equal portions of light sandy loam, and peat or leaf-mould, with a small quantity of bruised bricks. For the free-growing Cacti, such as Cereus speciosissimus, the soil ought to be made lighter and richer by using less loam, and more peat, leaf-mould and dung; but for the slow-growing Mammillarias and the very succulent Mesembryanthemums, such as M. tigrinum, it is best to use about one-third light loam, one of peat or leaf-mould, and one of bruised bricks and lime-rubbish. As a general rule, to which I believe very few exceptions will be found, I would advise all persons not acquainted with the particular habits of these plants, to use soil richer or poorer according to the quantity of roots which they produce, at the same time taking care that the poor soil is also loose and open, to prevent the plants from damping. In every case the pots must be well drained. The best season for shifting is the month of February or March. Once a year will in general be quite sufficient for the free-growing kinds; and although many of the others will not require it so often, yet it will be found the best plan to go over the whole at this time, examining their roots and adding a little fresh soil, taking care not to pot them too deep, nor to overpot them, as they are safest in small pots.

Water should be given to the slow-growing kinds at all times with a judicious hand, but particularly during winter, as more plants are killed by over-watering than by any other cause. At this time once in ten days or a fortnight will generally be found sufficient; but as this depends upon the situation of the weather, much must be left to the good sense of those who attend them. Those kinds which are more luxuriant in growth and not so succulent require more water, and are not so easily injured by it.

A great deal of misapprehension exists in the minds of many persons concerning the temperature which many of these plants require. The whole race of Mammillarias in books on gardening are generally consigned to the dry stove, and thus many persons are prevented from growing them who would do so if they knew the plants would succeed in the greenhouse. By far the greatest number succeed perfectly there, where the temperature is merely high enough to exclude frost—that is, anywhere betweeen 35 and 45 deg., as may be most agreeable to the cultivator. If my memory does not deceive me, several plants of this kind lived out of doors for several winters in the Edinburgh Botanic Garden some years ago. When Cacti are either very young, or old and sickly, there is nothing better for their health than growing them in a common dung frame during summer, but they must always be removed to a dryer atmosphere before the approach of winter.

Succulents are generally easily multiplied either by seeds or cuttings. If the cutting is very soft and liable to damp, it ought to be dried a little before it is put into the sand. Sometimes a little quicklime is useful for preventing decay, and can be either used for the base of the cutting, or applied to any part of the plant from which a damping piece has been removed.

Mesembryanthemums are very ornamental when planted in beds in the open garden during summer, but the free-blooming kinds alone should be chosen for this purpose. In some parts of the Continent where they excel in the cultivation of Cacti, it is common enough to see groups of these plants growing in the open air amongst rocks and stones in summer, where they not only produce a curious exotic effect, but also grow much faster than they do in pots. But if this system is practised in England, it must only be in our sunny spots in front of walls or hothouses, where they can be protected from continued rains.—*R. Fortune, Horticultural Society's Garden.*

THE MOST ORNAMENTAL SPECIES OF CRATÆGUS, OR HAWTHORN.

ARO'NIA.—This is the most showy species of all in the autumn; it has very large bright yellow fruit, which are produced in great abundance.

TANACETIFO'LIA.—This is an upright-growing kind, with finely-cut leaves, and bears the largest fruit of all; they are yellow, but not produced in such abundance as those of Aronia.

ODORATI'SSIMA.—This species forms a spreading tree; it has downy leaves, and numerous large bright red fruit in the autumn; and with

ORIE'NTALIS, which has large dark-red fruit, should be in every collection.

COCCI'NEA.—This species and its varieties are very showy; they have rather large and numerous bunches of bright-red fruit in the autumn. The variety called maxima is the most deserving of notice.

GLANDULOSA.—This kind has numerous small twig with large spines, forming a dense bush, and is ornaments in the autumn, when it is covered with an abundance o rather large red fruit.

PUNCTATA.—Of this there are three varieties well worth of notice; one with red fruit, another with yellow, and third with an upright or fastigiate habit of growth. All c them have very large showy fruit in the autumn.

OLIVERIANA.—This kind has small, deeply-cu woolly leaves, and small black fruit, which are very nume ous, and ornamental in the autumn.

DOUGLA'SII.—This is a very distinct kind, with va rious-shaped leaves and black fruit, which ripen early i the autumn, and contrast well with the bright shinir leaves and strong spines.

NIGRA.—This is a strong-growing kind, with blac fruit and deeply-divided leaves, flowering rather early.

HETEROPHYLLA.—This is a beautiful species, on a count of its profusion of flowers in the spring, and t numerous small red fruit in the autumn.

MACRACANTHA.—A singular kind, with immen spines, and small, shining, yellowish-red fruit, produced in large bunches early in the autumn.

PYRIFO'LIA. — This is a free-flowering kind, with rather small but very numerous yellowish-red fruit, which ripen very late in the autumn.

CRUS-GALLI.—This species and its varieties are desirable on account of their bright-shining green leaves and numerous bunches of dark-red fruit, which ripen very late in the autumn. The most desirable is the variety called salicifólia, which has horizontal branches, forming a flat table-shaped head.

PRUNIFO'LIA. — This is a desirable kind, forming a close bush; it has rather large, shining leaves, and numerous bunches of dark-red fruit, which ripen late in the autumn.

FLAVA.—This is very distinct; it has a rough-barked stem and straggling branches; it produces small greenish-yellow fruit, which ripen late in the autumn.

VIRGINIANA.—This is a dwarf kind, with numerous green fruit, which ripen late in the autumn. It is very desirable, as it retains its fruit nearly all the winter.

CORDATA.—This is the latest in flower, and bears the smallest fruit; it has bright-shining angular leaves and bright-red berries.

OXYACANTHA ROSEA SUPERBA.—This is the most brilliant of all when in flower; it bears bright crimson blossoms in May. The double variety of it has also flowers nearly as intense in colour, and quite double. Both these should have a place in the most select collection.

THE AMATEUR'S GARDEN.—No. I.

IN commencing the Amateur's Calendar of weekly operations, it may be as well to point out its objects, and the particular class of gardens for which it is intended. Among the readers of the *Chronicle* there is a large number who possess small gardens, and who manage them themselves. These gardens, in many instances, do not exceed two acres in extent, consisting of pleasure-ground, flower-beds, a greenhouse, and some pits and frames. It is to the management of such, therefore, that my remarks will chiefly apply; but I propose occasionally to advert to particular kitchen-garden operations, and to the treatment of plants in rooms; and also to introduce from time to time short accounts of any pretty plants which may seem deserving of notice, with practical directions for their cultivation. The objects will be to make such information practical and useful, as well as popular and interesting.

In these holiday times, it is of little use to recommend out-door operations, as people are more inclined to mirth and gaiety than to gardening; besides, the weather is so unsettled, that nothing can be done with any degree of pleasure. Greenhouse or half-hardy plants, however, must not be neglected; they require very little water at this season, but must have plenty of air when the days are fine and mild. The hard-wooded kinds in particular should have very little artificial heat, not more than is necessary to dry off the damp and keep out the frost. Take care that the weather does not deceive you, as we frequently have it mild at night and get several degrees of frost before the morning; if the wind is northerly, and the thermometer below 40° and falling, it is time to look after fires in the greenhouse. All dead and damping leaves should be carefully removed from the plants in cold pits or frames, when they are open on fine days. Mat them well up at night.

Examine Dahlia roots, and see that they are not moulding, as it will be provoking for you to find them a month or two hence with all their buds destroyed. If you are fond of Roses and of budding them, you ought now to get in as many Stocks as are likely to be wanted, and plant them in any spare corner of the garden.

Window-plants require very little water, but the quantity ought to be regulated by the habits of the kinds; Pelargoniums, for example, ought to have more than succulents; Fuchsias generally have lost their leaves, and therefore need very little. The principal attendance which is necessary consists in preserving them from the frost, and taking care not to force them into growth by keeping them in a room which is too warm. Hyacinths in glasses may have a little fresh water occasionally.—*R. F.*

HOME CORRESPONDENCE.

What to do with Kittens and Puppies. — The Spanish plan, named in your Paper (p. 815, 1841), of assassinating stray dogs for the benefit of sick Orange-trees, does not quite agree with English tastes, and I would beg to suggest that the little kittens and puppies generally thrown into the river when larger litters are born than required, would be a good substitute, and the gamekeeper may often help the gardener in this way. Spoiled game I have found a great help at the root of an old Moss-rose tree.—*Salopiensis.*

Holly Planting.—I doubt not you will think the subject of Holly-planting and pruning well-nigh exhausted, after the appearance of at least three sensible articles on that subject. But my own experience leads me to point out to your correspondents the necessity there is for stating the localities to which their remarks refer, or, if anonymous writers, the latitude and longitude. They forget that your Paper circulates in districts and counties far distant from those in which they live; and yet even at a vast distance and in a different climate their remarks would be equally profitable if the county, at least, to which they refer is stated, and so the discreet reader be enabled to make all due allowance for difference of situation. To show the connexion of this remark with Holly-planting, I have no doubt whatever that in a large, perhaps by far the largest part of England, spring-planting is the best, and yet my own experience, in 35° latitude and longitude, gives the preference to autumn-planting. In the year 1837, I planted a Holly-hedge of more than eighty yards in length, in a double line, after the way recommended by Cobbett in his "English Gardener," page 21, i. e., "one row eighteen inches from the other—the plants in each row fifteen inches apart, and placed opposite the middle of the intervals of the other row." Thus you will find I planted in all 384 plants; the soil low, wet, and peaty. I first planted these in the month of June, and they appeared to be going on most prosperously, till a cutting N. E. wind, near the close of the month, blackened them all and killed nearly half! I carefully supplied the places of the dead ones in the October following, of which I lost forty plants; but you will remember the extreme rigour of that winter. I again supplied their places in the spring of 1838, and again more than half died; the October of the same year I filled the vacant places, and not one died; and at this moment, I have every plant, as intended, rooted and settled, 384 in number, as originally. Thus you see, on the N. E. coast, three miles from the sea, the cutting winds which prevail in spring would seem to render autumn the preferable season for planting Hollies. After all, I am fully convinced that if trouble is taken in watering and puddling the roots at the time of planting, there is no time for evergreens like Midsummer. I have large Portugal Laurels, several Laurustini, and a few Hollies, all transplanted at Midsummer, and somewhat later this very year, all alive, with new shoots, and the Laurustini in full flower. I intend next Midsummer, in spite of the warning voices of two of your very clever correspondents, to cut down my Holly-hedge within six inches of the ground. Midsummer is the time to prune evergreens safely. I am glad to find that some notice is likely to be taken of the proper methods of warming, ventilating, &c., the common domestic greenhouses—as they are attached to dwelling-houses, and would venture to suggest, as an invaluable article in itself and one that would at once answer a host of inquirers, that the whole plan and proper directions be given for a good average-sized greenhouse, attached to the house, in which a few Vines might also be allowed, divided under the following six heads:—1. Size (say 30 by 15 feet); 2. Inclination of roof (say 45°); 3. Glazing; 4. Height in front (which when a greenhouse is attached to a dwelling-house should not be less than five and a half feet); 4. Best way of heating; 5. Vines, how many in number and what sorts best; and 6. Best arrangement of the stages for plants; perhaps, 7. A catalogue of plants easy to keep and cheap to purchase.—*Cepophilus* (Lat. and Long. 35°). [The latter part of our correspondent's letter describes very nearly the plan of the forthcoming articles on Domestic Greenhouses.]

The Fig.—It would be of great service to those who are not well acquainted with the real culture of the Fig-tree, if some experienced gardeners would give information upon its management in pots and tubs, in Grape-houses, Peach-houses, and pits; on the back walls of Vineries with a prepared border, in a pit with border and a table trellis of wire, in a Grape-house with the Vines up the rafters only, and also in a Fig-house. The writers should name the most proper sorts for all the above methods of growing Figs.—*Ficus.*

Run-Flowers.—Now that the subject of run-flowers is occupying the attention of the skilful in horticulture, you may, perhaps, think the following worth a place in the *Gardeners' Chronicle*, regarding a Picotee which flowered in my garden this summer. The plant is an old one of two or three years' growth, consequently of considerable size in the stem, which, after rising a few inches, throws out two branches right and left, having an equal quantity of layers on each, or nearly so, and possessing an equal luxuriance of growth. It bloomed freely; one branch producing self-coloured flowers, the other variegated.—*E. C., Hants.*

Hyacinths.—I have read in the *Chronicle* what has been considered a new mode of growing Hyacinths; but it is not a new mode, for I grew them myself last year in London nearly in a similar manner in Beet-roots; my father told me how to do it more than twelve years ago, and I believe he knew the method twenty years before. I think it wrong to put them in the roots immediately after the root is scooped out; but the proper way would be to hollow the roots, as your correspondent says, then to fill them with water, and suspend the roots inverted in some dark place, until the leaves are long enough to hide the roots; they will grow up, not down. The bulbs intended for the Beet-roots should be set in glasses, at the same time the Beet is filled with water and suspended in a dark place; then they may be taken out of the glasses when roots and bulbs are sufficiently forward, and they look very curious. I do not think they receive any nourishment from the Beet.—*J. C.* [Another correspondent speaks of the Hyacinth succeeding equally well in Turnips and Carrots. He also recommends the dark varieties to be placed in Turnips, and the light ones in Beet-root, when the contrast of colour is striking and beautiful.]

Potentillas.—On reading the *Gardeners' Chronicle* of December 11, page 817, in answer to an inquirer on Potentillas, I find the remark that hybrid Potentillas never produce seed, at least perfect seed, and several varieties are mentioned as having this peculiarity; now I beg to dissent from the above assertion, having, in 1836, saved seed from P. Hopwoodiana, which produced plants in 1837 and bloomed the year following. I also saved seed last year from P. Garneriana, which have this year produced a pot of healthy plants, which I expect to bloom next summer; and I am informed by a respectable gardener that he has succeeded in raising plants from seed of P. Russelliana, so that the above remark must be an error of the press, or a lapsus of the pen, which I have considered it my duty to correct.—*T. S.* [We wish our correspondent had informed us whether the seeds of the hybrid Potentillas reproduced the varieties from which they were saved.]

Slugs v. Sand.—There is in p. 766, (1841,) a recommendation of sea-sand as a preventive of the attacks of slugs. I have tried it, and am able to say little in its favour; for a short time it may do, but after that it is of no more use than if it had not been there, for I have caught them crawling on it in less than one week after it has been taken from the shore. Lime has been recommended, but, unless it is thrown over the plants often, it will not keep them off, for as soon as the dampness of the ground has slacked the lime, they are on it as much as ever; if the lime falls on the slugs in its unslacked state it is sure to kill them. As a proof that lime is of little value, I planted out about 250 Lettuces, and sprinkled them well with lime, and now I have not a single plant left. The best thing that I have found to keep off slugs is soot; I sowed two crops of Lettuce this year, one after the other—they were both eaten off, but the third time I sprinkled them with soot, and after that I never lost one. —*A Constant Reader, Ryde.*

British Oaks.—Under this title there is an article, at p. 3, (1841,) that brought to recollection a paper read before the Horticultural Society, January 15th, 1833, by the late William Atkinson, Esq., of Silvermere, not less celebrated for his talents as an architect, than for his knowledge of all relating to the vegetable kingdom, but above all for his modest, unassuming manners and general amiability of character. As many of your readers may not possess the Proceedings of the Horticultural Society to refer to, subjoined is an extract of his valuable paper—other parts chiefly relate to Oak of foreign growth, also very interesting, but omitted, not to swell this article beyond a fair proportion of space in your Journal:—"There are only two species of Oak that are considered natives of Great Britain and Ireland, the Quercus pedunculata and Quercus sessiliflora. The Q. pedunculata is called by some Q. Robur; and by others Q. sessiliflora is called Q. Robur; to prevent mistakes I think it better to adopt the name Q. pedunculata. This kind is easily known by the Acorns having long stalks and the leaves very short foot-stalks, or in some specimens hardly any. In the Q. sessiliflora, the leaves have footstalks from a quarter to one inch in length, and the Acorns sit close to the branch, having hardly any stalks. With respect to the qualities of our two native Oaks, the Q. pedunculata contains a great quantity of the silver grain which shows when the wood is planed—what workmen call the flower in the wood. In consequence of this, the wood splits clean and easy, and is best adapted for split paling and laths. It is also stiffer wood, and though it may be broken with a less weight than the Q. sessiliflora, yet it requires a much greater weight to bend it, and is, therefore, best calculated for beams, or to bear the greatest weight without bending. The Q. sessiliflora contains so small a portion of the silver grain or flower, that wood of that kind from old buildings has generally been mistaken for Sweet Chestnut (Castanea vesca): during the last thirty years I have taken every opportunity of procuring specimens of wood from old buildings, and particularly what the carpenters called Chestnut; but I have never, in a single instance, seen a piece of Chestnut from an old building: what has been taken for that wood, I have always found to be the Q. sessiliflora, mistaken for Chestnut from its deficiency of the flower or silver grain. The roof of Westminster Hall has been said to be Chestnut; while it was under repair, I procured various specimens from different parts of the roof; the whole of them were Oak, and chiefly the Q. sessiliflora. Most of the black Oak, from trees dug out of the ground, I have found to be of the same kind. From finding the wood from the oldest buildings about London to be chiefly the Q. sessiliflora, I should suppose that some centuries ago the chief part of the natural woods were of that kind *; at present the greater part of the Oak grown in the south of England is Q. pedunculata. Specimens of Oaks that I have procured from different parts of Yorkshire and the county of Durham have been all Q. sessiliflora, which is very scarce in the south. There are some trees of it at Caen-wood, the Earl of Mansfield's, near Highgate, which I believe to be one of the oldest woods near London, and a greater part of the Q. sessiliflora appear to be trees from old stools. Q. sessiliflora appears to grow equally well with Q. pedunculata; it is a handsomer tree in the foliage, and from finding so much of it sound in old buildings, I suspect it may be the most durable. It bends from a weight much sooner than the Q. pedunculata, but requires a much greater weight to break it; from its toughness I consider it best calculated for ship-timber. The old *Sovereign of the Seas* was broken up after forty-seven years' service, much longer than the general durability of ships, and as the wood the ship was built of was had from the north of England, it is very probable it was the Q. sessiliflora."—*M. D. P.*

Genus Citrus.—The author of some remarks on Oranges, in your Number of Saturday, Dec. 11th, 1841, page 814, has made some few mistakes, which I hope he will allow me to correct; and although correction and reproof are not often well received from any one, and much less from strangers, I am willing to hope that the excuse on my part of having been rather a successful cultivator of what is commonly called the Orange will induce him to pardon me and look over the impertinence. In the first place, there is no such word as Aurantia; Arrancio is the vulgar name for the Orange in Italy. Aurantium

---

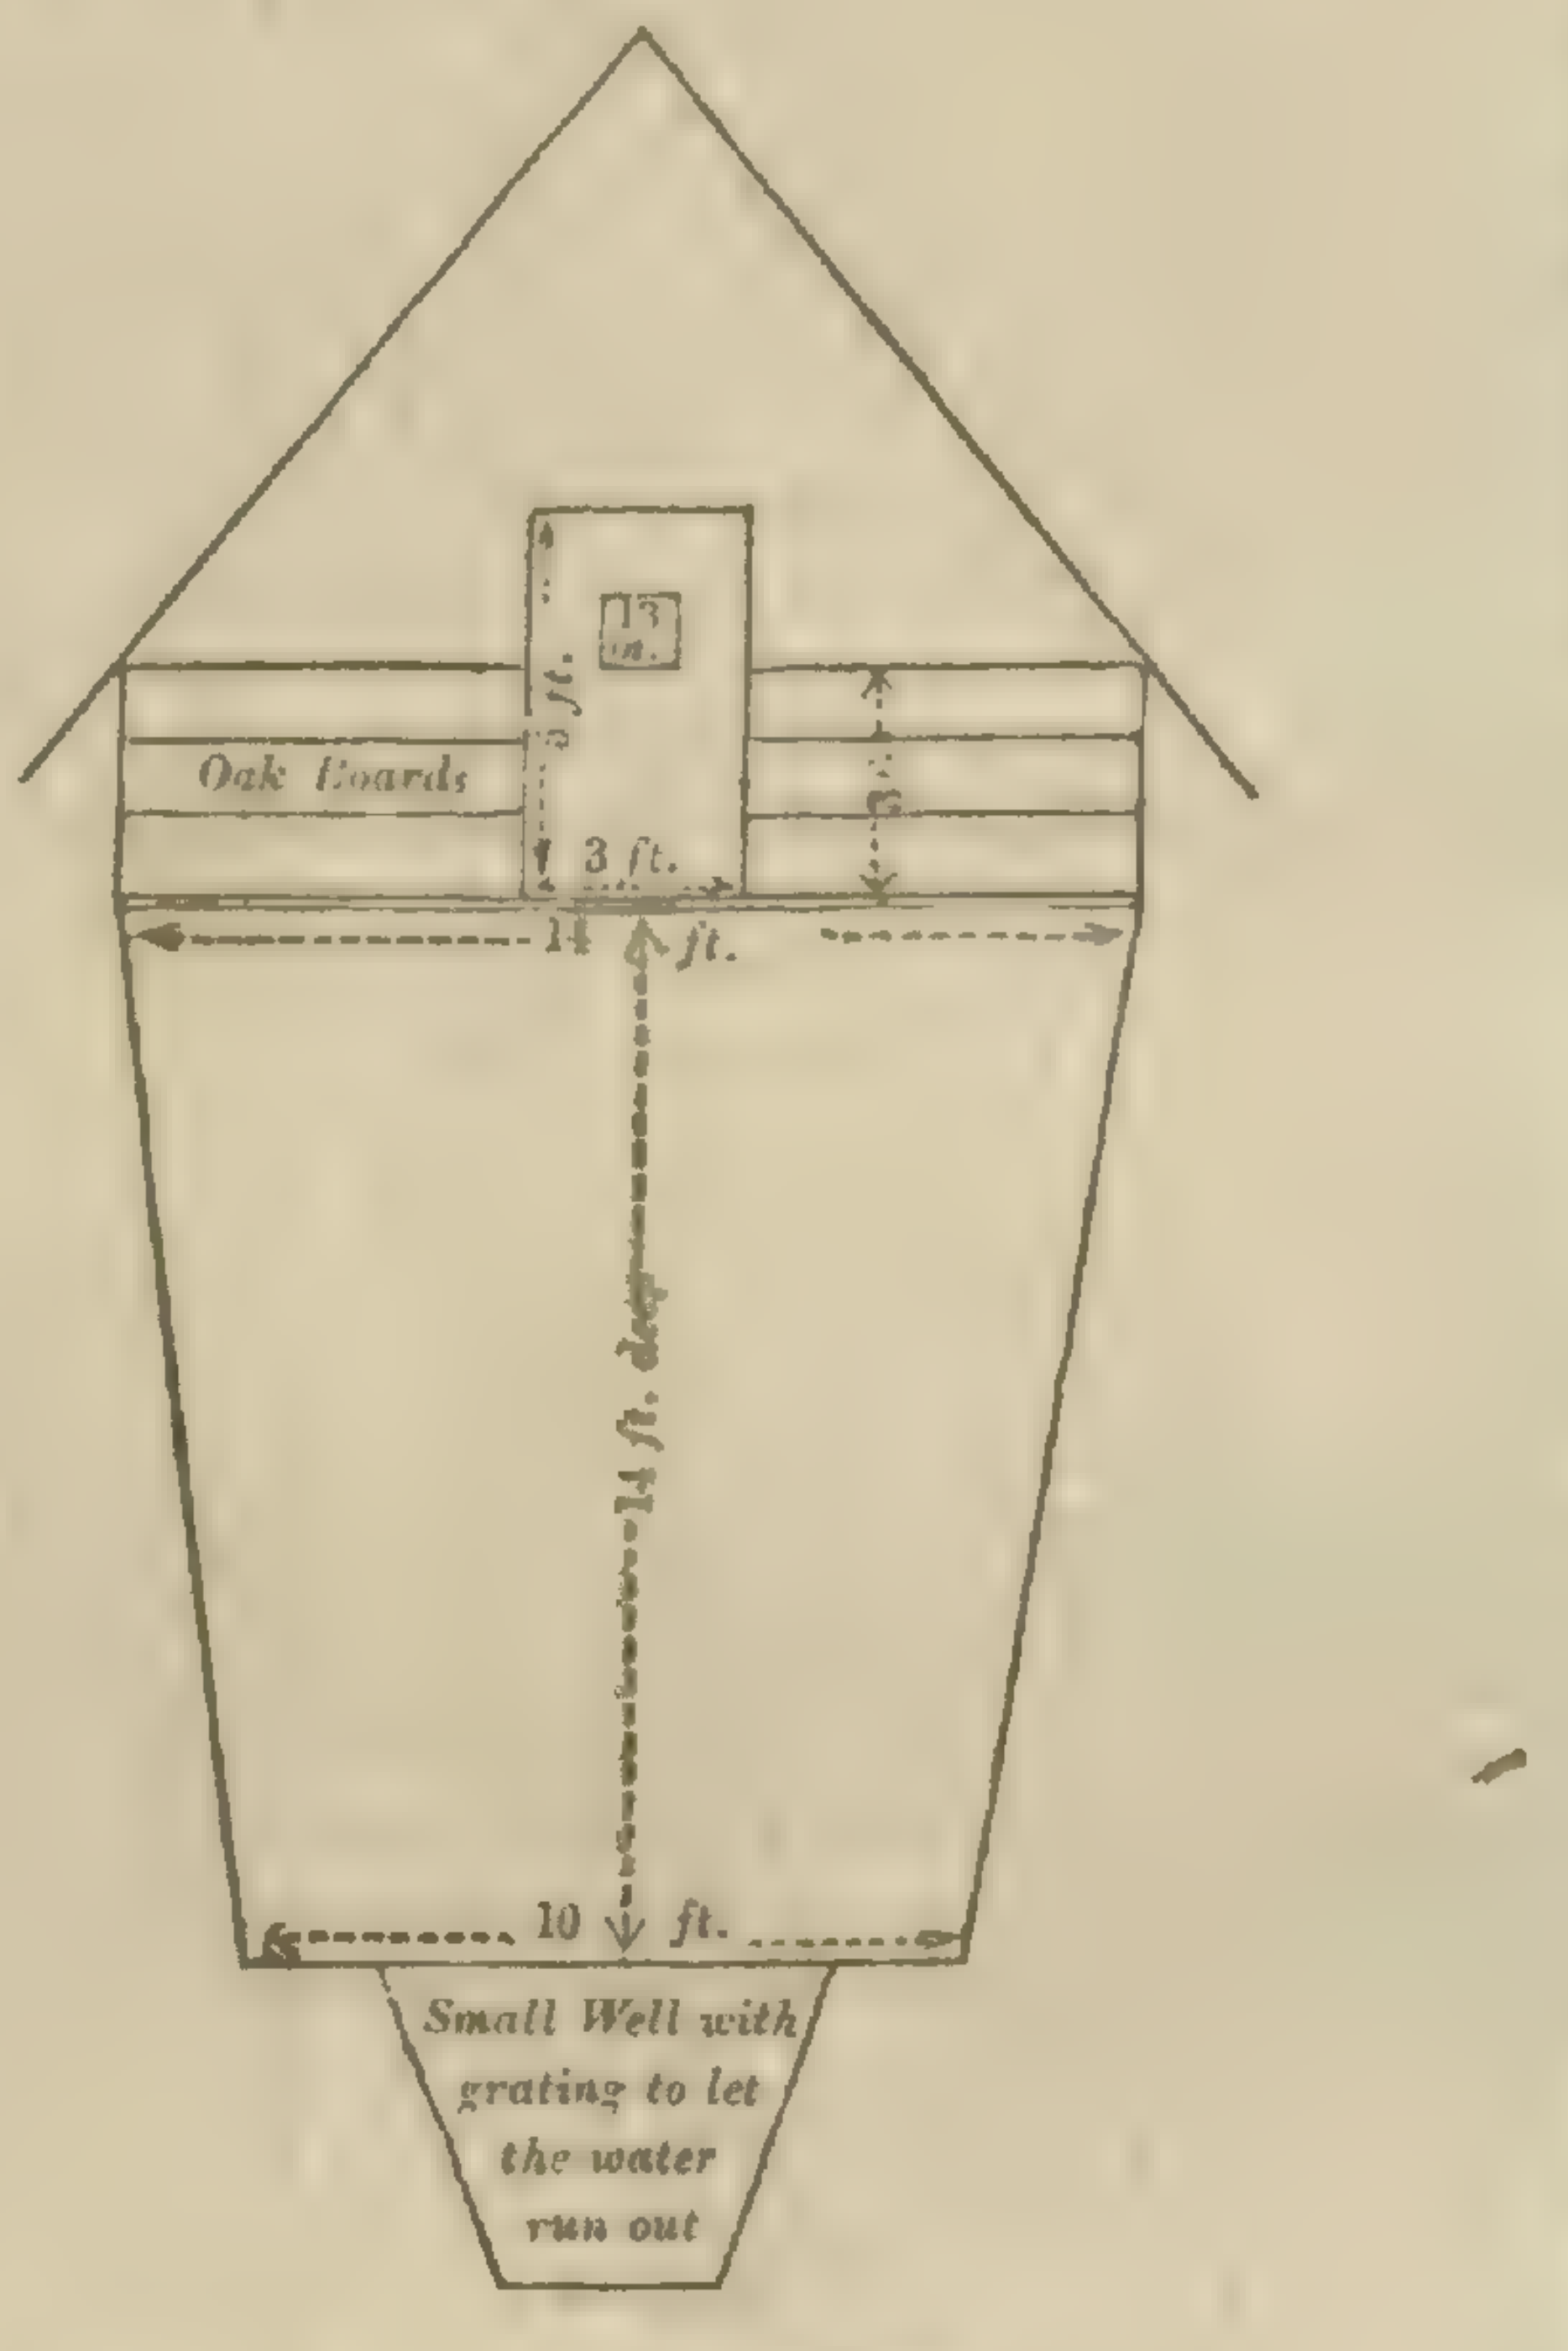
* "Mr. Atkinson's opinion upon this subject is confirmed in a remarkable manner by the discovery that the Oak in an extensive sub-marine forest at Hastings is Q. sessiliflora."—*Note by the Secretary.*

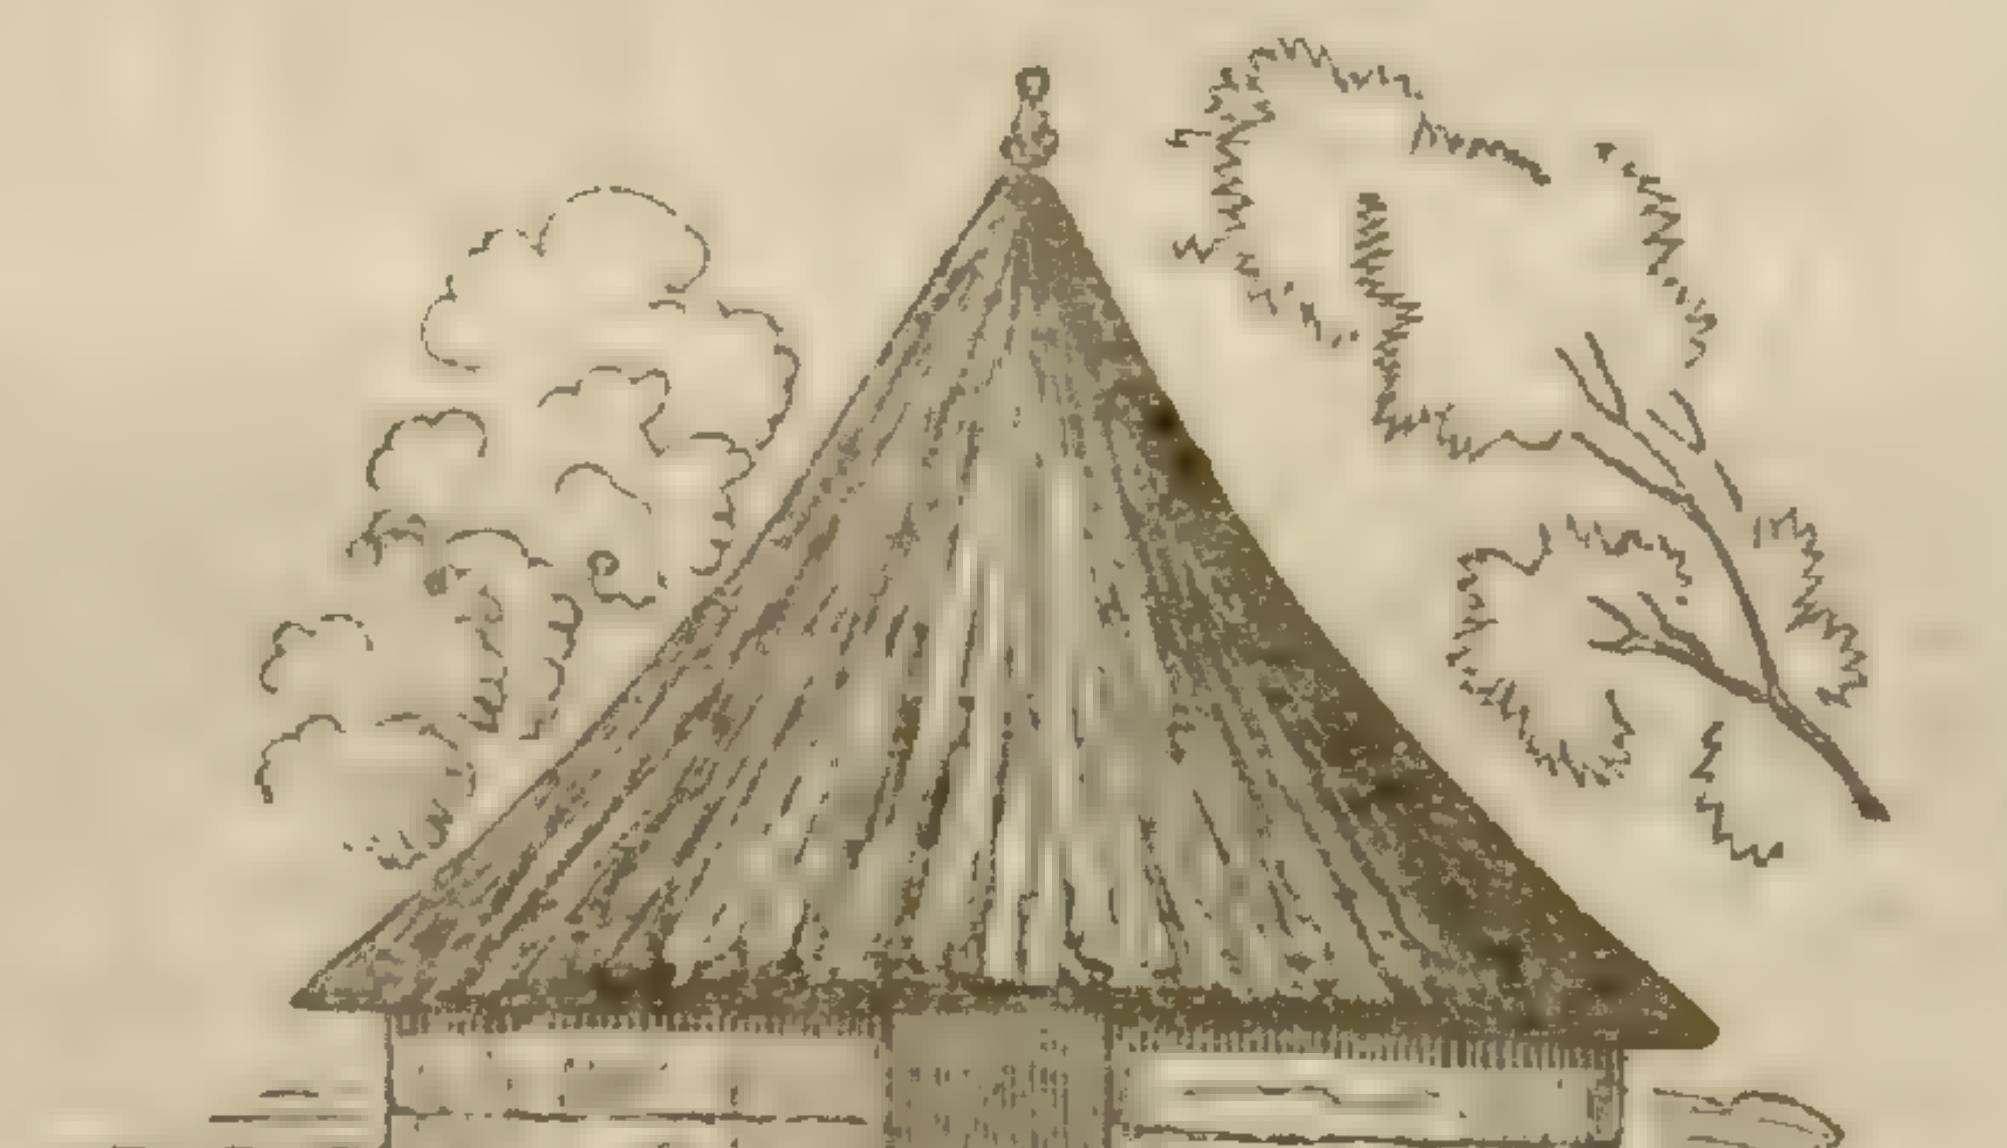
(Citrus Aurantium) is the proper botanical name for the Sweet or China Orange. Your readers may not be aware that Citrus is the generic name of all that large class and variety of fruits which are called Oranges, Lemons, Citrons, Limes, &c. Citrus Aurantium is the sweet Orange, Citrus Bigaradia the bitter Orange (vulgarly called Seville, from its having originally come from Spain), Citrus Limonum the Lemon, Citrus Medica the Citron, Citrus Bergamia the Bergamotte, Citrus Limetta the Lime, Citrus Pompelmos decumanus the Pompoleon and Shaddock, &c. &c. &c. Of all these there are varieties as abundant as the Apples of our own country[*]. Melangolo, Arrancio, and Portogallo, are the vulgar names for Orange in Italy; the latter, as having been introduced from Portugal. In Rome the Orange-sellers call their fruit Portogalli; in Florence the name is not known, and there you must apply for Arrancio. The Chinotto, and Nanino da China, large and small myrtle-leaved, are Bigarades, or bitter Oranges—Citrus Bigaradia sinensis and myrtifolia. The Mandarin, Citrus Aurantium nobilis, so much cultivated in Malta, of the merits of which your correspondent justly speaks so highly, was, I believe, originally introduced into that island from China direct, whence, and from its superior flavour, is derived the specific of Mandarin, *par excellence.* The Tangerine I suspect to be only a variety of it, having changed its nature and form, in a degree, by cultivation on the coast of Africa, to which country it very probably may have been exported. I have both kinds; they vary in the form of the leaves and blossoms, but to no great extent. The fruit and peel (which should be eaten together) are in one, the Tangerine, finer in the grain, but the flavour, which is excellent, is perfectly alike in both. They are much more tender, and require consequently a warmer climate, than all others, and may almost be considered stove plants. The Portogallo commune of your correspondent is the common sweet or China Orange, Citrus Aurantium sinensis. The Portogallo di Malta is the same plant grown in Malta, of which, and many others, there are varieties with red juice; the chief being denominated Citrus Aurantium Hierochunticum fructu sanguineo. The Otaietie is Citrus Aurantium otaitensis, as supposed coming from Otaheite. The Peretta di San Domingo is a Lemon, Citrus Limonum domingensis; Peretta is pear-shaped. By Pomarosa must be meant Mellarosa, of which there are Citrus Bergamia mellarosa and Citrus Limonum mellarosa. I have cultivated the Citrus tribe for some years, and have had, and I believe have now, more than 70 varieties. I have from the first adopted the classification of Messrs. Risso and Poiteau, to whose splendid volume, "L'Histoire Naturelle des Orangers," I beg to refer all such of your readers as may wish for further information on the cultivation of this "Tree of the Hesperides." The true Tangerine has nothing curious or remarkable in the scent of its foliage. The plants mentioned by your correspondent must belong either to the Lemons, Citrons, or Bergamottes, where highly-scented leaves are alone to be found, and of which the Citrus Medica odoratissimus is the chief. The shrivelling and falling of the embryo fruit arises, no doubt, from some evil at the root. The soil is evidently not congenial, and perhaps too much water, and that not rain, may be the cause. The small-fruited plants of the Citrus tribe require lighter and less rich soil than the larger fruited sorts; they require also less water and more warmth. It is a great mistake to suppose that Citrus Bigaradia myrtifolia will bear exposure on terraces; most of our collections in this country are greatly injured by the old-fashioned and perverse habit of putting them out of doors during the summer. I cannot conclude these remarks and not say, what indeed may appear unkind to a respectable class of persons, viz., the Italian nurserymen, that no reliance whatever can be placed upon their nomenclature; for they scarcely ever send out the real and true kinds required of them: few of them have any scientific knowledge, and they are, one and all of them, at least a hundred years behind the intelligent men of our own dear land. Were proof wanting of this, it might be seen in the clumsily-budded trees annually sent over from Nice, Genoa, Malta, &c. It is, however, to these men that we are chiefly indebted for our collections, and it is not fair, therefore, to abuse them; but it is by British science and British zeal that we can show the now rapidly-increasing and well-managed collections around us. —*C. A. F. A., E. H., Dec.* 21, 1841.

Phædon Vitellina on Willows.—We have been much troubled for a few years past with a small beetle, the Phædon vitellina, on our Willows; it increases yearly, and bids fair to destroy the whole. Can any of your readers inform us how to get rid of it? We think it would be best destroyed in its winter quarters. We have found it clustering in the clefts of trees near at hand, but only partially, and have sought for it in vain among the Willow stools.—*R. Lymburn.*

Tendency of Plants to seek Light.—We are of opinion with *A.*, p. 749 (1841), that most of the drawing of plants is to be ascribed to expansion by heat, and removal of atmospherical pressure. In a glass receiver subject to the action of light all around, plants are found to spindle excessively. The light will shorten the side exposed to it, by deposition of carbon, and thus cause plants to bend towards the light; but this is different from attraction, and acting from above, should rather depress than extend. —*R. Lymburn.*

Ice-houses.—I send you the plan of an ice-well which has succeeded perfectly. It is far less expensive than those in general use, and will be found to succeed either in clay or chalk. In porous soils, or where water is found near the surface, nothing will answer but a well above ground, with double walls.



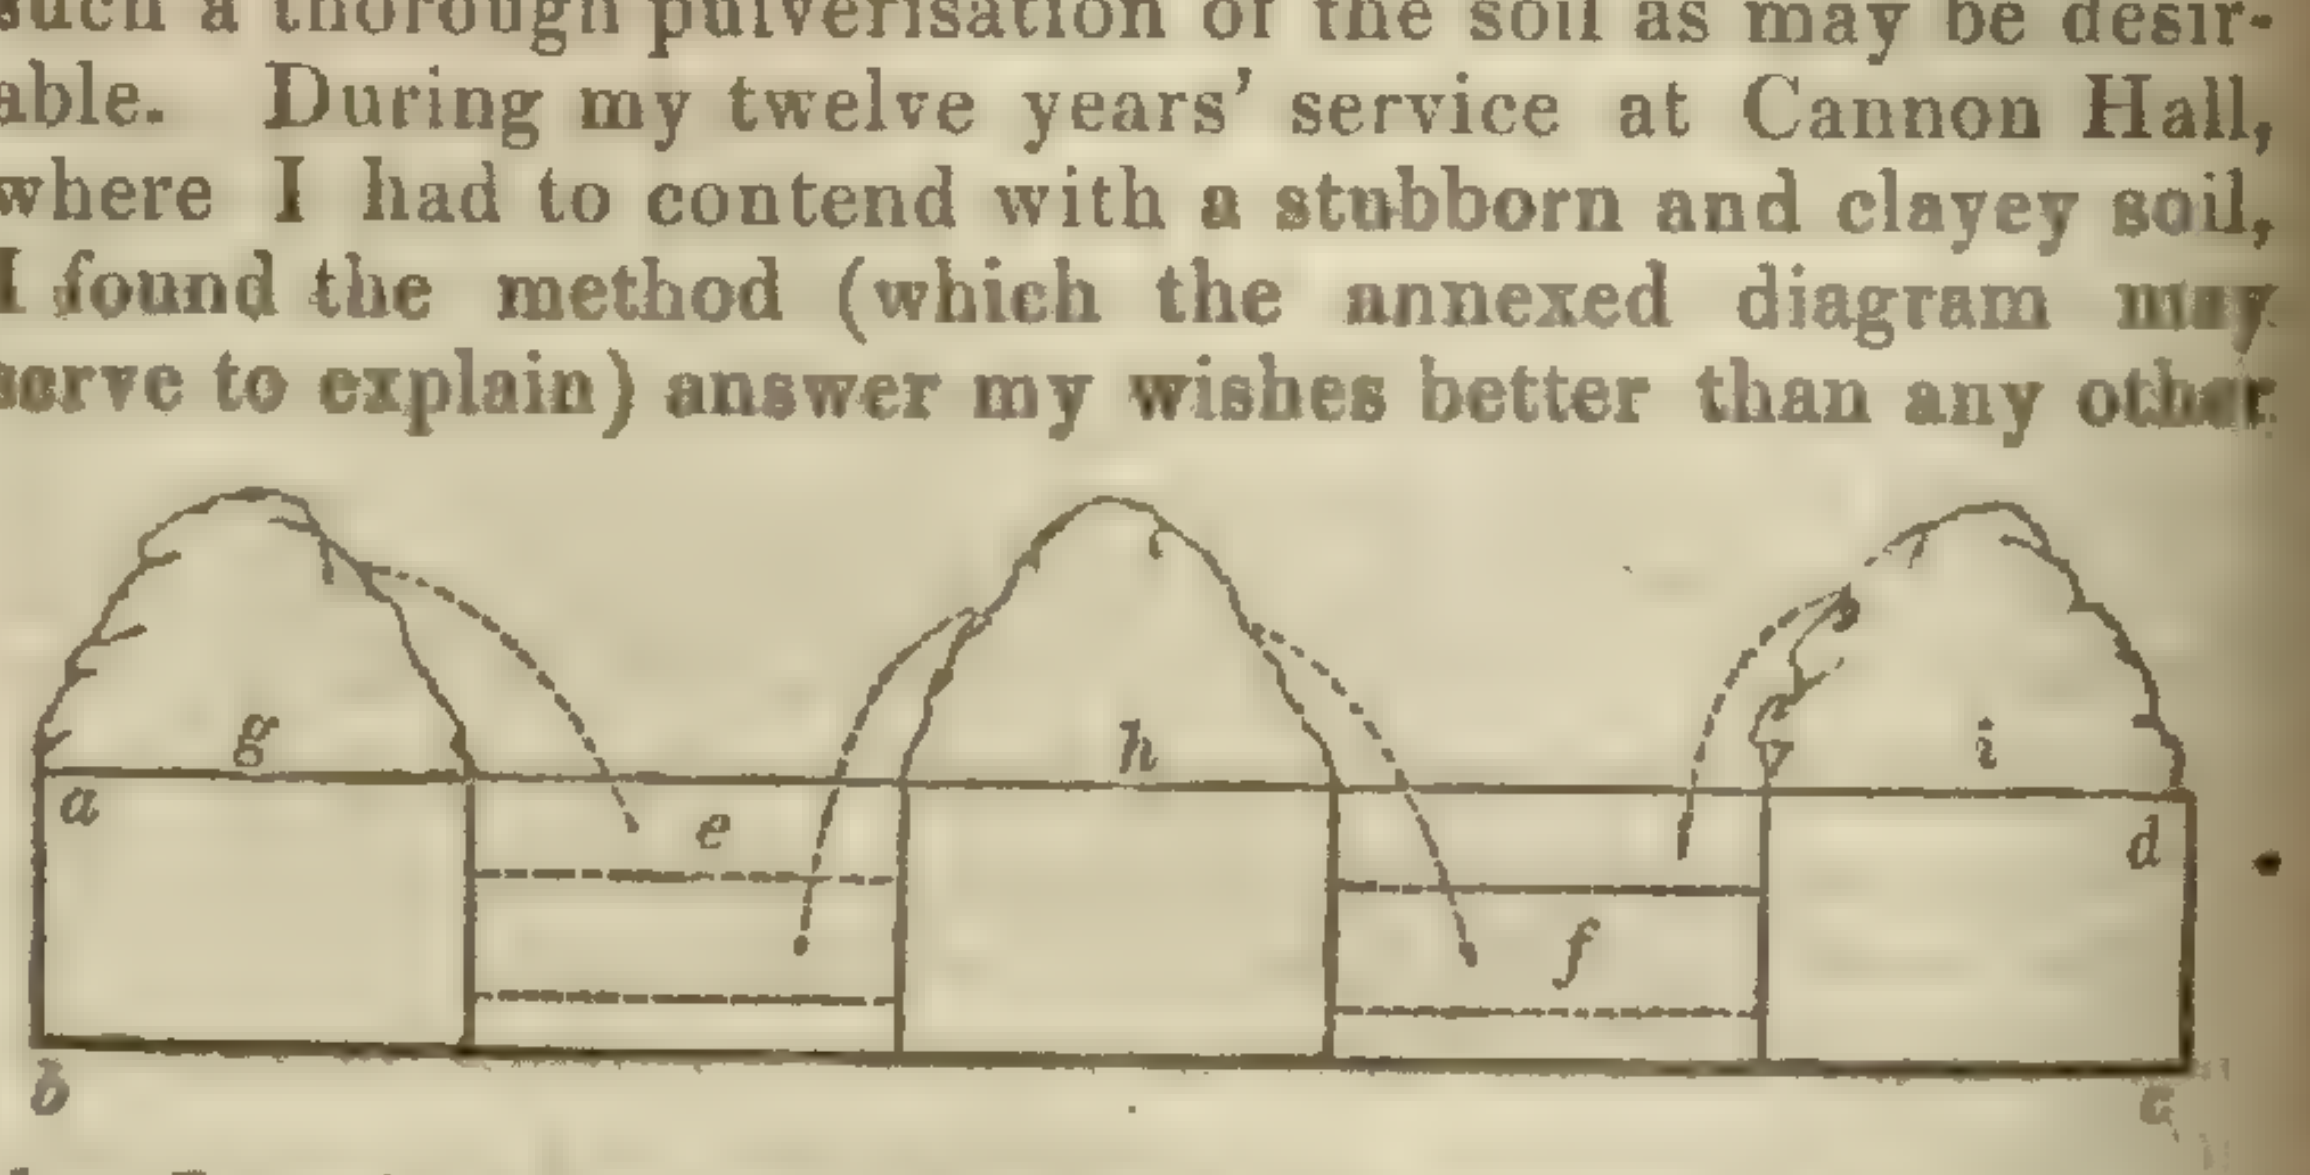


Boiling water must be poured on each layer to harden it, and it must be well beaten. If the soil should not be a stiff clay or chalk, the sides of this well should be brick or concrete, and well wattled before the ice is put in. Small door, opposite the large one, 2½ feet square: this door, and the small one of 18 inches in the large one, to be opened every evening, and shut before daylight. Price of such a well from 14*l.* to 16*l.*—*Forester, Ringwood.*

Ice-houses.—We have received a letter on this subject from "J. W.," who states that he knows an instance where ice has been kept for two years in a small house only holding between 50 and 60 cart-loads. During the winter, when the house was filled, there had been but little frost to the middle of March, and at this time the ice was not more than 1in. thick; and as there seemed but little chance of obtaining any thicker, this was taken, broken into pieces about the size of walnuts, and closely packed in the house. Two years after this the house was opened, and found to contain a considerable body of ice. This house is situated on a slope, and has a few trees round it; it is built of freestone, and has a door level with the ground. "W. J." thinks it is best for ice-houses to be quite under ground, and to have perpendicular entrances, as they keep out the air much better than side ones. He also objects to trees being near ice-houses, as their foliage creates a coolness, and the motion of their leaves and branches causes the air to be constantly changed, which must be injurious, he says, to houses half above ground. He recommmends a swan's-neck pipe to be placed below the centre of every ice-house, and to keep water continually in its neck, to prevent the admission of air through the drain. He also says that a drain should be carried round the building like a corkscrew, which will keep the walls dry. Where there is no declivity to carry off the water, he recommends a large tank, to be made, 6 feet square, by 4½ feet in depth, below the base of the building, and a pipe placed in it, with a pump fixed upon it to pump up the water, which only requires to be done once a month, unless the ground is naturally wet; stones in this instance will be necessary to be packed all round it, in which case the building will be kept as dry as one upon a sloping bank. The ice is taken out, by having two upright pieces of wood fixed in the side, with hinges to turn them, 3ft. above the ground, a cross piece to fix on spikes, and a pulley on its centre for a man below to pull up the ice with. [We do not publish more than the substance of "J. W.'s" communication, thinking his recommendations injudicious, for the following reasons:—1st, because it is well known that ice should be broken as thin as possible previously to placing it in the house; 2nd, because we think an entrance from the top objectionable, for the reason given in p. 797; 3rd, because we do not think a few single trees about a house are of much consequence; and 4th, because a tank at the bottom is, we think, injudicious; for a house in the situation described ought to be entirely above ground, and covered up with soil something like a potato-pit].

Fumigation.—Having experienced some difficulty in effectually fumigating places in which a man could not conveniently operate, such as low pits and frames; and having had plants injured in such places where coal cinders have been used in the operation, from the dust, when bellows have been used; besides, the process being disagreeable—I have adopted the following system, which has answered admirably. According to the size of the place to be fumigated, one or more pieces of cast-iron, one inch thick and three inches over, are made red-hot (pieces of old tiles, such as are used for covering smoke flues, would probably answer equally well); one of these is placed in a twenty-four sized pot, on which is put the quantity of tobacco considered necessary to charge the structure with smoke sufficient to destroy insect life. To fumigate an ordinary-sized eight-light house, I use three heaters and three twenty-four sized pots, which I have placed on the front flue or walk; one pound of strong tobacco is put on the three heaters in equal parts, and this I find sufficient to fill the house, so as to destroy all the kinds of insects that perish by fumigation. The system has these advantages: the tobacco is so quickly consumed, that the house is completely filled in a very short time, and but little smoke can escape before the insects are destroyed; the pure heat from the iron heaters prevents injury from gas, and as no blowing is required there is no dust, it being only necessary to put the tobacco on the heaters and leave the house. I have had Cucumber and Melon plants injured by fumigation when I used coal cinders to consume the tobacco; but since I have adopted cast-iron heaters no injury has been done to plants of any kind by fumigation, from which I infer that the mischief was caused by gas from the coal cinders.—*Geo. Mills.*

Trenching.—In No. 27 of the *Chronicle*, for 1841, in the article of weekly operations, Mr. Paxton has given some salutary hints to his brethren on the necessity of trenching vacant ground in the winter season. I believe there are few gardeners but what are fully sensible of the beneficial effects resulting from such operations. But by the old method of ridging or trenching, we do not obtain such a thorough pulverisation of the soil as may be desirable. During my twelve years' service at Cannon Hall, where I had to contend with a stubborn and clayey soil, I found the method (which the annexed diagram may serve to explain) answer my wishes better than any other



that I could hit upon. Let *a b c d* represent a section of the ground to be trenched, two feet deep. In the first place, the ground is measured out in longitudinal beds, 4 feet wide; this done, the top spit of the bed *e* is laid on the bed *g*, and the second spit of the bed *e* is laid on *h*. The first or top spit of the bed *f* is then laid on the bed *i*, and the second spit from the bed *f* is laid on *h*, so that the top soil and subsoil are kept on separate and alternate beds, and may be mixed, reversed, or returned as taken out, at the will of the operator. By this method, the advantages are, a much greater exposure of surface to the action of the weather; the opportunity of incorporating with the soil any desirable or obtainable manures, and at any desired depth; a thorough blending of the soil to the depth of two or three feet; and it also facilitates the operation of draining where necessary. It is needless to add, that when the first thrown-out beds are sufficiently pulverised, they are levelled down, and the others thrown out in the same manner.—*T. Parkins, Owston, near Doncaster.* [P.S. *g h i* represents the ridges thrown out and left as rough as possible.]

Coal-shale a Manure.—About 12 years since there appeared in a provincial paper a paragraph tending to throw much light upon the vegetative qualities of Coal-shale, which your correspondent, Mr. Mackenzie, West Plean, from his proximity to the locality to be named can easily verify, and upon due inquiry possibly be able to furnish more valuable facts in confirmation of one or other of the hypotheses advanced in the *Gardeners' Chronicle*, at p. 764. It happened that a few Potatoes were thrown aside in one of the Duke of Hamilton's coal-pits at the Redding, three miles east of Falkirk, which soon became covered with the refuse shale, and there at the depth of some thirty or forty fathoms vegetated most vigorously and in perfect darkness. In due time the roots were examined by the pitmen, and the tubers found to be of the full size, and of excellent quality; and further, which is particularly deserving of attention, at the time of the writer making known the circumstance, the men had for three months successively resorted to the same shaws for successive supplies of the Potatoe. Was the prolonged period of production to be attributed to the virtues of the coal-shale as a manure, or to the total absence of light, or to both?—*I. H. S.*—[We insert this, as our correspondent is known to us, but we confess the statement seems to require confirmation.]

Theory and Practice, and Root-pruning.—If the writer of the observations on Theory and Practice in No. 27 of this Journal had read and admitted my definition of the term science in No. 26, he might have summed up all he had to say in the few following words:—"No gardener can be master of his art if he is ignorant of the science." A great value of late seems to be attached to root-pruning, and many appear to claim the merit of its discovery; but, to whomsoever this may be due, it is pretty clear that this, like all other operations in gardening, can only be beneficial under certain circumstances; and unless the causes of the effects—it may be desired either to produce or to prevent—be understood, even these operations may be as likely to work evil as good. And as those causes do not appear to be fully described in this journal, the following explanations are offered. In the "Science of Horticulture," published by me in 1820, I have said, "The office of the roots is to collect and supply the food, which forms and determines the growth and productions of a plant or tree; and the constitution and habit of the roots determine those of the branches. If the roots grow luxuriantly, the branches will also: and the reverse. From hence it must be concluded that in planting trees, two essential objects present themselves for consideration: first, to ascertain the soil best adapted to afford a sufficient and accommodating body, bed, or space, for the roots to repose and range freely in, and induce and support such habits as are most desired; and next, that it contains, or will admit the application of, a due supply of food of a proper quality," &c. "In preparing beds or borders due attention must be paid both to the soil and subsoil, as each equally affects the health and fruitfulness of trees, and principally as it retains or discharges water, stagnant water being at all times particularly detrimental to the fructification of trees." "When trees are found to grow too luxuriant, and to exceed their bounds, the better way to check their growth is to open the earth two or three feet round the stem, and cut through one or more of those roots that grow the strongest and that run the deepest into the soil; by these means, the form and regularity of the tree will not be altered, as they would be by shortening and cutting out the branches." "When old trees are very subject to canker, the cause will generally be found either in the soil or subsoil, from its being too retentive of moisture, or from water stagnating from other causes: in the first case, therefore, the soil must be carefully removed from the surface so as to uncover the roots to their full length, or as nearly so as practicable, and then cut off such roots as appear to run downwards, or grow deep; or if some extend beyond the good soil into bad, they must be shortened; then mix with the soil some coarse sand, fine gravel, or brick rubbish—or in case these are not at hand, some coal-ashes, in a proportion sufficient to break its tenacity, or to make it open and free. If the subsoil only be in fault, or water stagnating from other causes, the cutting off the downright roots and making proper drains will be found efficient." I have also stated it to be a law of nature, that "Whether the supply of food be great or small, the fluids taken up must flow or spread over a proportionate surface of trunk, branches, and leaves, and be duly exposed to the action of light, heat, and air, before a tree can attain a perfect fructiferous state." Then if a plant or tree does not fructify because its surface of branches and leaves is not proportionally as large as the supply of food, it must be obvious that although nothing but time will produce a sufficient enlargement of the surface, we can, by cutting off and curtailing the organs of the supply of food, which are the roots, thus adjust the supply of food to the existing surface, as immediately to produce fructification. Then if the effect desired to be produced be fructification, or the effect to be prevented be a too extended growth of wood—diseases consequent on great repletion or unwholesome food—the causes as here described being established or removed, the desired object will be obtained.—*Jos. Hayward, Lyme Regis.*

---

[*] Hybridizing of the Citrus tribe is as prevalent in the warm climates, as it is with us in the Apple countries: and fancy names are given to the same extent. I possess now a Pompoleon-looking plant called Risso, another Gordon, and a third Arethusa; Risso from the author of the work mentioned above, Gordon from Lord Aberdeen——Arethusa? The most curious and interesting of hybrids is now to be seen at Versailles, under the name of Le Grand Bourbon: it is a Bigarade of great size, and far advanced in years. It is said that it sprang from a pip sown by a queen of Navarre, in the year 1421, at Pampeluna: it passed by succession to France, and for some time rested at Chantilly. In the year 1532 Francis I. had it conveyed to Fontainebleau, and subsequently Louis XIV. transported it at great cost to Versailles, where it is doomed, we will hope, to pass the rest of its days in that magnificent abode of the sovereigns of France. I possess a young plant of it: the foliage is large, and of a remarkably deep green—such a green as only the cultivators of the Citrus tribe know well how to appreciate.

Transplanting Evergreens.—Much has been said, pro and con., for both autumn and spring planting of evergreens, and yet the question must appear to amateurs and beginners anything but settled. I, therefore, beg to offer a few hints founded on considerable and successful practice. I have invariably found autumn the best for the following reasons:—1st, the atmosphere of autumn is by far less dry and capricious than that of spring; 2ndly, evergreens have then the greatest number of healthy leaves in full action whereby to produce roots; 3rdly, the surface of the soil possesses, in an eminent degree, the remaining heat of the past summer; 4thly, as spring always brings its own business, and that by no means trifling, it is folly to delay that until spring which may be done at least equally well in autumn; 5thly, "first come first served"—an old maxim, for in the case of purchasers from a nursery, those who come first get the choice, a circumstance by no means to be lost sight of. I will now endeavour to explain the points that I have assumed:—1st, "the atmosphere of autumn." Compare the ordinary state of the atmosphere in March, April, and May, with that of October, November, and December; the first is as an arid or parching state of air, as the latter is the reverse. A tree newly removed, more especially an evergreen, requires the same state of atmosphere (only varied in degree) as a cutting; the variation in degree dependent on the ball of earth and the condition of the fibres at the time of removal, together with a due regard to the atmosphere.—2ndly, "the number of leaves." "Leaves make roots, and roots make leaves," a truism which I conceive needs no disputation. It will be granted, I think, that an evergreen has a greater number of active agents, in the shape of leaves, in the months of September and October than at any other period. Now, although those leaves are in full exercise of their functions at a much earlier period, yet it not unfrequently happens, that in hot and dry periods, occurring through July and August, they become of a leathery texture, or, in other words, the secreting power is in advance of the absorbing, causing thereby a tendency to fructification in the wood more than renewal of the roots. This, I conceive, is for a time a kind of stagnation of the growing or woody principle, which is somewhat restored by the autumnal rains.—3rdly, "the bottom heat," if I may so term it. The utility of bottom heat is well known: I mean, of course, as related to the heat of the atmosphere, and the degree of solar light at any given period. This is an important affair, and not sufficiently understood. It has, in fact, to do, less or more, with nine tenths of our gardening operations, in many of which it is a matter of greater importance than is commonly imagined. I conceive it to be an argument of no small weight in the case in hand.—4thly, "spring brings its own business." Who more busy than a gardener in March, April, and May?—5thly, "the advantages of an early purchase." Everybody knows, or should know, that the best of the nurseryman's stock is taken first; therefore, I say, in the case of a purchase be early in the market. Some of your correspondents, I perceive, recommend July for planting Hollies; now I have removed large Hollies at that period, but it has been a matter of necessity. I did so in the past summer, one of which was eleven feet high and bulky in proportion, and it did well; but the past summer has proved an exception to the rule. The rains here have been almost incessant from that period until the middle of September. I have also known Holly-hedges planted, by farmers in this country, in April and May answer well, but it has been in cases in which I had advised them to skreen the young plants with long litter from the dunghill; this litter was thrown on loosely and thinly the moment they were planted; and I directed them to form the surface of the ground into a channel or basin to retain water, and advised also a slight sprinkling overhead twice a week, at least, done in the morning. Some of your correspondents, whose opinions cannot be lightly esteemed, recommend puddle planting, though I cannot see its utility. What would be thought of puddle potting? Your recommendation of raking the tree leaves into the bottom of the holes for planting is good; I have made it an invariable practice for some years, and no small benefits have followed that course. I hope the question, as to the time of planting, is not finally closed, and that some of those who have "grown grey in the service" will give their experience on this subject, and say something about the removal of deciduous trees.—*Robert Errington, Oulton, near Tarporley.*

Neatness in Turf Edgings.—Having to renew some turf edgings this spring, I sunk pieces of thin tile between the gravel and turf about an inch high, and the edging has been particularly neat all the summer. The tile (slate would do as well) prevents the grass from growing or spreading over the gravel, so that it does not require cutting every year; but when the grass has grown over the side, merely clipping with the shears. Care must be taken not to raise the tiles above the turf, so as to catch the scythes in mowing it. Nothing looks so bad in a walk as a high raw edge, as though a plough had cut it; the lower the edge, the neater it looks.—*Wm. Tillery.*

Nitrate of Soda.—In compliance with the request in p. 749, I send the following remarks on the nitrate. It is not at all likely, I think, that the roots will escape injury more than the leaves; and the difference of effect must arise from that spread on the ground finding its way to the roots, by degrees only, in smaller quantities and in a more diluted state, as washed down by the rain. If the spongioles of the roots were presented to the direct action of the nitrate, they would probably suffer in the same way; perhaps, however, the upper surface of the leaf, from its deficiency of absorbing powers, may may retain the nitrate longer at the surface, in connexion with the skin, and be more apt to be injured than the spongiole of the root, which passes it through more freely. Substances the most nutritive are found to produce disease and death when in excess, as pointed out by Sir H. Davy in his experiments narrated in "Agricultural Chemistry;" and it is probably from this cause that urine and other powerful manures produce death of the leaves when administered in small quantities, and death of the whole plant when applied in large quantities, not properly diluted, to the roots. It is not at all likely that any chemical alteration will take place on any quantity of the nitrates before absorption. It is on the nitrogen they contain, in the form of nitric acid, that the benefits of the nitrate of soda principally depend. Muriate of soda or chloride of sodium (common salt), and sulphate of soda (Glauber's salts), containing the same base of soda as the nitrate, are found to produce little effect. If the nitrate were thus acted on chemically before absorption, the nitric acid would most likely be lost. The nitrate absorbed into the system of the plant is then decomposed, the soda separated and excreted; probably to be again united to carbonic acid, absorbed and decomposed, and again excreted; unless the plant be one of the few which prefer soda to potash as a constituent. The nitric acid will be decomposed also; part of the nitrogen will go to form the gluten, albumen, and diastase of the plant, and thus be assimilated as a constituent; but a great proportion will unite to the free hydrogen of the plant, and form ammonia, which circulating in the cortex of the plant, more especially as here life is most active, will greatly increase the vigour and growth of the plant; by its powers of transformation hastening the compositions and decompositions going on in the plant, to supply the necessary substances as wanted by the different organs; and by its action on the walls of the tissue as it circulates, stimulating their vital actions. In accordance with the above opinions, it will be found that the first effect observed on plants subjected to manures containing nitrogen or ammonia, is to cause extension of the stem and growth, a deeper colour in the leaves, and greater breadth of foliage. If the weather is light and clear, greater benefit will be derived from them, in the greater action of the light on the extended surface of the foliage. In dull cloudy weather, however, we may have much more increase of stem than of grain or roots.—*R. Lymburn, Kilmarnock.* [We do not agree with our correspondent on several points regarding the action of nitrate of soda, and think the subject still much involved in obscurity. We believe that in some cases sulphate of soda produces similar and equally beneficial effects on plants to the nitrate. And again, there is no proof that the nitrate does suffer decomposition after it has been absorbed. We shall be very glad to hear accounts of experiments of all kinds in the use of this curious and powerful manure.]

Gooseberry Caterpillars and Mice.—In my last communication on the Gooseberry caterpillar, there was a mistake made in substituting the word one man, in place of our men. We were at the time the experiment was made of the same opinion as *W. R.* of St Ives, that the best way was to pick off the caterpillars; but we had employed our men 8 or 10 days in picking, at a cost of 3*l.* or 4*l.*, as we were anxious to get the plot cleared, being a few hundreds of the best new Lancashire sorts, and indispensable to us for cuttings. At the end of that time and expense, they were not, however, half cleared; and the remainder were cleared at an expense of 1*s.* 3*d.* for hellebore powder, and a morning's work of two men. Most people seem of the same opinion as *W. B.*, that it is better to exhibit the powder mixed among water, than in a dry state: we, however, as stated before, prefer the powder to be thrown on the caterpillar dry. We do not think it is necessary that the caterpillar should eat the Hellebore, as stated by Mr. Groom. Most of the applications to kill insects are external, and act on the delicate absorbing skins of insects. When the hellebore powder is mixed among the water, it is held in suspension, not infusion; and when it falls on the upper surface of the leaf, it falls on a surface that does not absorb, and will lie there till the water is evaporated, and the powder remains. All the benefits of the water are therefore confined to spreading the powder more evenly, and fixing it on the leaf till eat through, when it will fall on the caterpillar. The close hairy surface of the caterpillar will not admit water so easily as the minute dry powder; and we cannot doubt of its effects on the tender skin of the insect wherever it penetrates, when we perceive the spasms it causes in the nostrils. Mr. Henderson of Leadhall, a reader of the *Chronicle*, from whom we got the receipt for the caterpillars, we believe still applies it dry. He has one of the best Gooseberry gardens we have seen anywhere, the crop always excessive in quantity and quality; and a description of his particular mode of culture we have no doubt would be interesting. His receipt for preventing the attacks of mice on early-sown Peas, is to pound about a halfpennyworth of rosin to powder, and roll the Peas amongst the powder, which will suffice for 2lbs.; and he says he has never found it to fail. The chopped whins long ago recommended in the *Gardeners' Magazine*, he has found effectual too, but not so easily got.—*R. Lymburn.*

Galvanic Protectors.—As most likely many of those who have supplied themselves with the zinc and copper protectors have found them to retain their repulsive powers but a short time, the information that if they remove the oxide of the metals, by cleaning with brickdust or sand, the repulsive power will be restored, and if the protector be bent like a dog-collar, with a catch at each end, they may be readily removed and replaced—may not be unacceptable.—*Jos. Hayward.*

Gardeners.—Whilst the *Gardeners' Chronicle* is a channel through which we, as gardeners, often have conveyed to us useful hints, and which I hope we shall always receive in the best feeling, it is also open for courteous remarks from us to proprietors, which I hope may be accepted in the same spirit. A short time back, a little discussion upon the subject of proprietorship in plants, which was decided in the only way it could be, left an opening for a hint or two which I hoped would have been contributed by an abler pen than mine; but such not being the case, I am induced respectfully to advocate the cause of my brother green-aprons. I often hear persons say to my master, when walking round, "Well, I do not know how it is, but my man has nothing like this; where did you get such a thing?" I am appealed to, to know where it came from. "That, sir, was given to me by Mr. so and so's gardener; I gave him two or three Columbines last season, and he has sent us two or three bulbs." "That is it," says my master's friend; "my man never gets anything sent him." Now, if that gentleman were to go to the bottom of the thing, he would find that my master paid Mr. Catleugh several pounds for the Columbines; I increased the stock and had to spare. My friend's master paid some pounds for a collection of bulbs, and they increased with him; and here is not unfrequently the secret of the beautiful variety found in many collections. Sometimes when I come home from a visit to some establishment, which I have visited for information, I bring a plant in my hand, which I show my employer. The first question is, Can we do anything for them? and so the stock of good-will and friendly feeling goes on increasing. And let it not be supposed this hurts the florist's trade—just the reverse; give a man six plants of a kind, sufficiently good for him to become interested in their growth and bloom, and he will not stop there—he will be found to buy new varieties. Gentlemen who do not buy, or cannot with propriety afford to do so, should not compare their collections with those who do. Buildings, ever so suitable, do not make collections, any more than a steam engine without fuel constitutes power, and I would respectfully submit to masters whether they can, on reflection, like their gardeners to get collections by begging instead of by their buying. I believe it only wants the attention of employers to be directed to the subject to correct what has been found a source of humiliation to many good servants, and to have it fully understood that we cannot be expected to obtain plants from our acquaintances unless we have something to offer in return; it would be injustice to our friend's employer.—*P. G.*

PROCEEDINGS OF SOCIETIES.

LINNEAN SOCIETY.

Dec. 31, 1841.—Edw. Forster, Esq., in the chair. The secretary announced the death of the librarian of the society, Professor David Don. The society, he said, in his death had sustained a great loss. His proficiency as a naturalist, and his excellence as a man, had secured for him the respect and esteem of all who knew him.—An extract from a letter of Mr. Griffiths was read, containing a summary of the result of his observations on the development of the embryo in Santalum, Viscum, Osyris, and Loranthus; also some remarks on the reproductive organs of Isoetes. A paper more fully detailing the author's views is on its way from India to the society.—A paper from Mr. Myers, F.L.S., was read, giving a description of some new plants. 1. Solenomelcs chinensis, a plant he had formerly published with the name of Cruikshankia, but this name had been given to another genus. 2. Two species of a new monocotyledonous genus, which the author called Distrepta—D. vaginata and D. oblita.—A letter from Mr Bidwell of Sydney was read, describing a new species of Araucaria. It attained the height of 200 feet, and was frequently branchless for the first 100 feet of the stem. A description was also given of Knightia floribunda, which was growing in the botanic garden at Sydney, and in the embryo of which the writer had discovered three cotyledons. The secretary called the attention of the society to a communication from the Spanish naturalists at Barcelona, inviting the scientific men of Europe to join them in paying some permanent tribute of respect to their illustrious countryman La Gasca. The date of this document was Oct. 1, 1839; and it stated that subscriptions would be received by the secretary of the Linnean Society in London.

MISCELLANEOUS.

Run-Flowers.—According to a writer in Hovey's "Magazine of Horticulture," striped Dahlias will be best kept clean by planting in poor soil, while rich soil invariably runs them. He relates the following experiment with a variety called Striata formosissima, in which he is confirmed by Mr. Hovey, who says he has had the same results. No. 1, planted in poor, gravelly soil, in an open situation; all the flowers but two were beautifully mottled. No. 2, planted upon a rich, cool, sandy loam; not one-half of the flowers were mottled. No. 3. Three plants, very highly enriched; every bloom but one was self-coloured.

Œnothera biennis (*Onagre*, French).—The roots of this well-known plant are eaten in Germany, like those of Scorzonera, and the points of the shoots may be used in salads. The herbage would form a good forage for cattle, which are very fond of it. This use is of very old date. Formerly the roots were eaten as a relish for wine; and hence the name Œnothera, which being interpreted appears to mean "wine-hunter" (*οἶνος* and *θηράω*).

Asphalte Protecting Material.—We find this material has been employed in the garden of the Horticultural Society of London in the construction of boxes to protect tender plants. The cases are made like little sentry-boxes, with a door opening *to the north*, and have a very neat appearance. It is expected that they will prove an ample protection to Camellias, hybrid Rhododendrons, and such plants, in the open air. The same boxes will do well at a later season as screens against spring frosts.

Lobelia cardinalis.—A specimen is mentioned in an American paper, which consisted of fourteen stems arising from one root, each covered with fine blossoms. This unusual number was in consequence of some injury which occurred to the main stem after it had pushed up for flowering. The number of individual blossoms was upwards of 350; and it being of the white variety, presented a most beautiful appearance. Another variety, in which a distinct pale stripe is perceptible on each of the lower petals, contrasting with the usual scarlet, was also a pretty object. The first-mentioned had been cultivated in a large pot, with rich earth and abundance of water; the latter in the open border.

Reviews.

The Farmer's Encyclopædia and Dictionary of Rural Affairs. By C. W. Johnson, Esq. Longman & Co. 8vo. To be completed in ten monthly parts. Parts I. to IV.

One of the most useful books we have on Agricultural affairs is that "On Fertilizers," by the author of the work now before us, who has also contributed much valuable information on similar subjects in a variety of publications. When, therefore, the "Farmer's Encyclopædia" was announced as about to appear from the same hand, we anticipated a work which would prove of great interest to farmers. The author's name and fame, and the respectability of the publishers, seemed to offer a guarantee that, whatever the Encyclopædia might contain would be such as could be safely appealed to as a standard of accuracy. It is only in this respect indeed that it could be of any real service; for the newspapers and the pages of Agricultural and Horticultural magazines contain an abundance of information, although not always of good quality, upon current topics of interest. Accurate information in such a work was the more indispensable, considering the badness of the education in our country schools, and the total absence in them of all that has any direct bearing upon the future pursuits of the farmer, who must either get up his science and knowledge of the nature of the material objects that surround him after he has quitted his country school, or must be contented, as many are, to remain in utter ignorance of them.

Upon the appearance of the first Number, the work was received with unanimous approbation by all the newspaper critics, except perhaps ourselves, who did not feel justified, by what we there found, in joining in the exaggerated encomiums which were bestowed upon it in all directions.

An examination of the succeeding Numbers, in our opinion, fully justifies our caution.

We regret that we cannot agree with our contemporaries in considering this a standard book of reference, or even a very good work; and as we have the misfortune to differ from them, we shall, without further preface, proceed to state our reasons.

The work professes to contain articles upon all the plants of which the farmer takes cognisance, and includes notices of Agaric, Agrostis, Aira, Azalea, Celandine, Cedar of Lebanon, Festuca, Fir-tree, and the like. Now, if these plants are worthy of a place in the Dictionary, upon what principle, let us ask, are Æcidium, or the Berberry blight—Alaternus, one of the commonest of evergreen shrubs—Carpinus, the Hornbeam, and a thousand more omitted? Surely some kind of consistency should be observed upon a point of this kind. If it is intended to introduce such subjects in other parts of the work, they should have been referred to, as is done in some instances. Nor is it among plants alone that we find important omissions. Under acids, not a word is said of any other than vegetable acids, which is very strange; and what is said is not true, for vegetable acids do not abound in most plants, as is stated; on the contrary, they are found but in a very limited number of plants in any quantity.

But if many things are omitted which ought, for consistency's sake in one place, and from their importance in another, to have been introduced, there is no end to unimportant matter that should have been left out. What possible object, for instance, can be attained by the introduction of trifling varieties of Agrostis, of no sort of use to a farmer?—of Alvearium, the Latin name for a bee-hive; of Amaryllis—which, by the way, is not an Amaryllis; of Azorean Fennel, which cannot be cultivated in England; of the species of Elymus, of no value as fodder; of Epacris nivalis, a greenhouse plant; of Festuca uniglumis; of Fishing-net, if we are to learn no more than that it is a contrivance of a reticular texture, with two or three varieties? It can scarcely be denied that all this shows very unskilful arrangement of materials.

The grand complaint, however, we have to make concerning this Encyclopædia is, its numerous and incomprehensible errors in matters of the most every-day occurrence. As regards the plants, the compiler of that part has sometimes taken the old, forgotten names of herbalists as those of science, and sometimes those of modern botanists. Abutilon is said to be "the yellow Marsh-mallow," while it is, in fact, the name of a genus of tropical Malvaceous plants, and ought not to have been found in the book; Acorus is defined to be a plant of the Thistle kind, which is something like describing a horse to be an animal of the hedgehog kind; Adonis is said to be Adonis annua, instead of Adonis autumnalis. Alburnum is called "an integument composed of a soft white substance, scarcely perceptible in some sorts of trees, situated between the liber and the wood,"—a most absurd definition, which seems to have been intended for Cambium, which, by the way, is left out; Alexanders are called Hipposelinum, the name by which they are described in Gerarde's Herbal! instead of Smyrnium Olusatrum: this, again, is like calling England, Brittia; and Finger-grass Cock'sfoot, is named Dactylis sanguinalis, instead of Cynodon Dactylon. In short, what with incessant blunders of this sort, and very reprehensible typographical errors, the whole of the botany is little better than waste paper. The chemistry is not much more deserving of praise: the authorities that have been consulted are often obsolete, and not uncommonly misunderstood. Take the following memoranda as a sample of this department:—

Aeration is said to be "the process by which the soil is exposed to the air, and imbued therewith;" a very bad definition, as aeration is the general term applied to the absorption or condensation of air by any substance: thus the "aeration of the blood," "of water," "of earth," or any other matters, are common expressions. Under this head, carbonic acid ought to have been mentioned; but here, as under the head "Acid," it is quite left out. *Alabaster:* we are here told that it is sulphate of lime, which is right; but directly following, the author says, "it differs from marble in being easier to cut, and less durable; the basis being a calcareous earth, which is soluble in 500 times its weight of water." This is absurd; for carbonate of lime, as well as the sulphate, have a calcareous base, and the durability of a substance does not depend on the solubility or insolubility of its base. *Albumen* is said to be the "impure liquid which constitutes the white of an egg;" this is not albumen, but a solution of it. *Alcalies:*—here we are minutely given the derivation of the name, but hardly anything about the nature and properties of the substances. Ammonia is said not to be produced by plants (it is), and therefore nothing is said about it in this place. *Alumina:*—the earthy smell which clay gives out when breathed on is said to be due to the presence of iron. This is a strange story, and not true: the smell is due to the presence of ammonia. *Ammonia:*—the use of decimal proportions is very objectionable (for farmers), and might easily be avoided. At p. 95 ammonia is said to be composed of hydrogen 0·125, azote 1·75, whilst at p. 154 it is said to consist of hydrogen 74, azote 26: this will quite confuse any ordinary reader.

But we are weary of this ungrateful task. It is apparent from the evidence now produced, that whatever merit particular articles in Mr. Johnson's Encyclopædia may have—and some are excellent,—written, we presume, by himself—yet that in other respects the matter is of so bad a quality, that the book can never be regarded as an authority of any value. We may, however, add, that it is cheap and well printed, with some good woodcuts.

CALENDAR OF OPERATIONS *for the ensuing Week.*

In the Weekly Calendar of Operations for the ensuing year, no deviation will be made from the plan adopted by Mr. Paxton, which, it is conceived, cannot be materially improved. In the details it is hoped that some additional useful hints will be found by the young cultivator, although, from the very nature of the subject, much repetition is unavoidable.

Neatness in all operations, and general cleanliness, cannot be too rigidly enforced by the master upon his men; discipline in these matters benefits not only the gardener but those employed under him, by making them good workmen, and consequently more valuable servants.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—Great care is necessary in the watering of Pine-plants at this season of the year, when their vegetation is necessarily languid; the soil in the pots ought rather to be prevented from getting dry than be made wet. For this purpose it is an excellent plan to fill the houses with steam occasionally; but where this cannot be done, slight syringings through a very fine rose should be given, daily if strong fires are required; and shallow vessels of water, to supply moisture by evaporation, should be placed upon the flues or pipes. As the chief object to be aimed at in the winter management of fruiting Pines is the preservation of their roots in a healthy state, without exciting the plants into an unnatural growth, an atmospheric temperature of 60°, with a bottom heat of about 90°, is amply sufficient. Plants that are in fruit ought, if possible, to have a house or a pit to themselves, where the temperature might be eight or ten degrees higher; where there is no such convenience, they should be placed at the warmest end of the fruiting-house. Succession plants intended to be disrooted at the spring-potting must not be forced into growth; a temperature of 55° is sufficiently high. Let them have all the light possible by uncovering as early in the morning as the state of the weather will permit.

Vinery.—Vines which are in motion will now require careful nursing. If two or more buds break at each eye, remove all except the strongest one. When the roots are outside of the house, they must be carefully protected from the influence of frost by a sufficient mulching of leaves or litter laid over the whole of the border. A good thick covering of fermenting horse-dung might be used with advantage for this purpose. Keep a moist atmosphere in the house, and avoid sudden depression of temperature by the injudicious admission of cold air. If the young bunches are visible, the temperature ought not to vary much from 65° by fire-heat. Where Grapes are grown on the rafters of Pine-stoves, a few Vines might now be introduced; these, if tolerably early sorts, will ripen their fruit from the middle to the end of May.

Peach-house.—Do not attempt to hurry Peach-trees at this season; a crop is often lost by this error. If the blossoms are not beginning to expand, syringe the trees morning and evening with luke-warm water, and keep open vessels of water on the warmest end of the heating apparatus. Protect the roots from frost, as directed for Vines.

Cherry-house.—If early fruit is required, gentle fires may now be lighted, by way of preparing the trees; or a few trees in pots might be put into the Peach-house.

Figs.—A few plants in pots might be introduced into a gentle heat, in any house where there is room.

Cucumbers must be carefully attended to. If grown in pits, the stems should not be suffered to trail over the soil, but be trained to a moveable trellis, leaving sufficient space between it and the soil to allow the fruit to hang perpendicularly. An artificial temperature between 65° and 70° is suitable, with a moist atmosphere. A seed-bed might now be made of well-prepared dung, for a one-light box, in case there is no pit or stove at work in which young plants can be raised. Look sharply after woodlice, or all your labour may be lost in a single night.

Melons.—Sow for an early crop; a small green-fleshed sort, called "Mosulipatama," is very good for this purpose.

Strawberries.—Some plants might be put into the early Peach-house, on shelves near the glass. These are intended for removal to a warmer house after the fruit is set, and to be replaced by others which have been forwarded a little in any convenient place. Top-dress them with rich earth before they are taken into the house.

Kidney Beans which are in bearing should be frequently syringed, and not be stinted with water. Sow a successional crop. "Fulmer's Early" is an excellent sort for forcing.

Asparagus.—If the first-made bed has done bearing, it might be again planted with fresh roots, renewing the heat by linings, if necessary.

Sea-kale and Rhubarb Roots, where there is no other convenience, may be forced beneath the trellis of the early Peach-house, or on the Vinery floor.

Ash-leaved Kidney Potatoes, if planted now in small pots and placed in heat, will be fit to turn out by the end of the month into the pits or frames prepared for them.

Pot Tarragon and Mint, and sow small salading. If it is wished to have early Carrots, sow the Scarlet Horn on a slight hotbed, in alternate drills with Radishes of various sorts.

Out-door Department.

Continue to trench, manure, and dig vacant ground, if the weather permits. If frosty, see to the covering of Endive, Celery, young Lettuces, or any other crop liable to injury from cold. If not already done, protect Artichokes by a mulching of half-rotten leaves; these might be dug in when no longer necessary. Should severe frost set in, top and house Turnips. Broccoli which is showing flower should also be taken up with a ball, and put into a shed, or other place of shelter.

Orchard.—Pruning and nailing should be persevered in whenever the weather is favourable. Prune dwarf and standard fruit-trees of all kinds, and head down any trees which it is proposed to graft in spring; but leave the branches sufficiently long to allow an inch or two more to be taken off at the time of grafting, when a clean cut should be made.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Devote all spare time to the eradication of insects; at this season of the year they are less formidable in number, therefore try to prevent their increase. Continue to re-pot Orchidaceous plants, and go over all those that hang up, making them firm to the blocks with copper wire, and adding some fresh turfy peat or sphagnum for them to root in and retain moisture. Many of the Catasetums and Cycnoches are now resting, and ought to be kept rather dry. Those which are in pots and growing may be watered freely at the roots, but seldom over the leaves; the others which hang up may be frequently syringed. Use every means to destroy snails and slugs; young Cabbage-leaves are excellent decoys for them. Several of the Mexican kinds may now be expected to be in flower, such as Oncídium ornithorhynchum, Læ'lia álbida, and some Stanhópeas.

Greenhouse.—Little water is required unless severe weather compels frequent fires, in which case a more liberal supply must be given; look particularly to Heaths and similar plants in this matter, for if these once get thoroughly dry, they often perish in consequence. Give air at every opportunity.

Conservatory.—Camellias growing in the open border will now be advancing their flower-buds; see, therefore, that the plants do not want water, or the buds will probably fall off. Prune and train climbers. Plants in cold pits, intended for bedding out, should be well protected from frost, but exposed to the air at every favourable opportunity. Introduce a succession of Rhododendrons, Lilacs, Pinks, and other forcing plants into a gentle heat. Hyacinths and other bulbs should be forwarded slowly.

Out-door Department.

Beds of Fuchsias, Salvia patens, and similar plants, should be covered two or three inches thick with rotten leaves, if not already done. Mice often make great havoc among beds of Tulips, Anemones, and other choice bulbs, therefore they ought to be strictly watched. Protect young trees and shrubs of which the hardiness is doubtful by some kind of covering. Planting might be proceeded with if the weather is open and the ground sufficiently dry. Avoid planting when the ground is very wet.

NURSERY AND FOREST DEPARTMENT.

NURSERY.—Take up young trees which require removal; prune, and replant in rows, the largest at increased distances. Trench and otherwise prepare ground on which it is intended to sow seeds of forest-trees.

FOREST AND COPPICE WOODS.—Continue to fell, prune, and thin as required. Also plant and prepare for planting at every favourable opportunity. In planting, suit the kind of tree to the nature of the soil and situation as far as practicable; too little attention is generally paid to this important point.—*J. B. Whiting, The Deepdene.*

State of the Weather near London between the 23d and 30th Dec., 1841, as observed at the Horticultural Garden, Chiswick.

Dec.		Barometer.		Thermometer.			Wind.	Rain.

Dec. 23. Hazy; drizzly; cloudy and fine at night.

24. Overcast in the morning; rain; slight frost at night.

25. Rain in the morning; showers and fine throughout the day; very clear in the evening; frosty.

26. Overcast; fine with light clouds; frosty at night.

27. Frosty and foggy; hazy; thickly overcast.

28. Cloudy and fine; slight rain at night.

29. Drizzly; dense fog; overcast; close drizzling rain at night.

30. Hazy throughout the day; calm and overcast.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending Jan. 8, 1842.

Jan.		Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.

The highest temperature during the above period occurred on the 8th in 1827, and 6th in 1839—thermometer 53°; and the lowest on the 7th and 8th in 1841—thermometer 6°.

REPORT ON COVENT GARDEN MARKET,

For the Week ending December 31, 1841.

The market has been, generally speaking, well supplied during the week, though many articles are of dull sale.—*Fruit.* Pines are tolerably plentiful and of excellent quality; the kinds are Queens, with a few Providence. Foreign Grapes are excellent, particularly some samples of Almeria; a few good hothouse may still be obtained. Apples of good quality are abundant; among the kinds are Nonpareil, Ribston Pippin, and Blenheim Orange. Pears of various kinds are plentiful, and among others we noticed Beurré Rance, Easter Beurré, and Nelis d'hiver.—*Vegetables.* White Broccoli is becoming rather scarce. Brussels Sprouts are plentiful, and of good quality. Forced French Beans are excellent and tolerably plentiful. The supply of Asparagus and Sea-kale is increasing, and the quality is excellent. Lettuce, Endive, and most other kinds of salading are plentiful. Some of the Lettuces are slightly frosted. Many excellent samples of Celery are offered. A good supply of excellent Rhubarb has made its appearance. A few Tomatoes may still be obtained. Mushrooms and Truffles are tolerably plentiful.—*Flowers.* Among cut flowers were Stenorhynchus speciosus, Thunbérgia alata and aurantíaca, Amaryllis áulica, Bignónia venusta, and Jasminum grandiflorum. A few pots of forced Tulips and Crocuses have made their appearance.

PRICES, SATURDAY, Jan. 1, 1842.—FRUITS:—

Apples, Kitchen, per bushel, 3*s* 6*d* to 7*s*
— — Dessert, per bushel, 4*s* 6*d* to 12*s*
Pears, dessert, per hf.-sieve, 3*s* 6*d* to 12*s*
Pine Apple, per lb. 5*s* to 8*s*
Grapes, hothouse, per lb., 3*s* to 8*s*
— Spanish, per lb., 1*s* to 1*s* 3*d*
— Portugal, per lb., 1*s* to 3*s*
Oranges, per doz., 9*d* to 2*s*
— — per 100, 4*s* to 14*s*
— — Bitter, per 100, 8*s* to 14*s*
Lemons, per doz. 1*s* to 2*s*
Lemons, per 100, 6*s* to 14*s*
Almonds, per peck, 7*s* to 8*s*
Sweet Almonds, per pound, 3*s*
Chesnuts, per peck, 5*s* to 16*s*
Walnuts, per bushel, 14*s* to 24*s*
Filberts, English, pr.100 lbs. 120*s* to 130*s*
Cobbs, per peck, 3*s* to 3*s* 6*d*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s* to 24*s*

VEGETABLES.

Savoys, per dozen, 6*d* to 1*s*
Cabbage, White, per dozen, 3*d* to 1*s*
— Red, for pickling, 2*s* to 4*s*
Cabbage Plants, per doz., 2*s* to 3*s*
Brussels Sprouts, p. hf. sve., 1*s* 6*d* to 2*s*
German Greens, or Kale, per doz., 6*d*
Broccoli, White, p. bnch, 2*s* to 4*s*
— Cape, 1*s* to 2*s*
Kidney Beans, forced, per 100, 3*s* to 3*s* 6*d*
Potatoes, per ton, 50*s* to 85*s*
— per cwt. 2*s* 6*d* to 4*s* 6*d*
— per bushel, 1*s* 6*d* to 3*s*
— Kidney, per bushel, 2*s* to 3*s*
Artichokes, Jerusalem, pr half sieve, 9*d* to 1*s* 6*d*
Turnips, pr. doz. bunches, 1*s* 6*d* to 2*s* 6*d*
Carrots, per doz. bunches, 3*s* to 5*s*
Parsneps, per dozen, 6*d* to 1*s*
Red Beet, per dozen, 6*d* to 1*s* 6*d*
Scorzonera, per bundle, 1*s* to 1*s* 3*d*
Salsify, per bundle, 1*s* to 1*s* 3*d*
Horse Radish, per bundle, 2*s* to 5*s*
Radish, p. doz. hands (24 to 30 each) 1*s*
Spinach, per sieve, 3*s* to 3*s* 6*d*
Leeks, per dozen bunches, 9*d* to 1*s*
Garlic, per lb., 8*d*
Shallots, per lb., 1*s*
Onions, per bushel, 2*s* to 3*s* 6*d*
— for pick., per hf.-sieve, 2*s* to 4*s*
— Green, per bunch, 4*d*
— Spanish, per dozen, 2*s* to 6*s*
Asparagus, per 100, large, 9*s* to 11*s*
— Second or Middling, 4*s*
— Sprue, or Small, 3*s* to 3*s* 6*d*
Sea-kale, per punnet, 1*s* to 3*s*
Lettuce, Cabbage, pr. score, 6*d* to 9*d*
— Cos, per score, 1*s*
Endive, per score, 1*s* to 4*s*
Celery, Red, p.bdle (12 to 15) 6*d* to 1*s* 3*d*
— White, pr. bund., 6*d* to 1*s*
Watercress, p.dz. small bunch. 6*d* to 9*d*
Parsley, per half sieve, 3*s* to 4*s*
Tarragon, per dozen bunches, 6*s*
Thyme, per doz. bunches, 2*s*
Sage, per doz. bunches, 2*s* to 3*s*
Mint, per doz. bunches, 2*s* to 3*s*
Savory, per dozen bunches, 3*s*
Rhubarb Stalks, per bundle, 1*s* to 2*s*
Chilis, per 100, 1*s* 6*d* to 2*s*
Mushrooms, per pottle, 1*s* to 1*s* 3*d*
Truffles, per pound, 2*s* to 3*s*

Notices to Correspondents.

TO CORRESPONDENTS.—Our rule is to refuse to receive all parcels which are not carriage-paid. We will, therefore, beg those of our correspondents who for any reason send packets without paying the carriage, to apprise us by post of their having done so, in order that they may not be refused.

If *T. C.*, or any other correspondent, did send a parcel to the Office without paying the carriage, it was, as a matter of course, not taken in.

John Head will find an answer to his question in the advertisements of to-day.

J. C. L.—Your flowers having been placed in dry cotton wool, without having been previously wrapped in tissue-paper, were nearly ruined. The Zygopetalum is unknown to us, and the Oncidium was crushed; it looked like O. Suttoni. We are sorry we cannot adopt your recommendations, but there are many considerations, of which you are not aware, that prevent us.

Mr. Gardner's Manettia seems to be new; but in so difficult a genus a positive opinion cannot be formed upon such a small specimen. As our artist is not in town now, it will be better to forward specimens hereafter.

A. L. M.—The blue and pink Hydrangeas are the same; the different-coloured flowers being caused by different soils. In general a strong loamy soil produces the blue flowers, and any common garden soil the red ones. By cutting back some of the strong-growing Pelargoniums at various times during the summer, so as to keep them from flowering, you may make them bloom late in the autumn, and particularly the scarlet and Ivy-leaved kinds. Gas-tar and the ammoniacal liquor of the gas-works are quite different; you will hear of this in a leading article in a week or two.

Mr. W. Hurst, of Cheshunt, says he remembers to have seen, about the year 1818, at the garden belonging to the Castle-inn, Salt Hill, an immense quantity of a sort of semi-double Ranunculus, which grew very strong and much branched, producing flowers of all colours, continuing in flower a long time, and seeding abundantly. He has never seen anything of the kind cultivated elsewhere, and asks if any of our readers can inform him where he can procure some roots.

R. A.—Gárrya ellíptica is a hardy shrub well known about London, where it flowers every year in abundance. Pray give us the descriptions of trees.

T. D.—The "Botanical Register" contains the greatest number of new plants, with coloured plates; and as it comes out monthly, it exactly answers your purpose. With the year 1838 a new series was commenced, and that part is quite independent of what precedes it.

A Butonian.—Do you take us for the wondrous Michael Scott, or for Lord Cranstoun's goblin page, that you send us such puzzles? One leaf like a Dolichos, another like a Mallow, and a sprig like a Leptospermum, crushed in dry cotton wool, without being protected by tissue-paper, with the information that they were raised from seeds, would puzzle the greatest master of "Gramarye" that ever lived. I'xias, Watsónias, and Gladióli are from the Cape of Good Hope, not Brazil. You will find some information about them in the leading article of to-day. Keep Gloxinias dry and cool in winter.

The double yellow Rose has produced us some further correspondence, to which we shall advert in a short time.

T. C.'s plant is Maxillária Harrisóniæ.

M. D.'s account of the Bokhara Melon has already been published in the *Chronicle*, p.503 (1841). The seed can only be had from Bokhara, through the Court of Directors of the E. I. Company.

A Beginner's plant is the Melia Azedarach, or Azadirachta; they are the same thing.

Salopiensis.—The Pear is the Chaumontel; the Apple is probably Coe's Golden Drop, and if so you will observe ferruginous specks on the surface of the fruit occasionally, a characteristic which is wanting in the specimen received.

K.—Perhaps we were wrong. We have forgotten all about it now. Another time we will try to be more critical.

T. D.—A thousand thanks.

Mr. Towers soon.

W. D.'s plant is Fúchsia thymifólia. We doubt whether the bog-earth of salt marshes will suit any kind of tree; perhaps "W. D." will try the experiment, and let us know.

S. S.—Your information is too slight to enable us to judge why the blossom-buds of your Pear-trees are cankered; probably the soil wants under-draining. The Belladonna Lily will live under a south wall in the open air, and flower beautifully, *if kept dry in winter.* You had better pot the bulbs you have just received and turn them out next May.

T. S.—The plan of a snow-scraper is to us unintelligible. We have already given as much space to communications concerning icehouses as we can find room for.

B. K.—For so small a house a Rogers' boiler, if set reverberatory, will answer your purpose well. It should have a flow and return-pipe carried along the front and both ends of your house; or one end may be without pipes, if that is an important point. We dare not offer an opinion as to what a house should cost.

Philo-fern.—Procure your Ferns in the summer; a little peat will do to grow them in; and if the air is once made damp in a parlour-case, it will not again become dry unless it is often opened; in which case the plants must be watered. Ferns like a very damp atmosphere, without water. They love the temperature of 50° or 60°, or more, and prefer shade. The mode of cultivating Ferns has already been given at p. 519, for 1841.

C. D.—Ipomœa stans is a greenhouse herbaceous plant; it dies down in autumn, and ought now to be kept perfectly dry until spring, when the roots should be examined, and the plant repotted if necessary. Gardeners as yet have not been able to make it flower freely, probably from the plants not being strong enough; or perhaps it may require a warmer situation than is commonly given to it. We would advise you to start a plant of it very early in spring and grow it in a warm greenhouse near the light. Be sure to check the red spider if it makes its appearance upon the leaves, of which it is remarkably fond. The Gesnera is elongata, not oblongata. The Linnean system is abandoned by all botanists of any reputation, except for local floras. Endlicher's "Enchiridion" only gives the names of the genera of plants; their detailed characters are to be found in his "Genera Plantarum," a most excellent work. Another, also very useful, but not yet completed, is Meisner's "Genera Plantarum Vascularium," in which the genera are all analysed as far as the middle of Apetalous Exogens.

T. Gayman's plants are—1, Oncídium raniferum; 2, Rodriguézia recurva; 3, Maxillária, very near M. vitellina, but different, and probably new; the specimen is not in a state for full examination; 4, a Smilax. These plants arrived in bad order, in consequence of having been packed in dry cotton wool without the protection of tissue-paper.

Cecilia.—Lamps *may* be used in greenhouses to keep out frost; but they should be of the Argand construction, and so contrived as to consume all their smoke. There is little probability of artificial light being employed in Horticulture during winter; nor would it be useful except in a very few cases. We are obliged by the books, which, notwithstanding their strange titles, we will read.

Timothy Corkhead.—Passiflora incarnata may be had in any of the great nurseries. Oxalis Bowiei has only to be potted in light rich soil, and placed in a greenhouse, exposed to light, and it will not fail to flower.

W. T. C.—The Pinus excelsa and Abies Khutrow are certainly different plants, and perfectly hardy. The question about fruit will be answered next week.

A Brother.—The scaly root-like stems of Trevirana are called "scaly rhizomata."

G. B. K. next week.

M. W. K.—All the questions you ask about growing Hyacinths in Beet-roots are immaterial. The roots are not put in water, but are suspended in an inverted position by wire attached in any way that will make them steady. Repot Fuchsia corymbiflora. White Lilies, if forced, need only be taken out of the ground at the time it is desired to start them; they like moderate heat. It is as well to cover over the Hepaticas with a handglass in a frosty night. Lilium longiflorum should be allowed to die down, and should not be cut down. You will find, to-day, a paper on the cultivation of Leonotis Leonurus. We never supply copies of the *Chronicle*; you should insist upon your newsman procuring what you want.

A Subscriber.—To give instructions as to laying out a garden is beyond the means of a newspaper, and can only be done by actual inspection. Either common Thrift or Box may be used for the edgings: the former is very pretty, but takes more room than the latter, and requires to be frequently renewed. You will find in some of our late Numbers some lists of ornamental shrubs which will suit you; but as you say your garden is very limited, we would particularly recommend such things as Rhododendrons, Azaleas, Kalmia latifolia, the common Strawberry-tree and its varieties, and Laurustinus. If you fill your beds with the following plants, they will make your garden very gay: Heartsease, Roses, Ranunculuses, Hyacinths, Gladiolus psittacinus, hardy annuals—such as Nemophila insignis, Collinsia bicolor, and Erysimum Perofskianum; or if you have the means of preserving tender plants in winter, you may plant Verbenas, Salvia patens and others, scarlet Pelargoniums, Petunias, and Anagallises. You have done quite right in slanting your ground; but if you could drain it, it would be all the better.

Totty asks how to grow Tropæolum tricolorum and pentaphyllum well. They both require a light sandy soil, such as equal parts of peat and leaf-mould well mixed with sand. They should be potted as soon as they show any signs of growth, and placed in a light and airy part of the greenhouse, and by no means forced to grow rapidly during the dull winter months, as they will certainly lose their leaves afterwards if this is not attended to. Trellises, such as "Totty" has often seen at Horticultural exhibitions, should be fixed to the pots, and the plants carefully trained over them. The latter makes the most handsome plant when started early in spring, and turned out against a wall; in this situation it grows to a great size, and flowers freely during the summer and autumn long after Pelargoniums are killed by the frost.

Dr. Harris's suggestion will be taken into consideration, but not at present.

Mr. Kinchant will have full information about Pine seeds in a short time. There is plenty of time; nothing can be done with them for some weeks to come.

Philo-fern.—Your wishes concerning a paper on the cultivation of Ferns shall be attended to. In the mean time, we would advise you not to send for the collection for your case until there is no danger of its being frozen by the way.

A Constant Reader must never use fires except to exclude the frost, otherwise he will start his Vines. If they are greenhouse plants which he keeps in this house, a temperature of 35°, or from that to 40°, will be high enough. Vineries of this kind should always be constructed so that the Vines can be taken out during winter, and then any degree of temperature can be kept up which may be required.

Nemo.—Nothing will be gained by binding your hot-water pipes with canvas. If you *cannot* reduce the heat without casing them over, you had better enclose them in a brick or tiled flue, open at both extremities; the one end passing through the west end into the open air, and the other stopping half-way along the back wall; this will produce a strong current of air, and will cool the greenhouse. In that case, your flue may be made hollow at the top for water, but it must on no account be so used at this season. We, however, would suggest to you that the casing must be unnecessary if your fire were well managed. We presume it is overheated, and can hardly be furnished with proper dampers. If it were, the temperature of the water ought to be capable of being maintained at too low a point for the pipes to overheat the house.

A Slug-hunter.—"Bonnycastle's Introduction to Mensuration and Practical Geometry," and "Crocker's Land Surveying," will answer your purposes. When Professor Henslow's ideas on rotation are published, we will report on them.

Reader.—The blistered or swollen state of the leaves of your Peach-trees is the disease which the French call "La Cloque," and is solely owing to cold; this you can partly guard against by woollen netting in the spring, which, however, must be gradually withdrawn as the heat of the season increases.

Mr. Bell's plants are,—1, Marchantia cónica; the other, M. polymorpha. Either will, in all probability, do as well as M. hemisphærica.

Medicus will find instructions for the cultivation of Sea-kale at p. 263 (1841). If two-years old roots are carefully taken up, they will answer for the purpose of being once forced; but he had better procure one-year old plants for his more permanent plantation. Night-soil will form very good manure for trees, but it should be mixed with a large proportion of any common soil, or still better with gypsum.

G. S. Y.—The annual meeting of the Institution for the Relief of Aged and Indigent Gardeners will take place on the 13th of January, of which a full report will be given in the *Chronicle.*

B. F.—On the side of a steep hill, facing the south, and sheltered from cold quarters, Filberts will succeed. Provided the weather is not frosty, they may be moved at this period of the season. As your soil is not over rich, the Kentish mode of dwarf-pruning will be proper. Sorts most deserving of cultivation are the Cosford, Downton large square nut, Cob Nut, Red Filbert, and White Filbert. The plant is apparently Acacia melanoxylon.

As usual, many letters have arrived much too late for answers this week.

NEWS OF THE WEEK.

THE new year opens under circumstances of considerable interest to the political world, both as bearing evidence of the increasing desire of the Great Powers for the maintenance of peace, and as proving that the questions which have agitated Europe during the past year are at length advancing towards a settlement. The French Chambers were opened on Monday by a Speech from the throne, which is characterised by its pacific expressions towards other Powers, and by its uncompromising tone in relation to domestic affairs. It alludes with satisfaction to the Convention of July, which restored France to her position in the rank of nations, and consolidated the Ottoman Empire under the protection of the Allies. It directs the attention of the Chamber to the establishment of a balance between the expenditure and the revenue, and to the construction of a national system of railroads, as measures which honour peace, and render it permanent. It concludes by a powerful appeal against the revolutionary party, denouncing its intrigues against the dynasty and person of the King, as obstructing the energies of France, and retarding the development of her legal and pacific liberty. For the future it declares, in language not to be mistaken, that the King and Government will do its duty, and maintain the authority of the laws. On the following day the Chamber of Deputies met for the election of a President, when the result gave a large majority in favour of the Ministerial candidate. The Court of Peers has made known its sentences on the prisoners found guilty at the recent trials; Quénisset and two others are condemned to death; and the remainder, including M. Dupoty, are sentenced to different terms of imprisonment. Recent advices state that the King has consented, at the request of the Duke d'Aumale, to spare the lives of the condemned prisoners; but little interest appears to be felt in the affair beyond that connected with the fate of M. Dupoty. The entire press, with only one exception, are unanimous in reprobating the conviction of this gentleman; and declarations have been published by the leading journals and by the committee of the Literary Society, protesting against his sentence as an attempt to fetter the liberty of the press. The subject, it is thought, will give rise to serious discussion in the Chambers, and is expected to add considerably to the difficulties of the Ministry during the present session.—The affairs of Spain have been somewhat complicated by a difference which has arisen between the Government and the French Ambassador, on a question of court privilege, connected with the presentation of his credentials; but although the Ambassador has threatened to leave Madrid, it is not expected that the dispute will lead to any serious rupture of diplomatic relations. The Cortes were to be opened on the 26th ult., and the speech of the Regent was looked for with some interest. The Presidency of the Chamber of Deputies was to be made a party question by the opposition; and the republicans, entertaining hopes, it is said, of obtaining power, have published their political programme, avowing their plan to be the overthrow of the constitution, the throne and the regency, and the establishment of a union between Spain and Portugal under a federal republican government.—Our news from Germany announces that the King of Prussia is preparing for a visit to this country, in compliance with an autograph letter of the Queen, conveying her Majesty's request that, as the great Protestant sovereign of continental Europe, he would officiate as one of the sponsors at the christening of the Prince of Wales.—By the Levant mail we have recent intelligence from Constantinople, from which we learn that an important change in the Ministry has taken place; a new Grand Vizier has been appointed, and further changes are expected to follow. The Ottoman troops still continue their movements towards the Greek frontier; and new causes of complaint against the government of King Otho are said to have been discovered. Advices from Persia, received through the Turkish capital, mention that our ambassador has had an interview with the Schah, and that the treaty of commerce with Persia has been signed, and is now on its way to London for ratification.—From the United States we have received the message of President Tyler on the opening of Congress. It considerably exceeds the ordinary limits of these documents, and embraces a minute review of every circumstance connected with the foreign relations and domestic affairs of the Union. It refers of course to the recent trial of Mr. M'Leod, and praises the independent action of the Justiciary, although it admits the necessity of giving more power to the Federal Government in international questions involving the suspension of diplomatic intercourse. In regard to the Slave Trade, the message explicitly professes hostility to the traffic, but insists on the exemption of American ships from the right of search established by the great European treaty. The Boundary question is declared to have made no progress, although nothing has occurred to diminish the probability of an amicable adjustment.

At home, the chief point of public interest is the mission of Lord Ashburton on a special embassy to the United States, for the purpose of facilitating the speedy and final settlement of all points now at issue between the two countries. The christening of the Prince of Wales is said to be fixed for the 25th inst., unless any circumstances should arise to retard the arrival of the King of Prussia previously to that day.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal, are all well, and continue at Windsor. Her Majesty has taken her accustomed rides and walking exercise during the week, and on Wednesday was present at a stag-hunt in the Great Park.—It is stated in the *Court Circular* that Tuesday the 25th inst. is now positively fixed for the christening of the Prince of Wales; dependent, however, on the arrival of the King of Prussia, for whom preparations are already making among Ministerial and diplomatic personages. His Majesty, as will be seen under our Foreign intelligence, is expected to leave Berlin for London, with a numerous suite, on the 17th or 18th inst.

The Queen Dowager.—The latest intelligence received with respect to the health of her Majesty the Queen Dowager informs us that it progressively improves, and that her Majesty still continues in a convalescent state.

Diplomatic Arrangements.—It has been announced by the Ministerial papers that Lord Ashburton, at the request of Government, is about to proceed to the United States on a special mission, with the object of settling all existing differences between that country and our own. It is further stated, that his Lordship, who will sail in a few weeks, had been asked to undertake this service, and had consented to do so, before the President's Message had been received,—and that the mission in question has been had recourse to wholly irrespective of anything contained or omitted in that document.

Parliamentary Movements.—A vacancy has occurred in the representation of Forfarshire by the death of Lord Douglas Gordon Hallyburton, who died on the evening of Christmas day.—The death of Mr. West, which took place on Monday, has occasioned a vacancy in the representation of the city of Dublin. Mr. Vance, a manufacturer of Leeds, is proposed as the Conservative candidate; and, on the Liberal side, it is reported that Lord Morpeth will be put forward.

Foreign.

FRANCE.—*The King's Speech.*—On Monday, the Chambers were opened with the usual ceremonies. The King proceeded from the Tuileries in a close carriage strongly guarded, precautions having been taken to prevent the approach of any persons within musket-shot of the line of march, except the military on duty; and even the terraces of the Tuileries gardens were closed. On his arrival at the Chambers, the King delivered the Speech from the throne. The opening paragraph alludes to the Convention of July 13, which restored France to her position in the rank of nations, and announces that the settlement of that question "consecrates the common intention of the Powers to maintain the peace of Europe, and consolidate the repose of the Ottoman empire." The remainder of the Speech is on domestic affairs, and the tone is firm and uncompromising, indicating considerable confidence in the stability of the existing order of things. The King directs the attention of the Chambers to the establishment of a balance between the expenditure and the revenues of the State, and to the construction of a national system of railroads, as labours which "honour peace, and render it stable and fruitful;" and at the same time he assures them that he is endeavouring, by negotiations prudently conducted, to extend the commercial relations, and to open new markets for the production of the soil and arts of France. In a paragraph referring to Africa, he says, "I have taken measures to prevent any external complication from disturbing the security of our African possessions. Our brave soldiers are pursuing on that land, henceforth and for ever French, the course of their noble labours, in which I am happy that my sons have had the honour of concurring. Our perseverance shall complete the work undertaken by our courageous army, and France will introduce into Algeria her civilization as the consequence of her glory." He then concludes by noticing the disaffection of the revolutionary party towards his person and dynasty. "Whatever," says his Majesty, "may be the burdens of our situation, France would support them without difficulty, if faction did not unceasingly obstruct the course of her powerful activity. I will not dwell upon the intrigues and crimes of the factious, but let us not forget, gentlemen, that it is that which debars our country from fully enjoying all the blessings which Providence has conferred upon it, and which retards the development of that legal and pacific liberty which France has at last achieved, and of which I make it my glory to ensure her the possession. We shall follow up this task, gentlemen. My government will do its duty. It will maintain everywhere and constantly the authority of the laws, and cause them to be respected, as it will respect them itself. Your loyal support will aid me." The members of the Royal family were in the tribune, and the King's four sons sat at his side; Lord Cowley and Mr. H. Bulwer were also present. Immediately after the delivery of the Speech, the King returned to the Tuileries; no disturbance whatever took place, and perfect order reigned throughout the capital. The effect of the Speech on the Bourse, however, was a fall in the funds of ¼ per cent.

Election of President of the Chamber.—On Tuesday, the Chamber of Deputies met, and after the usual routine business proceeded to the election of a President. This question, it will be remembered, has for some time occupied much attention, and has been looked for with considerable interest, as one likely to show, by its result, the comparative strength of opposing parties in the Chamber. The result has been favourable to the Government. The whole number of voters present was 309; thus making 155 votes necessary to constitute an absolute majority. The numbers on the division were:—M. Sauzet, 191; M. de Lamartine, 64; M. Odillon Barrot (about) 57. M. Sauzet was accordingly declared duly elected. Our accounts add that the nominations and elections of Presidents and Secretaries of *bureaus* were also proceeding in favour of the Ministry.

Quénisset and his Co-accused.—The Court of Peers made known on Thursday its sentences on Quénisset and the other persons implicated with him in the late conspiracy, and in the attempt on the Princes. They are, however, almost the same as given by anticipation in our last Number. Quénisset, Colombier, and Just, *alias* Brazier, are condemned to death; the former, it is said, will be pardoned in consequence of the important revelations made by him with respect to the conspiracy; but it is supposed that the other two will be executed, although there appears to be an impression, in some quarters, that all their lives will be spared by the King. The other prisoners are sentenced to different periods of imprisonment; of these M. Dupoty's case is the only one that occupies attention, which it does to an extraordinary extent. He has been condemned to five years' imprisonment, with loss during that time of civil rights, and condemnation for all the rest of his life to be under the surveillance of the police; that is to say, he is never to live in Paris, but to remain in some frontier town under the eye of a police commissary. M. Dupoty, with some of the prisoners, has been removed to Doulens, and the remainder to Mount St. Michel. The three condemned prisoners remain in the Luxembourg, and await the decision of Government as to their fate.

Proceedings of the Press.—The entire press, with the single exception of the "*Journal des Débats*," the organ of the Court, have been unanimous in their reprobation of the conviction and punishment of M. Dupoty, editor of the "*Journal du Peuple.*" They have discussed the subject with considerable earnestness, arguing against the legality of the judgment, and the principle therein laid down of moral complicity; and their general tone is that of firm resolve to resist what is regarded as an attack on the liberty of the press. On Thursday night, immediately after the sentence was made known, several editors of the Paris papers, with a few directors of provincial journals, to the number of fourteen in all, held a meeting to deliberate on the subject. A committee was appointed to investigate and report upon it, and they again met on Sunday. The result of their deliberations was, that on Monday an important declaration in reference to this subject appeared in the Paris papers, signed by sixteen journals of the capital, the publication of which has produced considerable sensation, not only in Paris, but throughout the country. The declaration is an energetic protest against the sentence passed on M. Dupoty, on the principle of moral complicity; it deprecates the power assumed by the Court of Peers to act as a judicial body for the trial of such cases, which, it maintains, ought only to be tried by juries; it calls for some modification of the September laws, which bear so stringently on the freedom of discussion, and concludes by expressing, in a firm but moderate tone, their determination to resist, by every constitutional means in their power, such an attempt, as it is termed, to fetter the liberty of the press. A somewhat similar declaration, expressing in strong terms its condemnation of the sentence passed by the Court of Peers on M. Dupoty, has been published by the committee of the Literary Society in Paris. Government had not thought proper to seize the papers in which these declarations had appeared. The subject, it is thought, will give rise to serious discussion in the Chamber of Deputies, and is expected to add materially to the difficulties of the existing Ministry. It is said that the press, which signed the declaration, have agreed not to report the debates or proceedings of the Peers.

New Peers.—By individual ordonnances, dated Dec. 25th, the King has raised to the dignity of Peer of France—Vice Admiral Bergeret, Count Arthur Beugnot, Viscount de Bondy; M. Baillet, First President of the Royal Court of Amiens; Baron de Bourgoing, Baron Edmond de Bussière, Lieut.-Gen. Count Charbonnel; M. de Chastellier, formerly Deputy and ex-Mayor of Nismes; Baron Dufour, Mayor of Metz; M. Ferrier, President of the Council General of the Department of the North; Viscount de Flavigny; M. Frank Carre, First President of the Royal Court of Rouen; M. de Gascq, President of the Court of Accounts; Lieut.-Gen. Baron Gourgaud, Chevalier Jaubert; Lesergeant de Bayenghen, formerly Deputy President of the Council General of the Pas de Calais; Count Murat, Baron d'Oberlin, Lieut.-Gen. Viscount Pelleport, and Count Alexis de St. Priest. Of these twenty creations private accounts state that nine have been Royalists.

The Fortifications.—The journals state that Government is not content with the number of detached forts contemplated by the Chambers, and that the Minister of War has advertised to receive contracts for the erection of a new fort at Charenton. The amount to be expended on this construction, they add, is estimated at 3,000,000 francs; and the bail to be provided by the contractor is fixed at 50,000 francs. The fort is to have five bastions, connected by casemated curtains. The fort of Charenton, it is said, did not figure on the map delivered to the deputies when the law permitting Paris to be surrounded by fortifications was voted. This fort is one of those commenced in 1833, but which the opposition raised by the National Guard caused to be abandoned, as well as the fort l'Epine, upon the foundation of which magazines for the artillery have been erected, The hill of l'Epine commands the north of the Faubourg St. Antoine, as the fort of Charenton will command the south. The continuous wall will pass within 500 or 600 yards of the bastions of this fort and of works that are about to be erected on the hill of l'Epine to protect the artillery magazines.

The Provinces.—Accounts continue to be received from the Provinces, of fresh damage done by the inundations. A letter from Nice states that, a few days ago, the bridge of the Var was carried away for the second time within three months. The engineer-in-chief of Nice was engaged, with several workmen, clearing away the trees which obstructed the passage of the water through the arches, when the bridge gave way, and they were swept off by the current. The engineer and one of the workmen were drowned, and the others were saved with great difficulty. Despatches from Avignon announce that on the 23d ult. the Rhone again overflowed its banks, and that several quarters of the town were again flooded. The Marseilles journals represent the Rhone to be very high, the lands near Arles, Boulbon, and Tarascon being still under water. The road between the latter place and St. Remi is from three to four feet under water, but public carriages continue to run on it. A severe storm occurred on the night of the 16th ult., in the neighbourhood of St. Jean de Luz, when lightning fell on the steeple of Ciboure, and nearly destroyed it. The château of Jolimont was also set on fire at the same time by the lightning, and together with a farm situated near it was burnt down. The Council-General of the Meuse has voted 1,000,000 francs towards the formation of the Paris and Strasburg railroad; and the Municipal Councils of Bar-le-Duc and Commercy have voted 200,000f. and 30,000f., respectively, for the same purpose. On Sunday morning, the 19th ult., the Custom House at Lisle suddenly burst into flames, and being built of light materials, was in less than an hour reduced to ashes. The cause of the fire is not stated.

The Capital.—Private letters refer to the still-increasing amount of distress in the capital, and which, it is feared, will shortly bring about another commercial crisis. A comparative statement of the number of lodging-houses in Paris, since 1833, has been published by the journals, from which it appears that, in that year, there were 3,147 furnished houses and hotels, containing 39,619 lodgers; in 1839, there were 4,967, with 62,153 lodgers; and at present there are 5,065, having 75,500 lodgers. The Municipal Council has decided upon constructing two fountains in the Place de la Bourse, and one on the promenade behind the church of Notre Dame. The latter is to be of a Gothic style, to correspond with the cathedral, and the other similar to that in the Place Richelieu. A sum of 32,000f. has already been voted towards the expense of that near Notre Dame. The King, it is said, has resolved to restore the chapel of Henry IV., at the Louvre, in the tower of the gateway towards the Tuileries, to the same state in which it was in the time of that monarch, and has given orders to the Royal Manufactory at Sèvres for painted glass to fill the windows.

SPAIN.—Our accounts from Madrid, which are to the 21st ult., inform us that serious difficulties have arisen between the Ministry and M. de Salvandy, the French ambassador, on the subject of the presentation of his credentials. The question, it is said, involves the necessity of sending some couriers to Paris before it can be settled, and threatens a schism between the two Governments. The question at issue appears to be as follows. M. de Salvandy claims to deliver his credentials to the Queen in person, in a private audience, while on the other hand the Ministry insist that, as her Majesty is a minor, they must be presented to the Regent, as the actual Sovereign. M. de Salvandy, it is added, threatened to demand his passports, and the reply of Señor Gonzales, Minister for Foreign Affairs, was, that his Excellency might have them if he thought proper. M. de Salvandy appears to have displayed much feeling on the subject; but the Ministry was firm in maintaining the etiquette of the Spanish Court. Up to the 18th ult. his Excellency had been a week in Madrid, and had not presented his credentials to the Regent. Ministers had held frequent meetings for the purpose of preparing the speech to be delivered by the Regent at the opening of the approaching session, which was to take place on the 26th ult.—The question of the Presidency of the Chamber of Deputies continued to be discussed with much warmth by the journals. The Ministerial Deputies, it is said, intended to give their support to M. Arguelles, the guardian of the Queen. The Opposition seemed to be divided on that question, one party proposing for its candidate M. Vadillo, former Minister and deputy of Cadiz, and the other, M. Acuna, Vice-President of the Assembly during the session of 1841. The latter, it is thought, will obtain the votes of the deputies who have turned against M. Arguelles since his acceptance of the guardianship. The republicans, in the mean time, are represented as entertaining hopes of resuming the direction of affairs. They openly proclaim their intentions, and their organ, the *Huracan* of the 17th ult., declares, in an article which is regarded as their political programme, that "their plan is to overturn the Constitution of 1837, the Throne, the Regency, and the Regent Espartero; that they wish to realise the union of Spain with Portugal, and to establish for both countries a federal republican Government.—The Military Commission had been suppressed by a decree of the Regent, and the political offenders remaining to be tried were placed at the disposal of the Capt.-General of the province. The journals state that the widow of Gen. Diego Leon, who was shot for the October attempt, had been allowed a pension by Government. The Infante Don Francisco de Paula and family would, it was believed, spend the winter in Burgos. Rubini sang for the last time at Madrid on the 21st ult., for the benefit of the religious orders and hospitals of the capital. The Duke of Ossuna had presented him with a magnificent pin, in the centre of which was a splendid brilliant, surrounded by rubies. Some riots had taken place at Alicant, in connexion with the municipal elections: the assistance of troops from Valencia had been demanded, and a number of persons had been arrested. Government, it is added, has ordered the authorities to prosecute the parties connected with the disturbance with all the severity of the law. The territorial tribunal of Toledo has acquitted 43 clergymen who had been arrested in the convent of Gelitos, and tried for disobeying the orders of Government, by whom they had been enjoined to cease their clerical duties. Accounts received from Gibraltar, dated the 10th ult., inform us that the English Levant packet, the *Great Liverpool*, had arrived in that harbour in so damaged a condition that she was unable to proceed on her journey. There were upwards of 100 passengers on board, and another steamer was to be freighted for the purpose of conveying them and the mail to Malta. It is feared that in consequence of this accident to the *Great Liverpool*, our receipt of the next overland India mail will be delayed.—Our latest advices from the capital, which are to the 23d ult., inform us, that at that time M. Salvandy had somewhat modified his pretensions. He had addressed a new note to the President of the Council, demanding permission to deliver his credentials into the Queen's hands, in presence of the Regent. It was believed that the Cabinet would not accede to this demand. Advices from Barcelona, to the 20th ult., state that the majority of the members of the municipality returned for 1842 was favourable to the Government of the Regent. The members of the Junta of Vigilance, who had gone into voluntary exile, had been authorised to return. Accounts received from St. Sebastian, dated the 25th ult., announce the arrival of three French ships of war and a tender at the port of Passages, which had given rise to some speculations.

GERMANY.—Our German intelligence this week is not of much importance. It is stated by the Frankfort papers that the Austrian and Prussian Governments have come to an agreement, in virtue of which the two grand lines of railroads in Prussia and Saxony will be united with those of Bohemia and Hungary. Letters from Vienna state, that Sir S. Canning has gone from that capital to Athens, previously to going to Constantinople, in order to communicate the result of his conferences with Prince Metternich to the Greek Government. His Excellency, these letters add, is to recommend the Porte to follow altogether a pacific and moderate line of policy. The same accounts, dated the 15th ult., inform us that the Duke de Bordeaux had been allowed to get up the day before, and had remained in the company of the persons of his household. On the next day his Royal Highness received the Papal Nuncio, and was shortly to be visited by the other members of the diplomatic body. The journals state that for some time past the Austrian Government has entertained the project of lowering the duties of the last tariff, in order to render trade with the other German States more easy, and to remove certain prohibitions. Princess Paskiewitsch has passed through Vienna, on her return to Warsaw from Rome.—Letters from Berlin of the 19th ult. announce, that in consequence of an autograph letter of invitation of Queen Victoria, received by the King of Prussia, his Majesty will be present at the christening of the Prince of Wales as one of the sponsors. His Majesty was to leave Berlin on the 17th or 18th Jan., and was expected to proceed to Cologne, and thence by the Belgian railroads to Calais, on his way to London, a Government steamer conveying his Majesty up the River. The Royal suite will be numerous, occupying 14 carriages, and will comprise Gens. de Natzmer, de Neumann, and Rœder, Baron Alexandre de Humboldt, Count de Stollberg, and Bishop Nœnder. Accounts from Berlin, dated 21st ult., mention that the last number of the collected Prussian laws contains the treaty between Prussia, the Zollverein States, and Lippe, relative to the accession of the principality of Lippe to the existing Zoll system; and also the treaty between Prussia, the Zollverein States, and Brunswick, relative to the accession of the dukedom of Brunswick to the same system These accounts also state that the conference of the States of the Germanic Customs' Union on the sugar question are terminated, and the diplomatic commissioners are preparing to leave Berlin. The duty on lump sugar is raised from 5½ to 10 thalers; but this augmentation is not to begin until the 16th March, until which day the treaty with Holland will consequently remain in force.—In the sitting of the Chamber of Deputies of Wurtemberg on the 18th ult., a motion was made by M. Knapp, one of its members, having for its object to call on the Ministry to demand of the Germanic Confederation the re-establishment of the Hanoverian Constitution of 1833. The House, after some discussion, adopted the motion by unanimous acclamation. According to the *Frankfort Journal* of the 23d, the Municipal Council of Osnabruck has also addressed a memorial to the Legislative Body, praying the assembly to urge the King of Hanover to restore the Constitution of 1833.

HANOVER.—The Chambers, as announced in our last, have adopted the address proposed in reply to the speech from the throne without any amendment. The minority in the Chambers proposed to insert in the address a paragraph relative to the ordinance requiring the Deputies to declare in writing that they do not acknowledge any other Constitution than that of 1837; but the amendment was rejected, and the address was presented to the King. It commences by expressing their deep regret inspired by the lamented death of the Queen, and their sympathy with his Majesty in this loss as well to the country as to himself. Presuming that matters of the highest importance must have induced his Majesty to call them so suddenly together, they have hastened to assemble round the throne. They thank his Majesty for calling on them to exercise their constitutional right on concerns of such importance, and promise to devote their earnest attention to them. They conclude with fervent wishes that his Majesty may be permitted for many years to promote the welfare of his faithful subjects, promising on their part the most conscientious exercise of their important duties. The Chamber of Deputies also announces in the address that they will devote particular attention to the execution of railroads, and a committee has been appointed for that purpose. It is said that Government intends to demand from the States a guarantee of interest for a capital of 4,040,000 thalers, to be destined to the construction of railways. The individual accused of having attempted to assassinate the Privy Councillor Lutken remains in prison. In the sitting of the Second Chamber of the States on the 16th ult. a debate was opened on a bill for regulating the position of the Jews of the kingdom; this people being at present excluded from all participation in political rights. A Deputy proposed an amendment granting the right of voting at elections, but it was negatived.

HOLLAND.—Letters from the Hague mention that MM. Simons and Pescatare, members of the States of Luxembourg, are in that city. They have been received by the King, who has confided to them a mission to Berlin, for which place they were to set out in a few days. The mission, it is said, is principally for the purpose of making the Court of Berlin comprehend that the King Grand Duke could not act otherwise with respect to the non-ratification of the treaty of Aug. 8 than he has done. It appears that the exchange of diplomatic notes between the Cabinets of Berlin and the Hague has not succeeded in restoring harmony; and it is stated that the King of Prussia is so dissatisfied with the replies of the King Grand Duke, as to have threatened to refer the difference to the Germanic Diet, according to the fundamental law which declares that in the event of any difference between States of the Confederation which cannot be amicably settled, the points in dispute shall be referred to the Diet. Messrs. Simons and Pescatare are to represent to the Court of Berlin that the King Grand Duke owed it to his independence to refuse to ratify the treaty, as, by his accession to the German Customs Union, according to that treaty, he must have seen the affairs of Luxembourg decided upon at Berlin without his having even a vote. His Majesty has appointed a commission, consisting of three members, to examine into the administration and the manufacturing and agricultural proceedings of the Benevolent Society and its colonial establishments. We learn that the Count of Nassau, ex-King of Holland, has contributed a thousand florins towards the subscription for the erection of a statue in honour of Rembrandt. It is also said that the Count is endeavouring to get the domain of Neuland, which he has purchased for his wife, the Countess d'Oultremont, created a principality.

BELGIUM.—On the 23d ult. the Chamber of Representatives appointed a deputation to congratulate his Majesty on New Year's Day. The Chamber has voted a credit of two millions for the War departments; and has agreed to the law fixing the amount of the army at 80,000 men, and the contingent for 1842 at 10,000. The fêtes at Mons on the occasion of opening the railway have passed off with great éclat. One circumstance, however, occurred which threatened for an instant the general harmony. A man rushed from the crowd, and endeavoured, by laying hold of the bridle of one of the horses, to stop the Royal carriage; but he was immediately seized, and found to be a poor person who has sometimes exhibited signs of mental alienation, and who wished to present a petition to the King.

RUSSIA.—Intelligence has been received, by way of Trebizond, announcing a victory gained by the Circassians over the Russians, the most signal and decisive, it is said, that has occurred since the beginning of the war; but as no further details have been received, the account may be considered to require confirmation. A large expedition, this account states, consisting of 30,000 men, had been disembarked on the coast, with a view of destroying the grain which had been collected by the Circassians after the harvest, when a storm having suddenly arisen, drove the ships from their anchorage. The Circassians, availing themselves of the opportunity, assailed them vigorously on every side, and the Russians, separated from their stores, which had been carried out to sea, were compelled to commence a disastrous retreat through a country consisting entirely of mountain, forest, and defile. With the exception of 2,000 who escaped to Anapa, the whole of the 30,000 were killed or made prisoners. Such are the accounts received from Trebizond.—Letters from St. Petersburgh state that the Emperor, in further commemoration of the events of 1812, has erected at Smolensko a column similar to that which stands on the field of the battle of Borodino. It is 36 archines in height, including the pedestal, and 13 archines and a half in circumference, and placed in front of the King's Bastion, which was the principal point of attack, and forms a fine ornament to the parade. It was inaugurated Nov. 17, the day on which the French retreated before the troops of the garrison, in the presence of all the nobles of Smolensko, with their marshal at their head, and also of the veterans who took a share in the battle. The Emperor has granted various presents, pensions, and additions to former pensions, to several widows and orphans of persons who fell in opposing the insurrection at Warsaw in 1830, on occasion of the recent inauguration of a monument to their memory.

ITALY.—Letters from Rome of the 14th ult. state that the authorities have published the list of the foreign journals allowed to circulate in the States of the Church. The *Débats*, French Ministerial paper, does not appear in this list, and is therefore considered to be prohibited. Among the papers to which permission is given are the *Commerce* and the *Mode*. Prince Frederic of Prussia arrived at Rome on the 10th ult., under the *incognito* of Count of Rheinstein, and immediately visited his uncle, Prince Henry of Prussia, who has resided many years in the Pontifical capital. The young Spanish Princes, sons of Don Carlos, have had their audience of the Pope, to take leave previously to going to Naples. The *Diario di Roma* says that a fresh persecution of Catholic missionaries has taken place in China, and that the Vicar Apostolic, M. Ignace Dalgado, has been put to death under torture. Upwards of twenty other Christians are also said to have been put to death.

GREECE.—By intelligence received from Athens, of the 10th ult., we learn that the arrangements for establishing the bank were completed; and that M. George Stavros was appointed President. The answer of the Turkish Minister for Foreign Affairs (Rifaat Pacha), to the note of the Government demanding explanations of the warlike preparations in progress in Constantinople, was deemed unsatisfactory; and war with Turkey appeared to be regarded as unavoidable, unless the protecting Powers should interfere.

TURKEY.—By the arrival of the Levant mail, which by some irregularity, it is said, in the arrangement of the French post-office authorities, was delayed several days in its delivery, we have intelligence from Constantinople to the 7th ult., from which we learn that a change has taken place in the Ministry, and that much surprise has been created by the appointment of Mehemed Izzed Pacha, friend of Redschid Pacha, as Grand Vizier. Izzed Pacha was in the Syrian campaign, and was removed for incapacity. No other changes had as yet taken place; but the *Echo de l'Orient* of the 10th ult., the Ottoman organ at Smyrna, announces that they will soon follow. The hatti-scheriff, or imperial rescript, nominating Mehemed Izzed Pacha, is dated Dec. 4, and it states that the age of Raouf Pacha, the late Vizier, was the cause of his being replaced. The document terms the Grand Vizier 'absolute lieutenant of the empire.' A private letter states that the Turkish troops still continue their movements towards the frontier of Greece, and that the Porte having discovered a ramification of the Philorthodox Society in Thessaly, had founded on it some new subjects of complaint against Greece. An envoy from the Syrian Maronites had arrived from Beyrout to complain of the conduct of the Druses. We also learn from the same communication that Rifaat Bey, Minister for Foreign Affairs, and Tahir Pacha, Grand Admiral of the fleet, were at issue respecting a permission granted by the former to the Austrians to enter the Turkish arsenal to repair their frigate the Venere, and that the Capitan Pacha had positively refused to acquiesce in the permission. The Turkish squadron had sailed with troops on board for Salonica. The Porte had also ordered transport vessels to convey two regiments to Varna.

EGYPT.—By the Levant mail we have intelligence from Alexandria to the 9th ult., but it is not of much importance. The Pacha was still in Upper Egypt, buying up the grain. The Turkish treaty of commerce was put in force at Alexandria. Under the old duty British goods paid less than three per cent.; but now, it appears, they will have to pay eight per cent.—Soliman Pacha had left Alexandria for Suez under the pretence of ascertaining the practicability of re-establishing a canal between that point and Cairo, but the real object of his journey was understood to be for the purpose of fortifying Suez.

PERSIA.—Intelligence has been received, through the medium of private correspondence from Constantinople, that the Schah has given an interview to Sir John M'Niel, our ambassador, and that the treaty of commerce with Persia has been signed, and is now on its way to this country, Major Farrant having been expected daily in the Turkish capital, the bearer of the document for its ratification in London. It is also said that the Schah was going to make an expedition against the predatory Turcomans.

UNITED STATES.—By the packet-ship *Independence* and the *Acadia* steam-ship, which have arrived at Liverpool this week, we have received New York Papers to the 15th ult. They contain the President's message, a document of much interest, and which, from the state of the relations between this country and the United States, and the several important questions still remaining unadjusted, has been looked for with some anxiety. The message adverts to all the subjects at present under discussion between the two governments. After some preliminary congratulations upon the happy and prosperous condition of the country during the last 12 months, the subject of Mr. M'Leod's recent trial is referred to. "Since the last adjournment of Congress," says the President, "Alexander M'Leod, a British subject, who had been indicted for the murder of an American citizen, has been acquitted by the verdict of an intelligent and impartial jury, and has, under the judgment of the court, been regularly discharged." He then says that "Great Britain, whose Government had taken upon itself the responsibility of M'Leod's act, has thus been answered in the only way in which she could be answered by a Government, the powers of which are distributed among its several departments by the fundamental law; that happily for the people of Great Britain, as well as those of the United States, the only mode by which an individual arraigned for a criminal offence before the courts of either can obtain his discharge, is by the independent action of the judiciary, and by proceedings equally familiar to the courts of both countries; but that the precise stage of the proceedings at which such order may be made is a matter of municipal regulation exclusively, and not to be complained of by any other Government." In concluding this subject the President admits the necessity of giving more power to the Federal Government, to act in international questions like Mr. M'Leod's, without feeling itself fettered by the laws of individual States; he promises that the correspondence relating to it shall be laid before Congress, and adds a hope that "the British Government will see the propriety of renouncing, as a rule of future action, the precedent which has been set in the affair of Schlosser." Of the boundary question all that we learn from the Message is that its discussion has made no progress, and that this has arisen from cicumstances, alluding, it is supposed, to the change of administration in Great Britain, which are not calculated to diminish the probability of an amicable and satisfactory adjustment. As far as concerns the slave trade, which the Message, among other condemnatory terms, designates "that wicked traffic," the President's professions in hostility to it are very explicit; every possible device, he says, that American ingenuity can discover has been put into operation to suppress it among the United States vessels frequenting the African Seas. But as the Washington Government has not been a party to the general European treaty, in virtue of which the right of search is exercised, President Tyler is of opinion that to board and detain delinquent ships sailing under the American flag is both an outrage which cannot be endured, and when promiscuously committed, involves such an injury to American commerce as demands the most ample compensation. This question, indeed, appears to be one of much delicacy, and is treated of in the Message with great earnestness. The remarks of the President on this subject acquire an additional interest from the circumstance that it is contemporaneous with the conclusion of the treaty by the Five Great Powers of Europe noticed in our last, having for its object the entire suppression of the slave traffic. The other portions of the Message apply to domestic topics of little interest to the general reader. The Grand Jury of Philadelphia have found true bills against Messrs. Biddle, Jaudon, and others, for a conspiracy to defraud the United States Bank of 400,000 dollars in 1836.

WEST INDIES.—The Captain of the brig *Elizabeth Wood*, arrived at Liverpool, reports that the brig *Creole*, of Richmond, Virginia, bound to New Orleans, arrived at Nassau in the Bahamas on the 9th Nov., with about 150 negro slaves on board, in a mutinous state; they had taken possession of the vessel, and demanded to be landed at a British colony, and compelled a shipmaster, who was on board as passenger, to steer the vessel to Nassau. Capt. Orkin, who had commanded the *Creole*, was severely wounded, and considered dead; the mate and several of the crew were also much injured. A Mr. Hewell, who was part owner of the slaves on board, was murdered, and afterwards thrown overboard. Several ringleaders of the negroes were lodged in prison at Nassau, and the rest were set at liberty. It was reported that the American Consul had protested against their being allowed to land. The *Creole* had sailed again for New Orleans in charge of the mate.—By private letters from Dominica, dated the 9th Nov., it appears the yellow fever and black vomit had prevailed to a great extent, and that the 92d Reg. of Gordon Highlanders has lost several officers and a number of its best men. Two officers of two companies, and three serjeants of one company, who had been in the habit of paying it, all fell victims in the course of one week. 39 rank and file had died previously to the 18th Oct., and there were upwards of 30 men in the hospital at that date. The disease having somewhat abated, it was hoped it would have ceased entirely; but about the end of the month it returned with increased severity, and no less than 52 men of the garrison became its victims, and there were a great many hopeless cases in the hospital at the date of the latest letters. The following description of this dreadful disease is from a non-commissioned officer belonging to the detachment of Capt. Morgan's company, Royal Artillery, at present serving in Dominica: "No sooner does the black vomit commence than you may consider yourself a sure victim; there is no remedy, no cure; you linger for about the space of 12 or 14 hours in all the agonies of death, raving mad, and sometimes it takes three or four men to hold those who are attacked with it down in their bed. I do not know what will be done, if the sickness lasts, for duty men. There are only two sentries at present, and should the sickness continue, there will be but few to mount guard. Our men (the Royal Artillery) are all in the enjoyment of good health, which, I think, is on account of our having so little duty to do, and no exposure to the night air. With the exception of the death of one of our non-commissioned officers, who died the 15th Sept., and one gunner and driver, who died on the 28th of the same month, we have had no other casualties. The disease has committed great havoc in the island. The Fort Adjutant died first, the Governor's lady and the President of the House of Assembly were the next; it then became general, and carried off a great number of the respectable inhabitants and the military."

CITY.

Money Market, Friday.—Consols for the Account closed 89½, ⅜; Three per Cents. Reduced, 89½, ⅝; Three-and-a-Half per Cents. Reduced, 99⅜, ¼; India Bonds, 1s. to 3s. premium; and Bank Stock, 166 to 7.

Metropolis and its Vicinity.

House of Lords.—For some days past, workmen, by direction of the Earl of Lincoln, First Commissioner of Woods and Forests, have been engaged in decorating the interior of the House of Lords. The old dark-coloured flock paper has been removed from the walls, and they are now painted a light buff colour, which is thought greatly to improve the appearance of the house. The seats of Peers are ordered to be re-covered with scarlet cloth, and the other alterations in progress are expected to add materially to the splendour of their lordships' house. It is generally thought that his Majesty the King of Prussia, the King of the Belgians, and many distinguished foreigners will be present at the opening of the ensuing session of Parliament on the 3d Feb.

Metropolitan Improvements.—An improvement has just been completed at the north entrance to St. Paul's Cathedral, by the erection of additional doors on the outside of the large ones that are under the portico. The addition has been made to prevent the continual opening and shutting of the original doors, which are very heavy, every time a visitor required admission when divine service was not being performed. The new doors are but a few inches from the old ones: they open outwards and close with a spring, and there are two panes of glass in each door, so that the doorkeeper may see the approach of persons desirous of being admitted.

Public Institutions.—The number of persons who have visited the different public buildings in the Metropolis, during the past week, has been unusually great: no less than 14,763 visited the British Museum on Monday, being a much larger number than on any "boxing-day" since that institution has been open on public holidays. On the same day last year, Christmas-day falling on Friday, and the Museum being closed on Saturday, the number of visitors was 2,531, whilst last Whit Monday they were 9,031. Notwithstanding the large concourse of persons, consisting chiefly of holiday folks, three only were refused admission on the ground of intoxication; and in consequence of the precautions taken by the police, no robbery or damage of any kind was committed. There was, however, much confusion, and many parties were refused admission on account of having children under eight years of age, who are not, by the regulations, admitted into the Museum. The numbers which have visited other places of amusement, viz., the Tower, National Gallery, Polytechnic Institution, and more particularly the theatres, have been equally large; and the good order of the City has been little disturbed. In confirmation of this, it is stated that although, in consequence of Saturday being Christmas-day, the reports brought by the police under the notice of the City magistrates on Monday embraced two days and two nights, no more than five charges of intoxication and disorder appeared in the charge-sheets for their adjudication. This unusual event appears to be ascribed by the aldermen to the efficacy of the Police Bill, particularly to that clause which closes public-houses from 12 at night till one next day, and includes in the same regulation Christmas-day and Good Friday, and the night preceding each of those great holidays.

Metropolitan Post.—The following is the statement of London letters for the four weeks ending December 27, compared with the corresponding period in the years 1839—40:—Through the General Post: Four weeks ending Dec. 25, 1841, 5,338,639; corresponding period of 1840, 4,318,790; ditto, as nearly as can be given, of 1839, 1,682,912. Increase since 1840 on the four weeks' letters, 1,019,849; ditto since 1839 on the four weeks' letters, 3,655,727. Through the district post: Four weeks ending Dec. 25, 1841, 1,785,125; corresponding period of 1840, 1,567,835; ditto, before the reduction of postage, as nearly as can be given, of 1839, 1,021,386. Increase since 1840 on the four weeks' letters, 217,290; ditto since 1839 on the four weeks' letters, 763,739.

New Royal Exchange.—The Gresham Committee have held a meeting for the purpose of receiving the report of the sub-committee appointed to make the requisite arrangements for the ceremony of laying the first stone of the new Royal Exchange. The arrangements have been completed, and the following are said to be the correct particulars:—The ceremony is to take place on Monday, the 17th Jan., that day having been appointed by Prince Albert, who, as already announced, has consented to lay the first stone of the building. The site appointed by the committee is the foundation of one of the columns of the merchants' area on the north side of the ambulatory, the particular column being the one which is to be west of the centre opening or interval. This spot, it seems, has been fixed upon as being relatively the same as that adopted when Charles II. laid the first stone of the old Exchange, and is said to be very near the actual site. Round the stone the architect has constructed a large amphitheatre, which will contain seats for 1,200 visitors, the whole of which is to be roofed and decorated, so as to appear like a large tent, the roof being supported by a pillar in the centre. The access to the arena will be from Cornhill, by a covered way, descending gradually from the level of the street to the level of the platform; and the company are to assemble between the hours of 12 and 2—Prince Albert being expected to arrive about the latter hour. The Lord Mayor will give a banquet in the evening at the Mansion-house, in honour of the occasion; at which are expected to be present, besides Prince Albert, all her Majesty's Ministers, the Judges, officers of state, the principal merchants of London, the aldermen, some of the members of the Court of Common Council, the Gresham Committee, and private friends of the Lord Mayor.

Metropolitan Statistics.—The following is a general statement of the christenings and burials within the City of London and Bills of Mortality, from Dec. 15, 1840, to Dec. 14, 1841:—In the 97 parishes within the walls; christened, 678; buried, 582. In the 17 parishes without the walls: christened, 2,654; buried, 2,419. In the 24 out-parishes in Middlesex and Surrey: christened, 10,132; buried, 9,696. In the 10 parishes in the city and liberties of Westminster: christened, 1,670; buried, 1,902. Total christened: Males, 7,505; Females, 7,629; total, 15,134. Total buried: Males, 7,193; Females, 7,406; total, 14,599. Of the number buried, were—under 2 years of age, 3,749; 2 and under 5, 1,499; 5 and under 10, 611; 10 and under 20, 536; 20 and under 30, 1,065; 30 and under 40, 1,236; 40 and under 50, 1,347; 50 and under 60, 1,293; 60 and under 70, 1,474; 70 and under 80, 1,255; 80 and under 90, 483; 90 and under 100, 59; 100, 1. Buried, 777 still-born children, not included in the foregoing.

Public Meetings.—On Thursday the annual meeting of the proprietors of the Bolivar Mining Association was held in Throgmorton-street. The report was read by the Secretary, from which it appeared that the illness of the company's agent had retarded operations at the mines; and the quantity of ore supplied having been so much less than was anticipated from the statement of Capt. Matthews, the produce of the mine was insufficient to meet the expenditure. Under these circumstances, the trustees had ordered that the expenditure of the mine be suspended and the affairs closed, till the opinion of the whole proprietors was taken on the eligibility of a further continuance of the company. The receipts for the year amounted to 24,385*l.*, in which was an item for sale of 888 tons of copper ore, 14,095*l.*; and advanced on ore not yet arrived, 2,500*l.* The expenses at the mine were 17,266*l.*, and the half-yearly rental of the mine at Aroa (belonging to Miss Dent) was 1,462*l.*, which, together with other items of expenditure, left a balance of 834*l.* in favour of the company. The report was adopted. A proprietor expressed himself in favour of a longer continuance of the works, in hopes of finding some method of raising the ore at a greater per-centage, and spoke of the advantage of a wooden railway, which might be made for 5,000 dollars a mile. Mr. Thomas said it might be done for that in the United States, but not in Columbia. He had found that their working on the reverbatory system would not answer, but with good blast furnaces he had no doubt that fortunes were to be realised from the mines. A proprietor said that other companies had failed for the same reason, and it was to be regretted that our miners were so ignorant of the rudiments of chemistry.

Wood Pavement.—A meeting of the inhabitants of Oxford-street and its vicinity was held on Thursday, for the purpose of taking measures to oppose the proposition at present before the Marylebone vestry, noticed in our last, that the further employment of the wooden pavement in Oxford-street should be postponed for three years. Mr. Underwood, the chairman, opened the business of the meeting by animadverting upon the conduct of the vestry in reference to this subject, and said that the test which the wooden pavement had undergone was quite sufficient to prove its advantages over granite; and he could not conceive how the vestry, after their former declaration, that a year would be sufficient to test the wooden pavement, could now for a moment entertain the proposition of extending the probationary period over three years. A series of resolutions were then passed expressing the belief of the meeting in the success of the experiments already tried; deprecating any further delay in continuing the wooden pavement, and condemning the conduct of the vestry, in entertaining the proposition in question, as one directly opposed to the interests and the repeatedly expressed wishes of the inhabitants of Oxford-street. Lord Nugent, in defending the conduct of the vestry, of which he was a member, expressed himself strongly in favour of wooden pavement, and stated that he believed the majority of the vestry thought with him. Several gentlemen spoke in strong condemnatory terms of the conduct of the vestry, as being extraordinary and incomprehensible. It was then resolved that as many of the inhabitants of the parish as could make it convenient, would on Saturday (this day) attend the vestry and urge the propriety of continuing the wooden pavement in Oxford-street; and that all the vestrymen should likewise be invited to attend.

Kensington.—At a recent meeting of the vestry in this parish the following resolution was adopted: "That it is the opinion of this vestry that the guardians be earnestly requested to apply to the Poor Law Commissioners to dissolve the Kensington union as far as regards this parish, the union being too large for the proper and efficient management of the poor of the several parishes, Kensington alone being large enough for any parochial management." A poll was in consequence opened, which continued for three days. At its close another meeting was held, when the respective numbers were as follows: for the resolution 503, against it 8; being a majority against the union of 495. The result was announced amid loud cheering. Mr. Hanson then moved that a copy of the resolution adopted by the vestry by the result of the poll, and also of a former resolution that the vestry do not approve of the projected erection of a union workhouse, should be sent by the vestry clerk to the Poor Law Commissioners, the board of guardians of the Kensington union, and individually to each of the guardians for the parish. The motion was put by the chairman, Archdeacon Pott, and carried unanimously. Mr. Percival then moved, "That the vestry-clerk be likewise instructed to make known to the Poor Law Commissioners, to the board of guardians, and to the guardians of this parish, the almost unanimous opinion of the parishioners that the building of a union workhouse would be an impolitic and unnecessary expense." This resolution was also unanimously adopted.

Spitalfields. — We referred, in a previous Number, to a meeting held on the subject of the existing distress of the weavers of Spitalfields and its vicinity, and the application made on the subject to the Lord Mayor. On Wednesday a deputation of the weavers again appeared at the Mansion-house, for the purpose of applying to the Lord Mayor for his immediate interference to procure a distribution of the funds already subscribed for their relief, amounting, as they said they did, with their families, to 24,000 individuals. Alderman Wilson received the deputation in the absence of the Lord Mayor, with whom he had communicated on the subject. One of the deputation stated, that by the desire of a numerous meeting, they waited upon the Lord Mayor for the purpose of calling his Lordship's attention to certain resolutions which had been passed upon the subject of the existing distress, which was extreme, and entreating that his Lordship would exercise his great influence to alleviate it. The resolutions referred to were then read, which entered at length into some startling details of the privations under which the weavers were suffering; and the deputation concluded their address by handing a card to the Alderman, showing the mode of distributing relief when Queen Adelaide interfered a few years ago in their behalf. Alderman Wilson said, that but a short time since a statement on the subject was made to the Lord Mayor, who felt deeply for the multitudes who were reduced to such a deplorable condition. His Lordship was, however, in difficulty with respect to the distribution of the funds at his disposal, but he was convinced that immediate measures would be adopted to distribute the funds already in hand, and that a public meeting would be called in consequence of the increasing distress. The men expressed themselves grateful for the sympathy shown; and it was understood that some steps would be at once taken to facilitate the distribution of the funds in hand.

Robberies.—A few days since the following robbery was committed at Westmoreland-place, City-road. It appears that about nine in the evening, as Mrs. Gooch, an elderly lady, was sitting alone in her parlour, she was startled by the sudden entrance of two strange men, one of whom, before she could call for assistance, thrust a handkerchief into her mouth, whilst the other pinioned her arms, and with a rope bound her to the chair. They then told her that if she remained quiet, and gave up what money she possessed, they would not hurt her; but if she attempted to move or give the least alarm, they would murder her. Having rifled her pockets, they took her keys and unlocked a writing-desk, from which they stole gold and silver to the amount of 10*l.*, and several articles of value. On hearing footsteps on the stairs, however, they were alarmed and took to flight, knocking down in the passage the servant, who attempted to oppose their retreat. It is supposed that they gained an entrance to the house by the servant having left the street-door open while she went on an errand to a shop in the neighbourhood. The police have hitherto been unable to trace them.—On Sunday evening a man dressed as a porter knocked at the house of Mrs. Maddox, Bridport-place, Hoxton, and requested the servant to deliver a letter, and he would wait for an answer. On taking it to her mistress, it was discovered to be a hoax, being nothing more than a blank sheet of paper, folded in the form of a letter. Upon the servant's return the man was nowhere to be seen, and supposing him to be gone, she closed the door. Shortly afterwards Mrs. Maddox hearing footsteps on the stairs, went into the passage, and discovered a man with a large bundle in his hand, who knocked her down with a severe blow on the head, and immediately ran off. Mrs. Maddox afterwards found that her bedroom had been entered and robbed of a quantity of wearing apparel, jewellery, and a variety of other articles. The thief has not been apprehended.—On Wednesday information was received at the Metropolitan police stations of the following extensive robberies of Bank of England notes, &c., to the amount of 1,202*l.*, viz. from a gentleman, on Monday, while travelling by the London and Birmingham night train to Manchester, the sum of 950*l.*, consisting of one 500*l.* note, one 300*l.*, one 100*l.*, and one 50*l.* note. A reward of 50*l.* has been offered for their recovery. On Sunday evening there was also stolen from the dwelling-house of Mr. Grant, of Bingham, Notts, the sum of 252*l.* in notes and sovereigns. The house was broken open, and the money taken from an old oak chest. A reward of 50*l.* is offered for the apprehension of the thieves.—On Wednesday a man in the dress, and assuming the manner of a gentleman's coachman, called with a letter addressed to the lady who is the secretary of the Friendly Female Benevolent Society, and which purported to be from Lady Emily Farmer, of Clanvill-park, Petworth, announcing herself and three daughters as subscribers of two guineas per year each. It stated that, having occasion to send her coachman to town, he would take the receipts and the difference of 10*l.*, the amount of the check enclosed. The letter was in the first style of writing and address. The lady to whom it was addressed not being at home, the change was about to be handed to the man, when, in recollection of similar attempted frauds, a note to her ladyship, promising receipt, &c., by post, was substituted; and it was afterwards found, on presenting the check at Messrs. Weston and Co.'s, that it was a forgery.

Fires.—No less than eight fires occurred in the Metropolis on Christmas-day, some of which were attended with great loss of property. Three of these occurred in the southern and western suburbs. The first was in the house of Mr. Lavell, High-street, Camberwell. The family, it seems, retired to rest about twelve, and shortly after one the house was discovered to be in flames. The inmates made their escape with difficulty. Several engines were soon on the spot, but unfortunately there was a bad supply of water, and in a short time the whole building was reduced to ruins, and several adjoining houses much injured. The loss is estimated at 1000*l.* The engines had scarcely left, when they were summoned to a fire in the manufactory of Messrs. Bryan, patent leather-dressers, Dacre-street, Westminster, and which, from the thickly populated neighbourhood, excited great alarm. The fire commenced in that portion of the premises where the process of varnishing the leather is carried on, and so violent were the flames, that this portion of the building was soon reduced to ruins. By the exertions of the firemen, however, the other portion of the building was saved. The loss is said to amount to nearly 2000*l.*—Shortly after, information was received that the Eagle saw-mills, at Old Brompton, were on fire. Here, also, there was a scarcity of water, and the fire burnt itself out, destroying the whole of the mills and stock in trade. The damage is said to amount to several thousand pounds.—Five other fires occurred in the course of the day, by which much damage was occasioned. They took place severally at the premises of Messrs. Martinez and Co., wine-merchants, 77, Mark-lane; at Mr. Sabine's, card-maker and hot-presser, Lovell-court, Paternoster-row; at a house in Charles-street, Bethnal-green; at Limehouse; and at Stepney-causeway. Nearly the whole of these originated, it is stated, from the overheating of stoves in cooking their Christmas dinners. It appears that the occurrence of numerous fires on Christmas-day has been observed for many years past.

Provincial News.

Berwick-on-Tweed.—The failure of the banking-house of Messrs. Batson, Berry, and Co., has led to a meeting of the inhabitants of this town, to consider the best means of supplying the wants of the district, when it was resolved that an application should be made to the Bank of England, through the medium of one of the sitting members, to establish a branch bank in this town. An answer has been received from the Directors, declining, it is understood, the proposal, but intimating that every encouragement should be given to a joint-stock bank, should it be established, and the circulation conducted with Bank of England paper. With this object in view, a prospectus for a new bank has been issued; and it is said to be the intention of the parties concerned in its formation to call a public meeting shortly on the subject. A meeting of the creditors of the late bank has been held, when assignees were declared; the claims proved against the estate are said to be upwards of 250,000*l.* The entire liabilities of the firm are said to be nearly 350,000*l.*, of which the claims of depositors in the town and immediate neighbourhood are 160,000*l.*; similar claims in Alnwick and south of the town, 50,000*l.*; and notes in circulation, 40,000*l.*

Blackburn.—A few days since, two young men, name David Fisher and Robert Horsman, were summoned before the magistrates at the petty sessions, to answer the charge of not attending church on Sunday the 5th Dec., in accordance with a law still retained upon the statute-book, imposing a fine of five shillings upon those who do not attend a place of worship on the Sabbath-day. The constable who preferred the charge said, that on the day in question he accompanied the churchwardens of Clayton-le-Moors in their perambulations in search of disorderly characters, when they met the defendants in their working-clothes. The churchwardens asked them why they were not at church, but they made no reply, and walked away. The wardens then ordered the constable to summon the parties for non-attendance at church, and accordingly the young men were brought before the magistrates. The bench however dismissed the case; and the superintendent of police said that the summons had been taken out without his sanction, and as it was contrary to rule, the constable must answer for his misconduct.

Brighton.—A man, who gave his name Thomas Adams, has undergone an examination before the magistrates of this town on a charge of forgery. The checks which he had forged purported to be those of Mr. Serj. Adams, whose son prisoner had represented himself, under the name of Charles Adams. The police-officer said he had reason to believe his name was George Thomas Davies, and prayed a remand, as he expected a warrant to convey him to Kent, where several charges were likely to be brought against him. The prisoner was accordingly remanded.

Bristol.—It is reported that Sir C. Wetherell, the recorder of this city, is about to resign that office.—An accident of a severe nature occurred to Mrs. Monck, the lady of the Lord Bishop of Gloucester and Bristol, on Saturday. It appears that while passing down some steps which lead from the hall-door of the palace, her foot slipped, and she fell, dislocating her collar bone by the accident. The latest accounts, however, state that she is going on favourably, and that her recovery may be soon expected.

Carnarvon.—A local paper (the *Herald*) states that a correspondent has communicated some interesting particulars of a storm of thunder and lightning, accompanied by hail, that passed over the peninsula of Lleyn on the morning of the 17th ult. In its passage over the park at Madryn, it was of a very serious character, and did considerable damage to a long range of glasshouses, pits, and frames, that are used for forcing, besides endangering a large collection of valuable plants. Some of the hailstones measured, it is stated, 3 inches and one-eighth round the base, all of them being of a conical shape. The writer adds, that he cannot find that any hail of the same magnitude and quantity has fallen in that part of the country within the memory of the present age.

Chelmsford.—A serious fire occurred on the premises of Mr. Zurhorst, at Pilgrim's Hatch, in this county, on Friday the 24th ult. The house was burned to the ground, and nearly all the furniture destroyed. Mr. Zurhorst, it seems, has also incurred a serious loss by the burning of a cabinet, in which he had deposited 250*l.* in bank notes, 16 sovereigns, a check for 19*l.*, and a bill for 89*l.*; the furniture being the only part of the property insured. It is not yet known how the fire originated.

Derby.—On Monday addresses from this town were presented by a deputation of gentlemen and tradesmen to Lord Melbourne at Melbourne Hall. The address contained a summary of the leading measures of the ministry of which his Lordship was the head, and adverting to the measures proposed by them for meeting the deficiency of the revenue by an amendment of the general tariff, it expressed a conviction that though that attempt had been for a time defeated, it could not long be resisted by any party in power, and conveyed the hope that either the present ministers would be compelled to pursue the same line of conduct as their predecessors, or else that his Lordship, together with his late colleagues in office, would again ere long be called to her Majesty's councils. Lord Melbourne in his reply alluded to the language he held in the same place in the autumn of 1834, when he pressed upon the gentlemen whom he had then the honour of receiving, the necessity of union and concord, without which, from the natural strength and compact array of the adversary, there was no hope of success. Discord had succeeded to union, and the natural and necessary consequence, defeat and failure, followed. "Union alone," observed his lordship, "is irresistible; and union can only be insured by the choice of defined objects, not doubtful, speculative, and hazardous, but dictated by reason, approved by experience, and of a practicable character." His lordship having complimented the inhabitants of Derby on their consistency, and adverted to the expressions in the addresses of kindly feeling towards himself personally, concluded his answer by animadverting on the conduct of his political opponents. He referred to the measures for the supply of the pecuniary deficiency, and the relief of the commercial embarrassment, proposed, he said, in good faith, and in the hope that they would have received the sanction of Parliament, but which were met by a vote of want of confidence. "It will now be," said his lordship, "for her Majesty's present advisers to bring forward upon their part such plans as they may think better suited to the circumstances of the times; and it will be for your representatives to consider those plans with reference to and in comparison with the measures which we submitted to the last Parliament. I can only say that for myself they shall receive a full and fair consideration, and that, as far as in me lies, I will do to others that justice which I hold to have been denied to me and my colleagues, and in being denied to us, to have also been denied to the country."—We are informed by a local paper that the only cotton factory that was working at Chapel-en-le-Frith stopped last week. This factory, it seems, belongs to Messrs. Ashton and Co., of Hyde, who have been obliged, it is said, through depression of trade and other inconveniences, to stop all their works, both at Hyde and Chapel-en-le-Frith; whereby upwards of a hundred and fifty hands have been thrown out of employment at Chapel-en-le-Frith, who were altogether depending upon Messrs. Ashton for support.

Hull.—On Christmas night about twelve o'clock, a person on board a steamer then on her passage from London to this port caused a serious alarm among the passengers, of whom there were several of both sexes, by stamping on the deck over the fore-cabin, and crying out that the ship was on fire. The consequence was a general confusion among the fore-cabin passengers, during which a man, jumping from an upper berth, fell upon a woman beneath and seriously hurt her. All rushed to the ladder; but it was soon discovered to be a hoax, and that there was no cause for alarm. The author of the mischief, on being told he should be given into custody on arrival at this place, threatened to stab any one who dared to lay hands on him; and this deterred the summary punishment which many of the passengers, it is said, were disposed to inflict on him. The law, it seems, does not apply to such a case.

Ipswich.—A local paper informs us that one of the steamers from this port conveyed no less than ten tons of turkeys from the Suffolk coast during the last week; eight tons of the same description of Christmas fare having been previously forwarded by the same steamer for the London market.

Launceston.—A local paper states that this county is so extensively undermined, that churches and churchyards, mansion-houses and hostelries, are many of them suspended over a yawning gulph, and in constant danger of falling upon the miners below. The *Cornwall Gazette* of last week gives the following account of a narrow escape which occurred at Illogan: As the wife of a labourer called Dunstone was crossing her kitchen, the ground suddenly gave way, and she was left suspended by her arm over a shaft, but fortunately was rescued from her perilous situation without any injury."

Manchester.—The property recently destroyed by fire in this town has since been the scene of a still more serious calamity. The particulars of the fire alluded to were detailed in our last Number, the building destroyed being a large warehouse in Piccadilly, in the occupation of the Union Carrying Company. The ruins, which had remained undisturbed since the fire, were about to be removed on Friday, Christmas-eve, when another accident occurred. Though the building had been completely gutted by the fire, two of the entire walls were left standing, and that at the back of the warehouse was about 90 feet high by 100 in length, and was carried by means of two stone arches over the Rochdale Canal. This wall was about to be removed by a number of men, who were erecting some scaffolding against it, when the stone of one of the arches, which had become rotten and nearly pulverised by the action of the fire, giving way, the arch collapsed, and the wall dividing into two portions, fell a heap of ruins upon the men below. There were upwards of a hundred labourers about the building when the accident occurred, of whom five were killed on the spot, and ten others seriously wounded, two of whom afterwards died: all the rest escaped uninjured. Great excitement immediately prevailed throughout the whole town, and all the thoroughfares leading to the scene of the accident became densely thronged with thousands of persons; and it required great exertions on the part of the police to keep them from the ruins, and thus prevent the danger of further accidents. A considerable time elapsed before all the bodies were dug out, and general alarm was for some time felt from a report that all the men who were in the building at the time had been buried. This, however, proved incorrect, and the extent of the calamity was found to be as stated above. An inquest has been held, and after a lengthened investigation the jury expressed themselves satisfied that the unfortunate event was the result of mere accident, and that no blame or want of precaution attached to any of the parties connected with the removal of the ruins. They accordingly returned a verdict of "Accidental death" in all the cases. With the exception of one young man, who still lies at the Infirmary in a precarious state, all the others who were injured are doing favourably, and likely to recover.—On Monday the inmates in the house of Mr. Carman, Faulkner-street, St. Peter's, were thrown into a state of alarm, caused by the sudden indisposition of nine individuals, shortly after dinner on that day. It seems that Mr. and Mrs. Baker, of the Theatre Royal, and two daughters, and Mr. and Mrs. H. Holl, have apartments at Mr. Carman's; and that, on Monday, at dinner, they, as well as Mr. Carman and his two daughters, partook of some mutton broth. Shortly afterwards they were seized with severe illness, attended by all the symptoms of having taken poison. Medical assistance being called in, active remedial measures were adopted, and they were all restored; though some of them continued for several days greatly indisposed. There appears to be some mystery connected with the affair; no suspicion attaching to any of the inmates, though it is supposed that arsenic must have been mixed with the oatmeal used in the broth, and which had been some time in the house. The suspected substance is in the hands of some chemists, who are to examine and report upon it.—Some surprise has been expressed in this town, during the last week, by the report that a confidential clerk in the employ of the Manchester, Bolton, and Bury Canal and Railway Company had absconded with a large amount of property in his possession. It appears that his name is Samuel Hayward, and that he held the situation of book-keeper and collecting clerk, in which capacity large amounts of cash were continually passing through his hands. On the 4th ult. he paid over a balance of 80*l.* to the cashier, requesting permission to go into the country by the next coach, and return on the succeeding Monday. The permission was granted, and he left the town, but not being heard of for some time, search was made after him by the police, supposing that he might have been murdered, and finally his private desk was broken open, when two letters were discovered in his hand-writing, one directed to his wife, and the other to the cashier, in both of which he said that he had left the country for ever, and that he had remained as long as he could without being discovered and punished. A policeman was immediately despatched to Liverpool to see if he could trace him, and succeeded in apprehending him on board a packet in that port which was on the point of sailing for America. The prisoner was brought back to this town, and has undergone an examination before the magistrates, when four cases of embezzlement exceeding 1000*l.* were proved against him, and he was committed to take his trial. The prisoner is 27 years of age, respectably connected, and has a wife and family. His salary was 200*l.* per annum, and he states that the vessel in which he intended to have taken his departure had only sailed from Liverpool two hours before his arrival in that town. It is feared that he will be found a defaulter to a much larger amount than that already discovered.

Newcastle-upon-Tyne.—Mr. William Gibb, the agent, at Alnwick, of Messrs. Lambton and Co., bankers of this town, has absconded; and since his departure it has been discovered that forged bills to a considerable extent have passed through his hands, but to what amount is not yet publicly known. It is stated that the Messrs. Lambton possess security from Mr. Gibb to the amount of 3,000*l.*, and that four persons residing in Alnwick are his sureties to that extent. This circumstance, coming so soon after the failure of the Tweed Bank, has created additional alarm in Alnwick, where there are several instances of loss occasioned by the latter event. It seems Mr. Gibb left his home about three weeks since, but it is only a few days since it was suspected that he had absconded.

Shrewsbury.—An inquest has been held on Emma Evans, the woman who was murdered at Chirk, the circumstances connected with which were detailed in our last. The magistrates did not wish the coroner to enter into any subject beyond the immediate cause of death, fearing the ends of justice might be defeated, and the jury consequently returned a verdict of "Wilful murder against some person or persons unknown." The two men, Williams and Lawson, from whom the bundle of goods was taken, which belonged to deceased, were not at first apprehended, although they were supposed to be lying secreted somewhere in the neighbourhood. They have since been captured at Coventry; and were discovered on Monday in consequence of their endeavouring to dispose of some silver spoons at a pawnbroker's, who suspecting they were the parties concerned in the murder, forwarded information to the police of this town, who immediately proceeded there and succeeded in apprehending them. Their arrival in this place produced considerable excitement, and great numbers of persons assembled to meet them, but by the arrangements of the police they were safely secured in the gaol, without any interruption or violence being used towards them by the mob. They have since undergone an examination before the magistrates, which did not elicit any fresh facts of importance, and was adjourned for a few days. —Another murder has within the last few days been committed in this county, at Whexall near Wem. It seems that a wife, with the assistance of her husband, has administered poison to both her parents, whereby the mother has lost her life — the father escaped; but a third party unconnected with the transaction has since died from the effects of the food of which he had also been a partaker. The perpetrators of the crime are named Thomas and Mary Harries, living in the same cottage with the father, Arthur Williams, and his deceased wife. It seems that deceased had been in the habit of correcting two children which Harries had by a former wife, and that he had threatened her for so doing, and this is supposed to be the motive that led to the commission of the crime. The circumstances are as follows:—On Sunday deceased partook of an apple-dumpling at dinner, and was immediately taken ill, and died the same evening. Her husband did not eat any, being too ill, from having taken a small portion of poisoned food on the previous night; and the third party was the son of a neighbour to whom the female prisoner had given the remainder of the dumpling. An inquest has been held, and after the conclusion of the evidence the male prisoner made a statement to the effect that he had told his wife on Saturday that something was the matter with the meat, to make the old man so ill. He said he had purchased the poison some months ago for the purpose of destroying rats; and hinted that his wife must have administered the poison, if deceased really was poisoned. The female prisoner said that if any one knew about it, it was her husband. The jury returned a verdict that deceased's death was occasioned by poison administered by Thomas Harries, and that he was assisted by his wife; and they were both committed to take their trial.

Stamford.—A serious accident, attended by loss of life, has occurred at a coal-pit belonging to Messrs. Job and Page Taylor, at Darlaston. It appears that three men and a boy were descending to their work, when the skip on which they were standing, before their heads were lower than the mouth of the pit, got detached from the rope, and they fell a depth of more than thirty yards. One of the men was killed on the spot, and the other two have since died. The boy lies in a dangerous state and is not expected to recover. It was at first feared that the rope had been burnt nearly through designedly, as the end was charred, but on inquiry it appeared most probable that the loose end of the knot tied in the rope to secure a ring and hook, which carries the skip, had caught fire accidentally, as the men were in the habit of sticking a lighted candle to the bow of the skip, and that it smouldered till it got to the tight part of the knot, when it was extinguished. In consequence of this, it is thought that the weight of the men untied the knot, or slipped it through the ring, and thus caused the accident.

Stockton.—A local paper states that a singular evidence of the effects of railways upon the growth of towns is to be found at Middlesborough, a shipping port, on a branch of the railway from Darlington to this place. This little town at the terminus of the railway, from which there is a branch to it, has, it seems, been entirely formed in the course of ten years; and now numbers about 5,000 inhabitants, with a church, market, and all the accompaniments of a town of active industry and business. Many of its houses bear the appearance of being occupied by persons in comfortable circumstances, and the town looks more like one of settled and matured habits than of recent growth.

Stoke-upon-Trent.—A meeting of the ratepayers of this parish, pursuant to public notice, has been held to take into consideration the propriety of granting a church-rate. The vestry was crowded, nearly 1000 persons, it is said, being present, and many being unable to gain admission. The rector took the chair after considerable opposition, when Mr. Tomkinson, the churchwarden, read an estimate for the coming year; which for the two churches, he said, was 345*l.* 5*s.* 1*d.* He therefore proposed that a rate of 1¾*d.* in the pound, for the repairs and other expenses of Stoke and Shelton churches, be ordered. Mr. Robinson, a Chartist, then addressed the meeting, opposing the rate with considerable warmth; and concluded by proposing as an amendment, "That the meeting was of opinion that the church-rates were unjust in principle, and ought to be resisted, and that the meeting do adjourn for twelve months." The amendment having been seconded, the chairman stated that he should not put it to the meeting. Some warm and angry discussion ensued, during which one of the speakers, Mr. James Holden, said that the 10,930,000*l.* which the tithes produced ought to be appropriated to the support of the church, the clergy, and the poor, as it was before the time of the Protestant reformation. A gentleman of the name of Ridgway then spoke at considerable length, arguing against the imposition of church-rates on the ground of the existing distress among all classes; and after enumerating the difficulties in which the manufacturers are at the present time placed, the hardships of the shopkeepers, and the distress of all, he proposed to make use of the words, "that this meeting therefore do adjourn to Easter Monday." That, he said, would be legal, and then the rate-payers could come again and do likewise. Mr. Robinson then withdrew his amendment in favour of Mr. Ridgway's, amid loud cheers. The chairman called for a show of hands for the rate, when a few only were held up, and a great number against it. A poll was then demanded, which the chairman said should open immediately; and afterwards be adjourned to Friday. He declined to put the amendment, and left the room amid great confusion. After his departure the chair was taken by one of the opposite party, and the amendment of Mr. Ridgway was carried unanimously.

Sutton in Ashfield.—We have noticed in previous Numbers the frequent recurrence of incendiary fires in this place and neighbourhood, without any clue being discovered to the authors of them. On Sunday an attempt was made to set fire to the church. It appears that when the sexton went to ring the bell, he discovered that some pitch, cotton, and sticks had been inserted in one of the pews through a window, where a pane of glass had been extracted. No mischief, however, was done, the combustibles having fortunately fallen upon a part of the floor of the pew, which is old oak; otherwise, it is thought, the consequences might have been serious, as even the oak itself was partly burnt. No clue has yet been discovered to the author of this or the other numerous fires that have occurred in this neighbourhood.

Wakefield.—A public meeting, which was numerously attended, has been held in this town, to consider the propriety of forming a diocesan board of education, in accordance with the principles of the Established Church. The meeting was called by the Bishop of Ripon, in compliance with a numerously-signed requisition. The proposed rules were agreed to, and many speeches were made; but the most important feature of the meeting was the address of the chairman, Lord Wharncliffe, the substance of which was as follows:—"Government could not do much. It could not provide and support those schools; it could only aid and encourage them. Government could not provide the funds necessary for the education of the people; for, as a Government, it had no power to do that, even if willing. It depended entirely on the representatives of the people in the House of Commons. They had appropriated a small sum for the purpose; but before any government could go to Parliament with a proposition to increase that grant to any extent, it would be necessary to show that the laity, the clergy, and all ranks of the people were ready to contribute liberally to the object. He had some knowledge on the subject, and he was happy to say there was a disposition to contribute liberally. When that was done, then Parliament would give further aid. He had given the matter the most anxious consideration, and he believed all who had given attention to it would, with him, deprecate strongly that the charge of educating the people should be taken out of the hands of those who were willing voluntarily to superintend it."

Windsor.—On Wednesday, the Queen, accompanied by Prince Albert, several members of the Royal suite, and a select party of sixty, proceeded to the Great Park, about a mile from the Castle, to be present at a meeting of the Royal buckhounds, and to witness a stag-hunt. Her Majesty was in a carriage and four, attended by outriders. The Dinham stag, which had been hunted during the past two seasons, and let out to rove at liberty during the summer, was selected from the herd, and the hounds laid on at Bishopsgate, whither her Majesty and the Court proceeded to witness the sport. The stag, after a run of an hour, was taken close to Cumberland-lodge. The Queen, in her carriage, traversed the Park in various directions, and had a good view of the whole of the run, with which her Majesty, who was looking very well, appeared much pleased. Not only were the whole company comprising the field in at the take, but her Majesty also, who arrived at the Lodge at the moment of the capture. The stag, by the Queen's command, was immediately afterwards brought to her Majesty's carriage, by the keepers, for the Queen's inspection, the Prince, Lord Rosslyn, Master of the buckhounds, and the members of the Court, forming a circle. The Royal party then returned to the Castle. The equestrian statue of the late King George the Fourth, in bronze, by Sir F. Chantrey, nine feet high, is, it is said, likely to be placed in the Long Walk.

Worcester.—The spirit of incendiarism appears to have manifested itself on the borders of this county, two fires having occurred about the same time a few nights since, which, it is said, there is every reason to suppose were occasioned wilfully. In one case a blacksmith's shop and adjoining premises at Spernal, belonging to a widow named Blackburn, were burned to the ground; and in the other a rick belonging to Mr. Bennett, farmer, residing at Studley Holt. They occurred within half a mile of each other, and in Mr. Bennett's case, but for great exertions, two other stacks, it is thought, must have been consumed.

Railways.—An accident, which produced considerable alarm at the time and has since occasioned much excitement, took place on the line of the Great Western Railway, the day before Christmas-day, whereby eight persons were killed on the spot, and many others seriously injured. It appears that a luggage-train, with a number of passengers of the labouring class, left the Paddington terminus at 4 A.M., and had proceeded as far as the Sunning-hill cutting, near Reading, when it suddenly came into contact with a slip of earth that had fallen from the embankment, and covered the rails. It was quite dark at the time, and the immediate consequence was that the engine was forced off the line, and the heavily-laden luggage-trains (which were placed behind the passengers) in consequence of the momentum they had acquired, and the sudden check they thus received, were thrown on the carriages of the passengers, crushing eight to death and severely wounding twelve others. The sufferers were chiefly mechanics, and among the killed were several stonemasons from the New Houses of Parliament, who were going down into the country to spend the Christmas holiday with their friends. An inquest, which lasted two days, has been held, and a lengthened investigation gone into as to the cause of the accident. Two questions more particularly occupied the attention of the jury, the first of which was the practice of placing the passengers in trucks before the luggage, and to which in a great measure is attributed so extensively fatal a result; and the second whether the slip had been sudden and without notice, or whether it had taken place after a previous indication, which ought to have demanded the attention of the company. As related to the first inquiry, the position of the passengers' trucks, Mr. Brunel, the engineer of the line, stated that the plan was adopted because it was deemed the safest. The reasons he gave for this opinion were, that the luggage trains were uncertain in the time they kept, that they proceeded more slowly than the other trains, and hence there was always risk of their being overtaken and run into by a faster train, in which case, if the passengers were placed behind, they would necessarily be exposed to the greatest danger. With regard to the second inquiry, whether proper precautions had been taken by the directors for the security of the embankment, it appeared in evidence that the part where the accident took place had been observed for some time previous to be in an insecure state, so much so as to attract the notice of persons living in the neighbourhood, some of whom had expressed their apprehensions to servants of the Railway Company; that partial slips had taken place some short time before, and had been repaired under the direction of one of the assistant engineers, Mr. Berthram, and although this witness and his foreman deposed that everything was done which was thought necessary, and expressed themselves quite sure that the particular slip which led to the fatal catastrophe was new, and without any previous indication of danger, another witness, Mr. Gosling, jun., stated that he had perceived the ground bulging, where it afterwards fell in, on the very day before the accident happened. It further appeared that there was no watchman nearer the spot than half a mile, and he, not being aware of the obstruction, made the signal of safety for the train to proceed. Some evidence, which however did not appear satisfactory to the jury, was adduced to show that the slip took place at the moment the train was passing, and under circumstances against which the presence of a watchman could have afforded no security. The statement of the engine driver, however, who with the stoker singularly escaped uninjured, went to disprove this, for he stated that the engine ran into some loose earth which had slipped from the side of the cutting on to the rails. The jury ultimately returned a verdict of Accidental death in all the eight cases, with a deodand of 1000*l.* on the engine and tender; their reasons, which the coroner however refused to give, being understood to be that the passengers' trucks, in the first place, were not placed in the safest position; and secondly, that due precautions had not been taken for the security of the embankment, after the recent slips that had occurred near the spot. The last accounts report that the wounded persons, who had been received into the Reading Infirmary, were proceeding favourably, and that they are all likely to recover.—A fatal accident has occurred on the line of the Grand Junction Railway, to one of the down-trains, within two or three miles of Leeds. It appears that one of the wheels of the engine suddenly broke, whereby the rail was cut in two, and the engine twice overturned on a slight elevation at the side of the line. The engine driver was so seriously injured that he has since died, but the stoker, by keeping on the tender, escaped with only a few slight cuts. The carriage next to the tender was overthrown by the shock, but fortunately none of the passengers were injured.—An inquest has been held on John Clagg, aged 34, a labourer on the London and Brighton Railway. It appeared by the evidence of a fellow workmen, that he had left him on the line about six in the evening, walking towards his home, and shortly after he learned that he had been run over by one of the trains. Deceased had been taking a little beer, but was not intoxicated. The engine driver of the train which ran over deceased deposed that he never saw him, and not being aware of the accident, did not stop the train. Deceased was picked up a few minutes after by a railway labourer, but though he did not die for some days, he could give no explanation how the accident occurred. A surgeon deposed, that when deceased was brought to him to the hospital he found that he was seriously injured, and appeared under the effects of drink. His right hand and three of his ribs were broken, and he was labouring under a pulmonary affection at the time. Deceased appeared to have been injured by the fire-box; and witness was of opinion that the wheels did not go over any part of him, or he must have been killed on the spot. The only conclusion witness could come to was that deceased lay down on the line; and he could not positively say whether the cause of death was the result of the accident or the previous disease. Some of the jury proposed an adjournment, in order that a *post-mortem* examination might take place, but after some consultation it was overruled, and a verdict returned of "Death from natural causes, accelerated by the accident."—A special general meeting of proprietors of the Manchester and Leeds Railway has been held at Manchester, for the purpose of taking into consideration a proposal "to unite the company with certain other railway companies in taking a lease of a railway proposed to be made from Darlington to the Durham Junction Railway, and also for the purpose of considering the propriety of proceeding with the formation of the projected extension of the Manchester and Leeds Railway to Hunt's-bank, under the powers obtained by Act of Parliament for the purpose." There was a numerous attendance of the proprietary, and after some discussion resolutions were adopted, authorising the directors to proceed with the undertaking to Hunt's-bank, and also to unite with other companies for the extension of railway conveyance in the north.—An accident, attended with very serious consequences, occurred on Monday, on the line of the Bristol and Gloucester Railway, about 15 miles from the former city, whereby three men were killed on the spot, and five other persons severely injured. From the accounts received, it appears that the men were engaged in the formation of a tunnel, two miles from Wickwar; and on Saturday, a barrel of gunpowder, intended to be used in blowing up the rocks, had been placed for safety in a neighbouring shed, used as a blacksmith's shop. On Monday, whilst the blacksmith was sharpening the men's tools, a spark of fire fell from the anvil on the powder, which immediately exploded, and the men were blown in different directions. The shock, which was heard at the distance of six or seven miles, produced great alarm in the surrounding hamlets; and as soon as the extent of the mischief was ascertained, the dead bodies were removed to a neighbouring shed to await an inquest, and the five wounded men were conveyed to the Bristol Infirmary, where four of them continue in a dangerous state.

IRELAND.

Dublin.—A meeting for the purpose of taking into consideration the repeal of the Corn-laws has been held at the Mansion-house. The Lord Mayor, who presided, began his speech by stating that the effect of the present Corn-laws was actual starvation, and that the pressure of the Corn-law was grossly unequal. The quantity of bread consumed by the wealthier classes, he said, was insignificant compared with their wealth, while that consumed by the poor man amounted to nine-tenths of the value of his productive powers. The Corn-law tax was unjust in that respect, but it was also grossly unjust that one class of the people should derive an income from the food made use of by another. After some further remarks in the same strain, Mr. O'Connell added that when he looked at the recent accounts of the manufacturing interests of England, he found the quantity of manufactured goods diminishing day by day, the number of employers likewise diminishing, mercantile men failing, banks broken, manufactories shut up, artisans turned out, and starvation spreading far and wide; he found this progressive scale of deterioration, lasting and augmenting for six years, accompanied by serious accounts of the melancholy condition of the people. All nations of the earth had had their great revolutions. There was no great state that had not had its rise and progress, its gradual decline, and ultimately its fall; and he confessed it struck him with something—he hoped of superstition—which led him to think that the pride of England's greatness had passed away, and that her decline and fall were coming on. He reflected upon the subject with horror, although he felt that England had inflicted much bitter injury upon his country, and that a greater enemy his country never had had. But he wept over the miseries of the British people, and he was ready to struggle with them to maintain that superiority which he feared they were losing. His whole thought was engrossed in contemplating the coming misery of England, and he shuddered with horror at what might be its results. Hunger, it was said, would break through stone walls, and no political institution was strong enough to stand against the clamouring of a starving people. He prayed, however, that in saying this he might not turn out to be a true prophet. The Lord Mayor then announced Mr. Bright, of Rochdale, as the first speaker, who addressed the meeting at great length. Having adverted to the difficulties thrown in the way of Catholic Emancipation, and of the Negro Emancipation Acts, he proceeded to contend that the objections to the repeal of the Corn-laws were equally unjust, and would prove equally futile. Having given some instances of the injurious effects of restrictions on the import of foreign corn, the speaker appealed to the assembly to record their assent to a repeal of these laws, not merely, he said, on account of their English brethren, who were rapidly coming down to the low standard of food of the Irish peasantry, but on account of the sufferings of their own countrymen in England, in consequence of the ruinous operations of these destructive laws. After some further observations, Mr. Bright was succeeded by Mr. G. Thompson and several other speakers, who addressed the meeting at considerable length. The meeting terminated by the adoption of the following resolution, proposed by the Lord Mayor:—"That a total and immediate repeal of the Corn-laws is necessary for the revival of trade and manufacture, and that it is expedient that all Ireland should petition for their immediate repeal, and that measures be taken immediately for doing so.—The weekly meeting of the Repeal Association was held on Tuesday. The Lord Mayor, in handing in some money, congratulated the Association on the circumstance of a great demonstration in favour of Repeal having been made the previous day at Kells, county Meath; when from 10,000 to 20,000 persons he said attended, and came to the determination to post up in a conspicuous part of their dwellings "There is nothing for Ireland but the Repeal." A hatband with the same inscription was to be generally worn by the people of that district, and he had no doubt it would become universal in Ireland. He cautioned the people against being deluded, he said, by gangs of spies that were going through the country, trying to induce them to join illegal societies, for the very purpose of afterwards betraying them. His Lordship stated with great gratification that the Right Rev. Dr. Cantwell, the Catholic bishop of Meath, and nearly all his clergy were thorough Repealers, and concluded his remarks by moving the thanks of the association to Dr. Cantwell, his clergy, and the people of the county Meath, for the noble demonstration in favour of repeal made on the previous day. The resolution was passed. After several subscriptions had been acknowledged, the Lord Mayor alluded to the death of Mr. West, late member for this city, who died on Monday, for whose private character he expressed high admiration. He wished it to be known that he could take no part in the approaching election; the law had made him returning officer, and unless he resigned his office he could not conscientiously take part one way or another. In short, he was determined that during his year of office he would act with strict impartiality, and, according to his best exertions, with equal justice to all.

Belfast.—A public meeting of persons interested in the linen trade of Ireland has been held in this town, for the purpose of adopting some measure to relieve the existing pressure on that department of trade. After some discussion it was unanimously resolved—"That a memorial be forwarded to the Board of Trade, embodying a statement of the present position of the linen manufacture." This document was signed by all the banking companies of this town, and by a large portion of the merchants and capitalists of the neighbourhood; the whole of the signatures representing, it is said, nearly three millions of capital. The memorial, which extended to some length, stated that the manufacturers had for some time been suffering from the seriously depressed state of the linen trade, on the prosperity of which depends the welfare of almost the entire province of Ulster; this staple trade giving support, directly or indirectly, to one-half of its population. That from the improvement of manufactures in other countries, more particularly in Germany, and the restrictive measures lately adopted on the continent with respect to British goods, the memorialists are unable to find a sufficient market for their productions, and their trade, they fear, will ultimately be annihilated. They therefore suggest whether it would not be the interest of the country generally, as it would be their own particularly, to remodel our commercial relations, and, by a principle of concession, induce other countries to receive, on a more extended scale, our manufactures. The memorial was forwarded to Lord Ripon, President of the Board of Trade, who has replied to it, stating that he is fully sensible of the great importance of the matter to which it relates; and the memorialists may rely upon his readiness to consider every practicable means of endeavouring to meet the exigencies of the case.

SCOTLAND.

Edinburgh.—The committee of the General Assembly lately published a statement of their views, as to the settlement of the questions at present affecting the church. It was extensively circulated, and a copy, it is said, was sent to every Cabinet Minister. On Tuesday, the 21st Dec., a meeting of the committee was held, for the purpose of approving of the statement, when one of the members protested against it in strong terms. He said that all the agitation against patronage had proceeded on the ground of supporting the rights of the Christian people, by preventing ministers from being improperly thrust upon them; but that the statement proved that this was a mere pretence; that the rights of the people were to be thrown aside, and the whole power, both of the patrons and of the people, vested in the clergy. Any such measure he should oppose to the utmost, as establishing a clerical domination, which, he considered, must be attended with fatal consequences to the liberties of the country, and never would be submitted to. A long discussion followed. Dr. Gordon, Messrs. Candlish and Cunningham, &c., voted an approval of the statement, the member alluded to alone dissenting—It is announced that Mr. T. Carlyle has declined becoming a candidate for the Chair of History, now vacant in this University; and that he has communicated this determination to the students, who, as mentioned in a previous Number, were getting up a requisition to the Faculty of Advocates in his favour.

Perth.—The Scottish bishops have published a synodical letter on the subject of the proposed university in the neighbourhood of this city. It is to be called "The College of the Holy and Undivided Trinity;" and is intended to receive and board from 150 to 200 of youths from eight to eighteen years of age. 6,000*l.* have been already privately contributed; and, when the sum resulting from a public subscription amounts to 20,000*l.*, the edifice, it is said, will be commenced. According to a prospectus of the institution, which accompanies the synodical letter, the purposes to which the funds will be devoted, comprise the providing of a chapel, with halls and other suitable buildings, the salaries of a warden, professors, and teachers, and the foundation of bursaries. Subscribers to the amount of one hundred guineas, and upwards are to have a perpetual right of nomination of young men to the college, with a deduction of 10 per cent. in their favour, from the current rate of annual payment for board and education.

Paisley.—The numerous bankruptcies which have lately occurred in this town, and which have seriously added to the existing distress, have now been followed by the bankruptcy of the Corporation itself. It is stated that on account of the great depression of trade, and partly on account of a run raised by the circulation of some statements regarding the affairs of the Corporation, the Town Council, at a meeting on Wednesday, 22d Dec., ordered the chamberlain to suspend receipt or payment of deposits in the mean time, but to proceed with all possible despatch in realising the outstanding debts due to the community for the regular payment of the interest on the money borrowed, and other current engagements of the burgh. It appears with respect to the finances of the Corporation, that there is a deficiency of income to meet the expenditure by at least 700*l.* annually; that the income is about 3,300*l.*, and the unavoidable expenditure not under 4,000*l.* This unfortunate occurrence, it is feared, will greatly add to the distress of the working classes in this town; the more so, as it is stated that the whole of a local savings fund, amounting to 19,000*l.*, has been thus sunk; that sum, it seems, having been lent to the trustees of the Cart (River) Improvement, connected with the Corporation. The Council having established two savings funds, as part of their system, some confusion appears to have arisen in connexion with these and the National Savings Bank; but it is positively announced that the latter has nothing whatever to do with the corporation.

THEATRICALS.

Drury-Lane.—On Monday evening this theatre was re-opened for dramatic representations under the management of Mr. Macready. The house was filled throughout, and after the national anthem had been sung by the whole strength of the company, an attempt was made to commence the play, which, however, was unanimously resisted until Mr. Macready had obeyed the call for his appearance, when the whole audience rose, and greeted him with long-continued acclamations. The performance selected for the occasion was Shakspeare's *Merchant of Venice*, which was finely illustrated as regards scenery and costume, and as strongly cast as the force of the company would admit. Mr. Macready took the part of *Shylock*, Mr. Phelps played *Antonio*, Mr. Anderson *Bassanio*, Mr. Hudson from Dublin made his *début* successfully as *Gratiano*. *Lorenzo* was personated by Mr. Elton, and *Gobbo* by Mr. Compton. Among the lady performers were, Mrs. Warner as *Portia*, Mrs. Keeley as *Nerissa*, Miss E. Phillips as *Jessica*, and Miss Poole and Miss Gould as *Portia's* "minstrels fair." The play was throughout well sustained, and the acting of Mr. Macready was more especially well received. The play was followed by a pantomime, the usual entertainment at this season of the year, under the title of *Harlequin and Duke Humphrey's Dinner, or Jack Cade Lord of London Stone*. It contained the usual quantity of merriment, and began and ended with considerable spirit and attraction. There was very loud applause at its conclusion, accompanied however with a few hisses. Mr. Macready has carried out several reforms in the general management of the house, and some important changes and improvements in the embellishments and fittings up of the interior have been effected.

Covent Garden.—The subject of the pantomime at this theatre is the old and popular story of *Guy Earl of Warwick, or Harlequin and the Dun Cow*. The adventures of the knight are represented in a very attractive form, and the moving panorama of the beauties of land and sea, sky and night, and day and twilight; the princely hall, battled tower, magic wood, and fairy palace, were all beautiful, and received with great approbation by the audience. In the scenery, indeed, appears to lie the chief strength of the pantomime at this theatre, containing a fine combination of lovely views. The material of the pantomime, however, appeared to want life and energy; the tricks were neither new nor comical, and, if not pronounced a failure, it appeared to be regarded as bearing no comparison to the adjuncts with which it was put on the stage. Some good transformations, however, were made, and the changing of the "Cannon Brewery" into "Prince Albert's Gate," and that of Harris's far-seeing telescope into a view of the "past and future" showing a series of medallion portraits of the Kembles, from "the noblest Roman of them all" to Miss Adelaide—were those which drew down the greatest approbation. The launch of the *Trafalgar* was also a fine *coup d'œil*, and was loudly cheered. Altogether the pantomime was successful, and the house was well filled.

Haymarket.—The performances at this theatre have been the play of *Pizarro*, and a new afterpiece, as a substitute for a pantomime, entitled, *The World of Dreams, or the Man in the Moon*. The former piece was got up with spirit, and its chief characters were well supported: the only novelty, however, was the performance of Mr. Wallack as *Pizarro*, and Mrs. Stirling as *Cora*. Both gave satisfaction to the audience, and Mr. Wallack was called for at the fall of the curtain. *The World of Dreams* is rather a complicated piece. *Violette* (Mdlle. Celeste), the daughter of an aged, blind woman, falls asleep under the Elfin oak tree, on a night in the merry month of May; and, according to the legend, is transferred in body as well as spirit to the moon. Here she inspires the "man in the moon" with the tender passion; and after she has received all manner of civilities at his hands, is sent down again to earth, under convoy of *Andgrim* (Mr. Mitchenson), the spirit of troubled dreams. On her arrival, however, she finds a sale in her mother's cottage, who is herself on the point of being ejected by *Hans Braunwig* (Mr. Strickland), a rich old miser of the village; but the proceedings are stopped on her agreeing to become his wife, which she does to save her mother. The night of the marriage, however, is marked by a catastrophe. The bridegroom is led across moss and moor by an ignis fatuus, while *Violette*, separated from him, is safely reconducted to her mother's cottage. Old *Braunwig* falls asleep at the close of the night, just under the Elfin oak, and is tormented by the spirit of troubled dreams. The piece concludes with the abrogation of the contract of marriage between *Violette* and *Hans Braunwig*, the acceptance of the "man in the moon" by the betrothed bride, and her apotheosis after death. The man in the moon turns out to be a certain *Prince Fazenheim* (Mr. J. Webster), who has been compelled to carry the well-known "bundle of sticks" by a potent enchanter with whom he was at enmity, and all ends happily. The piece was well got up, and was favourably received by a numerous audience.

Olympic.—After the first piece, entitled *Sixteen-string Jack*,—being the history of a highway robber, which has for some time been successfully performed at this theatre, a new pantomime was produced, entitled *Riddle-dee Riddle-dee Riddle-Dum-ree*. It contained a number of devices as to passing events, but the jokes, which were of an ordinary character, were but poorly received. There are few really comic expressions throughout the whole piece; but the superior singing and comic powers of the *Clown* (Mr. T. Mathews) carried it through successfully. There was also some pretty dancing during the *Clown's* feats, which tended to soften the effect of the amusing antics which he played. The pantomime was announced for repetition.

Adelphi.—After the performance of *Barnaby Rudge*, and *Norma* burlesqued, which have been given for some time at this theatre with considerable success, a pantomime of unusual length was produced, entitled *The Little Old Woman and her Pig; or, Harlequin Pedlar and the Magic Petticoat*. This entertainment, purported by the bills to be selected from "the most approved nursery ballads," and its plot appears to consist in the amalgamation of three of these old rhymes, relating respectively to the "Little Old Woman and her Pig," as recited in its title; to the adventures of the old lady whose petticoats were "cut round about" on her way from market; and to the successful destruction of a magic duck upon a magic lake, and by a magic gun. A plot is framed in which a great variety of views are introduced; and with the aid of well-managed scenery, the pantomime, properly so called, is brought forward. Miss Bullin was a pretty and agile *Columbine*, Mr. Frampton made a good *Harlequin*, and Mr. Wieland and Mr. Sanders rendered their respective characters of *Clown* and *Pantaloon* effectively. Some disapprobation, however, was exhibited at the close of the performance, by a very full house, whose patience seemed to have been wearied by the protracted entertainment.

Miscellaneous.

Longevity.—In our last obituary we recorded the death of Mr. George Smart, a gardener, who died lately at the age of 102. We learn from an article in the *Montrose Review* that this patriarchal gardener was born in the parish of Methlick, Aberdeenshire, in November 1739. In the troubles of 1745 he removed with his father to the parish of Fyvie, thence to the parish of Echt, then to the county of Montrose, when he married at the Whiteriggs, in 1777, and went to Stonehaven in 1781; when, after having numbered his 102d year, he, on the 26th Nov., 1841, at last "crossed that bourne from whence no traveller returns." Until within 24 hours of his dissolution he retained all his faculties. He had 11 children, 53 grandchildren, and 8 great-grandchildren, making a family of 72.

Domestic Servants in France.—During a recent trial before the Correctional Tribunal at Verdun, it was shown that out of the 700 domestic servants employed within the town 500 were under suspicion of the police, as being dishonest or immoral. In consequence of this state of things, it has been recommended to bring into force the old law enjoining every servant to be the bearer of a book containing a certificate of character, signed by every employer, without which no servant could obtain a place. This regulation is in force at Bordeaux, and, it is said, works well.

Antiquities.—The French journals inform us that there has been recently found, in a loft at the Ministry of Commerce, a table given by the King of Spain to Henry IV., on occasion of his marriage, and on which the nuptial banquet was served. As soon as the genuineness of this piece of furniture was proved, M. Cunin Gridaine gave orders for its being repaired with the utmost care, in order that it might be placed in the Museum of the Louvre.

Chinese Curiosities.—A singular collection of Chinese curiosities, made by a Mr. Dunn, of Philadelphia, has just arrived in this country, having, by a treasury order, been admitted free. Mr. Dunn, it is stated, has spent considerable time and spared no expense in forming it; and, as giving some estimate of its value, it is added that the French Government have offered 65,000*l.* for it. It is said to present a complete epitome of the various trades and occupations, as well as the progress which the arts and sciences have made in China; and that in every instance where it has been possible, the reality has been obtained; but when that could not be done, an accurate model was procured. A building, near Hyde Park-corner, is in the course of erection, and will be completed in about six weeks, when the collection will be opened to the public for inspection.

MARK LANE, Friday, Dec. 31.—Of English Wheat there is but little offering; prices may be considered nominally the same as last Monday. There has been less business doing in Foreign than we have noticed for some time, which we may attribute in some measure to the holidays. We did not hear of any transactions in Bonded Wheat.—Barley is a slow sale at our quotations.—Peas and Beans are unaltered in value.—Oats are almost unsaleable, although offered at a further reduction.

BRITISH, per Imperial Quarter.

TATTERSALL'S, Thursday.—The betting proved but an indifferent wind-up to the year, there being only three engagements; viz., 1,250 to 50 agst Lord Verulam's Robert de Gorham, 1,300 to 50 agst Mr. Gregory's two (Barrier and Defier), and 25 to 1, to 35*l.* agst Lord George Bentinck's Topsail, the latter for the Oaks. It is not thought probable that there will be any improvement previously to the meeting of Parliament.

GAZETTE OF THE WEEK.

INSOLVENTS.—R. Waters, Newport, Monmouthshire, iron and tin-plate manufacturer—T. Wooster, jun., late of Newcastle-upon-Tyne, Northumberland, but now of Peckham Rye-terrace, Surrey, merchant—T. Forty, late of the Royal Hotel, Richmond, Surrey, hotel-keeper—J. H. Robberds and S. Day, Taverham, Suffolk, paper makers.

BANKRUPTCY ANNULLED.—C. J. Carttar, Greenwich, banker.

BANKRUPTS.—F. T. West, Lambeth, coal-merchant—R. Richards, J. Briant, and J. Coker, Shadwell, Middlesex, ropemakers—W. Horsnaill, Dover, carpenter—J. Fowkes, Beeston, Nottinghamshire, grocer—T. Benrose, Spalding, Lincolnshire, grocer—A. Phillips and J. Phillips, window glass cutters—J. Ford, Bristol, cooper—T. Berriman, Montague-cottage, Camberwell, builder—C. Robottom, Black Bull Inn, Holborn-hill, tavern-keeper—T. Barnsley, Tipton, Staffordshire, engine maker—H. Clark, Fleet-street, brush manufacturer—T. F. Balls, Vassal-road, Brixton, and of Vauxhall-road, Lambeth, coach proprietor—J. Stevens, 1, James-street, Limehouse, brickmaker—J. Gardiner, Cathay, Bristol, common brewer—M. Marshall, Chew Magna, Somersetshire, money scrivener—S. Shingler, Liverpool, linendraper—J. Close, Worcester, glove manufacturer—A. Procter and R. Procter, Kingston-upon-Hull, coach proprietors—E. Whitney, Liverpool, soap boiler—J. Bedford, Hunslet Moorside, Yorkshire, cudbear-manufacturer—W. Biddle, Holborn-hill, fishmonger—S. Shingler and S. T. James, Liverpool, silk mercers—J. J. Lock, Northampton, tea dealer—W. Swift and R. Crampton, Manchester, drapers—G. Carpenter, Chelmsford, chemist—W. Goodwin, Dronfield, Derbyshire, maltster—W. E. Pouten, Ludgate-hill, chemist—T. Humfrey, jun., Great Stanmore, Middlesex, builder—J. Stevens and R. H. W. Drummond, Mile-end, road-contractors—J. Thompson, Blackburn, Lancashire, power-loom cloth manufacturer—J. Newstead and J. Hextall, Regent-street, Middlesex, lacemen—J. Fisher and E. Fisher, Meghtill, Lancashire, spirit merchants—C. H. Weigall, Conduit-street, Regent-street, tailor—C. Hilton, Manchester, cotton manufacturer.

SCOTCH SEQUESTRATIONS.—W. Johnstone, Edinburgh, baker—Russell, Macnish, and Co., and Russell and Macnish, Glasgow; Arthur, Strachan, and Co., London; and Murray, Greig, and Co., Adelaide, South America, merchants—P. Henderson, Perth, coal merchant—A. Bannatyne, Glasgow, grain merchant—P. Lowson, Dundee, shipmaster.

BIRTHS.—On the 23d ult., at Walworth, Mrs. H. Groom, of a son—On the 17th ult., at St. Thomas's, Southwark, the lady of the Rev. W. Deey, of a daughter—On the 23d ult., the wife of W. H. Cary, Esq., of Woodford, of a daughter—On the 29th ult., at Brighton, the lady of J. B. Lousada, Esq., of Oakfield-lodge, Sussex, of a son—At Sydenham, on the 30th ult., the wife of E. D. Colville, jun., Esq., of a son—On the 30th ult., Mrs. W. F. Hodgson, Stockwell, of a son—On the 23d ult., at Maida Vale, Edgware-road, the wife of A. A. Mackey, Esq., of a daughter—On Christmas-day, in Old Burlington-street, the lady of Dr. Aldis, of a daughter—On Christmas day, at the Parsonage, Daresby, Cheshire, the lady of the Rev. Charles Dodgson, of a daughter.

MARRIED.—On the 11th ult., at Fetcham, Surrey, T. E. Eden, Esq., of 6, Langham-place, to Elizabeth, second daughter of the late W. B. Cranfield, Esq., of Askew-villa, Shepherd's bush—On the 22d ult., A. J. Gulston, of Llandilo fawr, Carmarthenshire, Esq., to Augusta Catherine, only daughter of the late Capt. Green, 10th Hussars—At Edinburgh, on the 27th ult., Edw. Fenton, Esq., youngest son of the late J. Fenton, Esq., of Loversall, in the county of York, to Georgiana, the only daughter of Col. J. Camac, of Brettenham park, in the county of Suffolk, and of Woodville, in the county of Wicklow.

DIED.—At Constantinople, on the 1st ult., J. Ponsonby, the only son of S. M'Guffey, Esq., M.D., physician to the British Embassy in that city, aged 29 months—On the 15th ult., at Malta, E. Jacob, Esq., M.A., Fellow of Caius College, Cambridge, and one of her Majesty's Counsel—On the 18th ult., in his 76th year, M. Dyer, Esq., of Eden-place, Old Kent-road, and formerly of Knightsbridge—On the 23d ult., at the Rectory, Everingham, Yorkshire, the Rev. W. Marsden, M.A., aged 32.

Printed by Messrs. Bradbury and Evans, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 3, Charles-street, Covent Garden, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, January 1, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 2. SATURDAY, JANUARY 8, 1842. PRICE 6*d.*

T. AND C. LOCKHART, SEEDSMEN, &c. 156, CHEAPSIDE, LONDON, beg to announce that their LIST OF SEEDS, &c. is now published, and will be forwarded Post-paid on application.—5th Jan., 1842.

MELONS AND CUCUMBERS.

CUTHILL'S EARLY IMPROVED MELON, Snow's Horticultural Prize Cucumber, and Cuthill's Black Spine Cucumber. The above at 2*s.* 6*d.* per Packet each. Lisianthus Russellianus, 2*s.* 6*d.*—James Cuthill, Love-walk, Camberwell, London.

MYATT'S VICTORIA RHUBARB.

J. AND W. MYATT having a good Stock of Strong Roots raised by offsets from the original Seedling, can supply them at 10*l.* per hundred.—N. B. As various spurious sorts have been sold and are now selling under the name of "Myatt's Victoria," purchasers would do well to require them warranted.—Manor Farm, Deptford, Oct. 23, 1841.

SPLENDID SPECIMEN CAMELLIAS.—An Amateur in the neighbourhood of Exeter has a fine Collection of CAMELLIAS, which he intends to dispose of in one lot, having no longer convenience to cultivate them. It consists of fine large specimens of all the best kinds in the highest health, finely set with flower-buds; many of them are quite unique, and will be sold a bargain.—Particulars respecting them may be had on application to LUCOMBE, PINCE, and Co., Exeter Nursery.

Dec 29th, 1841.

APPLEBY'S "QUEEN OF LILACS."—This Dahlia has been pronounced to be in reality the "Queen of Lilacs," by every grower who has seen it, and is sure to give general satisfaction, as there is no Lilac Dahlia out that can be at all compared with it. For a *faithful description* and prices of it, see advertisement in the 47th Number of the *Gardeners' Chronicle.*—N.B. If the above Dahlia does not answer to the description given of it, the price will be deducted.

CHAPPELL'S CREAM BROCCOLI.

CHARLES FARNES, Seedsman, No. 128, St. John-street, London, begs to inform the Public that he has purchased of Mr. CHAPPELL, Market-gardener, Edmonton, the whole of the SEED saved by him this year of that splendid variety of BROCCOLI, which for size and flavour is not surpassed by any kind grown. Also now ready to send out—

Farnes' superior first Early Pea.
Flack's new large Victory do.
Young's do. do. Marrowfat do.
Knight's Dwarf Green do. do.
New Auvergne Pea.
American Dwarf do.
Chappell's Early White Broccoli.
Legg's Early Walcheren Broccoli.
Fine Early Frame Radish.
Ady's fine large Cos Lettuce.
True Brighton do. do.
Black-seed Bath do do.
Imported Early Dutch Turnip.
Imported Dutch Horn Carrot.

BRACHYCOME IBERIDIFOLIA SEED in small packets at 5*s.*, to be had of W. J. NUTTING, Seedsman, 46, Cheapside. Lisianthus Russellianus, 2*s.* 6*d.*; Pink, from fine named flowers, 2*s.* 6*d.*; Calceolarias, from 30 varieties, 2*s.* 6*d.*; Pansies, selected from a few first-rate flowers, 5*s.*; do., from a superior collection, 2*s.* 6*d.*; Dahlia Scapigura Mexicana, 1*s.*; Clintonia pulchella, 1*s.*; Schizopetalon Walkerii, 1*s.*; Phlox Drummondii, 1*s.*; &c. &c.—Packets of the following Cucumbers at 2*s.* 6*d.*: Man of Kent (Barnes'), Victory of Suffolk (Allen's), Prize-fighter, Weedon's Frame, Roman Emperor, and Windsor Prize.

☞ A Catalogue of Seeds to be had on application.

SEEDLING DAHLIAS.

J. BATES, NURSERYMAN AND FLORIST, OXFORD, begs to inform his friends and the public that he has the following New Varieties to send out in dry root immediately, and in plants the first week in May, 1842.

BATES' OXFORD CHAMPION, a seedling of 1840, shaded, claret and purple flower, good depth of petals, and a first rate show flower; height, 4 ft. Stock, 8 roots, 5*l.* 5*s.*, or 10*s.* 6*d.* per plant.

BATES' LADY JULIA LANGSTON, a seedling of 1840; fine large pure white flower, rather low in the centre, but superior to any flower in the class already sent out; height, 5 ft. Stock, 16 roots, 4*l.* 4*s.*, or 8*s.* 6*d.* per plant.

BATES' ALBA PURPUREA SUPERBA, a seedling of 1840, with a dark purple ground, edged and tipped with white, acknowledged by all who have seen it as the best in that character, very constant, always fills and throws its flowers above the foliage, rendering it a most desirable border variety; height, 5 ft. Stock, 15 roots, 3*l.* 3*s.*, or 7*s.* 6*d.* per plant.

COOPER'S MAID OF LANGOTHLIN, a seedling of 1839, but almost lost last year, light rosy crimson flower, fills well in the centre, very constant, a superior show flower; 4 to 5 ft. in height. Stock, 10 roots, 3*l.* 3*s* . or 7*s.* 6*d.* per plant.

JAMES DICKSON & SONS, NURSERY SEEDSMEN and FLORISTS, in returning their sincere thanks for the liberal patronage they have enjoyed from the Nobility, Gentry, and Public at large, both in this country, England, and Ireland, beg respectfully to intimate that they have received their full supply of SEEDS, in fine condition, for SPRING SOWING, of first-rate quality.

From the arrangements they have recently made with some of the first Growers, their Customers may depend on receiving Fresh Seeds of all descriptions, carefully selected for J. D. & S.'s sales.

J. D. & Sons beg to call the attention of their Friends to their Stock of EVERGREENS, FRUIT and FOREST TREES, in their Nurseries of Inverleith and Broughton Park, which will be found equal in quality and extent to any in Scotland.

J. D. & Sons beg further respectfully to intimate that they have considerably extended the Floral Branch of their Business; and they assure their numerous Customers and the Public at large that no pains or expense will be spared by which the efficiency of every department of the concern shall be secured, so as to ensure a first-rate article at the lowest figure.

N.B.—Noblemen and Gentlemen provided with experienced Gardeners, Land Stewards, and Wood Foresters, whose character and abilities may be depended on.

32, South Hanover-street, Edinburgh, Dec. 31, 1841.

JOHN PAMPLIN and SON, NURSERYMEN, Hornsey Road, Islington, begs to acquaint the Dahlia Trade that they have purchased the entire Stock of "The Marquis of Camden" Dahlia, that was raised by Mr. Garratt, of Hampstead, and shown Sept. 7th, 1841, by Mr. Ansell, at the Horticultural Rooms, Regent-street, where it was much admired; and the same evening six Blooms were shown at the Meeting of the Floricultural Society of London, Crown and Anchor Tavern, Strand. (See the Report in the *Gardeners' Gazette,* 11th Sept.) Four Blooms gained the first prize at the Hampstead Floricultural Society in Sept.—Dark crimson, first-rate, cupped petals, throwing all blooms out of the foliage, with a long, stiff stalk; always to be depended on for a show flower. Five ground roots to be parted with, at 5*l.* 5*s.* each, Plants in May, 10*s.* 6*d.* each. The Stock is only Six Ground Roots and Two Pot do. Early orders, to prevent disappointment. Ready Money from unknown correspondents.

DAHLIAS.—J. KEYNES, on announcing his Catalogue of Seedling Dahlias for 1842, most respectfully begs to offer his acknowledgments to his Friends whom he had the honour to supply with Plants last season. J. KEYNES begs to assure them it shall be his study to send out nothing but First-rate Show Flowers, in accordance to which the new Flowers advertised by him are all *warranted as such.* Catalogues containing all the best varieties which were exhibited by J. KEYNES at nearly all the principal Shows in the Kingdom, obtaining Sixteen Prizes, Eleven of which were First, may be had on application. Amateurs intrusting to him their orders, either for the old or new sorts coming out, may depend on nothing being sent them but Show Flowers and extra fine Plants, such as they may depend on for Blooming.

Plants in May as usual.

DODD'S PRINCE OF WALES.

Clear bright circular *Yellow,* most decidedly the best ever offered to the Public, combining every quality necessary to constitute a first-rate Show Flower. Great depth of petal, form unrivalled and not to be surpassed, fine centre always full, never showing the eye, most certain, and open to show Twelve Blooms against any yellow in the world; obtained the following Prizes:—

First	Prize,	Salisbury Plain, .	August	1840.
First	,,	Bath, . . .	Sept.	1840.
Third	,,	Salisbury Plain, .	August	1841.
First	,,	Chippenham, . .	Sept.	1841.
First	,,	Bath (Victoria Park),	Sept.	1841.
Second	,,	Calne, . . .	Sept.	1841.
First	,,	Bath (Sidney Gardens),	Sept.	1841.
Second	,,	Salisbury, . .	Sept.	1841.
Fourth	,,	Salt Hill, . . .	Sept.	1841.

Plants in May, 10*s.* 6*d.* Warranted by J. Keynes.

KEYNES' PRINCESS ROYAL.

Blush deeply tipped with Purple; quite a new variety, and first-rate, was exhibited only at Bath, where it obtained the Second Prize. There being but *Two* roots of this variety, early orders only will insure Plants.

Plants in May, 10*s.* 6*d.* Warranted by J. Keynes.

YOUNG'S TWYFORD PERFECTION.

Dark Puce shaded with deep Crimson; perfectly round full centre well up, one of the most perfect shell-petals ever seen. This beautiful variety was raised from Egyptian King by Mr. Peter Young, of Twyford, near Winchester, who is well known as an established Florist.

Plants in May, 10*s.* 6*d.* Warranted by J. Keynes.

ADAMS' PRINCE ALBERT.

Fine shaded Bronze: quite distinct variety; most perfect petal, and first-rate noble show flower. Second prize Salisbury Plain. Warranted first-rate; 4 ft.; plants, 10*s.* 6*d.*

HALL'S WESTBURY RIVAL.

Fine bright Puce; very constant; full high centre; decided improvement on President of the West, one of the finest selfs of the season; new colour. Warranted first-rate, 4 ft.; plants, 10*s* 6*d.*

Pot and Ground-roots of all the fine varieties of last year at moderate prices, on application. Salisbury, Nov. 10th, 1841.

DANECROFT NURSERY, STOWMARKET.—SAMUEL GIRLING, impressed with gratitude to his numerous friends, both British and Foreign, begs to return his sincere thanks for the distinguished patronage he has been so liberally favoured with, having sold at least 2000 more Dahlia plants this than in the previous year; it will be his constant study to do all in his power to merit a continuance of their support. Having made arrangements for a supply of plants from distant growers of nearly all the leading sorts in new flowers coming out next May, except from unseen accident or loss of stock, he can engage to supply all orders committed to his care without disappointment. S. G. has 10 superior SEEDLINGS coming out in May next, in some points, perhaps, considered a little short of first-rate, but every one of them will be found serviceable to all growers for competition, however limited the number shown. The prices at which they are advertised may, in the opinion of some people, condemn them, but he confidently recommends them, not wishing payment till blooming season; and should any one fall short of the description given, it will be deducted from the account entirely; the price separately, 7s 6d. per plant. Any Amateur taking the set of 10 will be charged 3*l.* or for 6 selected plants, 1*l.* 18*s.*

Thankful for past, and solicitous for future support, I am, gentlemen, your obedient servant, SAMUEL GIRLING.

	s.	*d.*
No. 242. CAPTIVATOR—Bright Pink, finely shaded with dark Crimson, well up in the centre, excellent habit, and fine show flower; four feet	7	6
169. LOUISA—Dark Nankeen, very constant, well cupped, and good show flower; three feet	7	6
52. PLOUGHBOY—Fine Purple Rose, free bloomer, beautifully up in the centre, colour of Amato, constant, and desirable show flower; has taken two first Seedling prizes; four feet	7	6
36. GIPSY MAID—Bright Purple, shaded and striped with Crimson, profuse bloomer, a little pointed, but a desirable and useful show flower; three feet	7	6
29. FAVOURITE—Buff, fine round cupped petal, well up in the centre, rather uncertain, new in colour, when caught, the best flower of its class; three feet	7	6
9. LIBERTY—Bright Lilac, large and well-formed, free bloomer, good centre, and fine back-row show flower; four to five feet	7	6
PRINCE OF WALES—Dark Purple, finely shaded, well cupped, short round petal, superior form, and most desirable show flower; four feet	7	6
ANNA MINERVA—A Bright Rose, free-bloomer, well cupped and constant, good show flower. Seedling prize at Bury and Stowmarket; three to four feet	7	6
NANETTE—Buff, shaded with Pink, good habit, well cupped petals, free-bloomer, flowers well up, a superior show variety; three to four feet	7	6
SAMBO—Very dark, well cupped, good habit, and constant show variety; four feet	7	6

The four last are Seedlings of 1840, bought in and warranted by the raisers to be superior show flowers; have been seen and approved by many growers in the neighbourhood, and highly deserving a place in every collection. The first six are selected from many thousand Seedlings of 1840, and raised by S. Girling. The stock of nearly all being limited, early orders are solicited to prevent disappointment.

The fancy seedling varieties, sent out by S. Girling last May, as superior border flowers, will, in May next, be sent out, adding two varieties of fancy kinds, for 18*s.* the dozen, or 12*s.* for the best six. Every kind of Dahlia worthy of cultivation will be sent out at moderate prices in May 1842. S. G. has a few of the leading kinds in dry roots to part with, at moderate prices. His Catalogue of Geraniums, Pansies, and Verbenas can now be had, on pre-paid application. Foreign orders faithfully executed.

Robinson's Northern Beauty Dahlia. S. Girling having purchased the entire Stock of the above Dahlia, plants will be sent out in May next at 10*s.* 6*d.* each; admitted to be one of the most distinct and beautiful Dahlias to be sent out next season. For particulars refer to the "Floricultural Cabinet" of January next. It took the 5th Prize at Salt Hill open Show in September last and was generally admired.

WANTS a SITUATION as GARDENER, a Middle-aged Married Man, without incumbrance, who perfectly understands his business in every department—as Forcing, Framing, Kitchen Garden, Pleasure Ground, Farming, &c.; his wife could take care of the Dairy, Poultry &c. The Advertiser has lived in his last place eight years, and can be highly recommended.—Direct to G. C., at the Post Office, Church-street, Chelsea.

WANTS a SITUATION as GARDENER in a Nobleman or Gentleman's family, a single middle-aged man, master of his business in all its various branches, who can be well recommended from the last situation he has just left. Direct to A. B., at Mr. Grimes', post-office, Hornsey, Middlesex.

TO NURSERYMEN AND OTHERS.

WANTED, a FINE STRONG PLANT of ARAUCARIA IMBRICATA, from 18in. to 3ft. high. Any one having such to dispose of, may hear of a purchaser by stating the height in inches and the price.—Direct to W. Bassett, Westonbirt, Tetbury, Gloucestershire.

DAHLIAS.

W. R. WHALE begs to announce to the Floricultural World in general, that he intends to send out the next approaching season three varieties of New and Splendid Seedling DAHLIAS, which he trusts will give general satisfaction, equal to his three former Flowers, which he has had the honour of sending out to his numerous friends—viz. President of the West, Phenomenon, and Royal Standard. W. R. W. had not an opportunity of exhibiting them at the different shows of last season, in consequence of a heavy family affliction; but those friends who saw them growing can vouch for their superiority.

1st—ATTILA: A Lilac, shaded with bright Rose, a decided improvement on Lady Cooper, being possessed of a full centre and a greater depth of petals, an abundant bloomer and good habit, took the first prize at Marlborough and first at Andover in 1840, the only places ever exhibited at. Height 4 to 5 feet. Price, 10*s.* 6*d.*

2nd—CHANCELLOR: A rich glossy Crimson, shape of Springfield Purple, full centre, and a fine-cupped Shell Flower. Height 4 to 5 feet; 10*s.* 6d.

3rd—MARCHIONESS OF AYLESBURY: A clear white ground, beautifully tipped with bright scarlet, good centre, a most pleasing variety, and an abundant bloomer, a good back-row flower. In consequence of the Stock of Roots being small, and orders already numerous, this variety will not be sent out before the third week in May. Height 4 to 5 feet; 10*s.* 6d.

Eltco, Newbury, Berks, December 1841.

THE ANNUAL DINNER of the SUBSCRIBERS to, and FRIENDS of, the GARDENERS' BENEVOLENT INSTITUTION, the MEMBERS of the FLORICULTURAL SOCIETY of LONDON, and the NURSERYMEN, GARDENERS, and AMATEUR FLORISTS of GREAT BRITAIN, will take place at the CROWN and ANCHOR TAVERN, STRAND, on THURSDAY, the 13th of JANUARY, 1842, at Four o'clock. PROFESSIONAL SINGERS will attend.

The GENERAL MEETING of the GARDENERS' BENEVOLENT INSTITUTION, the FLORICULTURAL SOCIETY of LONDON, and ANNUAL MEETING of the TRADE, at One o'clock the same day.

Dinner Tickets 12*s.* 6*d.* each (including a bottle of wine), may be obtained of the following Members of the Committee:—

Messrs. BEATON, Shrublands, near Ipswich; BRISTOW, Knightsbridge; CHANDLER, Vauxhall; CHARLWOOD, Covent-garden; GAINES, Battersea; GREGORY, Cirencester; HENDERSON, Pine Apple-place; LOW, Clapton; MOUNTJOY, Ealing; NOBLE, Fleet-street; OSBORNE, Fulham; ROGERS, Eaton square; SMITH, gardener to Lord Tenterden, Hendon; THOMSON, Iver; TOWARD, gardener to H. R. H. the Duchess of Gloucester, Bagshot Park; WARNER and WARNER, Cornhill; WATERER, Knapp-hill, Bagshot.

Of Messrs. ATKINS, Northampton; DAY, Oxford; DICKSON, Acre-lane, Brixton; FLANAGAN, Mansion-house-street; GARRAWAY and Co., Bristol; GIRLING, Stowmarket; MACKAY, Badmington; NUTTING, 45, Cheapside; OGDEN, Coventry; ORSON, Orange row, Kennington; WOOD & SONS, Maresfield; at the GARDENERS' GAZETTE Office, 320, Strand; of Mr. WILDMAN, Hon. Sec. of the Floricultural Society, Grove place, Southampton-street, Camberwell; and of Mr. BOWLER, Hon. Sec. of the Benevolent Society, Albany-road, Kent-road.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE that entitle the assured *to participate in the profits,* as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The BONUS declared in 1834 amounted upon an average to 16*l.* per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31*l.* per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam-vessel) from any one Port thereof to another during peace, to Assurers not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

HEATING BY HOT WATER, WITH THE CIRCULATION OF ATMOSPHERIC AIR.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER; see the 3rd and 37th Numbers of the *Gardeners' Chronicle.*

References may be had, and their works seen, at Mr. Perry's Nursery, Banbury; Mr. Green's, Lower Cheam; Messrs. Henderson's, Pine-apple Nursery; Messrs. Rollisson's Nursery, Tooting; Mr. Knight's Exotic Nursery, Chelsea; Messrs. Low's, Clapton Nursery; Mr. Catleugh's Nursery, Chelsea; Mr. Gaines's Nursery, Battersea; Mr. Buck's, Portland Nursery; Mr. Young's, Milford Nursery; Mr. Smith's Nursery, Dalston; Mr. Woodroff's Nursery, Kensall Green; Mr. Hopgood's Nursery, Bayswater; Mr. Willmer's Nursery, Chelsea; and at most of the Nobility and Gentlemen's Seats in the country.

Every particular to be had at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

IMPORTANT TO THE NOBILITY, GENTRY, AND LANDED PROPRIETORS IN GENERAL.

DONALD and SON, (Goldworth Nursery, Woking, near Ripley, Surrey, have to dispose of from 2000 to 3000 handsome ENGLISH OAKS, from 9ft. to 16ft. high, and from 2in. to 5in. in circumference, at 1*s*. 6*d*. each, if taken one with the other; or, if not, at 1*s*. to 2*s*. 6*d*. each. They were large when quartered, and have excellent spreading roots.

EXOTIC NURSERY, CANTERBURY.

WILLIAM MASTERS having for many years cultivated upwards of THIRTY ACRES of Land as Nursery Gardens, begs to submit to the public the following List of Fruits:

PEARS.—W. M. having collected in the first instance, through the kindness of the late J. Braddick, Esq., and subsequently from his own personal visits to the Netherlands, a large collection of the celebrated FLEMISH PEARS, as well as many others from various sources, planted a specimen of each variety in his Nursery, and they having for several years produced fruit, he is enabled to pronounce with certainty that many are wholly worthless—some are too tender for our exposure—and that many are of the utmost importance on account of their prolific and early bearing, as well as of their delicious flavour. Out of a very large collection W. M. confidently recommends the following, which become fit for use nearly in the order in which they stand:—DESSERT PEARS.—Madeleine, Jargonelle, Williams' Bonchrétien, Flemish Beauty, Rouppé, Capiaumont, Beurre Diel, Autumn Bergamot, White Doyenne, Marie Louise, Princess of Orange, Seckle, Monsieur le Curé, Althorp Crassane, Bezy de la Motte, Napoleon, Duchess of Angoulême, Louise bonne de Jersey, Knight's Monarch, Rouse Lench, Swan's Egg, Beurré d'Aremberg, Nutmeg, Ne plus Meuris, Passe Colmar, Winter Nelis, Hacon's Incomparable, Beurré Rance, Easter Beurré. BAKING PEARS.—Royal Coreless, Double de Guerre, Uvedale's St. Germain, Catillac. Many other sorts are still cultured, but a garden furnished with these will produce fine fruit for every season.

APPLES.—W. M. having been a Fellow of the Hort. Society nearly from its commencement, has availed himself of the privilege of selecting from that liberal establishment such sorts of Apples as appeared to merit particular notice, and which, added to the selections from the famed Kentish orchards and elsewhere, have produced a number far exceeding the point of usefulness. The whole have been fruited, and the following condensed list is particularly recommended. The sorts are arranged as nearly as possible in the order in which they become fit for use:—Juneating, Borowitski, Kerry Pippin, Quarrenden, Hawthornden, Keswick Codlin, Franklin's Golden Pippin, Summer Nonpareil, King of the Pippins, Beauty of Kent, Gloria Mundi, Downton Pippin, Hughes' Golden Pippin, Ribston Pippin, Blenheim Orange, Margil, Sam Young, Scarlet Pearmain, Dumelow's Seedling, Forman's Crewe, Beachamwell Seedling, Dr. Harvey, Lemon Apple, Pile's Russet, Screivton Golden Pippin, Cornish Gilliflower, Scarlet Nonpareil, Knight's Ganges, Court of Wick, London Pippin, Walmer Court, Canadian Reinette, Alfriston, Court Pendu, Cockle Pippin, Hubbard's Pearmain, Old Nonpareil, Downton Nonpareil, Braddick's Winter Nonpareil, Collins' Russet, Golden Harvey, Dutch Mignonne, Hunt's Green Newtown, Norfolk Beaufin, French Crab. With the above selection, fruit for all purposes and all seasons may be obtained.

CHERRIES.—Purple Griotte, Early Black, Masters' White Heart, Elton, Black Eagle, May Duke, Kentish, Black Tartarian, Canterbury Black, Bigarreau, Late Duke, Florence, Small Morello, Large Morello. The above have proved the most valuable out of a large number of sorts.

PLUMS.—Lawrence's Early, Early Orleans, Hâtive Royal, Orleans, Denyer's Victoria, Greengage, Nectarine, Washington, Black Griffin, Catherine, Coe's Golden Drop, Imperatrice, Winesour, Large Bullace, Damson, Small Bullace.

Of PEACHES the following have given most satisfaction:—Early Ann, Grosse Mignonne, Early Newington, Noblesse, Red Magdalen, Old Newington, Admirable, Royal.

Of NECTARINES—The White, Elruge, Roman, Newington, Violet Hâtive.

Of APRICOTS—The Hemskirke, Large Early, Moorpark, Breda, Orange.

Of STRAWBERRIES—Grove-end Scarlet, Roseberry, Old Pine, Keen's Seedling, Myatt's Pine, Downton, Elton.

Of GRAPES Miller's Burgundy, Sweet water, Muscadine, Black St. Peter, White Cluster, Esperione, Hamburgh, Frontignan, Muscat of Alexandria, Verdelho, Horsforth Seedling, Black Damascus.

Of GOOSEBERRIES, selected out of 80 kinds—Early Green, Early Red Rough, Queen of Sheba, Lady Delamore, Warrington Red, Rookwood, Roaring Lion, Gunner, Duke of York, Crown Bob, Woodward's Whitesmith, Heart of Oak.

Of NUTS—Cosford, Frizzled, Dwarf Prolific, Knight's Large.

Of RASPBERRIES Red Antwerp, White Antwerp, Barnet.

Of FIGS—Lee's Prolific, Brunswick, Common Purple, Brown Naples, Black Ischia, French Prolific.

W. MASTERS offers the above List of Fruits, all of which are grown, and nearly the whole of which have been proved in his Nursery, as a more complete one than those usually submitted to public notice.

*** Early Commissions will insure immediate attention.

SLATE CISTERNS, SHELVES, TROUGHS, &c., for Horticultural purposes.—EDWARD BECK, Manufacturer, Isleworth, near Brentford. Orders, Working Drawings, &c., forwarded by post, will receive due attention.

*** Slate Edgings for Flower Borders, &c.

AUSTRALASIAN, COLONIAL, AND GENERAL LIFE ASSURANCE AND ANNUITY COMPANY.

Secretary, Edward Ryley, Esq.

The following are specimens of the low rates of Premiums for the Assurance of 100*l*., which the method of Investment in Australasia adopted by this Company enables it to offer to the public.

Age . . .	20	30	40	50	60
Annual Premiums	£1 10 3	£2 0 7	£2 15 3	£4 1 8	£6 3 9

To EMIGRANTS to the Australasian Colonies, the Company offers the permission to proceed to and reside in any of those Colonies without extra Premium, and to pay their Premiums and obtain a Settlement of their Claim in the same. For Residence in New Zealand a moderate extra Premium is charged.

To ALL PERSONS the Company offers the advantages of the guarantee of an ample subscribed Capital,—of permission to retain one-third of the Premium in their own hands the portion so retained, with interest upon it, being deducted from the Policy when it becomes a claim,—of Ascending, Descending, and other Scales of Premiums, and of Participation in Profits.

Prospectuses and full Particulars may be had at the Offices of the Company, No. 126, Bishopsgate-street. By order of the Board.

GEORGE FREDERICK YOUNG, Esq.

1. The Court of Directors of the New Zealand Company hereby give notice, that a limited number of allotments of preliminary Lands, each of which consists of three sections, viz., one acre of Town Land, fifty acres of Suburban Land, and one hundred and fifty acres of Country Land, are still open for Sale in their second Settlement of Nelson. The price of each allotment is 300*l*.

2. These allotments were unsold when the general ballot for priority of choice was held on the 30th August last; nevertheless the numbers which represent them in the original Registry of applications were placed in the wheel with all the other numbers, and the unsold numbers were drawn promiscuously with those which had been previously disposed of; consequently, to each of the unsold numbers definite rights of priority of choice (distinct in respect to each of the sections above described) have been attached by the ballot.

3. Until further notice, any party, or his agent, attending at the New Zealand House on any Thursday at three o'clock p.m., and producing the receipt of the Company's Bankers, Messrs. Smith, Payne, and Smiths, for 300*l*., will be entitled to draw in the presence of the Court of Directors, from a wheel in which the registry numbers of all unsold allotments have been deposited, with special precautions for their security and for the fairness of the proceeding. The register of the original ballot will then show to the party drawing any number, to what rights of priority of choice he is entitled.

4. Applicants, therefore, will obtain preliminary allotments, on precisely the same terms, with respect to price and the chances of priority of choice, as original purchasers.

5. A list of the registry numbers, with the rights of choice which were attached to each by the original ballot may be seen at the New Zealand House, on application to the Secretary.

6. Present purchasers will be entitled to the same privileges, in respect to an allowance for cabin passengers (not exceeding 25 per cent. on the purchase-money), as those who bought allotments before the general ballot.

7. Purchasers not proceeding to New Zealand will be entitled to delegate their rights of choice to any agent whom they may nominate; or, if they should prefer it, such choice will be exercised on their behalf by the officers of the Company.

By order of the Court,
New Zealand House, JOHN WARD,
Broad-street-buildings, 1st Jan., 1842. Secretary.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained to any size of JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

EXPIRATION OF LEASE AND SALE OF NURSERY STOCK.

To Noblemen and Gentlemen, Public Companies, Nurserymen, Gardeners, and others,

MESSRS. PROTHEROE and MORRIS have received instructions from Messrs. Buchanan and Co. to announce for Sale by Auction early in February the valuable stock growing upon that portion of their Nursery situated in Wyndham Road, Camberwell, the lease thereof having expired, and being required for building purposes. The stock will be found to be remarkably thriving and healthy, consisting of the greatest variety of Ornamental Trees, Shrubs, Evergreens, Roses, American Plants, and Fruit Trees, ever offered to the Public by auction.

Noblemen and gentlemen, and the proprietors of public gardens, will find this a most desirable opportunity of enriching their collections with many scarce and valuable hardy trees and shrubs. There are several splendid specimens of Cratægus and other ornamental trees; also fine Beech hedges. A considerable portion of the stock will be lotted, to suit those gentlemen who have only a limited space adapted for horticultural purposes. Catalogues and further particulars will be announced in a few days. In the mean time the stock may be viewed by application to Messrs. Buchanan and Co.

BRITISH SHEET-GLASS for HORTICULTURAL PURPOSES.

NOBLEMEN, GENTLEMEN, and HORTICULTURISTS generally, are respectfully informed that they may be furnished with Lists of Prices, and every particular regarding the above article, which has been adopted so successfully at Chatsworth, upon application to J. DRAKE, Plate and Crown Glass Warehouse, 8, Jermyn-street, St. James's, and 100, Edgeware-road.

Orders for small or large quantities of Glass for Lights or Houses accurately cut to the required size, and punctually executed upon the lowest wholesale terms. Window Lead, Solder, Putty, Prepared Cement, and every requisite for Garden Glazing.

PATENT ASPHALTE PROTECTING MATERIAL.—Extract from *Gardeners' Chronicle*, Dec. 25, 1841, p. 843.—"In the midst of frost it will not be unseasonable to warn all our Readers of the great importance of preventing their more tender Plants that may have been frozen from being thawed suddenly by the sun. All Gardeners know how often Peas frozen below a south wall are killed, and that if any contrivance to prevent their being suddenly thawed is made use of, they recover. What is true of Peas is, to a great extent, true of other things. A few weeks ago we had a severe frost, 16°; at that time young Araucarias exposed to the south died, while others within a few yards, but screened from the sun by stone, did not suffer at all. We may remark by the way that CROGGON'S ASPHALTE ROOFING forms a most excellent material for such screens." In page 8 of same Journal, Jan. 1, 1842, is fully described the purposes to which it is applied by the Royal Horticultural Society. Being a non-conductor it effectually protects from heat or cold.—THOMAS JOHN CROGGON, 8, Ingram-court, Fenchurch-street, London.

THE NONCONFORMIST, a Weekly Metropolitan Newspaper.—This Paper—commenced on the 14th April, 1841, containing a full digest of News clearly arranged, and more Original Matter than any similar Journal—has already taken the position of an established organ of Liberal principles both Political and Ecclesiastical. The numerous quotations from it by the contemporary press of all parties—its rapidly increasing circulation—and the unsolicited testimony to its character furnished by several of the leading men of the day, have stamped the NONCONFORMIST as a paper worthy the support of all classes interested in promoting the cause of civil and religious liberty.

The NONCONFORMIST contains 16 pages ("Spectator size), Price 6*d*. Published every Wednesday afternoon at the Office, 4, Crane Court, Fleet-street, and may be had of all News Agents.

In one small volume, price 15*s*.

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, an Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur or Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. Andrews, Bond-street; Orr & Co., Paternoster-row.

In cr. 8vo. 4*s*. 6*d*. bd. with 220 Diagrams engraved for the work.

EUCLID'S ELEMENTS OF PLANE GEOMETRY; with Explanatory Appendix, and Supplementary Propositions for Exercise. Adapted for the Use of Schools, or for Self-instruction. By W. D. COOLEY, A.B., author of the "History of Maritime and Inland Discovery."

"This is the best edition of the Elements which has yet appeared."—*Athenæum*. "For brevity, clearness, and discerning attention to the wants of learners, cannot be easily surpassed." —*Dublin University Mag.*

II.

Uniform with the "Elements," price 3*s*. 6*d*.

COOLEY'S GEOMETRICAL PROPOSITIONS DEMONSTRATED; or a Supplement to Euclid: being a KEY to the Exercises appended to the "Elements," for the use of Teachers and private Students. Upwards of 120 Propositions deduced from the first Six Books of Euclid, are illustrated in it by new diagrams.

"Will be found of considerable value as an aid to Teachers of the Mathematics."—*New Monthly Mag.*

III.

In foolscap 8vo, price 1*s*. 6*d*.

COOLEY'S FIGURES OF EUCLID; being the Diagrams Illustrating the "Elements," with the Enunciations, printed separately for use in the Class-room.

*** Orders received by all Booksellers.

IV.

FUN FOR THE FIRESIDE!!

Bound in cloth, price 5*s*. 6*d*.,

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation. But that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiæ.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself, and everybody else, is perfectly familiar with its contents . . . . and yet if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."

V.

One Volume, price 7*s*. 6*d*.,

THE LIFE AND TIMES OF RIENZI.

"Not less interesting than Sir E. Lytton Bulwer's eloquent Romance, and scarcely less romantic, is this historical record of the Conspiracy of Gabrini."—*Monthly Repository*.

"To all who have read Sir E. Lytton Bulwer's 'Rienzi,' its perusal is, in a measure, a duty."—*Spectator*.

"A curious and pleasing volume, and full of matter of historical character and illustration."—*Literary Gazette*.

"The publication of this work is well timed . . . . The Life of Rienzi is to us full of interest."—*Athenæum*.

"Those that wish to become acquainted with the true history of a man who was, in some sort, the *Napoleon* of his own age and country, would do well to consult the extraordinary narrative of the 'Life and Times of Rienzi.'"—*Tait's Magazine*.

Whittaker and Co., Ave-Maria-lane, London.

This day is published, price 6s. cloth,
THE HAND-BOOK OF CHEMISTRY; with a complete Index of reference. By G. H. CAUNTER, Esq.
London: W. S. Orr & Co.; and W. & R. Chambers, Edinburgh.

The Gardeners' Chronicle.

SATURDAY, JAN. 8, 1842.

MEETINGS IN THE ENSUING WEEK.

Tuesday	Zoological	8½ P. M.
Wednesday	Medico-Botanical	8 P. M.
Thursday	Gardeners' Benevolent	1 P. M.

WITHOUT entering into the entangled and vexed question of CORN-LAWS—which, fortunately, is not our vocation—we may be permitted to express a decided opinion that some more efficient means of increasing the produce of land than we at present employ *must* be introduced. To this we will also add, that no reasonable doubt can be entertained that it *may* be introduced. The extravagant manner in which the substances fitted for this purpose are wasted, and the rude mode of preparing that which is principally employed, can only be tolerated where food is more abundant than the demand for it, and cannot possibly go on in a densely-populated country like England unless half the inhabitants are famished.

This is evidently also the conviction of the farmers themselves, and their landlords; and hence the eagerness with which the important works of Liebig, Sprengel, Cuthbert Johnson, and others have been read, in the hope of discovering some method of augmenting the efficacy of those manuring substances we possess: hence, too, the unexampled demand for nitrate of soda, guano, and other powerful foreign substances.

We have now to announce to our readers the result of the application of science to the art of manuring, in the form of a report made to the Bath and West of England Agricultural Society, by Mr. G. Webb Hall, as given in the *Bath Chronicle*. The substance of this report is as follows:—

In 1827, a piece of land (from which four successive crops of wheat have since been taken) was sown with barley after being manured with ashes obtained by burning the weeds from the ground: the produce did not amount to four sacks of barley per acre. In 1838, 1839, and 1840, it was sowed with spring wheat, manured only with a new manure, and lime and ashes procured as above. The crop after the first year was 5½ sacks; in the next, 6; the next also 6, averaging 64 lbs. per bushel; and in 1841, the crop while in straw was calculated at seven sacks per acre. The crop of straw in each year was exceedingly heavy, quite equal alone in value to any one entire crop of grain or other produce grown on the land during the previous nine years. The last time, prior to 1838, this piece of land was sown with wheat, was about eight years ago, after a summer fallow, and then it did not produce four bushels per acre; in fact, the crop was so bad that the farmer who rented it did not think it worth reaping, and had it cut with a scythe. There has been no stable or farm-yard manure put on this piece of land since that time; there has been no manure on it of any description that could have produced this improvement, excepting that which is referred to, and that only in small quantities, and imperfectly got up; and notwithstanding these successive crops, the land on which they grew is so increased in productive value as to be worth double at least that immediately adjoining. In 1836 the value of this land was taken by Mr. Armstrong, of Bristol, an eminent land-surveyor, at 15s. 6d. per acre."

Such was the statement read by Mr. Webb Hall, a gentleman of unquestionable veracity; who added, that he had himself verified a part of it, and that others present at the meeting would testify to the remainder. There could be no doubt, that by the application of the manure in question, land valued at 15s. 6d. an acre *had been made to carry wheat four years successively*, and that the last year it bore more than the first; and this, too, *by sowing three pecks and a pint of seed, instead of ten pecks an acre.* Samples of the straw and the corn were produced, and appeared of the best quality.

It did not transpire how the manure was made; but it was mentioned that a Mr. Daniel, of Twenton, had prepared it; that it was a carbonate of ammonia; that it could be manufactured at so cheap a rate, that 20s. worth would suffice for an acre, and that it could be obtained to an extent almost unlimited.

Here then, almost at the outset of a scientific inquiry into the preparation of manures, is a discovery by which, upon the best and most disinterested testimony, the produce of wheat is capable of being increased sixfold!

It would seem that, in this instance, the manure is a combination of carbonic acid and ammonia; but we are much inclined to suppose that a mixture of sulphuric acid and ammonia would be as energetic; and we have some reason to believe that reports upon the extraordinary efficiency of this kind of manure, formed by the mixture of gypsum and urine, will, before many months, be made by at least one practical agriculturist.

At all events, the fact that we now lay before our readers ought to show them that our present practice with regard to manure is immeasurably inferior to that which must be very soon universally adopted.

THE death of the late Professor Don has created a vacancy in the Librarianship of the Linnean Society, and in the Professorship of Botany at King's College. It is rumoured that Mr. Babington, of Cambridge, has offered himself for the latter office, and we know that two candidates for the former are recognised by the Council, namely, Mr. Kippist, who was Mr. Don's assistant, and Dr. Leman, a gentleman of education, and considerable scientific knowledge as a botanist. We also learn that the Council of the Linnean Society are divided in their views as to the eligibility of the two candidates. Upon this subject, then, we beg to make a few remarks.

The Linnean Society is one of the most respectable of the scientific bodies of London, whether we regard the members who constitute it, or the proceedings which it has published. It is entitled to the support of all Naturalists, as being the repository of the papers and books of Linnæus. But we regret to add that its finances are by no means flourishing, and that it requires more than all the support which its friends can give it. We shall not enter at present into the cause of this, the first Natural History Society of the country, declining, at a time when all branches of Natural History are cultivated in an unprecedented degree. We shall for the moment only ask the Fellows of the Society to consider well what they are doing in the election of Mr. Don's successor.

We have stated who the two candidates are; let us add a few words concerning their respective fitness for the office they seek. Mr. Kippist is acquainted with the business of the Society, is diligent, zealous, and very respectable,—but he is a mere lad. Dr. Leman, on the other hand, is a travelled Naturalist, an experienced Botanist, a man of education, and a gentleman. Can any member of the Linnean Society doubt which it is the interest of the Society to elect? We think not. If any one supposes that the failing fortunes of the Society are to be supported by the election to the most responsible office it has of a mere boy, however respectable, he must have a strange idea of human nature. With what satisfaction, let us ask, can any Fellow of the Society consult the library if he learns that all his inquiries are to be addressed to a lad without experience? What kind of appearance will it have with foreigners who visit England, to find the representative of the Linnean Society such a youth as one of the candidates? And yet some persons—well-meaning but unwise friends of the Society—are bestirring themselves in favour of Mr. Kippist, at the election, which is expected to come on at the next meeting, on January 18th. We, therefore, as sincere well-wishers to the Society, would call on all persons who possess votes to record them for Dr. Leman.

We wish Mr. Kippist well, we have not a word to say against him as the Assistant, and some years hence he will be eligible as librarian; but if he is wise, he will not now persevere in a contest which, if successful, can only injure the Society under which he would have to act.

IN a treatise upon Foresting, the most logical mode of proceeding would be to begin with the beginning, when the seed is sown, and to end with the end, when the forest-tree is fully grown. But as the observations we at present propose to offer are not of so formal a character, we may be permitted to treat the subject in a more desultory manner, and to commence with the very important question of thinning plantations—an operation best performed at the present season.

To look at the plantations in some parts of the country, it seems evident that their owners are not aware that crowding trees together ruins them; for acres of land may be found in which the trees of all kinds have run up to the state of hop-poles. In some instances this has been done under the impression that the first thing to secure is a straight stem, and that when that has been gained, by compelling the trees to maintain a crowded growth, they can then be thinned at any time—a most fatal error.

Let any one take a handful of mustard-seed, and with it sow two contiguous patches of ground, very thickly, so that when the seedlings come up they may be excessively crowded. Leave the plants in one without thinning, and from the other patch continually remove so many as will allow the remainder of the plants to touch without crowding each other. At first both patches will present the appearance of greenness and vigour; but by degrees the crowded plants will become more crowded, their green will change to yellow, their growth will be arrested, and in no great time a large proportion will die; or if, when this yellow state has been brought on, they are then thinned, the plants that remain will never lose their original feebleness of habit. None of these symptoms of disease will, however, present themselves among the plants in the patch regularly thinned, where, on the contrary, the vegetation will be healthy and uninterrupted to the last. For this there are two reasons. In the first place, the soil can only yield a certain quantity of food to the plants that occupy it; the food may be enough for ten individuals, but not for a hundred, and may therefore prove an abundance in the one case, and cause a famine in the other. In the next place, the life of a plant cannot be maintained unless the leaves are fully exposed to light and air, which will happen when plants are sufficiently separated, but will be prevented when they crowd each other.

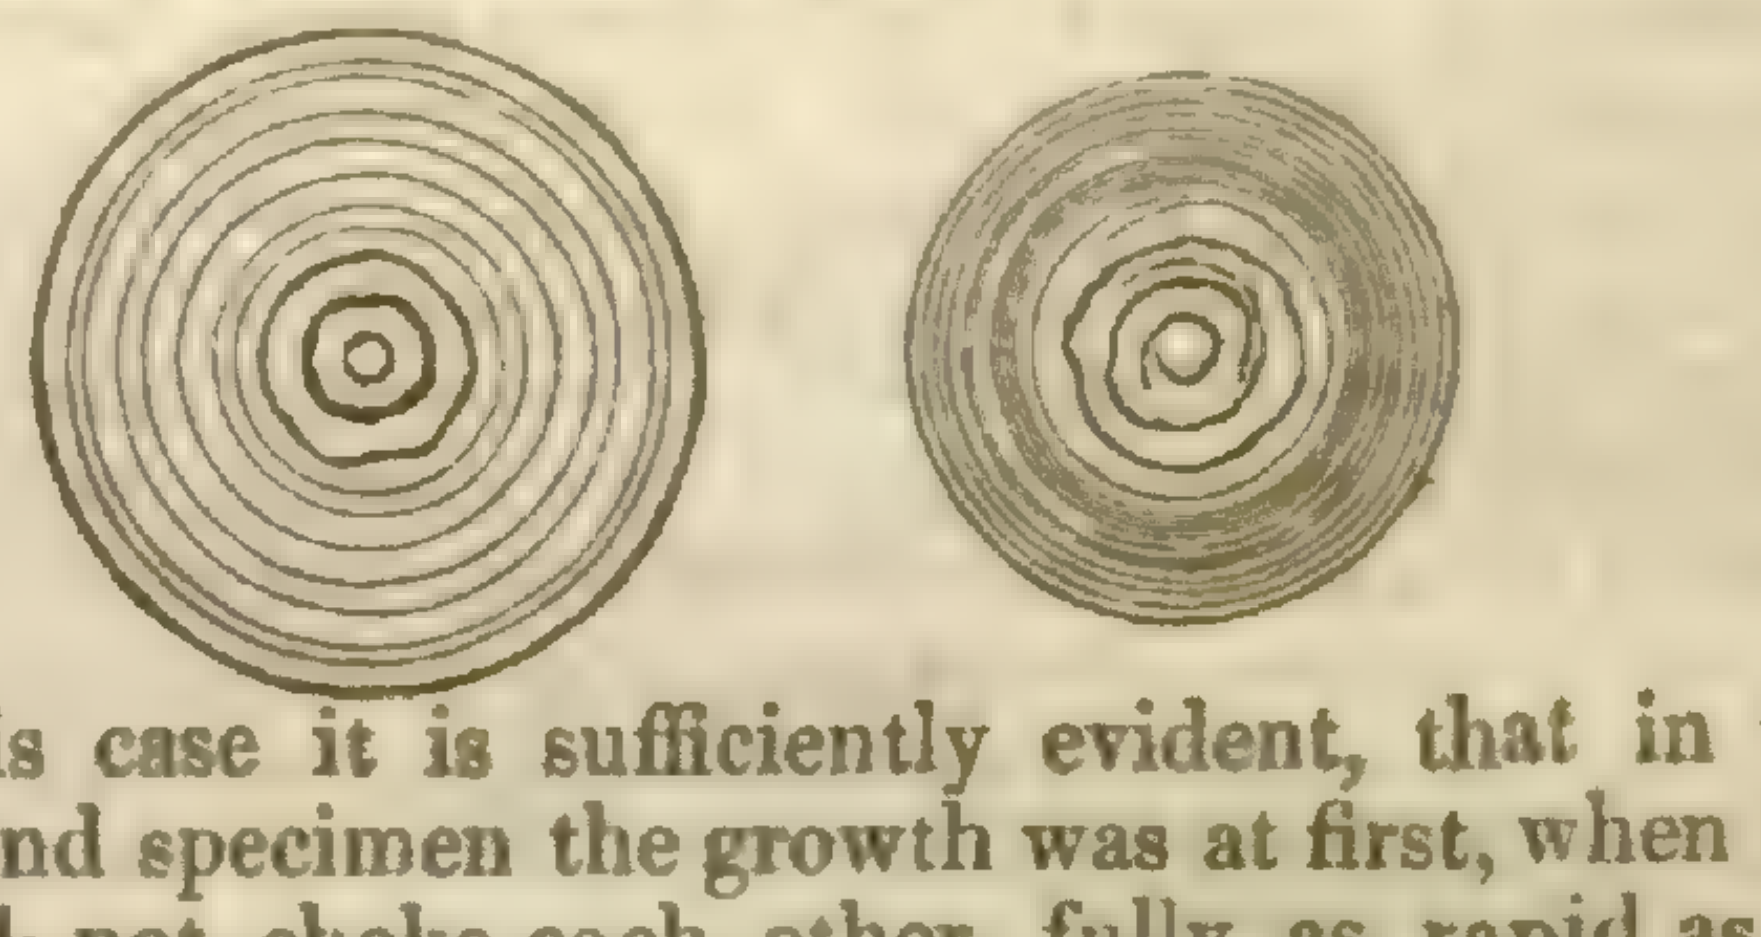
Now what is true of the Mustard plants is equally so of any other plant, whether herb or tree, and explains in a manner familiar to every one the disadvantage of allowing trees in plantations to be drawn up by crowding each other.

The object of a planter is either the decoration of his estate, or the profitable investment of capital, to be repaid by the production of timber. In the majority of cases both ends are sought for; and they are never incompatible. As there is no disputing about taste, we shall drop that part of the argument, lest correspondents should be produced who may maintain that a tree loaded with all the foliage intended for it is less beautiful than one in which the greatest possible quantity is abstracted consistent with the maintenance of life. We shall confine ourselves to the question of profit.

That the quantity of timber found in a tree is in direct proportion to the breadth of its foliage, is what no one acquainted with the nature of vegetable life will dispute. That a crowded tree has less foliage than one fully exposed to light and air is self-evident. Therefore a crowded tree must form less timber than a tree freely exposed to light and air. But this is not a question dependent upon reason alone; it is capable of being reduced to the plainest evidence.

Segnius irritant animos demissa per aures
Quam quæ sunt oculis subjecta fidelibus.

A memorandum from Mr. Hamerton, of Hellifield Peel, furnishes it:—The two following transverse sections as nearly as possible resemble the originals, one of which is taken from a tree of my own growth, and the other from a crowded plantation of about 1000 acres, which it gave me very great pain to view. The one is progressively advancing to maturity; the other retrograding, dying year by year—the diminution of its concentric rings proving to demonstration that it has not room to grow.



In this case it is sufficiently evident, that in the right-hand specimen the growth was at first, when the trees did not choke each other, fully as rapid as in that on the left, when they continued to be properly thinned; but after the third year, the formation of timber in the former case began to be arrested, and was immediately after reduced to a minimum quantity; while in the latter it continued to form, with little variation, year by year.

In the east of Yorkshire there are some thousands of acres of plantations going to ruin for want of thinning, and a great deal of it is gone already. The same friendly hand which sent us the sketch above given, has also furnished us with a specimen of Spruce-fir from this estate.

The following are the rates of growth exhibited in this specimen:—

In the first five years the tree grew	26-10ths	of an in. diam.
Second	24	
Third	20	
Fourth	12	
Fifth	8	
Sixth	6	
Seventh	10	

Here, in 35 years, the tree only acquired a diameter of ten inches and a half, the annual formation of timber beginning to diminish after the 5th year, and rapidly after the 15th, as the trees became more and more crowded together; and it was only after the 30th year, at which time the increase in diameter had been reduced from more than 5-10ths to little more than 1-10th of an inch annually, that the formation of timber began to be restored, and this, which was apparently owing to some accidental clearing, only in a slight and very unequal degree; for, from the section before us, it appears that, although on one side an inch of increase in diameter took place in five years, yet over the principal part of the circumference not more than *two-tenths of timber were formed in five years.* Now, had this tree been properly treated, it ought, by the end of 35 years, to have been eighteen inches in diameter, instead of ten inches and a half.

But, bad as are the consequences of a crowded growth to the formation of timber—and, let us also add, to its quality, it is not the only evil. Plantations which have been allowed to remain crowded for many years cannot afterwards be thinned successfully. The trees become bark-bound and rootless, so that they are blown over by the first storm.

Roots, like timber, are formed in proportion to the quantity of foliage, and to the space a tree has to grow in. A tree whose trunk is divided into limbs, loaded with healthy leaves, fixes itself to the soil by gigantic roots, which hold it immoveably, and help it to defy the storm. But a tree drawn up to a pole, with a few limbs at the summit, has neither the means of forming roots, nor the space in which to develop them. A few fibres are all that it produces, bearing no due proportion to the head; and the moment the protection of the trees around it is withdrawn, it necessarily falls over. Not to go further in illustration of this, our readers have only to look now at Kensington Gardens, and some years hence to plantations not a hundred miles from Windsor.

It may now be expected that we should offer some directions as to the manner of thinning plantations. It does not, however, appear to us possible to give particular rules for such an operation. Instead, therefore, of saying that when a tree is of such a height it ought to be at such a distance from those around it, we think it far better to state the general rule, which is, that no one tree should be allowed to touch another, but that they should be allowed to remain as close as circumstances will permit, provided they do not touch. Practically, it will be impossible to adjust the thinning of a plantation with much exactness; and in the annual removal of such trees as are touching others, spaces much larger than are actually requisite, according to this rule, will be formed. This is, however, a great advantage, because it will allow the wind to find its way freely among the trees, and will give them sufficient room to spread their roots about. But this part of the subject is connected with the subject of pruning plantations, to which we shall advert on a future occasion.

We shall only add that the planter should be careful to mark during summer the trees that are to be removed in winter; because it is only at that season, when the trees are covered with leaves, that it is possible to ascertain in what degree deciduous trees really interfere with each other.

CHATSWORTH.

(*Continued from page* 3.)

AND now a word about the "Grand Cascade," of which the merits have been freely canvassed of late, by many names deep in the mysteries of the picturesque, with Mr. Loudon at their head. This cascade, as all the world knows, consists of an almost interminable flight of broad steps, with a water-temple at the summit, from whence foaming torrents of water burst forth, and afterwards impetuously descend the stairs. The grandeur of this vast flight of water-stairs is undeniable, but it has been objected that its termination is meagre (the water escaping into underground culverts), and its commencement awkward. As regards the "meagre termination," the dissentients are right as to the fact, but completely at fault as to the means of remedying it. This, however, may safely be left in the hands that have already with wonderful skill overcome the far greater difficulties that beset the "awkward commencement," before alluded to, of this famous cascade. The awkwardness complained of was this: that at the back of the water-temple rose a steep and lofty hill, down a portion of which leaped a quasi-natural cataract, which was seen bounding from rock to rock, until it lost itself for a moment behind trees, to reappear in foam and spray, on the roof of the temple; the transition from the supposed natural to the avowedly artificial, as seen from the grounds below, being peculiarly abrupt and offensive to the critical eye. But how was the blemish to be remedied? A more difficult task could scarcely be imagined, and therefore the having completely accomplished it is no puny triumph. Returning from Italy, where the Duke's keen eye had become familiar with its noble aqueducts, it occurred to him that a similar structure abutting against the mountain side, and sustained on a long series of arches, might with perfect propriety be placed in a position where its original intention having apparently been to cross the valley, nevertheless, either through the lapse of time or the abandonment of the design, the range of arches should be suddenly interrupted, and the water which had been carried smoothly along the summit of the aqueduct, be precipitated with tremendous violence from the point of its termination. This grand and most original idea has been nobly worked out; a long range of arches is seen issuing from the declivities at the back of the cascade, and proceeding in a direct line towards it until they have attained the height of nearly a hundred feet, when they abruptly cease, and the water pours down in a magnificent volume, apparently close in the rear of, though in reality at a considerable distance behind, the water-temple, which is thus worthily supported, and an air of completeness given to the whole scene. When viewed in profile, this unfinished aqueduct has also a noble effect. The present is, so far as I am aware, the only instance in which any structure of the kind has been impressed into the service of purely ornamental scenery. But, however successful the experiment, it is not probable that it will be frequently repeated—its costliness amounting to almost a prohibition.

But we must now hurry on to the Great Conservatory, of which glimpses may have been already caught from some of the higher points in the park and grounds: nor can anything be more beautiful than its appearance as it is seen,

"Gleaming like a silver shield,"

above the level of the woods by which it is surrounded. And here let me remark on the peculiarly judicious selection of the site, at such a distance from the mansion as in no respect to interfere with the effect of the latter, and yet within five minutes' walk of it. There never was, and there never will be, an instance of a structure suited to the habitation of plants being tacked on to a building adapted to the habitation of civilised man without the effect of both being destroyed. Each has a beauty and propriety of its own; but let none attempt to unite the twain. What a horrid excrescence is the Conservatory at ——! (any one will fill up the blank a hundredfold.)—But to return to the matter in hand. The approach to the great Chatsworth Stove winds through a wood, and is excavated to a considerable depth, the banks being sprinkled with masses of evergreens, &c., and studded with huge fragments of rock. As you come closer to the sacred territory, a massive arch, of a peculiar character, and which it would be vain to range under any of the five orders, spans the road. This passed, a scene the most extraordinary and peculiar presents itself, and which has certainly no parallel in the world. You are in the midst of an extensive clearing, in the form of a parallelogram, that has been cut in a wood of "old patrician trees." This again has been surrounded by tall embankments or terraces, or I would rather call them ramparts, which protect a level area, and from which the wondrous Conservatory rises in all its majesty. The effect of the clearing is good, as impressing the beholder with an un-English sensation; while the ramparts, as I style them, are quite in keeping, inasmuch as they afford a sort of security to the fragile edifice within their pale, and which may well be supposed to stand in need of some protection of the kind. Terrace-walks are carried along the ramparts, and flights of steps descend to the plateau at their angles and centres.—*Argus.*

(*To be continued.*)

CULTURE OF WHEAT IN THE WEST INDIES.

I HAVE read with much interest the article on the culture of wheat in the West Indies, which appeared in the *Gardeners' Chronicle* for the 10th of July last, and conceiving that a short historical sketch of the attempts which have been made to introduce this valuable grain into general cultivation there may not be without utility in promoting it, or unacceptable to such of your readers as feel desirous of advancing the prosperity of our West Indian colonies, I venture to solicit a short space in your columns for the purpose of contributing all the information which I have been able to collect upon the subject, abridged from a "Memoir on the Cultivation of Wheat within the Tropics," which I printed for circulation in our colonies last year, but of which the impression was so small, that few if any copies can at present be obtained.

It is now upwards of 347 years since the first attempt was made to cultivate wheat in the Antilles by one of the companions of the adventurous Columbus, whose experiment was made with the most satisfactory results at the settlement of Isabella, on the north side of St. Domingo, about 10 leagues to the eastward of Monte Christ, in lat. 19° 58' N. nearly. Of this experiment, the only record which I have been able to procure is the brief notice contained in the following extract from Washington Irving's Life of Columbus, vol. 2, ch. xi., p. 129.

"The appearance of everything in the vicinity of the harbour was calculated to increase his anticipations of future prosperity. The plants and fruits of the Old World, which he was endeavouring to introduce into the islands, gave promise of rapid increase. The orchards, fields, and gardens were in a state of great forwardness. The seeds of various fruits had produced young plants. The sugar-cane had prospered exceedingly in the soil; a native vine, trimmed with care, had yielded grapes of tolerable flavour; and cuttings from European vines already began to form their clusters. On the 30th March, 1494, a husbandman brought to Columbus ears of wheat which had been sown in the latter part of January. The smaller kind of garden herbs came to maturity in sixteen days; and the larger kind, such as Melons, Gourds, Pumpkins, and Cucumbers, were fit for table within a month after the seed had been put into the ground. The soil, moistened by brooks and rivers, and frequent showers, and stimulated by an ardent sun, possessed those principles of fecundity which surprise the stranger accustomed to less vigorous climates, by the promptness and prodigality of vegetation."

Here we have a striking instance of the successful culture of wheat introduced at once, and without any intermediate acclimatisation, from Europe—a fact which appears to be somewhat at variance with the opinion expressed in your Paper as to the probable failure of English red or white wheat, if suddenly transferred to the soil of an abandoned sugar plantation. English wheats have, I must admit, been the subject of many unsuccessful experiments, made at my request in various parts of the West Indies, especially in the Bahamas, Antigua, and Barbados; but as failure to an equal extent was the result of experiments with wheat the growth of warmer climates, as Sicily, Poonah, &c., and as the temperature of the cycle of wheat varies little from the mean temperature of the cooler months in the West Indies, I should be inclined to look for some other cause of failure than the mere abruptness of introduction; and I should wish to know why the experiment of 1494 made with wheat introduced directly from the western parts of Spain should have succeeded so fully, while even Talavera wheat, the produce of the same part of Spain, and Poonah wheat, the produce of the elevated but hot district adjoining to Bombay, should have wholly or partially failed in 1840. The Victoria wheat produced from Caracas seed sown in England, retained its native properties unaltered by the change of climate, and succeeded in the West Indies as well as that introduced directly from the region adjoining to La Victoria and San Mateo.

To return, however, to matter of history:—No record which has come within my reach throws the faintest ray of light upon the subsequent history of the culture of wheat in the Antilles, or explains the causes which led to its discontinuance, with the exception of the short and unsatisfactory notice taken of its existence in Cuba by Humboldt, who, in his valuable dissertation "De Distributione Geographicâ Plantarum," published at Paris in 1817, says, somewhat perhaps too dogmatically, at page 161, that "Frumenti quodcunque genus calores plagæ æquinoctialis ægrè tolerat, ideoque in universum Cerealia Europæa in Orbe novo, lat 0°—10°, eâ altitudine coli incipiunt, quâ in zonâ temperatâ, lat. 42°—46° fere crescere desinunt. Tamen ob certas causas, locis proprias, nec satis erutas, in Provincia Caracasanâ, Triticum colitur propter Victoriam, alt. 270 hexapodarum; et, quod magis mirandum, in parte interiori Insulæ Cubæ, lat. 23°, propter Las Quatro Villas, in planitie paulum supra mare elevatâ." And in the fourth volume of his "Personal Narrative," published in London in 1819, he admits, at page 111, that the fine harvests of Egypt and of the kingdom of Algiers, those of the valleys of Aragua and the interior of the island of Cuba, sufficiently prove that the augmentation of heat is not prejudicial to the harvest of wheat, unless it is attended with an excess of drought or moisture. To this circumstance, no doubt, we must attribute the apparent anomalies that are sometimes observed between the tropics in the inferior limit of corn. "We are astonished," he continues, "to see to the east of the Havannah, in the famous district of Quatro Villas, this limit descend almost to the level of the ocean; while to the west of the Havannah, on the slope of the mountains of Mexico and Xalapa, at 677 toises of height, the luxuriance of vegetation is such that wheat does not form ears."

Struck with the facts furnished by this distinguished traveller, but unconvinced by the reasoning adopted for their explanation, I resolved to apply myself to the solution of the problem, not by the delusive light of theory, but by the direct interrogation of nature. Accordingly, having through the kindness of Sir R. K. Porter obtained a supply of seed from Caracas, I transmitted a portion to Dr. Bancroft in August 1834, for trial in Jamaica, 340 years after its first introduction into the neighbouring island of Haïti. The wheat thus sent was distributed among some of the more intelligent and enterprising planters, by whom it was tried on the mountains of St. Ann's and those of St. Andrew's, with the most satisfactory results, having been planted in both cases in the latter part of January, and been reaped in the latter part of April. On one of the estates in the mountains of St. Andrew's, called Fair Hill, 2000 feet above the level of the sea, a single grain produced 28 ears, yielding altogether 1500 grains; notwithstanding which success, the owner of the estate informed Dr. Bancroft that he thought it "unlikely that the planters would grow the Victoria wheat in preference to the Great Corn," Zea Mays. On another estate in the same mountains, called Charlottenberg, the property of the Hon. W. B. King, an assistant judge of Assize, at an altitude of about 4000 feet above the sea, "the seed," as Dr. Bancroft informed me, "was sown early in March, and received a top-dressing; in the course of a few days it had sprung up three inches above the ground; and as favourable and moderate rains continued to fall subsequently, the corn throve, and ripened in the early part of June, producing abundantly grain of a larger size than the parent seed, the ears being large and full. Six of these, for instance, yielded 336 grains, weighing half an ounce to each ear." From the success of this trial Mr. King was fully satisfied of the practicability and advantage of this new culture.—*W. Hamilton, M.D., Plymouth.*

(*To be continued.*)

ON THE CULTURE OF THE POLYANTHUS.

THIS beautiful flower has had bestowed upon it a most appropriate name, derived from the Greek words *πολυς*, many, and *ανθος*, a flower—many-flowered. It is of the natural order Primulaceæ, and must be considered as but a variety of, and derived from, the Primula vulgaris, or common Primrose, though some Botanists rather suppose it to be the more immediate offspring of the Primula elatior, or Oxlip, this again being thought by Sir James Smith and others to be a hybrid between the Primrose and the Primula veris, or Cowslip. The great difference between the Polyanthus and Primrose is, that while the former bears its umbel of flowers on an elevated scape or stem, the latter possesses only a sessile stem, the flowers being supported on peduncles. By cultivation, however, the Primrose not unfrequently throws up a stem, bearing an umbel of flowers of different colours, as light crimson, purple, brown, &c.; while, on the other hand, the seed of the Polyanthus will often produce plants which are sessile, or without elevated stems. With these facts before us, therefore, and taking into consideration other points of more exact resemblance, as of foliage, &c., I am induced to consider the Polyanthus as immediately derived from the Primrose itself. Its rich and variegated colours present, of course, no difficulties to this derivation of its origin, as the effects of cultivation in it are not more remarkable than in the Pansy, Pink, Carnation, &c.

There are, perhaps, none of the peculiar favourites of the florist which really require so little care and trouble as this flower; and yet its cultivation is, for the most part, so greatly misunderstood and mismanaged, that it is frequently left either to pine in comparative neglect, or is entirely thrown aside as being of difficult and unsatisfactory culture. The grand mistake is in the attempt, the fruitless attempt, of growing it in pots. So thoroughly am I convinced, both by reason and experience, of the futility of this mode of culture, that I shall not speak of it further than to state, that it differs but little from the treatment proper for the Auricula, which I fully detailed in a previous Number of the *Chronicle*. It is true that the Polyanthus may be made to exist in pots; but its poor, stunted growth, when so treated, presents but a miserable contrast with the luxuriant large green foliage, bold stem, and noble head of flowers, which are invariably obtained by the simple means I shall now point out.

Situation and Soil.—A free and pure air is necessary for its vigorous growth; hence it never does well in confined situations, or in the immediate vicinity of large and smoky towns. It should always be grown in a bed or open border, and in one which has an eastern aspect. It is most impatient of heat and drought, but delights in a cool, or rather moist, and shaded locality, where it can enjoy about two hours of the morning sun. Light or rich compost are quite unsuitable; it thrives best in a retentive soil, from a rich old pasture, to which has been added about the sixth part of cow-manure, two or three years old, and the same quantity of leaf-mould. The natural soil of the garden should be dug out to the depth of a foot, and the space filled up with the above, three months previously to planting them, that the bed may have become settled before it is required for the plants.

Planting.—The proper time is at the end of July, not later, for it is important that the plants should get well established in the soil before the approach of winter. The operation should be thus proceeded with. Shorten the main or tap-root, as it is called, to within about half an inch of the leaves, that a few of the vigorous young fibrous roots only may be retained; with a small trowel make a hole in the soil sufficiently deep that the plant, when once set therein, may have the very crown of the main root covered at least one inch with the soil. It is of the utmost importance that the Polyanthus should be thus deep set, for the young roots always emanate from the very top of the main root, and throw themselves out for the most part in a somewhat curved or horizontal manner, and it is essential that they should at once meet with support, which they cannot do when a superficial method of planting is adopted: hence, how frequently do we see the common Polyanthus in the borders exhibiting bunches of bare curly roots above the soil! Having well watered the bed, the plants require no more care whatever, except being kept clean; they should be left entirely without covering or protection in the winter.

Blooming, &c.—In spring, as soon as they have thrown up their bold stems, and just when the pips (corollas) are about to expand, if they are wanted for the purpose of exhibition, or to ornament the stage or cool greenhouse, they may be taken up with a moderately-sized ball of earth, and put into common Auricula pots, for they bear this removal without the slightest injury or apparent check. Water must now be supplied rather freely, and should occasionally be sprinkled over the foliage also (avoiding the flowers), for this is invigorating to the Polyanthus. When in bloom, whether they have been removed into the cold frame, &c., or have been suffered to remain in the bed, they must be entirely protected from the sun and rain, or the richness and beauty of their flowers will be injured; and, as is the practice with Auriculas, the smaller and central pips should be thinned out, that the truss or umbel of flowers may have a uniform and uncrowded appearance. When the bloom is over, the plants should be turned out of their pots into the border from whence they were taken; here they must remain, without further care, except an occasional watering, till the end of July, when they should be taken up, the soil crumbled from their roots, and those which present two or more heads, divided gently with the fingers, and prepared and planted as before described. The properties which constitute a perfect flower have already, together with a plate, been most accurately given in the *Chronicle*.

No one who has not seen an extensive collection of the finest varieties of Polyanthuses can form an adequate idea of their extraordinary beauty and loveliness, when treated in the above manner. And let not these instructions be thought the less of because they are uncomplicated and without mystery; for it is even with floriculture as it is with the arts and sciences themselves, that those discoveries and processes approach the nearest to perfection, which are the most simple and devoid of intricacy. Let us then, in conclusion, hope that this good old-fashioned, old English flower, one of the first and loveliest daughters of spring, associated and endeared as it is, together with its parent the Primrose and its twin sisters the Oxlip and Cowslip, with all the mild, pure, and innocent delights of our earliest childhood, may obtain in the estimation of the florist that consideration to which its peculiar beauties so eminently entitle it.—*F. R. Horner, M.D., Hull.*

SCRAPS FROM THE LIFE OF A GARDENER.

Under this title we propose to introduce occasionally some papers *by a Gardener*, which a correspondent has put into our hands, in the hope that they may tend to show the real feelings and true condition of this important class of men, in whose welfare we take a lively interest. As genuine pictures of a gardener's life, they cannot but have their value, however humble the subject to which they relate.

NO. I.—MY FIRST ADVENTURE.

From my earliest infancy I entertained a great love for flowers—while the dance and the game had attractions for my play-fellows, they had none for me; I always loved the fields and the green woods beyond everything else, and ever found a peculiar happiness in the place where Nature finds a home. I loved flowers for their beauty. I was one day busy among my flowers, watering and tying them up, for I always like neatness, when a person came in; he had been a gardener, and a fortunate one. He admired my garden and my flowers; he talked with energy on the subject; he took hold of them tenderly to examine their class and order; he showed me and told me that they were arranged in families, and he produced such a thirst for Floricultural information that I was resolved to make gardening my trade. My parents gave consent, and a place was sought for and found many miles from home. I was taken from my kindred, but I had one cheering hope, that I should live amongst the fairest and brightest of created beings.

It was night, in the latter end of October, when I arrived at the Hall, which was situated in the immediate vicinity of dark and long woods and plantations; the night was dark, and as I entered the gateway of the paved court-yard all was silent and lonely; no sound was heard but the echo of my footsteps. The ancient turrets appeared dim in outlines still darker than the cloudy heavens; I never felt such a sense of loneliness; the thoughts of my happy, merry home and the dear friends I left there came over me, and I was sorrowful for the change I had made. There were no lights visible in the house, and such an awful stillness reigned around that I was chilled into fearfulness: of all the lonely places to be found there is not one to compare with a large house in the country, when the family has left. With Hallerton Hall, where I then was, this was particularly the case. At last I saw a light glimmering in the distance, and to it I repaired, passing through solemn arches, until I arrived before a small house. I stood at the door a little while considering what to do; at last I knocked, and was bid to come in by a voice anything but remarkable for its sweetness. I did so, and in a chair opposite a comfortable fire sat an old man; his hair was grey, and his forehead was wrinkled with furrows of thought; his table was covered with dried specimens of plants, and living ones were scattered about in confusion, in the midst of which a microscope was standing. It required no telling, but I at once knew that this was to be my future master. I inquired if Mr. Hartley lived there—his answer was, "Yes, I am he." I then handed him my letter of introduction—he told me to sit down, and broke the seal of the letter and read it through. I watched his features during the time, as if to read my future fate in his countenance, but it was rigid and fixed like a statue. I took advantage to look about me while he was engaged; his room was hung round with shelves, on which rested rows of books and piles of dried specimens bound and tied in their cases, together with many papers of his own; he was happy in the midst of his own books and the pursuance of the study he loved. After reading the letter, he eyed me with a glance so keen and penetrating, that my eyes fell in the struggle to return his scrutiny, and I felt my own littleness and incapability. He said, "So you are come to receive instructions from me, young man?" "Yes, sir," was my rejoinder. "Well," he said, "you must be attentive and industrious at your trade, you must be obliging and friendly to your fellow-workmen, for your success depends upon the good fellowship existing between you and your companions in labour—for they will have it in their power to show you more than I can; be industrious and obliging, and you will succeed—but be presumptuous and saucy, or impertinent, and you will rue it."—*W. P.*

(*To be continued.*)

THE AMATEURS' GARDEN.—No. II.

The directions which were given last week concerning the protection of greenhouse and half-hardy plants ought to be carefully attended to. Amateurs should always bear in mind that the beauty of the greenhouse and flower-garden in summer depends upon a little attention being paid to these things now. All that is required, is to protect them and keep them alive, but not to force them into growth with a high temperature; they will grow fast enough when the season is more advanced.

Half-hardy plants in the lawn or borders ought to have been protected long ago; but if in any cases this has not been done, it may not yet be too late to do so. Deciduous shrubs, such as Fuchsias, may be tied up and thatched over with dry fern-leaves or straw, in a conical form, to throw off the wet. The asphalte roofing described by Mr. M'Intosh will be found very useful for evergreens, such as Rhododendrons and Camellias; or frames made with stakes and hoops, and covered with mats, may be used for the same purpose: in both cases, however, they should be made with sloping roofs to carry off the rain, and each should have a door on the north side, which can be opened when the weather is favourable. Many things may be used for covering tender herbaceous plants or bulbs, such as leaves, ferns, straw, or old tan; ashes will do if nothing else can be had.

As many of our friends have little fruit-gardens as well as pleasure-ground and flower-beds, it may be proper to remind them that the season is at hand for making any additions to their collections of fruit-trees, and also for getting those into a good bearing state which they now possess. If trees degenerate from a healthy or fruitful state, the cause will generally be found in the depth of the roots or in the wetness of the soil; the remedy in these cases is a most simple one, which any amateur may easily perform. The trees should be taken up with care, and all the roots preserved except the more perpendicular ones; the latter should be cut close off, and those horizontal ones which extend to an inconvenient length may be shortened. If the soil is cold and wet, it ought to be taken out to the depth of two feet six inches, and the bottom paved with stones or bricks, and well drained with brick rubbish, the object being to prevent the roots from running too deep and getting into a cold and wet subsoil. The drainage may be about a foot in depth, and then covered over with another foot of soil, upon which the roots are spread out and fastened down if necessary. The whole may then be covered over, the trees pruned, and, if large, supported with stout stakes until the roots get sufficient hold of the ground. Where the bottom is dry, the drainage will not be required; the only thing necessary in this case will be to raise the roots. This operation will generally be a sufficient check to the luxuriance of the tree; if not, a trench can be cut round it the following autumn, about three or four feet from the stem: the distance, however, should be regulated by the luxuriance of the tree, the object being not to kill, but to check and to cure. Much useful information will be found on this subject in the former volume of the *Gardeners' Chronicle*.—*R. F.*

HOME CORRESPONDENCE.

Gesnera Elongata a Greenhouse Plant.—This being a very desirable plant, from its flowering at the present season when little else is to be had, perhaps it may be acceptable to some to know that I have found it succeed better in a greenhouse than in the stove. Having two plants, one was this summer placed out of doors and removed to the greenhouse in the autumn; it is now at a temperature of 55°, loaded with bloom and in the highest health. The other was kept in the greenhouse and afterwards in the stove; it is much more weakly, the flowers are paler, and not half so abundant as those of the former.—*C. D.*

Improvement of the Red Currant.—I wish I could persuade some influential individual in South Lancashire to endeavour to prevail upon the growers of the Gooseberry, to grow the Red Currant instead, with a view to prizes. They who are acquainted with the writings of Mr. Knight will know that he paid some attention to the improvement of this fruit, and raised two or three improved varieties. He had arrived at the conclusion, from his extensive experience, that fruits which in their unimproved state are acid, first become sweet and then insipid by improved culture and successive generations, and on that account he considers that the Apple and Gooseberry alone, of our fruits, have been shown in the greatest state of perfection, nearly what they have the power of acquiring in our climate. Mr. Knight, in a letter written a very short time before his death, laments that the improvers of the Gooseberry did not in preference select the Red Currant. Culture, he observes, has a tendency to render fruits less acid, and, to some extent, more tasteless; and the Currant, on that account, promised a wider extent of improvement than the Gooseberry. And he thought it not improbable that the Red Currant might be made, by successive generations and improved culture, a sweet, perhaps a very sweet fruit. Many varieties of the Gooseberry which we now have, are grown to three times the size they were when the workmen of Lancashire first grew them for prizes; and the best of the Red Currants we have are not much larger than the wild fruit of the plant. If only one energetic and influential individual in the Gooseberry districts would take the matter in hand, the object would, I think, be readily accomplished. Let it only be explained to the men why it is desirable that they should substitute the Red Currant for the Gooseberry, supply them with cuttings or plants of the best known varieties, and let them have a printed account of the mode of cross-breeding, with a plain statement of its objects and effects. As their object in cultivating the Gooseberry is principally amusement, I think it is advisable that, at the shows amongst themselves, size should still be the test of merit. I question if we should have had so many good varieties of the Gooseberry if flavour as well as size had been taken into consideration at their shows. About the mere size of a fruit there can be no mistake—no room for unpleasant disputes about the supposed unfairness of the awards of the judges: but if gentlemen connected with the Horticultural Societies in these parts would offer a medal or some other prize worth contending for each year for the best-flavoured Red Currants, the prize to be accessible to all without the payment of any subscription, then, I think, it is probable that they might be induced to endeavour to raise varieties uniting excellence of quality with large size. And if, in addition to this, two trees of each of the best seedlings were sent to the garden of the Horticultaral Society of London, there to be grown, and if another and more valuable medal was awarded by that society—say once in three years—for the seedling which was proved to be the best, it would act as a further stimulus. The thoughts of their exertions and amusements being thus recognised and appreciated by such a powerful society, would, I consider, have a very beneficial effect; and I think that such a proceeding would be in accordance with the objects of the society, and well worthy of its attention.—*John Townley.*

Root-pruning.—Root-pruning and the benefits to be derived from it cannot be too clearly pointed out to the readers of the *Chronicle*. Its application to Hollies, Yews, Junipers, Portugal Laurels, and evergreens generally, in the nursery, where they are taken up at least every two years, root-pruned, and replanted, furnishes the plants with a mass of roots that will ensure their safe removal with as much certainty as many other trees and shrubs, provided their roots are not allowed to get over-dry in transmission from the nurseries. A little research will prove that neither Mr. Billington, Mr. Errington, or Mr. Rivers can lay claim to the merit of having been the first to publish the root-pruning system. If they will refer to the Memoirs of the Caledonian Horticultural Society, vol. i. page 84, published in 1814, they will find an essay on the cultivation of French Pears, by Mr. J. Smith, gardener to the Earl of Hopetoun, where root-pruning is hinted at; and at page 104 is a short account of the state of the fruit-trees on the garden-walls at Loanwells, near Kirkaldy, by Mr. Sang, where he says, "I had formerly experienced the good effects of cutting the roots of fruit-trees which were too luxuriant in growth. I found it necessary to shorten them, not only to stop the rambling growth complained of above, but to furnish the tree with proper feeders, in order to render it fruitful." Had Mr. Sang considered the system new, he would no doubt have entered more into particulars as to how the operation should have been performed. The above gives a priority of publication before Mr. Billington of 11 years. The priority of practising the system may also be traced back to earlier than 1800, the date of the commencement by Mr. Billington; the trees that were the subject of the above-quoted paper having been planted by Mr. Sang in 1792, who before that date, and before he resided at Loanwells, I know had been witness to the good effects of root-pruning wall-trees as practised by a gardener in Fifeshire, both to render them fruitful and to check their further growth when they had nearly covered the wall. No doubt hundreds of gardeners have both invented and practised root-pruning, whenever the necessity for doing so presented itself, without ever considering that they had made any wonderful discovery.—*D. Cameron, Botanic Garden, Birmingham.*

Temperature of Germination.—In respect to the time of germination of Peas at various temperatures (page 832, 1841), I observe that it is omitted to state whether the temperature be that of the air or the earth. At Meerut, in the East Indies, Peas sown in December, when the temperature of the air is about 70° in the day, and sometimes as low as 40° in the night, appear above ground in about five days. The temperature, occasionally, is below the freezing point at Meerut about a quarter of an hour before sunrise, at the end of December and beginning of January. In 1818 and 1819, the thermometer fell as low as 30° on the 14th and 15th of February; the Wheat and Barley crops then in ear were all cut off, and a famine ensued.—*Anon.*

The Radiating Power of Hot-water Pipes.—Amongst all that has been said yet on the heating of houses, we have seen no notice taken of the radiating power of the substances employed as pipes. When the radiating power of lamp-black is 100, polished iron is estimated at 15; and though rough cast-iron, and oxidated on the surface, will be much more, still it would add greatly to the effect, to have them coated with lamp-black. One of the greatest benefits to be derived from Mr. Corbett's open gutter system, will be the radiating power of water, which is equal to lamp-black. The new improvement lately suggested in steam-boilers, to connect the fire and water by pins of iron passing from the fire through the bottom of the boiler into the water, thus conducting the heat at once to the water, should be useful, especially when speedy effect is wanted.—*R. Lymburn.*

Oxalis Crenata.—I have no doubt that the writer in the *New Farmer's Journal* speaks of Oxalis crenata and knows nothing of the Deppei, and I am glad you noticed his letter, as I hope your observations may lead to further remarks from some of your correspondents on the respective merits of these two new vegetable products. I know nothing of Oxalis Deppei as a vegetable, but I am glad to say that I am pretty well acquainted with O. crenata, having grown it in my kitchen-garden I believe upwards of eight years, and consider the stems when young far superior in tarts to either Rhubarb, Apples, or Gooseberries. I cannot say, however, so much for its tubers, which I have given up dressing, finding no one likes them; but some of my neighbours who also cultivate the Crenata tell me that its acid leaves are a great addition to a bowl of salad, but of this I am no judge, never eating salads myself. I think it, therefore, very probable, that while Oxalis crenata is valuable for its leaves and stems, Oxalis Deppei may be more so for its tubers—but I cannot conceive that the latter is as superior to the former as "a Crab Apple to a Brown Beurré Pear" for tarts and puddings.—α. β. γ.

Truffles.—I am not aware that any mode has hitherto been devised of propagating that culinary luxury the Truffle in gardens, as in the case of the Mushroom, now so successfully cultivated; but I apprehend that individuals possessing parks where it grows naturally, may, by a simple process, greatly extend its produce. Many years ago, when residing at Highclere, I had much amusement in watching the operations of the Truffle-hunter and his dog, a pair of originals, who occasionally came from the neighbourhood of Winterslow, and obtained permission to pursue their professional avocations in the park. I could not help observing that the old man confined his attentions principally to certain old and umbrageous Beech-trees, whilst others of much younger standing were passed by unvisited; and a little inquiry elicited the fact that he had become practically acquainted with every individual tree, and consequently spared himself the trouble of investigating those which experience had shown him to be unproductive. Reflecting upon this matter, it seemed to me that the sterility of these younger trees in Truffles admitted of explanation. They were thinly interspersed among the older trees, and they had been brought 30 years previously from a distant grove, where no Truffles existed, to their present locality, differing in soil, which was on a substratum of chalk. Now it was not easy to apprehend in what manner the seeds of this subterraneous plant could transfer themselves from one tree to another, at a considerable distance. It was clear that the process must always be slow and accidental. Might it not be assisted by art? Such was the train of thought which led me to propose to the old Truffle-hunter to bury at the proper depth some of his Truffles that were in a state of decay and unfit for the table, under one of the unproductive trees sufficient in stature and in umbrageous development. At the beginning of the next winter, when his visit was repeated, he sought for me, and told with great satisfaction that my scheme had answered, for he had found two or three pounds of excellent Truffles beneath the hitherto barren tree under which we had experimented. I urged him never to throw away an unserviceable Truffle, but always to dispose of it in a similar manner; and I know that he did so for two or three years. By following this example, proprietors of places adapted to Truffles, and where the proper trees have been planted, may in a short period do that which a lapse of years unassisted would not effect. I may here observe, that of all trees the Cedar of Lebanon is the most favourable to the growth of the Truffle.—*J. R. Gowen.*

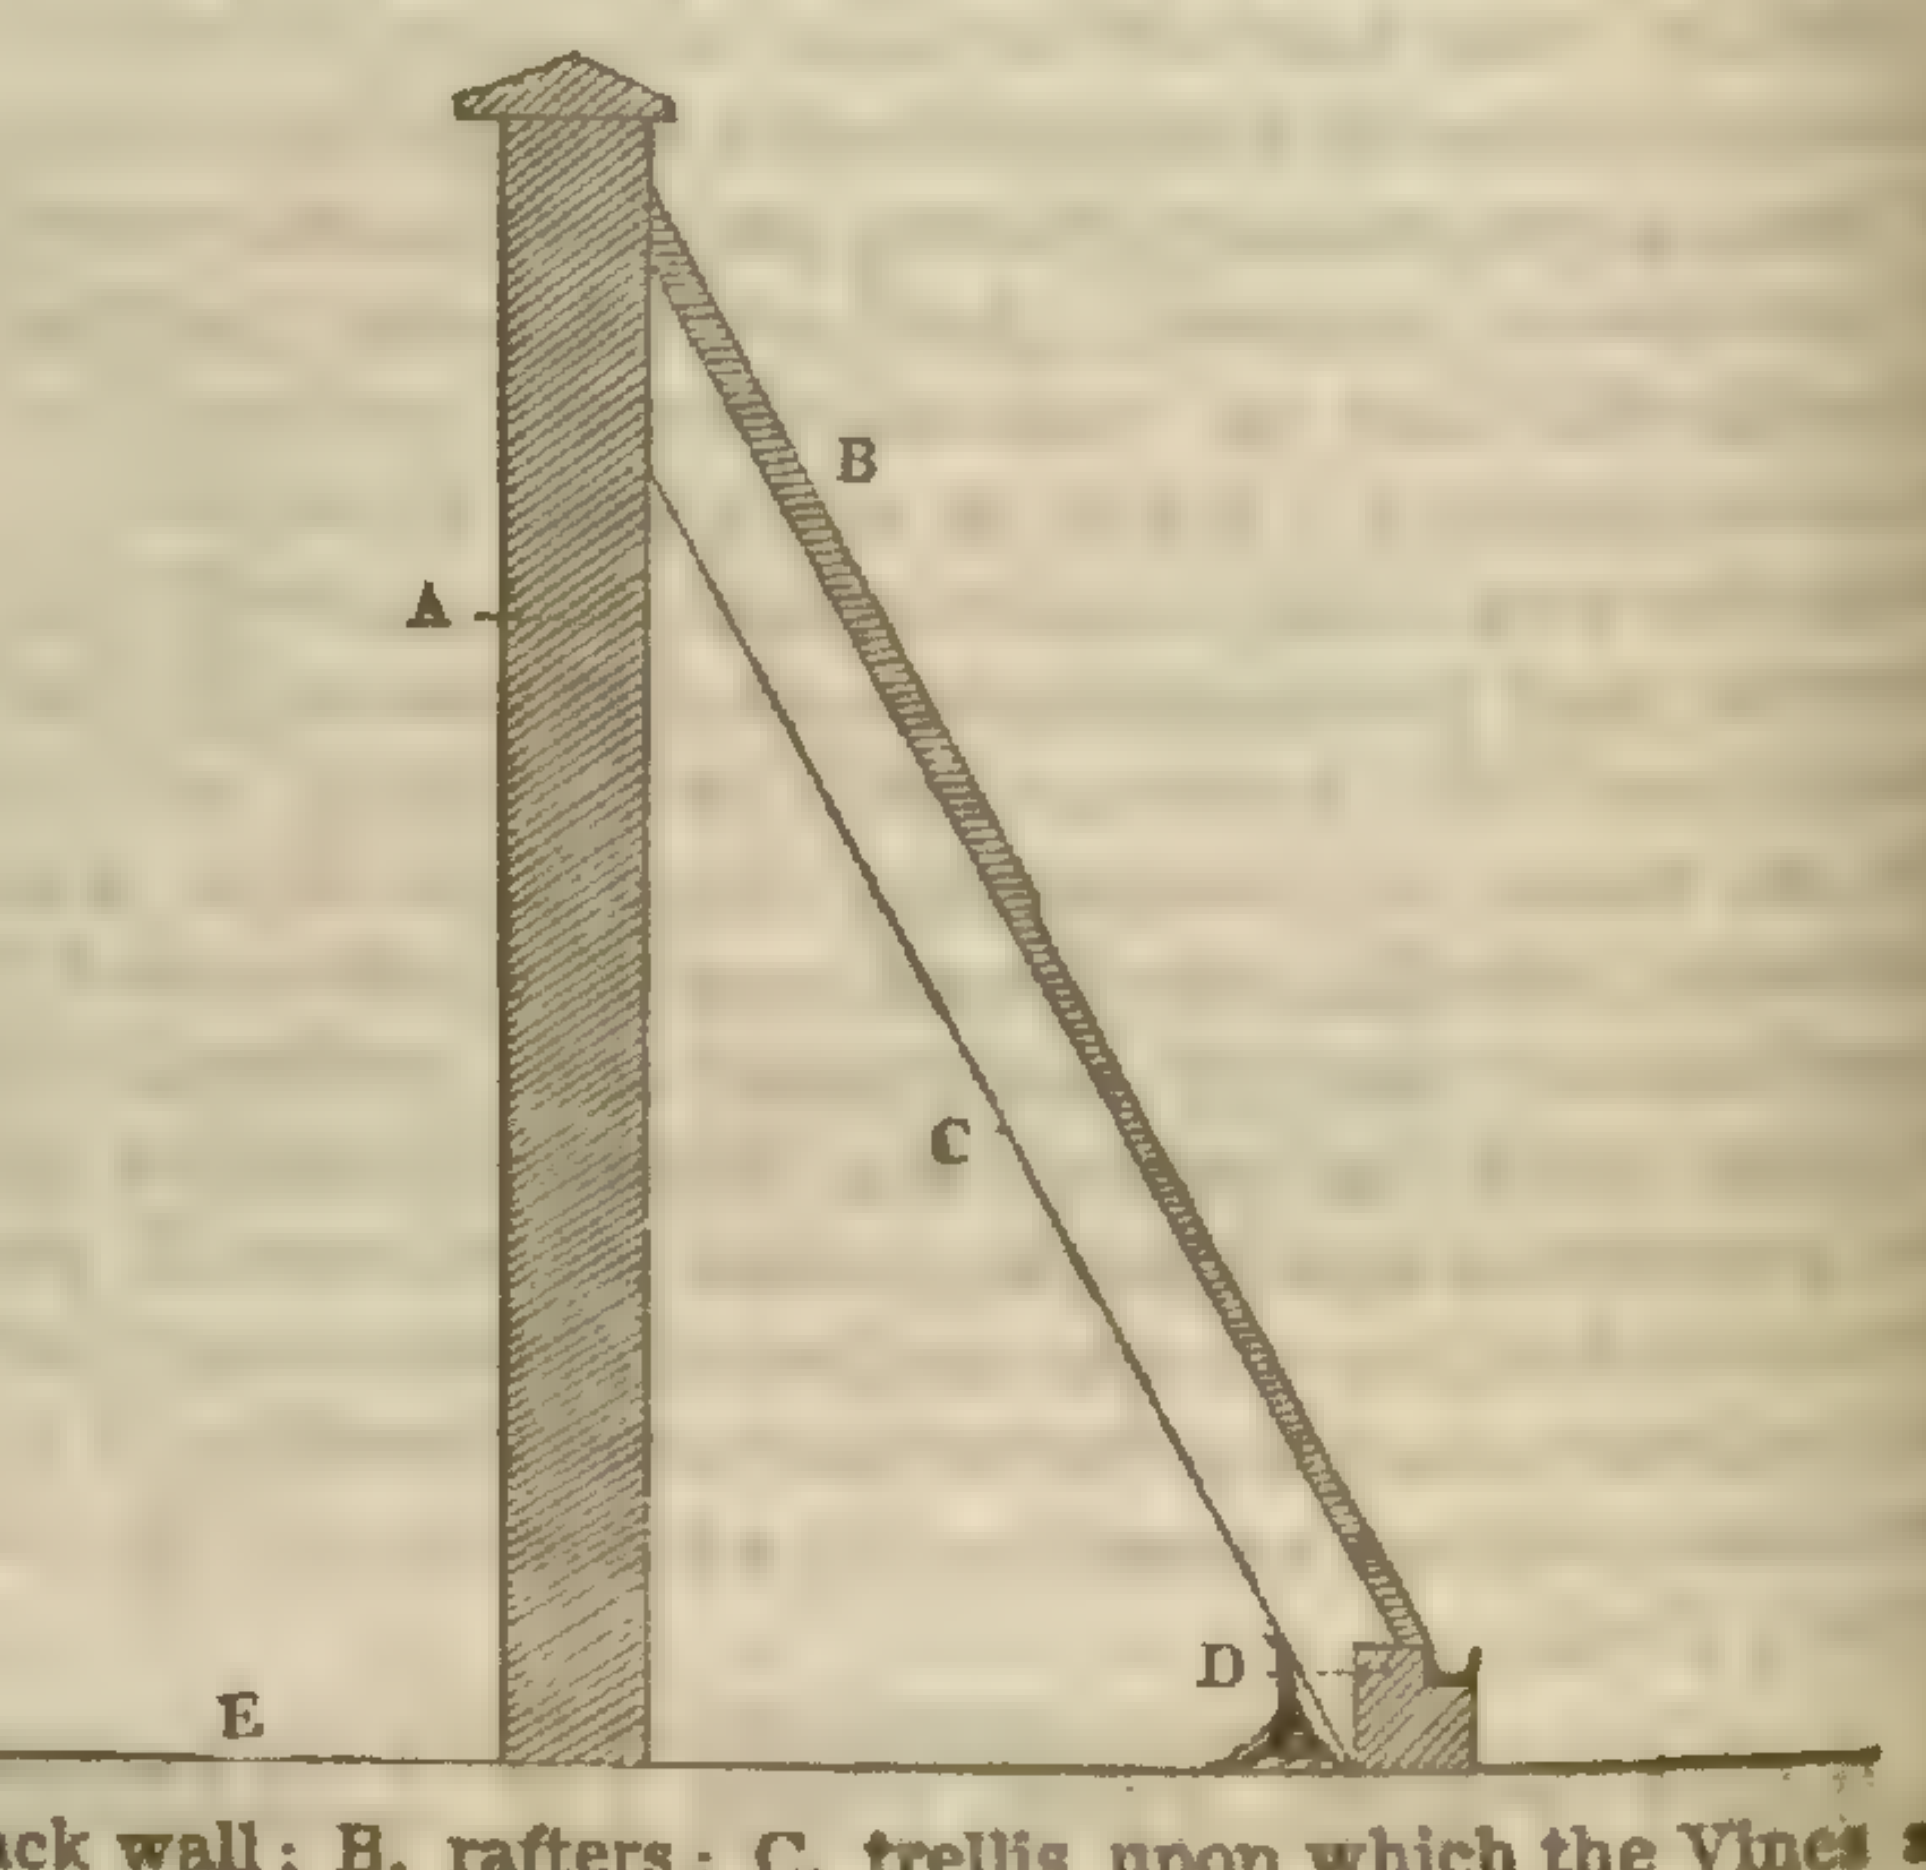
Root-pruning.—When I first came to my last place, the orchard had been planted 12 years, without one bushel of fruit per year having been obtained, and yet the trees looked well. When they were first planted, the ground was trenched to the depth of three feet, the soil being a moist brick earth; however, I caused three or four of the largest roots to be cut off each tree; in the autumn and the following spring the benefit was visible, for the trees were covered with blossom, and in the autumn I gathered above 20 bushels of Apples, and from that time there has been on an average 30 or 40 bushels per year. The wall-trees were also pruned at the roots in the same manner as the orchard, and for the last nine years there has been a full crop. After the orchard had been planted some years, another piece of ground was added to it; this was merely turned up with the plough, and the trees were planted; but though the trees never grew quite so strong as those on the other part, they always bore well, even the first year after planting.—*A Constant Reader, Ryde.*

Icehouse Filling.—A few years back I had the charge of an icehouse built on the declivity of a large pit; it was egg-shaped, had double walls, with a cavity of six inches between the walls closely filled with pounded charcoal, the dome being well secured and thatched over, and the outer walls protected as far as possible from the influence of the weather; the drainage was good, and the house was surrounded by a close plantation of tall trees on the S. W. and north; but this seemingly well-constructed house preserved ice indifferently, and some seasons barely until the end of August. As this was the case, when filling the house I used salt and boiling water with complete success. The diameter of the house was 14 feet, and on every layer two feet deep of well-broken ice I poured 14 gallons of boiling water, having as many pounds of salt dissolved in it, and finished at the top with a double quantity. This solidified and cemented the mass so closely that the house contained about 15 tons more than in any previous year; and when required for use, the force of a strong pickaxe was always necessary to break it up. At the time of refilling there was a quantity of the old store remaining. This was unprecedented in the history of the house, and showed the benefit of salt and water, for in every other respect the house was filled as usual. Where there is a small house and a bad preserver, I think it would be advisable, when filled and about to be closed up, to have a few loads of well-broken ice thrown into the passage, covered with dry wheat-straw—and this will give an early supply for several weeks; and whenever the house is open the ice should be regularly taken from the sides and a few days' supply placed in the passage; this saves opening the house daily, and the consequent waste of much ice.—*H. Bowers, Laleham.*

Fruit-tree Borders.—Several interesting articles on Root-pruning fruit-trees have appeared lately in the *Chronicle*, but though it is a subject of importance, yet I think the necessity of making properly-prepared bottoms to fruit-tree borders cannot be too strongly advocated, because even root-pruning and shallow planting will only be a temporary relief from the evils complained of, unless a properly-prepared bottom is made the whole width of the border. This will keep the root near the surface, and in great measure prevent the necessity of root-pruning, and the want of fruit for one or two years after that process. It is of little consequence what sort of materials the bottom is made of, so that it is impervious to the roots; perhaps in a wet or swampy soil, about a foot of small stones or brick-bats well blended on the surface would be equal to anything else that could be used, as the surface would be impervious to the roots, while the bottom would act as a drain. We have lately made a bottom to a Peach-wall border in the garden here at a trifling expense, as the stones were near at hand, and the work was done by the garden labourers. Some of the trees on this wall had been planted about 20 years, and I am informed that they produced excellent crops of fruit for several years after they came into bearing, but the roots having penetrated into the subsoil, the trees became less fruitful, and were annually attacked with mildew. The leaves were curled and diseased, and they never ripened their young shoots in the autumn to form blossom-buds for the following season. Considering that nothing but making a bottom the whole width of the border would be of permanent benefit, I commenced at one end of the border by digging out a trench two feet deep, nine feet wide, the whole width of the border; this being half the space allowed for each tree, enabled me to get the roots carefully taken up; they were then pruned more or less as it was found necessary. The whole of the trench was then paved with stones of any sort or size that came in the way, from two to nine or ten inches thick; they were laid to a level 20 ins. below the surface of the border, and sloped a little towards the walk; the joints were filled with small pieces of stones; then new slacked lime and gravel, such as is generally uses for garden-walks, were mixed with water, and made similar to mortar; it was then mixed with more water, and when it was laid on the pavement it partly ran into the joints, and the rest was worked in with a broom until every crevice was full. The soil of the next trench was thrown upon the one finished, and so on until the whole border was done.—*J. Alexander, Carton Gardens.*

Cucumbers and Melons.—In pp. 814, 815, (1841,) there are some remarks respecting the advertisements of new Cucumbers and Melons, and I think the fairest way to test them is for gardeners to speak of them as they find. I am a fancier of Cucumbers and Melons myself, and generally succeed pretty well. Amongst other things last spring, I had a little seed of Allen's Victory Cucumber; but having supplied myself with plants of other sorts before, I did not give it the attention it should have had. I grew one plant in a pot in which Carnations had been flowered, and it produced eight fruit at one time, three of these upon one stem; one measured twenty-six and a half inches long, another twenty-six, and the third twenty-four and a half. The form and colour of Allen's Victory are all that could be wished; my fruit were as straight as a line, and regularly swelled from top to bottom; but what pleased me was its prolific disposition. I only suffered my plants to mature eight fruit, and these I kept for seed, as I intend to grow the kind again, for I believe it to be the best for a house, though perhaps Kenyon is the best adapted for early frame forcing, at least I have found it so. I know about 30 varieties of Melons, and I have grown most of them, but both for crop and flavour I have never found any equal to the Ispahan. Last year I cut ripe fruit on the 26th of May; the worst fault it has is the difficulty of getting a second crop, for it is apt to rot off at the main stem, if the grower is not cautious in watering. I always put a wire trellis all over my beds, six or eight inches above the soil, and train the plants over it. I water without a rose, and never pour the water within a foot of the stem. I grew the Pine-apple Melon last year from seed procured from the Horticultural Society; it is an excellently-flavoured fruit, but I found it a shy bearer. The Beechwood Melon also sent out by the Horticultural Society I grew last year, and found every way worthy of cultivation; but there appears to be little difference between it and the Ispahan, except that the former is netted, and the latter smooth; but this is not always the case.—*Robert Towers, Gr. to D. Waterhouse, Esq., Aigburth, Liverpool.*

Vineries.—The accompanying section of a Vinery is of the form, in my opinion, best suited for keeping late grapes. I was struck on seeing it towards the end of November with grapes in as good a state of preservation as they are generally seen during the summer months, and that without lighting a single fire. My attention was more particularly called to this subject from the fact of my having had a late house of grapes under my care, and in which, although I had the command of fire-heat to the fullest extent, I was unable to keep the fruit. I may, however, remark that my house was in a much more unfavourable situation than the one here alluded to. The great superiority which a house of this construction has over the old form is, first, that by the nearly upright position of the glass, scarcely any of the rays of the sun are lost; while, for the same reason, scarcely a drop of wet can find its way into the house. Another recommendation for this plan is, the small space to be heated; consequently the temperature can the more readily be raised to any degree required. This kind of house would also be the very best for early forcing, as from the small space to be heated, one boiler placed in the centre would be quite sufficient for heating a house of 150 feet in length. This kind of structure differs very little from that recommended by the late Mr. Atkinson, except in the more upright position of the sashes; and probably the method of ventilation adopted by Mr. Atkinson would be found the best. The upper sashes could, however, be made to slide up and down if necessary.—*A. Saul, Castle Hill.*



A, back wall; B, rafters; C, trellis upon which the Vines are trained which are planted inside; D, parapet wall upon which the sashes rest at bottom; E, ground level.

Peas in Pots.—I have found the following method very successful for having early peas ready by the 1st of May, and I think it may be advantageous for gardeners who have extensive Vineries under their care. The Peas are supposed to be ready for transplanting by the 1st of February; so that the same sowing does for the first out of doors as well as for those I am about to mention. The seedlings are removed from the boxes or pots where they have been thickly sown, when about four inches in height, and are planted thinly into large pots (twelves) which have been filled with good soil, not too rich. They are staked with moderately strong willows, and run round at distances of six inches with small twine, which has a neater appearance, and does not shade so much as common pea-sticks. The situation I have found quite suitable is the back walls of the late vineries. The pots so filled and staked are placed on the top of the back flues, elevated to the glass as near as the stakes will permit; where they are to remain till the crop is gathered, which will be from the 1st to the 15th of May. It will readily be seen that the Peas are certainly kept from the frost and severe weather, and have always plenty of air when the weather is fine. They are watered rather sparingly at first, but plentifully as they advance into bloom. The following is the result of two years' experience on the above method :—In 1839 and 40 I gathered a peck of Peas on the 1st day of May; on the 11th of last May, above two pecks; and a peck on the 15th, 20th, and 25th days of the same month. The whole was gathered from pots standing on the back flues of two vineries each 40 feet in length. I have tried the early-frame Pea, the Warwick, and Thompson's early dwarf; but I have found very little difference as to earliness or produce. I have tried to force Peas in pits and various ways, and have found that they will not bear forcing till they are out of bloom, and the pod set; then they will bear it, and be forwarded admirably. I have tried them in the autumn on the same principle, but could not get them after the 20th of Nov.—*N. Wilson, Gopsall.*

Bad Butter.—In reply to "R." I have to say that the cause of the butter being bad, was nothing of the kind supposed by those who noticed my inquiry, and consequently Mrs. M.'s directions were nothing new, as everything about the dairy was perfectly clean. The only cause seems to be the cows having eaten the tuberous-rooted Ranunculus; for when that plant died down in the autumn, the butter improved. To get rid of such a nuisance, it would appear necessary to pare and burn the sod, paring so thick as to take up the roots. As the field I complain of is not my own property, I cannot attempt this process. The curious thing is, that it is only after the butter is made that the bad taste comes out, the milk and the cream being perfectly sweet.—*A. B.*

Cuthill's Early Melon.—I was last year struck with the advertisement in the *Chronicle* respecting "Cuthill's Early Melon," and I was induced to buy a packet of his seed. As he has been alluded to by a correspondent, in p. 781, (1841,) who, it appears, has made an unsuccessful attempt to grow it, I am sure you will consider it justice to Mr. Cuthill that I should state that it proved with me fully equal to the character given of it. It was early, a great bearer, it continued to bear for a long time; the fruit was well shaped, of a rich colour, with a sweet and high flavour—its rind so thin and its flesh so deep, that though a small-sized Melon, there was more to eat of it than in some other kinds of double its size. I have, for a number of years, successfully grown a variety of Melons; but this season, in our part of the country, was so wet and cold, that I should have had little fruit, had I not sown Cuthill's seed. A nurseryman, near me, grew it with similar results; and has informed me that other persons in this country have found it equally good.—*C. A. Walker, Belmont, Wexford.*

Cepophilus — of the Home Correspondence of the *Chronicle* of the 1st of Jan., describes himself as gardening in "Lat. and Long. 35°." I beg to ask where that may be? Is it in N. or S. Lat., in E. or W. Long.? I have looked on a map for the position of the spots on the earth's surface corresponding with that described by your said correspondent, but not finding any spot suitable for such pursuit, I am at a loss to guess at his "whereabout," and trouble you with this line of inquiry.—*A. B. of Woodbridge* —[We overlooked the absurdity of "Cepophilus" dating from a place where, as another correspondent truly says, "his Hollies were not likely to want water for some years to come."]

Ice.—Your Hull correspondent has, I fear, given you an over-safe plan for the keeping of ice; as it would be impossible to get it out at the bottom of the house, for this reason—the whole of the ice, when put into the house, would of course very soon form one entire solid mass: consequently, when ice is wanted, it is necessary to use a pickaxe to break it up, which could not be effected with the aperture at the bottom. I have been in the habit of filling icehouses for the past fourteen years, and invariably have found the ice to keep better when I was able to be present myself to superintend the well pounding and packing of the ice; and upon these two points, I consider, rests the principal secret in keeping ice.—*T. Parkins.*

Edgings.—In the *Gardeners' Chronicle*, Oxalis acetosella, Vinca minor, and Omphalodes verna, are all three recommended to form edgings to shady walks: allow me to add to the above the two species of the genus Chrysosplénium, C. oppositifólium, and C. alternifólium; they are both suitable plants for an edging to a shady walk, and I strongly recommend them as they are not particular to a shade. Should it be a dark one, they will grow in either a wet or dry situation, and form a low and compact edging, not more than four inches high, always green; and in the months of March and April, they send up their numbers of small yellow flowers in abundance.—*T. Fuller, Bramham Park.* [This is very good when the plants can be had, but that is not often.]

Double Yellow Rose.—I have just finished reading your article in the *Chronicle* regarding the Double Yellow Rose, in which you say you have not heard of one north of Cheshire. Having had one for some years in this county (near Bala), Merionethshire, North Wales, perhaps you would like to hear the result of its growth. About seven years ago it was planted in a light, rich soil, in an eastern aspect, where it grew very luxuriantly, but never showed a single flower. Afterwards it was moved to a due southern aspect (a brick wall, as before), where it has several times made attempts to blossom; but the buds have always burst on one side, and decayed, only one ever having reached a yellow colour. I am now quite at a loss what to do with it, whether to try it on a north wall, or train it on moss and stones pegged down to the ground, as I am in the habit of training moss roses, which flourish remarkably well here. I shall not touch it until I see by the *Chronicle* what you advise me to do.—*An Original Subscriber.* [In this case it is evidently want of vigour that prevents the flowering. It would be worth trying the effect of placing a glazed sash from a cucumber pit over it early, in a slanting direction, so as to keep it dry, and to raise the temperature of the soil and air.]

Edgings for Walks.—I am not sorry that I troubled you with a short notice respecting Woodsorrel, recommending it as an edging for shady walks, as it has been the means of bringing into notice plants apparently better adapted for that purpose than the one I recommended. Several plants have been recommended in the *Chronicle* as fit for planting in shady places: these lowly flowers will make little noise whatever way the opinion of the world may take, for or against them; and although I am far from believing that the prize would be awarded to the Wooodsorrel, for the other plants appear to have superior qualities which the Woodsorrel does not possess, yet I still think it is not without its charms, and might come in for a small share of patronage. There is a Rose known by the name of Lancaster and York—the one half is white and the other red; it may not rank high in the estimation of the dealer in Roses, and yet to others it may be very interesting. It recalls to their minds the "wars of the Roses." It conjures up before them Margaret of Anjou, the Battle of Wakefield, and the field of Bosworth; and when the "land of red heather" is mentioned, many a thrilling emotion is produced in the hearts of others: and setting aside the beauty of the leaves and flowers of the Woodsorrel, numbers may find pleasure in looking upon it as the Shamrock of Ireland.—*Peter Mackenzie.*

Entomology.—One of your correspondents asked what were the best works on British Entomology, and I confess, as a *ci-devant* entomologist, I did not think your answer satisfactory. If his object be to learn something of the general habits and arrangement of insects, Kirby and Spence's "Introduction to Entomology," 4 vols. 8vo, with Mr. Westwood's admirable "Classification of Insects," 2 vols. 8vo, are by far the best works for the purpose. If the expense (about 6*l.* 6*s*) is an object, then some of the vols. of the "Library of Entertaining Knowledge," and Burmeister's "Manual of Entomology," translated by Shuckard, 1 vol. 8vo, and Newman's "Grammar of Entomology," 1 vol. small 8vo, might suffice. If he wishes to study the genera and species, and to "make out" the insects themselves, Stephens' "Illustrations of British Entomology," though incomplete, is indispensable. The cost is somewhere about 20*l.* Should that be deemed too much, the Coleoptera, or Beetles, will be found succinctly described by Mr. Stephens in a single small 8vo. vol. published by Murray. The bees, by Mr. Kirby, in his "Apum Angliæ Monographia," 2 vols. 8vo, or by Mr. Shuckard, in a similar work, which I believe he published in 1 vol. 8vo, and the "Fossorial Hymenoptera," by the same author, in 1 vol. 8vo. The pigmy, but highly-interesting "Chalcididæ," by Mr. Walker, in 1 vol. 8vo. The "Lepidoptera," or Butterflies and Moths, in a "scissors and paste" translation of the specific characters of Stephens' larger work, in a small 8vo vol. by an unknown hand. For the numerous, and to a gardener very important race of Ichneumons, Gravenhorst's "Ichneumonologia Europea," in three large 8vo vols., is the only work; and for the Diptera (Flies) recourse must be had to Meigen's "European Diptera," 6 vols. 8vo, and Macquart's "Diptères du Nord de la France," in 6 parts, 8vo. For the other orders, various papers in periodical works and many Continental works must be consulted, with whose titles an entomologist will soon become acquainted. If the minute anatomy of the genera of British insects forms his study, then Curtis' "British Entomology" ought at least to be consulted (its cost is above 40*l.*); or so far as the beetles, the most difficult portion of Entomology in this respect, are concerned, Spry and Shuckard's "British Coleoptera delineated," and Shuckard's "Elements of British Entomology," will afford a cheap substitute. I must not forget Samouelle's "Entomologist's Compendium," 1 vol. 8vo, which gives a very good idea of the arrangement of British insects, according to the views of the celebrated Dr. Leach, and is especially useful to a beginner, for its calendar of insects and the times and places of their appearance. I would observe that, like most other works, many of the above are to be met with at very reduced prices in the catalogues of the various second-hand booksellers in London.—*S.*

Masters and Gardeners.—Your remarks, in p. 731, on the relation between masters and gardeners, are very proper and very much needed. Still there are proprietors, though you are unaware of it, who though willing to see their gardens admired by others for their beauty as well as utility, yet grudge the expense of plants. The beauty of the garden is no doubt a source of gratification, as well as the ornamenting of the person; but it has not been customary in some places to pay so freely for it. If the poor gardener in such situations, rather than be behind his neighbours, should purchase plants to help his credit, while his master, if he gave the time, enjoyed the pleasure of showing them, it would certainly be hard, though it might be legal, to lose them at the end of the year.—*R. Lymburn.* [In our opinion this is not to the purpose. The gardener should not have purchased them; having done so, they are his master's property.]

Glazed Pots.—I was reading M'Nab's Treatise on Heaths the other day; and I met with an observation in that work which seems to support my suggestion, that the difference in the value of the pots may be owing to the temperature and moisture of the soil. It is as follows :—"In an oaken tub, with three good coats of paint on the outside, and a thick coat of pitch or coal-tar inside, when, to all appearance, it is as impervious to moisture as even a glazed earthenware pot; in such a tub I have seen no instance in which Heaths did not grow as freely as in ordinary flower-pots; and yet, though I have repeatedly made the experiment, I have seen no instance of a Heath thriving in a hard-burnt earthenware pot."—*M'N. on Heaths*, p. 24. Is it not probable that this is owing to the wood being a much worse conductor of heat than the pot? Supposing a small Heath was planted in a large hard-baked pot, and one in another soft-baked pot of the same size, would the growth of the two be the same until the roots reached the sides of the Pots?—*J. Townley.*

PROCEEDINGS OF SOCIETIES.

FLORICULTURAL SOCIETY.

Jan. 4th.—Mr. Wrench in the Chair. The accounts of the past year were audited, preparatory to their being read at the Annual Meeting on January 13th.

Limerick Practical Horticultural Society.—At a numerous meeting of the Society, held 1st January, the Right Hon. Lord Clarina in the chair, a full report of the proceedings for the past year was read by Mr. Bevan, the treasurer, showing the improvement and progress of the Society, and submitting the treasurer's account, all which was considered highly satisfactory. It appeared that 220 prizes, amounting to 50*l.*, were obtained, awarded, and distributed amongst the different gardeners, in the several classes of fruits, flowers, and vegetables: and after arrangements were made for the three exhibitions for the new year, the meeting separated, much pleased, and returned a vote of thanks to the chairman for his continued patronage and support, and to the treasurer and secretaries for their management and attention to the interests of so useful a society.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

ONCI'DIUM I'NSLEAYII. Mr. Insleay's Oncidium. *(Stove Epiphyte).*—The number of species in the genus Oncidium, which have flowers only varying slightly in the combination of their brown and yellow tints, seems to render each acquisition in which the colours of the blossoms are in any degree similar, of comparatively small value. Such, however, is the extreme richness of hue in the flowers of the O. Insleayii, that, connected with their great size and pleasing arrangement, this property places the species in the first rank of Orchidaceous plants. It is a native of Oaxaca, in Mexico, whence it appears to have been introduced by George Barker, Esq., of Birmingham; this gentleman having succeeded in blooming it two or three years back, named it after his gardener, Mr. Insleay. Messrs. Loddiges also imported it from the same district, and it flowered in their nursery in the autumn of 1840. In the "Botanical Register," Mr. Barker's plant is described as producing a rigid, erect raceme of flowers; but the specimen which flowered at Messrs. Loddiges bore a raceme of a half-drooping character. The flower-stalk issues in a graceful curve, and depends in an elegant flowing manner. The species was originally thought to be identical with Odontoglossum grande, on account of the partial resemblance of their pseudo-bulbs; but even in this particular a practised eye will easily detect a difference between the two plants, if both are in a perfect and fully developed state. The pseudo-bulbs of O. grande are larger, and with a greater tendency to roundness; while those of O. Insleayii are more concave on one side, and with sharper edges. In the flowers, the latter plant is far inferior to O. grande, except in the colours of the labellum, where it has a manifest pre-eminence. The colours, the forms of the wings of the column, of the tubercles and appendages of the labellum, and of the latter organ itself, are essentially remote; and O. Insleayii comes much nearer to O. papilio, with which, again, it can never be confounded, from the peculiarities of each. Messrs. Loddiges cultivate it on a block of wood, keeping it in the warm Orchidaceous house, during summer, and removing it to a cooler and drier place when its new pseudo-bulbs are perfected, which will be towards the month of November. Here it will most likely flower about February or March; at least, that is the period at which it blossomed with Mr. Barker.—*Mag. of Botany.*

GESNERA ZEBRINA. Zebra-leaved Gesnera. *(Stove Herbaceous plant.)*—Gesnera zebrina may properly be accounted one of the most meritorious plants which have developed themselves in the year just closed: for, not only does it arrest the attention during the time at which its blossoms are unfolded, but, by the diversified markings of its leaves, at every season when these are in perfection. And whether, on further experiment, it will prove an evergreen sub-shrubby plant, or will lose its stems and foliage in the later winter months, we are at present unable to say. The probability is that it will be found an herbaceous perennial, flowering in October, November, and December, and dying down, like some other species, after the inflorescence has all withered; though it is possible that it will partake more of the character of G. mollis, and acquire a woodiness of stem at the base. A plant flowered finely at Mr. Low's, Clapton, in October and November last, and on which there is yet a considerable number of flower-buds, if the season would permit their expansion. It was obtained by Mr. Low from Mr. Doncklaer, director of the Botanic Garden of Ghent, and is doubtless from some district of South America. The species produces stout, succulent stems, which mostly grow to six or nine inches in height before they protrude a flower-spike from their summit: but we have seen plants not more than three inches high beginning to show flower. The flower-stem rises perpendicularly from the top of the general stem three or four inches, where the lovely blossoms are spread out on long, slender stalks, and continue to be thrown out, indefinitely, till the height of a foot or eighteen inches is attained, when there still seems an equal number of buds at the top, and lateral flower-bearing shoots are, moreover, liberally developed from near the base. The colour of the blooms is of a rich orange red on the upper part, and a light yellowish orange beneath, with a quantity of bright red spots in the throat. Being pendulous, they are, when the plant is elevated on an ordinary stage, examined to great advantage. But the leaves are, perhaps, the most interesting, because the most permanent features. They are of a rich and lively green, with numerous and irregular streaks and bands of a purplish tint, and the whole has a remarkably velvety appearance. It has hitherto been managed as a stove plant, and kept in a moderate heat, with proper supplies of moisture. As it blooms in the autumn, and does not cease on the approach of winter, it will be advisable to go on watering it till it shows natural signs of decay, when its habits may be fully ascertained. A rather rich compost will be appropriate; and it would seem capable of ready increase by cuttings. Seeds, too, will most likely be perfected. *Mag. of Bot.*

MINA LOBATA. Lobe-leaved Mina. *(Greenhouse Climber.)*—This is a Convolvulaceous plant of much beauty and more singularity, for which we are indebted to G. F. Dickson, Esq., who presented its seeds to the Earl of Burlington. Under the care of his Lordship's gardener, Mr. Wilson, a single specimen was raised last year, and produced its curious flowers in November. The habit of the plant is quite that of a common lobed-leaved Ipomœa, but the flowers grow in forked erect racemes, and have not at all the aspect of a Convolvulus. At first they are deep crimson, but when expanded are of a pale lemon colour. By all modern authors this genus Mina is regarded as the same with Exogonium, an error which can only have arisen from the plant itself not having been seen. It is in reality quite a distinct form of the Convolvulaceous order. It is cultivated by the Mexicans for the beauty of the flowers. It will no doubt be a greenhouse plant; but it is at present in no collection except that of the Horticultural Society, to which it was presented by the Earl of Burlington.—*Bot. Register.*

LOBE'LIA PYRAMIDALIS. Pyramidal Lobelia. (*Hardy Herbaceous Plant.*—An herbaceous plant from the Himalayas, of no beauty. It has narrow, lanceolate, finely serrated leaves, and greenish-violet flowers, so embosomed among long green leafy bracts, that they are hardly distinguishable by a passer-by. The tube of the stamens stands back aloof from the corolla, and of the latter the two dorsal petals are quite free down to their base. —*Bot. Reg.*

EPIDENDRUM LATILABRUM. Broad-labellumed Epidendrum. (*Stove Epiphyte.*)—A Brazilian plant, allied to Epidendrum umbellatum, of which it has the habit. But its lip, which is four times broader than long, and curved downwards on each side, so as to bear no little resemblance to a stiffly-starched lady's apron, gives it a most singular appearance. It has lately flowered at Messrs. Loddiges'.—*Bot. Reg.*

MISCELLANEOUS.

The Vitality of Seeds.—The following remarkable instance of the tenacity of life in the seeds of the common Elder is mentioned in the "Annals and Magazine of Natural History" for the present month. The seeds in question were derived from the dregs of some Elder wine, which was strewn as manure over a flower-border, where hundreds of them grew. The lady with whom it happened says that they had been twice boiled in making wine; had been present during the fermentation; after which the wine was drawn off, and the dregs were bunged up for 20 months, in the cask where the seeds remained without injury.

Instinct of Plants.—A rather remarkable instance of the instinct of plants in searching out food and support for themselves, is now to be seen in the woods of Comrie. An Oak-tree, high perched upon the point of a comparatively bare rock in the face of Dunmore Hill, finding its home supplies of soil and hold rather stinted, and observing (one is almost inclined to think) a more fertile spot below, has sent off a foraging party, in the shape of a large "root-trunk," for several yards directly down the precipice on which it stands. This root-trunk, after reaching a projecting point of the rock, bends horizontally onwards, clinging firmly to the rock in all its course, till it reaches another face, down which it again descends, until it eventually seizes, in its many-fingered grasp, the object it travelled so far in search of.—*Stirling Advertiser.*

Alkaline Substances of Plants.—M. Fr. Göbel has given a very valuable chemical examination of the principal Halophytes of the Caspian steppe with regard to the quantity of potash and soda they contain. The research was undertaken, partly in order to learn whether the quantities of potash and soda vary with the age of the plants, and partly to settle the question whether plants are capable of converting the one alkali into the other. The principal results are as follows:—The young plants give a much larger quantity of impure soda than the old fully developed ones, but the substances soluble in water contained in the rough soda do not differ much from one another in quantity. In the case of Halimocnemis crassifolia it appears that during growth a part of the chloride of sodium is converted into carbonate and sulphate of soda, as is seen by analysis. The young plants of Salsola clavifolia contain no chloride of sodium, but considerable quantities of chloride of potassium; while in the old plants there is less chloride of potassium, but a nearly equivalent quantity of chloride of sodium. The quantity of carbonate of soda is nearly equal in both young and old plants. The young plants of Salsola brachiata also contain less chloride of sodium than the old ones, while the quantity of carbonate of soda remains the same. M. Göbel thinks it is perfectly immaterial whether young or old plants are used for procuring soda, for the quantity of carbonate of soda is the same in both cases. The plants might therefore be burnt at any time, and the value of the impure soda would not materially differ. The analyses of Halimocnemis crassifolia, Salsola clavifolia and brachiata, both in their young and old state, show "that the quantity of soda has remained nearly constant in all." The quantity of potash is always greater in the young plants than in the old ones, and strikingly so in Salsola clavifolia; so that one might really be led to believe, "that in the course of the vegetative process potash is metamorphosed into soda, or, at least, is got rid of in some manner or other." If this were correct, it would certainly be a wonderful discovery, but I may be allowed to propose a question which is not answered in M. Göbel's treatise: Were the old specimens of the three above-mentioned plants (which M. Göbel did not collect himself) from exactly the same spot as that from which, in the same manner, M. Göbel gathered the young ones? Probably this was not the case, and as all these salts are extracted from the soil, a difference therein will of course make a change in the results of the analyses. We must therefore consider this metamorphosis of one substance into the other as yet unproved. M. Göbel also states, that in other plants the quantity of potash is larger in the young than in the old ones. With respect to the relative value of the Halophytes for the fabrication of soda, M. Göbel gives the following list:—1. Salsola clavifolia, young dried individuals, 42 per cent.; 2. Halimocnemis caspica, young specimens, 22·9 per cent.; 3. Salsola Kali, young specimens, 25 per cent.; 4. Kochia sedoides, old specimens, 9·16 per cent.; 5. Salsola brachiata, young specimens, 33 per cent.; 6. Halimocnemis crassifolia, young specimens, 30 per cent.; 7. Tamarix laxa, young specimens, 33·6 per cent.; Anabasis aphylla, young specimens, 19 per cent., &c.—*Annals of Natural History.*

GARDEN MEMORANDA.

Masters' Exotic Nursery, Canterbury.—The most attractive house at present is the one devoted to succulents, as well for the strangeness of the forms of some as for the beauty of the flowers of others. The Soccotrine Aloes were particularly conspicuous, for their large size and the number of handsome spikes of scarlet flowers; and plants of the Ram's-horn Aloe, Pachydendron africanum, were flowering abundantly, young as well as old. The soil used for succulents here consists chiefly of sand, peat, loam, and broken bricks, which, judging from the vigorous growth they make, suits them well. From the roof of the house plants of Epiphyllum truncatum and various kinds of Céreus are suspended, which add to the picturesqueness of the scene. In the hothouse we observed a handsome Bauhínia, received from Dr. Wallich, under the name of piperifólia; it has curious binate leaves, which, when young, are of a delicate pink colour. Among the Orchidaceæ were several Zygopétalums, Cypripédiums, and the lively Ornithídium coccíneum, which has been in constant flower for many months. In a large conservatory devoted to Camellias and Oranges, is a handsome tree, which has probably numbered a hundred years, full of ripe fruit, some of which are shaped like Oranges and others like Lemons; near it is a fine Seville Orange, with fruit as large as any foreign ones we ever saw. The most remarkable plant out of doors is a handsome specimen of Gárrya elliptica, which is between six and seven feet high, and is at present covered with elegant long, pendulous catkins, which look at a distance like locks of hair. Owing to the extreme humidity of the autumn we found many of the hybrid Rhododendrons expanding their flowers, though, from want of light, they are not so brilliant as they would have been in May.—*Dec. 27th.*

Bicton, the seat of Lord Rolle.—At Bicton the houses are superb; they are well constructed, and admirably adapted for the various purposes intended, and all in the best possible repair. Portland stone being cheap and easily obtained, is much used in the various buildings about the estate. Benches, pits, and paving, both within and without the houses, are of this material, which has a neat and substantial appearance. Although Bicton is rather elevated, water of excellent quality for every purpose abounds; there are beautiful streams of fine soft water running in various directions, brought from the neighbouring hills, supplying the whole of the houses, sheds, and every part of the premises, there being water-taps in nearly every corner of each building, and the fountains are constantly at play in different parts of the flower-garden. The whole of the houses are heated by hot water, on various principles; so that hot-water taps are placed in each house as well as cold. The convenience of sheds for growing Mushrooms, and other purposes, surpasses anything I ever saw, there being fine roomy ones at the back of all the houses, so constructed that large plants may be shifted in them without trouble or inconvenience. Here are some of the largest specimens of the Cactus tribe I ever saw; those I have seen exhibited at Chiswick, at various times, are finely grown, but there is no comparison between them; one remarkably fine bush of Epiphyllum speciosum, grafted on Céreus hexágonus, when in flower must be magnificent; and another on its own bottom measures five feet in diameter. A plant of Céreus speciosissimus growing in a tub is eight feet high, and finely proportioned. Jenkinsónii and the varieties of Ackermanni are equally as good. The collection, altogether, if brought into flower and exhibited at one of the Chiswick fêtes, would surprise the growers of this tribe in the neighbourhood of London. There is a fine collection of Camellias, all in good health, in the house, although they grow and flower well in the open air. I saw some clumps of Camellias growing as large and vigorous as Portugal Laurels, well set for bloom. The Heaths and New Holland and stove plants were clean and healthy, and among them were many new and good ones. A little distance to the left of the greenhouses is a beautiful Palm-house, the inmates of which consist of many good kinds, which are healthy. The roof of this house has been considerably heightened this summer, to give more head-room to some of the plants, which were growing too lofty. Near this house, in the open air, stands the stem or trunk of the beautiful Acácia affinis, measuring in several places 3½ feet in circumference, it is now nearly lifeless, having suffered greatly from the severity of last winter, which seems to have been felt more here than the severe frost of 1837-38, for the Acácia withstood that winter and many previous ones, and flowered beautifully every autumn. A. dealbata, armata, and several other kinds are growing in great luxuriance in the open air, as well as many other half-hardy trees and shrubs. Here was also a fine specimen of Araucária imbricata upwards of 13 feet high and well proportioned, a Deodar Pine from 12 to 13 feet in height, and, in fact, all the kinds of Pines. An avenue of Araucária imbricata is contemplated in the park fronting the first range of houses. The flower-beds for planting out tender plants in summer, are capable of containing all the best and prettiest; the terrace-walks, which are well kept, the ornamental water, the fountains playing in all directions, the slopes, and the American ground, with banks of Magnólias, and clusters of all the finest hybrid Rhododendrons and Azaleas, must certainly produce a delightful appearance.—*J. R. S., Dec. 27th.*

Review.

The New American Orchardist; or an Account of the most valuable varieties of Fruit, of all climates, adapted to cultivation in the United States. By William Kenrick. 3d Edition; 8vo. Boston, U. S., 1841.

THIS is an 8vo volume of between 400 and 500 pages, written upon the plan of Lindley's "Guide to the Orchard and Kitchen-garden." It contains an account of a large number of fruits, both European and American, and is the best guide we possess to those of the United States. Those, however, who may read the work must bear in mind that the descriptions apply to the climate of North America, where the summers are very hot, and that, consequently, it by no means follows that a fruit will be good in England because it is so in the United States. Some allowance must also be made for the difference between American and English tastes; this is particularly apparent in the chapter about the Vine, where a great deal is said of the excellence of American Grapes. With us, however, their foxy flavour and mucilaginous pulp will always prevent their being esteemed.

An appendix contains some useful information concerning vegetables, flowers, and other matters related to gardening. The following vegetables, or their uses, will probably prove new to our readers:—

"*Bitter-Root.* Racine Amère.—A new plant, found growing in the valley of the Columbia River, in form resembling a Carrot. It is used as an article of food by the Indians and hunters, and although not very pleasant to the taste, its use as food is considered by them as being conducive to health.

"*Bread-Root.* Psoralea esculenta.—A southern perennial plant, a native of Missouri. Its roots are eaten like those of the Potatoe, and with cultivation produce abundant crops.

Cammas.—A new species of plant, found growing in the valley of the Columbia River; a truncated root, which grows in moist, rich land, in the form of an Onion. It is first roasted, then pounded, and made into loaves, like bread, and has a liquorice taste. An article of food of great importance to the Indians. (Probably Camassia esculenta.)

"*Cowish.*—A new species of plant, or biscuit-root, found growing on dry land in the valley of the Columbia River; its size that of a walnut, but sometimes larger. In taste it resembles the Sweet Potatoe, and is prepared for food by the same process as the Cammas, in which state it is a tolerable substitute for bread.

"*Wappatoo.* Sagittaria.—A bulbous root; a new species of the Arrowhead, which is found only in the valley of the Columbia River, below the cascades. It grows in shallow lakes, and in marshes covered with water. When roasted, it becomes soft, and is then both a palatable and nourishing food, and is much used by the Indians as an article of trade. The Indians search for the roots with their feet, and these being extracted by their toes, rise to the surface of the water.

"*Martynia.* Martynia.—An annual plant, with conspicuous, showy flowers. The green pods are fine for pickling. Sow in May; the plants may remain two feet asunder."

CALENDAR OF OPERATIONS *for the ensuing Week.*

AT this season of the year there ought to be little left undone in the way of manuring and digging; if, however, a press of other important work has suspended these operations, advantage should now be taken of every suitable day to resume them The benefit that ground, particularly if of a clayey texture, derives from exposure to frost, is well known; but besides this, the more perfect incorporation of the manure with the soil, which will be effected by the necessary processes of ridging, levelling, &c., is advantageous to the ensuing crop; therefore, as a general rule, all vacant ground ought to be manured and dug as early in winter as practicable. Should the weather be frosty, sufficient employment might be found in getting together a quantity of leaves for hotbeds, in turning and mixing composts, pointing and dressing flower-stakes, &c. &c.

KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—It is desirable, in a gentleman's family, to obtain ripe Pine-apples at different periods, in preference to having a great number ripe at one time; therefore, where there is convenience, and a sufficient stock, some plants should now be encouraged to start, by raising the temperature five degrees in as many days; the bottom-heat should also be increased if below 90°. To effect this, only the front row of plants need be removed, when a trench three feet wide, and the same in depth, is to be taken out along the front of the bark-bed, and the space filled up with new bark, not recent from the tan-pits, but such as is already warm. This method of increasing or renewing the bottom-heat might often be adopted in preference to disturbing the plants, which is always injurious to them in some degree. In very cold weather it will be necessary to cover the linings of dung-heated succession-pits with long litter, fern, or any similar material, to prevent their being suddenly chilled; and if, notwithstanding this precaution, a decline of temperature should occur, the coverings had better be kept upon the lights, except for a short time in the middle of the day, until means can be taken for renewing the heat.

VINERY.—Especial care must be taken to prevent the access of frost to the roots of growing Vines; for if they are once paralysed by this cause, there will be very little chance of obtaining fruit. As the young shoots advance in growth they should be carefully tied to the wires, by no means too tightly at first, for fear of breaking them; to prevent this mishap, it will be advisable to go over the Vines every morning, tieing and loosening as may be required, until all the young shoots are gradually brought into their proper position. Stop all the shoots (except the leader), one clear joint above the bunch, and pinch clean out all the laterals below the bunch. Vines recently introduced should be syringed every morning and evening with lukewarm water (by this term water heated to about 70° is meant) up to the period of their breaking. In case of severe frost, any Vines which have been turned out of Pine-stoves, or other hothouses, should be protected; if they are tied in a bundle along the front of the house, close to the glass, a double covering of mats will secure them from injury.

PEACH-HOUSE.—Trees which blossom excessively would be greatly benefited, particularly if weak, by pulling off the half or more of their flowers, leaving, of course, those for fruit which are best situated. The night temperature should range within a few degrees of 50. Where a succession of Peaches is required, a second house should now be shut up, but no fires made unless necessary for the exclusion of frost. The fruit in this house, if moderately forced, will ripen from the middle of June to the middle of July, according to the earliness of the sorts and the propitiousness of the season.

CHERRY-HOUSE.—If forcing was begun in December, the temperature by fire-heat should not even now exceed 45° for any length of time; but if a continuance of dull, cold weather occurs, it might occasionally be increased 10 or 12 degrees by day, for the sake of admitting fresh air; merely keep the frost out of the house if forcing has been commenced since Christmas.

CUCUMBERS.—Guard against sudden variations of temperature. The tender leaves are exceedingly liable to injury at this season of the year, and upon their health and vigour the productiveness of the plant depends. Mix a good portion of the leaves with the dung intended for Cucumber and Melon beds; they will moderate, and consequently prolong, the fermentative process.

KIDNEY BEANS that have been sown in pots half filled with soil, must have their stems gradually earthed up as they advance in growth, and not more than five plants suffered to remain in a 24-sized pot. If thrips appear upon the older plants, they should be repeatedly fumigated, and no other plants brought into contact with them.

SEA-KALE is best forced in beds in the open ground; for this purpose leaves should be used, because there is not much danger of their overheating; a light covering of litter will, however, be requisite, to prevent them from being blown about. Wooden boxes with hinged lids are better than earthen pots, and more economical in the end.

RHUBARB might also be forced in a similar way, and very little heat is sufficient to induce vegetation.

MUSHROOM-HOUSE.—Keep the temperature between 55° and 60°, and the atmosphere humid. Bearing-beds ought not to be watered unless absolutely necessary. Turn fresh horse-droppings frequently.

Out-door Department.

If severe weather is apprehended, Peas and Beans, as they make their appearance above ground, should be kept covered with rotten leaves or tan; or in case these materials are not at hand, a little soil might be drawn over them. If the ground is in a fit state, a few more rows might be sown across a south border; a better plan, however, is to sow in pots or boxes, and afterwards transplant. "Marshall's Early Prolific" is the best Bean for early cropping, but it cannot always be procured true. If not already done, advantage should be taken of a fine day to earth up the late crop of Celery. Take up and house Jerusalem Artichokes, and make every preparation against severe frost. In mild days look over Cauliflower and Lettuce plants under walls, to see that no slugs harbour among them. In places where Spinach is in great demand at this season, a few rows might be sheltered from cold by a covering of Fern, or by some Fir branches laid over it; the same also of Parsley.

SUCCORY is sometimes used as a substitute for Endive in salads, in which case the roots are now to be taken up, planted in boxes or other conveniences, and stowed away in a cellar or any dark place where there is a little warmth.

Orchard.—Where there are any wall-trees yet to remove no time should be lost, particularly if the aspect is south, in which situation vegetation commences somewhat earlier than in any other.

Gooseberry, Currant, and Raspberry trees, if not yet pruned, should be no longer delayed provided the weather will permit it to be done. In pruning Raspberries, take care not to leave too many bearing canes, which weaken the stools without a corresponding increase of fruit. The best support for Raspberry plants is a row of stakes placed at intervals of eight or ten feet, with a strong wire fixed along the tops of the stakes, between four and five feet from the ground; and to this wire the tops of the canes are to be fastened by a single tie of matting; the plants will thus be regularly arranged in single rows, whereby each will enjoy its share of light. Dig lightly between the rows.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—The operations in the Orchidaceous house recommended last week may still be carried on. Some of the plants in pots which are growing rapidly, such as Pháius grandifólius, ought to be liberally supplied with water, but the greater part ought to be kept rather dry at this season; those which hang up, however, must be frequently syringed. The night temperature ought always to be kept from five to ten degrees lower than usual during the winter months.

GREENHOUSE.—Tropæ olums, Kennédias, and other twining or climbing plants, should be frequently tied to their supporting frames; for if the shoots are suffered to entwine with each other, they cannot be separated without injury, nor can the plants be so neatly and symmetrically trained. Chinese Primroses will now be coming into flower, and will require rather more water in consequence; but take care not to give them too much, and do not water over the tops.

CONSERVATORY.—Apply no more fire than is just sufficient to exclude frost; unless Roses, Lilacs, and other forced plants in bloom are placed there, in which case the house should be kept a little warmer.

Out-door Department.

Proceed with the digging of shrubbery borders, and similar rough places. Hardy Rose-trees might now be pruned, but the more choice sorts had better be deferred till all danger from frost is over. In frosty weather, wheel rotten leaves, or other manure, on to the flower-borders.

NURSERY AND FOREST DEPARTMENT.

The directions given for last week are equally applicable to this; or, should bad weather prevent their being carried on, seeds of all kinds should be got ready for sowing; number-sticks and layering-pegs made; axes and other tools ground and repaired, and everything got in readiness against the return of open weather, so that no time may then be lost.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending January 6, 1842, as observed at the Horticultural Garden, Chiswick.

Dec. 31. Very fine throughout; overcast at night.

Jan. 1. Fine; slightly overcast; cloudy; slight frost at night.

2. Overcast; cloudy; snow-flakes; overcast.

3. Frosty and overcast; clear and dry; sharp frost.

4. Frosty and cloudy; clear; slight frost at night.

5. Frosty; calm, overcast and fine; very slight frost.

6. Showers of broad snow-flakes in the morning; cloudy and fine; densely overcast at night.—The deposition denoted by the small fraction in the rain column is melted snow.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending Jan. 15, 1842.

The highest temperature during the above period occurred on the 15th, in 1834—thermometer 56°; and the lowest on the 14th, in 1838—thermometer 4°.

REPORT ON COVENT GARDEN MARKET.

For the week ending Jan. 7th, 1842.

CONSIDERING the season the market has been well supplied during the week, and many articles have advanced in price. *Fruit.*—Pines of the kinds noticed last week are plentiful. A few good hothouse Grapes may still be obtained; foreign are generally excellent. Apples of the kinds mentioned in our last report are abundant, and differ but little in price. Pears of the varieties mentioned last week are plentiful. There are many excellent samples of Oranges and Lemons. *Vegetables.*—The frost has rendered many of the vegetables indifferent, and consequently the better samples have advanced in price. White Broccoli is rather scarce. Brussels Sprouts of good quality are plentiful. Good forced French Beans may be obtained from 3*s*. to 3*s*. 6*d*. per hundred. The supply of Asparagus and Sea-kale is well kept up, and the quality of both is generally speaking excellent. Lettuces are injured by the frost, and good ones are difficult to be obtained.; other kinds of Salading are pretty good for the season. Excellent forced Rhubarb abounds. Mushrooms and Truffles are plentiful. *Flowers.*—Among Cut Flowers we observed some excellent Gardénias, large-flowered and yellow Jasmine, Epacrises and Heaths of several kinds, some beautiful Chinese Primroses, and forced Tulips and Roses.

PRICES, SATURDAY, JAN. 8, 1842.—FRUITS:—

Apples, Kitchen, per bushel, 3*s* to 7*s*
— — Dessert, per bushel, 4*s* to 12*s*
Pears, dessert, per hf.-sieve, 3*s* 6*d* to 14*s*
Pine Apple, per lb. 5*s* to 8*s*
Grapes, hothouse, per lb., 3*s* to 8*s*
— Spanish, per lb., 9*d* to 1*s* 3*d*
— Portugal, per lb., 1*s* to 3*s*
Oranges, per doz., 9*d* to 2*s*
— — per 100, 5*s* to 14*s*
— — Bitter, per 100, 7*s* to 12*s*
Lemons, per doz. 1*s* to 2*s*
Lemons, per 100, 6*s* to 14*s*
Almonds, per peck, 7*s* to 8*s*
Sweet Almonds, per pound, 3*s*
Chesnuts, per peck, 5*s* to 10*s*
Walnuts, per bushel, 12*s* to 24*s*
Filberts, English, pr.100 lbs. 120*s* to 130*s*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s* to 24*s*

VEGETABLES.

Savoys, per dozen, 6*d* to 1*s*
Cabbage, White, per dozen, 8*d* to 1*s*
— Red, for pickling, 2*s* to 4*s*
Cabbage Plants, per doz., 2*s* 6*d* to 4*s*
Brussels Sprouts, p.hf.sve., 1*s* 6*d* to 2*s* 6*d*
Broccoli, White, p. bunch, 2*s* to 4*s*
— Purple, 1*s* to 3*s*
Kidney Beans, forced, per 100, 3*s* to 3*s* 6*d*
Potatoes, per ton, 55*s* to 80*s*
— per cwt. 3*s* to 4*s* 6*d*
— per bushel, 1*s* to 2*s* 6*d*
— Kidney, p. bush, 2*s* 6*d* to 3*s*
Artichokes, Jerusalem, pr half sieve, 9*d* to 1*s* 6*d*
Turnips, pr doz. bunches, 2*s* to 3*s* 6*d*
Carrots, per doz. bunches, 3*s* to 5*s*
Parsneps, per dozen, 6*d* to 1*s*
Red Beet, per dozen, 9*d* to 1*s* 6*d*
Scorzonera, per bundle, 1*s* to 1*s* 3*d*
Salsify, per bundle, 1*s* to 1*s* 3*d*
Horse Radish, per bundle, 2*s* to 5*s*
Spinach, per sieve, 3*s* 6*d*
Leeks, per dozen bunches, 9*d* to 1*s*
Garlic, per lb., 8*d*
Shallots, per lb., 1*s*
Onions, per bushel, 2*s* to 3*s*
— for pick., per hf.-sieve, 3*s* to 3*s* 6*d*
— Green, per bunch, 4*d*
— Spanish, per dozen, 2*s* to 6*s*
Asparagus, per 100, large, 9*s* to 11*s*
— Second or Middling, 4*s*
— Sprue, or Small, 3*s* to 3*s* 6*d*
Sea-kale, per punnet, 1*s* 6*d* to 3*s*
Lettuce, Cabbage, pr. score, 4*d* to 1*s*
— Cos, per score, 1*s* 6*d*
Endive, per score, 1*s* 6*d* to 4*s*
Celery, Red, per bundle 6*d* to 1*s* 6*d*
— White, per bundle, 6*d* to 1*s* 3*d*
Small Salads, per punnet, 3*d*
Watercress, p.dz. small bunch. 6*d* to 9*d*
Parsley, per half sieve, 1*s* 6*d* to 2*s* 6*d*
Tarragon, per dozen bunches, 6*d*
Thyme, per doz. bunches, 2*s*
Sage, per doz. bunches, 2*s* to 3*s*
Mint, per doz. bunches, 2*s* to 3*s*
Savory, per dozen bunches, 2*s* to 3*s*
Rhubarb Stalks, per bundle, 1*s* to 2*s*
Mushrooms, per pottle, 1*s* to 1*s* 6*d*
Truffles, per pound, 2*s* to 3*s*

Notices to Correspondents.

WILL ANY OF OUR CORRESPONDENTS FAVOUR US WITH A DETAILED ACCOUNT OF MR. CRAWSHAY'S MODE OF MANAGING THE VINE? WE HAVE MANY INQUIRIES ABOUT IT.

C. D., if he wishes to complete his set for binding, must order the Numbers he wants immediately, as we are nearly out.

Wood and Sons.—Your Pear is the Bezy de Caissy, often sold in Covent-garden market under the name of the Nutmeg Pear.

A Pupil has sent the pod of the Algaroba, or Ceratónia Síliqua; commonly called in English St. John's Bread, upon the supposition that it was the Wild Locust that supported him in the Wilderness. The pods are eaten for the sake of the sweet nutritive substance they contain. Such pods are often sold in London by the foreign fruiterers.

A Subscriber.—The generality of American plants thrive best in damp places, especially Rhododendrons; but if too much shaded, they will not flower so well as if they are fully exposed to the sun. If grown in dry places, the ground should be screened from the sun by the plants themselves, which must therefore be placed close together.

E. R.—Thanks for the hint. Your wishes shall be complied with.

Clareinch.—Upon looking back to the observations made by us on the rights of property in plants, we find nothing to alter or retract.

W. P. had better not go on till we have made some progress with what he has sent.

W. W. P.—Cryptogamic plants are not subjects of Horticulture, except Ferns, and we cannot undertake to name them.

Inquisitor.—The pipes in the hotbed at Knight's Nursery are arranged horizontally, and are not more than six inches apart. To prevent the pots from slipping down between them, boards are placed on them, and over these about six inches of old tan, in which the pots are plunged. Copper pipes are sooner heated than iron, but they do not retain the heat so long; the latter are in every respect preferable. The asphalte roofing would, with proper care, last, in all probability, for many years. It is advertised at p. 825 (1841).

Omikron.—Your loam and leaf-mould, mixed with a little river or bank sand, will be found a good substitute for peat. Grafting Rhododendrons is not of much value to you, as any of the stronger-growing varieties may easily be trained as standards.

W. Bassett.—You will be able to procure young Gooseberries, correctly named, from any respectable nurseryman.

Mary.—Poinséttia pulchérrima is a native of Mexico; in the early part of summer it may be kept in the greenhouse, but when it begins to show flower it should be removed to the stove. During the season of growth, and also when in flower, it may be freely supplied with water, but at other times rather sparingly. The best method of improving your clay soil is to dig in sand or coal ashes, or lime rubbish, which will render it more open and friable. Perhaps you can burn it.

J. Marshall.—A sieve contains about 5 pecks; a Currant-sieve, 2½ pecks. A punnet is a round flat basket that holds from 12 to 18 good-sized Plums. A pottle is a long tapering basket that holds about a pint and a half. 'Hand' applies to a bunch of Radishes, which contains from 12 to 30, according to the season. A bundle contains 6 to 20 heads of Broccoli, Celery, &c., and in the case of Asparagus from 100 to 150. A bunch is applied to herbs, and varies much in size, according to the season.

A Young Gardener.—The best method of pruning the black Currant is to thin out the branches where they are too thick, and not shorten, unless where a shoot or branch requires to be cut back, in order to produce one or more additional to fill up an adjoining opening.

G. S. had better send his newsman a post-office order for 13*s*. (the half-year's subscription) in advance, and then there can be no difficulty about price.

W. T. C.—The following varieties of Pears and Apples will improve any deficient collection:—PEARS—Dunmore, Louise Bonne (of Jersey), Beurré Bosc, Althorp Crassane, Passe Colmar, Winter Nelis, Hacon's Incomparable, and Knight's Monarch. APPLES—Wormsley Pippin, Hughes's Golden Pippin, Court of Wick, Herefordshire Pearmain, Hubbard's Pearmain, Scarlet Nonpareil, Boston Russet, Court-pendu Plat, Reinette du Canada, Sturmer Pippin, Bedfordshire Foundling.

J. W.—Wilmot's New Hamburgh Grape can still be procured from Mr. Wilmot, of Isleworth. See Advertisement in this *Chronicle*, p. 465 (1841).—Cookery by-and-bye.

Inquisitor and *A Yorkshire Gardener.*—The following dessert and kitchen Apples are proper for dwarf training in the open ground:—*Dessert*—Early Harvest, Oslin, Summer Golden Pippin, Golden Reinette, Maclean's Favourite, Golden Harvey, Braddick's Nonpareil, Pearson's Plate, Old Nonpareil, Boston Russet, and, though last, none more suitable than the Court-pendu Plat. As *Kitchen-Apples*, the Hawthornden, Royal Russet, and Alfriston may be mentioned; but as most kitchen varieties are strong-growers, it is best to keep them within proper limits by pinching or otherwise shortening the shoots in summer. *Kitchen-Apples for Standards*—Dutch Codlin, Bedfordshire Foundling, Keswick Codlin, Wormsley Pippin, Waltham Abbey Seedling, Yorkshire Greening, Dumelow's Seedling, Brabant Bellefleur, Northern Greening, Mère de Ménage, and the three above-mentioned.

A Subscriber.—Your plan is a *very good one.*

X. X. X.—It is the Minorca Honeysuckle, Caprifólium baleáricum, or implexum, two names for the same species.

J. M.—We are endeavouring to procure some seeds for you of the Trifolium giganteum, which is a true Clover, and not one of the worthless Melilots. If we can get them, they shall be sent by post.

P. P.—We had by no means put away your Stat, but have delayed it for a short time; we will, however, take advantage of your permission to shorten it. Many thanks for your kind remembrances.

A. B. and C. will find their questions *fully answered* in Mr. Ainger's excellent papers upon heating with hot water, already published in our columns.

Mr. Bainbridge.—We can form no opinion of the value of your prevention of mildew from the specimen sent. All we can see is that the shoot was covered with fungus, which seems dead; but for anything in the nature of evidence before us, the shoots may be killed by the mixture, or the mildew may all revive. If you will send us a bottle of the preparation, we will try its effects and report upon them.

F., Berks, and another, will have a reply concerning Quicks next week. In the mean while nothing can be done with the Haws, except to break them up with sand and throw them in a heap.

L—n.—If your Strawberry plants have not set their fruit, it is in all probability owing to your having forced them too quickly; 68° to 76° is far beyond the temperature they will bear. You should have placed them *close* to the light, have kept them thoroughly ventilated, if possible, so that the leaves were actually in motion, and the temperature should have been raised very slowly. Consider how slowly the heat of the spring is increased which brings the Strawberry to maturity in the open ground. Have you not also kept them as warm at night as in the day? Read our Calendar for last spring.

Linimensis.—The different species of Hemerocallis require to be planted in a rich loamy soil, kept rather dry in winter, but freely supplied with moisture in the growing season. They are also the better if planted in a situation where they are partially screened from the mid-day sun. The Japan species, now called Funkias, are more delicate and are apt to suffer from superabundant moisture during the winter; they should be protected either with a handglass or a large flower-pot inverted to keep them dry. If your Pentstemon seeds are from the colder parts of North America, sow them as soon as they are ripe in the autumn; but if they are from the warmer parts (such as Mexico and Texas), do not sow them before the spring.

As usual, many letters have arrived much too late for answers this week.

NEWS OF THE WEEK.

BY the arrival of the Overland Mail, we have received intelligence of considerable importance from India and China. The Chinese news comes down to the 10th Oct., and brings an account of the capture of the great fortress of Amoy. It appears from the detailed particulars of the operations adopted by the new Plenipotentiary, Sir Henry Pottinger, that finding the trade at Canton comparatively uninterrupted, he determined to coast the Chinese shore with the fleet and troops under Admiral Parker and Sir Hugh Gough, and to destroy the fortifications met with in his progress. until, in the event of his failing to obtain justice from the Emperor by his previous measures, he should renew his demand under the walls of Pekin itself. As the first fruits of this policy, the large city of Amoy, with its extensive lines of formidable fortresses, protected by about 500 pieces of cannon, was carried by storm on the 26th Aug., after considerable firing, but without the loss of a single man belonging to the British forces. The particulars of this event will be read with considerable interest, as an assurance that the main objects of the Expedition are no longer likely to be thwarted by Chinese diplomacy. At Canton, also, there have been some operations of a hostile character; the Chinese having broken the truce by repairing their batteries and placing barriers to obstruct the navigation, Capt. Nias, of H.M.S. *Herald*, proceeded up the river, destroyed the fort of Wangtong, and issued a proclamation to the Chinese, intimating that any further breach of faith would be immediately followed by a renewal of hostilities.—Our Indian news relates chiefly to Burmah and Cabul. We learn that the Calcutta Government has assembled a considerable force on the Burmese frontier, in order to resist the apprehended attack on our possessions; that the King of Burmah was at Rangoon, but it was believed that the warlike preparations of Government and the recent successes in China would deter him from any act of aggression. A battle has taken place between our local troops and the Ghilzies, a mountain tribe holding the passes from Cabul to Jellalabad, in consequence of the suspension of an allowance for their services in keeping open the roads; the British forces were successful in carrying the disputed defiles, but at a sacrifice of life which has given rise to severe comments in the Indian journals. The Governor-General has published an order from the Directors, authorising the payment of a further portion of the booty captured in the late Burmese war, the amount of which is said to be not less than nine lacs of rupees.—Our European news is likewise interesting: In France, the leading topic of attention is the dispute which has arisen between the Spanish Cabinet and the French Ambassador, in consequence of his refusal to deliver his credentials to the Regent; the question begins to assume an appearance of much difficulty, and it is formally announced that the Ambassador has received instructions to leave Madrid, if the Spanish Government does not modify its pretensions. The addresses presented to the King by the diplomatic body, by the legislature, and by the clergy, in accordance with the annual custom on New Year's day, are regarded by the Paris journals as an additional assurance of pacific intentions on the part of the European Powers, and as a proof of the determination of the Chambers to support the King in enforcing his authority at home.—From Spain we have received the Speech of the Regent on the opening of the Cortes; it entered at great length into the foreign and domestic affairs of the kingdom, alluding with satisfaction to the complete suppression of the late revolt, and to the favourable relations now existing with those European Powers which had already recognised the Queen; while it announced that those Governments which had not acknowledged her authority regarded the political condition of the country without hostility, and were likely at no distant day to give their sanction to the triumph of the national cause. It takes a lengthened review of domestic subjects, and concludes by recommending a reform in the administration of justice, the modification of the Basque *fueros*, the restoration of the navy to its ancient character, and the necessity of preserving faith with foreign creditors. The Senate and the Chamber of Deputies have since assembled for the election of officers; but the appointments made by both houses are considered unfavourable to the Cabinet, in which several changes are already anticipated.—The accounts received from Germany in relation to the accession of Austria to the Customs' Union are somewhat contradictory, although it is still urged that by a modification of duties the commercial relations between the Austrian States and the remainder of Germany will be considerably extended. From Berlin we learn that the departure of the King of Prussia for London is now definitively fixed for the 16th inst., and that his Majesty may be expected to reach London on the 21st.—Recent advices from Turkey announce some new changes in the Ministry, and the organization of two military divisions in the neighbourhood of the capital; the one being intended for the frontiers of Greece, and the other as a corps of observation to keep in check the northern provinces of the empire.

At home, active preparations are making for the christening of the Prince of Wales, which will take place on the 25th inst. in St. George's Chapel, Windsor. It is rumoured that her Majesty has intimated her intention of opening Parliament in person, and that additional interest will be given to that ceremony by the presence of the Kings of Prussia and Belgium. The naval and military services will receive with satisfaction the announcement in the Ministerial papers that a large portion of the sum received by Government as the ransom of Canton has been appropriated as prize-money to the officers and men engaged in the operations against that city.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal are all well, and continue at Windsor. Her Majesty has walked as usual in the grounds adjoining the Castle, and taken her accustomed exercise during the week. Lord Byron has succeeded Viscount Sydney as the Lord in Waiting on her Majesty, and Sir F. Stovin has succeeded Admiral Sir R. Otway as the Groom in Waiting on her Majesty. Lord C. Wellesley (Clerk Marshal) has succeeded Col. Arbuthnot as the Equerry in Waiting on the Queen, and Col. Bouverie has succeeded Major-Gen. Sir E. Bowater as the Equerry in Waiting on Prince Albert. Active preparations have already commenced at St. George's Hall and Chapel for the ceremony of the christening of the Prince of Wales. The presence of the Earl of Delawarr, Lord Chamberlain, and the Earl of Jersey, Master of the Horse, has, it is said, been commanded at the Castle, to make further arrangements in their respective departments of the household for the same occasion. It is stated that the reigning Duke of Saxe Coburg, uncle of Prince Albert, and the Dowager Duchess of Saxe Coburg-Gotha, will unavoidably be absent; but that his Excellency Baron Gersdorff, the Saxon Minister, will officiate as representative of his Serene Highness, as one of the sponsors; and that the Duchess of Kent will act for the Dowager Duchess.

The Queen Dowager.—The latest accounts from Sudbury-Hall inform us that her Majesty the Queen Dowager continues to improve, but that she is still too weak to undergo the fatigue of the journey to town.

Parliamentary Movements.—Mr. Vance, mentioned in our last as the proposed Conservative candidate for the City of Dublin, has retired; and a deputation has waited on Mr. Wolverley Attwood, to request his permission to put him in nomination; and in the event of his declining, the same proposition, it is said, will be made to Mr. Colquhoun. Lord Morpeth is now positively announced as the Liberal Candidate.—Viscount Jocelyn has accepted the invitation of the Conservative electors of King's Lynn to come forward to represent that borough in the place of Sir S. Canning, appointed Ambassador to Constantinople.

Army and Navy.—A Ministerial Paper states that the Queen has been pleased to grant to the forces employed at the capture of the outworks of Canton, out of the sum received under the Convention, a donation equal to one year's amount of the Indian allowance known by the name of "Batta." The shares of colonels will be 900*l.* each; of lieutenant-colonels, 720*l.*; of majors, 540*l.*; of captains, 216*l.*; of lieutenants, 144*l.*, &c.; the officers of the navy sharing according to their relative rank with those of the army. Those who were not present at the operations against Canton, but who were engaged at the other operations of the war, such as the taking of Chusan, are to receive six months' Batta.

The Revenue.—The official tables of the Revenue for the years and quarters ended 5th Jan., 1841 and 1842, have just been published, and appear to be on the whole of a satisfactory character. On the general revenue for the year ended the 5th inst., as compared with that of last year, there is an increase of 506,095*l.*; and on the revenue for the quarter an increase of 338,549*l.* On the year there is an increase in the Customs of 145,245*l.*; in the Excise, of 6,356*l.*; in the Taxes, of 536,467*l.*; in the Post-office, of 14,000*l.*; Miscellaneous, 19,622*l*: and there is a decrease in the Stamps of 26,456*l.*; and in the Crown Lands of 5,500*l.* On the quarter there is an increase in the Customs of 414,368*l.*; in the Stamps, of 21,871*l.*; in the Taxes, of 123,239*l.*; in the Post-office, of 29,000*l.*; in the Crown Lands, of 9,000*l.*; and Miscellaneous, of 2,615*l.*; while there is a decrease in the Excise of 277,096*l.* The total ordinary Revenue for the year is 44,387,598*l.*; or including imprest and other moneys and repayments of advances, not specified in the ordinary receipts, 45,252,495*l.*

Post-Office.—The following is an official table, just published, of the number of letters delivered in the United Kingdom, for the year ended the 5th inst., compared with those of the two previous years. It is, however, premised that the numbers given are, in some degree, the result of estimate, more especially those previous to the reduction in the rates.

LETTERS SENT THROUGH THE LONDON GENERAL POST.

Year immediately preceding reduction, viz., that ending Dec. 4, 1839 (chargeable letters only)	21,088,000
1840	49,309,000
1841	68,671,000
Increase in the last year's letters since 1840	19,362,000
Ditto, since reduction	47,583,000

LETTERS SENT THROUGH THE LONDON DISTRICT POST.

Year immediately preceding reduction, viz., that ending Dec. 4, 1839	13,278,000
1840	20,306,000
1841	22,820,000
Increase in the last year's letters since 1840	2,514,000
Ditto since reduction	9,540,000

LETTERS DELIVERED IN THE UNITED KINGDOM.

The letters sent out of the United Kingdom are excluded from this account.

Year immediately preceding reduction, viz., that ending Dec. 4, 1839 (exclusive of franks, which are estimated at 7,000,000)	75,469,000
1840	168,768,000
1841	196,500,000
Increase in the last year's letters since 1840	27,732,000
Ditto, since reduction	121,031,000

Church Preferment.—The death of the Bishop of Ossory, against whom a commission of lunacy was recently issued, took place on the 31st ult., and the names of Dr. Elrington, Regius Professor of Divinity, and the Very Rev. R. Daly, Dean of St. Patrick's, are mentioned as the probable candidates for the vacant bishopric.

Official Appointments.—The Right Hon. H. Hobhouse, formerly Under-Secretary of State for the Home Department, has been appointed on the commission of inquiry into the Exchequer Bill fraud, in the room of Lord Ashburton, who is about to leave on a special mission to the United States.

Foreign.

FRANCE.—*Relations with Spain.*—The leading topic which appears to occupy the attention of the journals is the difference which it is apprehended may arise between France and Spain, on the question of etiquette at the latter court, already known to our readers. The Opposition prints impute the blame of the whole transaction to the French Cabinet; whilst on the other hand the Ministerial papers contend that the Government is altogether in the right, and the Regent of Spain is alone responsible. The question has given rise to a great deal of discussion; and on the ministerial side it is urged that M. Salvandy never presumed to conceal himself from the Regent; that he never pretended to the right of speaking to the Queen without witnesses; and that the letters he took with him were so far from containing any mysterious matter, that M. Salvandy offered to give the Regent authenticated copies of them. They further urge, that the Spanish Government had a minister at Paris, who was beforehand perfectly aware that M. Salvandy would be accredited to the Queen; and argue, from diplomatic precedents, that it is to the Queen in person that the ambassadors' letters should be delivered, and refer to the Spanish ambassador, Cellamare, during the minority of Louis XV., and the ambassadors of the European Powers to the Emperor of the Brazils, who refused to deliver their credentials in each case to a Regent. They conclude by saying that they should much regret that an unexpected difficulty should suspend the good effects which both countries had a right to expect from M. Salvandy's mission, and which they maintain was purely one of peace and amity. Though the question has assumed an appearance of much difficulty, it is hoped that the new instructions sent to the British and French Ministers at Madrid will prove of a nature calculated to effect an arrangement, unless the Spanish Government should manifest obstinacy, in which latter case M. de Salvandy will, it is positively stated, withdraw. The retirement of M. Gonzales, Spanish Foreign Minister, from office would, it is added, be a consequence, if not a preliminary, of the amicable adjustment of this affair.

Addresses to the King.—On New Year's day, the diplomatic body in Paris, the Chamber of Peers, the Chamber of Deputies, and other great functionaries, presented to the King, according to custom, their several congratulatory addresses. That of the diplomatic body was spoken by the Marquis Brignole-Sale, ambassador of Sardinia, as the senior member, and was marked by pacific assurances. He congratulated his Majesty on the providential escape of the young princes from the attempt of the assassins, and on the adhesion of France to the treaty of July, which, he said, had drawn closer the bonds of union between the great Cabinets—a union so necessary to the repose of nations, and to the preservation of general peace. The King, after returning thanks for the expressions of sympathy thus conveyed to himself and family, observed, that the year 1841 had been productive of happy results, since the great Cabinets had given in that year, by their accord, a new guarantee to the general peace, which his Majesty trusted the Powers would continue to maintain unimpaired. The speeches of the Duke de Broglie, Vice President of the Chamber of Peers, in the absence of Baron Pasquier, the Chancellor, from indisposition—of M. Sauzet, President of the Lower Chamber, and the Minister of Justice, conveyed to his Majesty their several congratulations for the protection displayed towards the Royal Family by Providence, whose goodness, they said, had preserved his Majesty's life for them, and his children for theirs. They desired to express their admiration of the noble example offered by his Majesty and the Royal Family, whose lives were devoted to the practice of every virtue and the dispensation of favours. They expressed their belief that there was nothing in the aspect of events that seemed to forebode new storms, and nothing to dim their joy and their hopes on that auspicious day; and concluded by assuring his Majesty that they would devote their attention to the several interests they represented, and that whatever difference of opinion might be expressed in the approaching debates in the Chambers on other subjects, on this occasion all parties coalesced in assuring his Majesty that they were the sincere defenders of his person. The King in reply thanked them for himself, and in the name of his family: he said that it was for the sake of saving the country "that he had undertaken the fearful task of conjuring the hurricane which was gathering round France; and that he was happy to find that, thanks to the progress of public tranquillity, the institutions were daily acquiring additional strength. It was, as they remarked," added his Majesty, "a laborious undertaking to found in France a free and regular Government; but the support which he had ever found in the Chamber of Peers was one of the great means of attaining that end." His Majesty concluded by saying that there were parties who would deprive the country of the blessings of tranquillity by exciting alarm, and making those incessant attacks against property which were calculated to shake society to its very foundation; but with their assistance he trusted to triumph over all such attacks, and guarantee to France the maintenance of repose and the development of her prosperity, which could only be effected by a firm execution of the laws, so as to render them a protection for all, and an oppression to none." Numerous other addresses were presented to the King on the same occasion, the most remarkable of which was that of the Archbishop of Paris, which was a formal act of submission, on the part of the clergy, to "the Royal power, so clearly recommended by the precepts of Christianity." The papers remark, that not only was the Russian minister, and all belonging to the Russian embassy, absent from the reception on New Year's day, but also that no Russians were presented to the King, which they suppose to be owing to orders from the Emperor.

Meeting of the Chambers.—The Chamber of Deputies met on Monday, to nominate the commission to draw up the reply to the Speech from the Throne, when more than 320 members were present. The discussions in the bureaux were long and animated, and a speech of the Minister for Foreign Affairs, M Guizot, appeared to produce a great sensation. The Ministry obtained the advantage in the whole nine bureaux, as all the members chosen are Conservatives. M. Passy—and this is looked upon as important, as proving his party to be with the Cabinet—warmly defended the Ministry on the Eastern question. He stated that the system of isolation was impracticable for France. M. Carne, who has joined M. de Lamartine, severely attacked the Ministry for the treaty respecting the right of search; and M. Thiers, who declared himself in favour of the treaty with Belgium, said that he was for the infusion of the two people, and the disappearance of the custom-house lines. M. Fould, the banker, formerly an ally of M. Thiers, approved of the policy of the Ministry. It is now expected that the address of the Commission will be a mere echo of the Speech.

Quénisset and his Co-accused.—Quénisset, together with his two accomplices, Colombier and Brazier, who were condemned to death by the Court of Peers, have received their respite. They still, however, remain at the Luxembourg, and their removal will not, it is said, take place until after the termination of the new trial of the persons arrested in consequence of their disclosures, since they will have to appear as principal witnesses for the prosecution. The number of new political prisoners is stated to be eleven—they have been conveyed to the Luxembourg, and most of them are represented to have the appearance of persons in easy circumstances. Some important papers, it is said, have been seized at their residences, and numerous other warrants are still out in different parts of the capital.

Proceedings of the Press.—Nothing of importance has occurred since our last relating to the proceedings of the press, with respect to the sentence on M. Dupoty, which excited at the time so much alarm and indignation. The provincial papers, however, continue to send in their adhesion to the declaration, noticed in our last, protesting against the sentence, and the implied attack on the liberty of the press. The Cour Royale of Limoges has just condemned, without the intervention of a jury, two journals for libel upon M. Bourdeau, Peer of France. One of them is sentenced to pay 6,000f., and the other 1,500f. damages and costs. The prosecution was, in the first instance, brought before the Tribunal Civil of Limoges, which declared itself incompetent; but on the appeal of M. Bourdeau to the Cour Royale, that Court declared itself competent, and gave the above decision. M. Gaugain, the editor and proprietor of another provincial paper, has been sentenced by the Police Court of Caen to pay a fine of 500f., and to imprisonment for one month, for having published in his journal an account of the deliberations of the Court of Peers.

SPAIN.—We have received the Speech of the Regent, on the opening of the session of the Cortes, on the 26th ult. On the arrival of the procession at the Palace of the Senate, her Majesty, the Regent, and her Royal Highness the Infanta, were received by deputations from the two Chambers. Her Majesty took her seat on the throne, with her sister on her left, and the Regent upon her right, one step lower than the throne, which was surrounded by the ministers and officers of the palace. The President of the Council then delivered the Speech to her Majesty, who placed it in the hands of the Regent, by whom it was read to the assembled Cortes. It was of considerable length, and commenced with the assurance that the relations of the country with friendly Powers continued to gather strength by the bonds of strict harmony and good intelligence; that those nations which had recognised the Queen preserved those sentiments of justice which dictated that recognition; and that the Governments which had not taken that step contemplated them without hostility, made continued inquiries respecting their political situation, and as it became more stable, the day, it said, was not far distant when reason would triumph, and the national cause complete its victory. No allusion is made in the Speech to the present difference between M. Salvandy the French Ambassador, and the Government. The Speech then alludes to "the revolt which broke out in October, disturbed the public tranquillity, and obliged Government to proceed with activity and energy to crush it in its origin. The Constitution," it says, "as well as the precious lives of our innocent Queen and her august sister, were menaced by an armed conspiracy. But Providence enabled loyal Spaniards to save those dear objects of our hopes. All the means at our disposal were employed to repress this horrible attempt, and the hand of justice chastised the principal delinquents; their criminal attempt failed against the firm attitude of the nation, and the energy of Government. The public vengeance once satisfied, Government deemed that it might exercise clemency, and spare the lives of some of the rebels." Allusion is also made to the disturbances that took place at Barcelona, "obliging Government to declare that rich and populous city in a state of siege. This measure, which had for its object to avoid the effusion of blood, produced neither violence nor punishments, and the tranquillity of the city had again been happily re-established. Since those events peace had been restored throughout the whole monarchy by the triumph of the laws, and every cause of new disturbance had disappeared." The remainder of the Speech is occupied with domestic subjects; the administration of justice, the regulation of the finances, and the proposal of various reforms in different civil and military departments. It recommends some modification of the Basque fueros; proposes to renovate the navy, and restore it to its ancient character; and advises measures to be adopted to promote the interests of the trans-marine provinces of the empire. The necessity of preserving faith with foreign creditors is also enforced, and a plan is proposed for securing this desirable end. The Regent concluded in the following words:—"The eyes of the nation are fixed upon you; its hopes repose on your integrity and your patriotism. Rely upon my exertions, and upon the honest heart of a soldier, who has always fought for the liberty and glory of his country. For myself, I have no ambition; my life belongs to my country; and the glory of having served it in good faith will form my patrimony. May the existing Constitution, the throne of the young Isabella, the national independence, and the Government created by the will of the people, be the objects of our fidelity, and guide us in our legislative labours for the consolidation of a strong and just Government, which, avoiding the snares laid for it by ambitious factions, shall for ever assure the prosperity and the happiness of the nation!" The Senate and the Chamber of Deputies met on the following day, and proceeded with the election of officers. The appointments made by both houses were considered to be hostile to the Cabinet. The difference between the Government and M. Salvandy has not been arranged; and some sensation was produced in the capital on the 25th ult. by the departure of that ambassador to visit Aranjuez and Toledo, in order, it is said, to avoid assisting at the meeting of the Cortes, where "his position could not be clearly defined." He was, however, expected to return to Madrid the day after the ceremonial. Nothing new had transpired relating to the subject in dispute; and M. Salvandy was, it is said, awaiting instructions from his Government before taking any further steps. The definitive convention for the capitalization of the coupons, signed by the Spanish Minister of Finance on the 23d ult., was despatched on the same day for London by a cabinet courier. M. Salamanca, as one of the contractors, and M. Borrajo, a chief of division of the Financial Department, were to leave Madrid in a few days for Paris and London. A change of Cabinet, with Cortina as the Premier, was one of the rumours of the day. Señor Arguelles, it is said, will not be re-elected President of the Chamber of Deputies; and Don Pedro Acuna, First Vice-President of the first session, is spoken of as his successor. Accounts received from Barcelona inform us that the manufacturers in that city had burnt a large quantity of foreign goods.—Subsequent accounts, to the 29th ult., inform us that up to that date M. Salvandy had not left Madrid; but Paris letters state that he was expected to demand his passports, so as to be in that capital by the 14th or 15th inst., to take part in the debates on the address in the Chamber of Deputies. In the sitting of the Cortes on the 29th ult., the bureau of the Chamber of Deputies was formed; and the organization of the standing committee is said to prove a decided advantage over the *exaltado*, or democratic portion of the Chamber. The debates on the address were expected to be of a stormy character.

Portugal.—We have received, by the *Tagus* steamer, intelligence from Lisbon to the 27th ult. The critical and embarrassing state of financial affairs still appears to absorb public attention. The difficulty of raising the ways and means on the terms deemed eligible by Senhor Avila, Minister of Finance, appears to have nearly occasioned that gentleman's resignation; but it is now thought that Government will be able to carry its views into effect on its own terms. The election of the corporation of the capital had terminated in favour of the Government candidates by considerable majorities. The municipal election at Oporto was also proceeding favourably to Government. It was expected that the Cortes, on their meeting *pro formâ* this month, would be adjourned for the despatch of business till March. Lord Howard de Walden, the British Ambassador, had, it was understood, in consequence of the abolition of the Portuguese differential duties, recommended his Government to revoke the orders in council, establishing retaliatory duties against Portuguese shipping, and thus prevent the imposition of additional duties on goods imported in British shipping, which would otherwise take place on and after the 19th inst. The change about to take place in the Spanish mission seems to be looked upon with satisfaction; and it is thought that in consequence of a declaration which has been made by Lord Aberdeen on the subject, the demand as to the giving up the political refugees will be abandoned. One of these, Gen. Oribe, was on the point of sailing for England. The Prince de Joinville had arrived at Lisbon from New York, and was expected to make a stay of some days.

Germany.—The journals state, that hopes are entertained that Austria will join the Prussian Customs' Union, and that by a modification of duties the commercial relations between the Austrian States and the remainder of Germany will be extended. Private accounts, on the contrary, said to have been received from the Swiss Minister at Vienna, declare that Austria has decided on not joining the German Customs' Union; and a letter from the Rhine, published in a French paper, states that Prince Metternich is opposed to the junction, and that even if Austria were inclined to effect such a measure, many of the smaller States of Germany would strenuously oppose the admission of that Power into the Union. Accounts received from Pesth, of the 19th ult., inform us that the deputation of the Hungarian Diet has displayed great activity. A small majority had decided against the establishment of trial by jury. The minority, however, was about to publish the reasons of its vote, and in the ensuing session the proposition was expected to be renewed. The deputation on the 19th ult. was engaged in the adoption of some new plan of publicity for judicial proceedings.—From Berlin we learn that the departure of the King for London, to be present at the christening of the Prince of Wales, is now definitively fixed for the 16th inst. These accounts add that he will stop the first night in Magdeburg, from thence proceed to Hagen, and arrive on the 19th, by way of Aix-la-Chapelle, at Liege. On the 20th he will reach Ostend, where a Government steamer will be in readiness to receive him, and he will reach London on the 21st. The journals, speaking of the autograph letter sent by Queen Victoria to the King on this occasion, say that it was written in German, and that it contained the following passage: "I shall indeed regard it as a favourable augury of the happiness of my child, if my beloved cousin would be so kind as to be godfather in person at the christening." Some of the papers state that the well-known theologian, Bishop Neander, will also accompany the King for the purpose of conferring with certain of the English clergy on measures hereafter to be adopted in the ecclesiastical concerns of Prussia; but this seems to be unauthenticated. They also express the possibility of an approximation being made between the churches of Prussia and England, and associate with this view of the case the recent departure of two clergymen from Berlin for London. The object of their mission is, however, said to arise out of the necessity of increased church accommodation at Berlin, and they are sent to England in order to ascertain the plan adopted in this country under similar circumstances. Accounts from Frankfort of the 1st inst. state, that unexpected difficulties had impeded the conclusion of the arrangements agreed on between the King of Prussia and the Holy See relative to the Archbishop of Cologne. It would appear that the Chapter of Cologne refused to grant M. Geysell, the coadjutor, the rights of succession; nor would the Archbishop sign the manifesto which the Prussian Government proposed to publish relative to the origin and conclusion of the affair. Government, it seems, have just prohibited the sale, within the kingdom of Prussia, of all works published by Messrs. Hoffmann and Campe of Hamburg. This firm, it seems, has for some years published most of the works of the ultra Liberal party in Germany, as well as a great number of school-books in general use, and also many works of a miscellaneous character. This extreme measure will, it is said, be imitated by other German Governments. — Prince Pückler Muskau had a narrow escape from being killed a short time since. He was riding in his park at night, when his horse fell into a deep fosse, and was nearly killed; but the Prince escaped without injury.

Russia. — Accounts received from St. Petersburgh, dated the 19th ult., state that the winter this year in that capital is the most extraordinary ever experienced; that at the same period last year the cold was very severe, and the frost continued without intermission all the winter through. In one of the journals the following description is given by a correspondent of the state of the weather during the last month: "In our city gardens no trace of winter is to be seen. The grass-plots are all green, and the flowers are budding out. To-day, Dec. 1 (13th), I gathered in a garden at Wassili-Ostrow a nosegay, consisting of daisies, half-blown primroses, auriculas, and various other flowers, which I carried to an invalid lady residing on the English Quay. I rowed across the Neva in a little boat, the river being as free of ice as in the month of May."—We learn from the papers that on the 1st inst. the first number of an English periodical was to appear in the Russian capital, under the title of the *St. Petersburgh English Review*. The work was to appear twice every month, each number consisting of five or six sheets, and composed chiefly of extracts from English publications. The Empress, it appears, takes the undertaking under her immediate patronage. The editor is Mr. S. Warrand, teacher of English to the Emperor's children.—Savings banks have been established at St. Petersburgh and Moscow. Private letters from the banks of the Memen state that, in consequence of the treaty of London closing the Dardanelles, the tribes of the Caucasus who revolted no longer receive assistance so regularly as formerly, and no doubt was entertained but that they would be obliged to submit, and recognise the rights of sovereignty acquired by Russia in consequence of the treaty concluded with the Sultan.

Italy.—Intelligence has been received from Rome, under date the 16th ult., announcing the assembling of the Consistory in the course of the present month, when it was expected that four or five prelates would be raised to the rank of Cardinal. Private letters state that official notice had been communicated to the Auditor-General, Monsignore Acton, and the Governor of Rome, Monsignore Casoni, that they were to be immediately created Cardinals. Cardinal della Porta, Vicar-General to the Pope, died at Rome on the 18th ult., after a short illness. His Eminence was in the 60th year of his age, and had been invested with the purple by the reigning Pope in 1835. The following persons are reported among the distinguished foreigners who have lately had the honour of being presented to the Pope: Lord Somerset and family, Sir W. W. Wynn, Sir J. Hope, Mrs. Trollope, and Mr. Siventon It is said that the Abbé Drach, librarian to the Propaganda, had been invited to Paris by Louis-Philippe, with the intention of conferring on him the functions of librarian at the Palace of Versailles, to replace M. de Valery, who was obliged to retire in consequence of ophthalmia.

Greece.—Private letters, received through Ancona, inform us the Government had proposed to M. Mussurur, the Ottoman Chargé d'Affaires, to refer to arbitration the territorial question and the indemnity due to Turkish subjects: but that M. Mussurur had refused this proposition. Government had not yet formally replied to the note of the Ambassadors. Trieste letters, however, of the 22nd ult., assert that the dispute with the Porte will be amicably arranged.

Turkey.—Private letters from Constantinople, of the 8th ult., published in the German papers, state that the Sultan intended to appoint Hussein Pacha, Seraskier; and Hafiz Pacha, Minister of Finance. Zekeria Pacha had been recalled from the pachalic of Diabekir to take the command of the Roumelian division amounting to 50,000 men, to which 15,000 Albanians, 2000 Spahis, and 3000 Baschi Boruk were to be joined as the irregular corps. This large force, it is said, was to be divided into a corps of observation and a corps of operation: the first, 30,000 strong, to be concentrated at Adrianople, Philippopolis, Sophia, Varna, Silistria, and Shumla, for the purpose of watching Bulgaria; and the second, 40,000 strong, to take up positions near Salonica and the provinces on the frontiers. If the differences with Greece were not arranged, this army, it is said, would take the offensive. In the capital an army of 50,000 men was organising. The fleet was to be divided into two squadrons, each of six ships of the line, one destined for the Gulf of Volo, and the other for Candia. Tahir Pacha, the Grand Admiral, and Walker Pacha, had received the command of the two expeditions. The Porte's avowed intentions as to these armaments were to keep the Christian populations in check in Roumelia, and to thwart the plans of the Phil-orthodox societies of Greece; but the accounts add, it is generally thought that a division of this fleet is intended for Tunis, to replace the present Bey by a Turkish Pacha, and to submit this pachalick to a more rigorous subjection to the authority of the Porte.

India.—By extraordinary express, in anticipation of the overland mail, which arrived on Thursday morning, we have received intelligence from Bombay to the 30th Nov. The news of chief interest relates to Burmah and Cabul. From Burmah we learn that the extraordinary activity of the Calcutta Government had surprised Tharawaddie; and that within a very short space of time a considerable force had made its appearance ready to resist his contemplated attack on the British possessions. This force consisted of 8000 men, several vessels of war, and some steamers; and it is thought that there is now little chance of his beginning a war, particularly as he has been made aware of the British successes in China. There has been some fighting between the Ghilzies, a tribe of hardy mountaineers, who hold the mastery over the passes leading from Cabul to Jellalabad and Peshawar. It appears that a tribute, or blackmail, paid to them for liberty to pass through their defiles having been reduced or not paid by Shah Soojah, they stopped the mails coming from Calcutta and through the Sikh country. There were orders issued to clear the passes, and a force under Sir R. Sale proceeded from Cabul for the purpose. This force encountered considerable obstacles: the mountaineers, being fully acquainted with the ground, chose such positions as enabled them with their long matchlocks to do great execution among the British. Of the officers, three were killed; Capt. Wyndham and Lieut. Jenkins, Bengal 35th N. I., and Lieut. Edward King, 13th Queen's Light Infantry; and ten wounded, among whom was Sir Robert Sale. This fighting in the defiles, with an enemy almost unseen, is much commented on by the Indian journals, and the utility of forming an effective Rifle Corps is also urged. Sir W. H. M'Naghten was expected in Bombay some time in January, but the date was not positively known. He was coming, it was said, by the Bolan pass, which through the management of the new political agent, Major Outram, is represented as being in a fair state of becoming a safe communication: the conciliatory arrangements adopted by Major Outram appearing to be highly acceptable to the neighbouring tribes. In the Sikh districts tranquillity is stated to prevail: and nothing is said of their expedition in Thibet. The trials of the Arab revolters on the frontiers of the Nizam's country are over: one of them has been executed, several ordered to be transported, and tranquillity has been entirely restored to those districts. There were some apprehensions of a famine in some districts of Bengal, where the rice crop had failed.

Egypt.—By the overland mail we have recent intelligence from Alexandria, but it brings no political news. The Pacha had returned from Esneh, within 24 hours' distance of Cairo. The new tariff had been put in force for imports, which was found to weigh heavily on trade; but the freedom of trade in exports remained yet to be finally settled.—Accounts received from Syria stated that that country was a little more tranquil. The evacuation had taken place, all the British officers and soldiers, artillery and stores on service there, having embarked. A Russian Envoy had arrived at Alexandria on a mission to Mehemet Ali. The Divan, it is said, has insisted that the Pacha shall introduce the free commercial system immediately, the Pacha, it seems, having proposed to the Porte to do it in three years.

China.—Our intelligence from Canton brought by the overland mail reaches to the 10th Oct., and brings the account of the taking of the great Chinese fortress of Amoy, on the 27th Aug., after considerable firing, but without the loss of a man on the side of the British. The following are detailed particulars of the movements of the squadron after leaving Canton, and the circumstances connected with this last achievement of the British forces :—The fleet, consisting of 34 sail, including steamers and transports, having left Hong Kong Bay on the 21st Aug., arrived at noon on the 25th within 40 miles of Amoy. As the fleet neared the harbour, the Admiral made the signal for the *Druid* and *Blonde* frigates, to run ahead and report the soundings ; the remainder of the fleet following at a moderate distance. The Chinese from the batteries on the islands immediately opened their fire on the leading ships. Of this, however, no notice was taken, the shot either falling short or passing over the vessels. At daylight of the 26th all the boats were hoisted out, and the two Commanders-in-Chief proceeded in a steamer to reconnoitre. At 8 A M. they returned to the flag-ship. Shortly afterwards a mandarin came on board the *Wellesley* with a flag of truce. The ostensible purpose of his mission was to inquire why so many ships had come there to trade at one time, and what commodities they required. He was, however, soon dismissed by the Plenipotentiary ; it having been clearly explained to him that the visit of the fleet to Amoy was not of a commercial nature. In consequence of its continuing calm during the whole forenoon, nothing further was done until about half-past twelve, when a breeze having sprung up, the signal was made to weigh. The steamers *Sesostris* and *Queen* first got into action, and were engaged half an hour before the other ships joined against a long battery mounting 76 guns, on the right-hand side of the harbour. The *Blonde*, closely followed by the *Druid* and *Modeste*, led the larboard division ; and about twenty minutes before two these three vessels were closely engaged with the batteries on the left-hand shore. At the same time, the centre division, consisting of two line-of-battle ships, *Wellesley* and *Blenheim*, followed by the *Columbine*, *Pylades*, *Cruiser*, and *Algerine*, stood across the harbour to relieve the steamers, running along shore at the distance of about 400 yards from the beach and 600 from the fortifications. The line-of-battle ships anchored by the stern, and commenced a heavy cannonade, in which they were aided by the smaller sailing vessels ; the *Queen* and *Sesostris* having been despatched to aid the larboard division. The cannonade lasted about two hours, by which time H. M. 18th and 26th Reg., with parties of seamen and marines, had been landed at various points. Sir H. Gough put himself at the head of the first-named corps, and took possession of one end of the long battery. About the same time, the 26th Reg., with the sailors and marines, attacked and carried the batteries on the island of Koolangsu. Shortly afterwards the end of the long battery furthest from the point held by the Major-General was seized by the seamen and marines of the *Wellesley*. The fortifications were now entirely in the hands of the British ; the Chinese having fled in all directions without offering any resistance worth mentioning to the storming parties ; so that very few lives were lost by the enemy, and none by the victors. The fortifications of Amoy were found to be of immense thickness, composed of huge blocks of granite faced with mud. Scarcely any impression was made on them by the ships' guns ; and had not recourse been had to storming, the Chinese might have remained uninjured under shelter of their ramparts for an indefinite period. On the morning of the 27th Aug Sir H. Gough marched into the city at the head of the troops. He met with no opposition, all the mandarins and soldiers having quitted the place. Eighteen war-junks and a few gun-boats were captured. The treasure found in the city did not exceed 5,000 dollars, everything valuable having been removed prior to the entry of the British. The future movements of the expedition being too important to allow of its being weakened by leaving a sufficient number of troops to retain possession of the town of Amoy, the Guards were withdrawn from the fortifications on the evening of the 30th of August. It was, however, determined to garrison the island of Koolangsu with 500 of the 18th and 26th Regts., together with a few artillerymen. The rest of the troops were embarked in the squadron which sailed to the northward on the 5th Sept. H. M. ships *Druid*, *Pylades*, and *Algerine* remain at Amoy, to keep the provincial authorities in check, and afford assistance, if necessary, to the garrison on the island. The Chinese in the neighbourhood of Canton having broken the truce, by repairing their batteries, and placing stakes and stones to obstruct the navigation of the river, Capt. Nias, of H. M. ship *Herald*, senior officer at Hongkong, proceeded up the river, and destroyed the fort of Wangtong. He also issued a proclamation to the Chinese, intimating that any further breach of faith on their part would be immediately followed by a renewal of hostilities. No other event of importance has occurred near Canton. Trade is going on in the usual style, the Chinese offering no opposition to British ships taking in cargoes. The merchants at Macao, however, consider the duration of this state of affairs to be very uncertain.

UNITED STATES.—By the steam-ship *Acadia*, which left Halifax on the 19th, and whose arrival we noticed in our last, we have New York papers to the 16th ult. With the exception of the presentment, submitted by the Grand Jury of Philadelphia, charging Messrs. Biddle, Cowperthwaite, Jaudon, and several of the late directors of the Bank of the United States with conspiracy and mismanagement, as relates to the funds of that institution, these papers are almost filled with the correspondence between Mr. Stevenson, the American Minister at London, and Lords Palmerston and Aberdeen, on the subject of the right of search. The matter discussed between the two Governments, as far as the question of facts is concerned, does not appear to be a long or complex one. Mr. Stevenson, it seems, complains of certain proceedings of British cruisers towards American merchantmen in the African seas. Lord Palmerston justifies these proceedings, by referring Mr. Stevenson to an agreement entered into between the English and American commanding officers on that coast. To this defence no exception appears to have been taken by Mr. Stevenson, and even the Journals appear to regard Lord Palmerston's explanation as satisfactory. Mr. Stevenson, however, says that Lieut. Payne, the American officer on the African coast, was not authorised to enter into such an agreement ; but this disclaimer, it is urged, only affects any case of detention or search that might occur after it was made ; and that such is not likely to take place appears from Lord Palmerston's reply on that occasion, which stated that " Such cases could not happen again, because positive orders were sent by the Admiralty, in February last, to all her Majesty's cruisers employed for the suppression of the slave trade, not again to detain or meddle with the United States vessels engaged in the slave trade These orders have been sent by her Majesty's Government with great pain and regret, but as an act due by them to the rights of the United States." In a subsequent correspondence with Lord Aberdeen, Mr. Stevenson claims the exemption of all ships carrying the American flag from search by the ships of war of other nations, under all circumstances whatever ; but Lord Aberdeen contends that the admission of this doctrine would virtually offer a premium to the pirates and slavers of all countries to evade detection by sailing under American colours ; and his Lordship claims, not only for England, but for the whole civilised world, the right of vessels of war to satisfy themselves by an inspection of the ship's papers, when reason for suspicion exists, that the vessel is entitled to carry the flag under which she professes to sail. This question, which appears still to be regarded as one of great difficulty, will however, it is thought, be satisfactorily arranged, without giving rise to any misunderstanding between the two Governments ; and it is hoped that the mission of Lord Ashburton will be successful in this as well as the other points which are to be the subjects of his negotiation —The New York papers notice with strong approval the appointment of Mr. John Quincy Adams as Chairman of the Committee of Congress on Foreign Relations, in the room of Mr. Cushing, and the change is regarded as one of considerable importance by the friends of peace.

CITY.

Money Market, Friday.—Consols for money left off, 89¼ ⅜ ex div. ; do., account, 89¼, ex div. ; Bank Stock, 167, 168 ; Three per Cents. Reduced, 89½ ⅝ ; Three and a Half per Cents. Reduced, 99¼ ⅜ ; New Three and a Half per Cents , 98¼ 99 ; India Stock, 247 ex div.

Metropolis and its Vicinity.

The Weather.—The weather has again become cold and severe ; and the frost, which set in on Sunday, has continued without interruption during the week. The weather, however, has been fine and dry ; and the Parks, where the waters have again become fit for skaiting on, have attracted, as usual, a great number of visitors.

Metropolitan Improvements. — It is stated that his Grace the Duke of Bedford has finally arranged with Government respecting his claims for compensation for certain land in the neighbourhood of Covent-garden, where the intended improvements are projected ; and that in lieu of money his Grace has agreed to take the Crown lands in the Regent's Park.

Wood Pavement. — On Saturday, a meeting of the Marylebone vestry was held, at which a deputation of the inhabitants of Oxford-street, amounting to nearly 200 persons, waited upon the board, for the purpose of presenting a memorial, agreed to at a public meeting, and which set forth the feeling of surprise and regret which the inhabitants of Oxford-street entertained on hearing that a proposition was in contemplation by the vestry to postpone the further use of wood-paving for three years, although one year had been assigned by them as a sufficient trial ; that after the repeated memorials and deputations to the vestry upon the subject, it was hoped, if they were disposed to meet the wishes and welfare of their constituents, that they would complete wood-paving throughout the whole street without delay. After detailing the advantages to be derived from this description of paving, and stating that a trial of eighteen months had proved its success beyond the most sanguine expectations, the memorialists expressed a difficulty of comprehending on what grounds the proposal for so long a postponement rested ; and concluded by praying the vestry to reject such a proposition, and carry out the motion before them for paving the entire street with wood forthwith. The deputation having withdrawn, a long discussion ensued, after which a division was demanded, and there appeared for the amendment of Mr. Biers, proposed at the previous meeting—" That the sum of 3,000*l*. having already been expended upon experiments in Oxford-street, the vestry deem it inexpedient to entertain the question of wood-paving within a period of three years from the present time," 21 ; and for the original motion proposed by Mr. Cochrane on the same occasion — " That the wood-paving be laid down throughout the whole of Oxford-street at the earliest possible convenience," 19.—Majority for postponing the further consideration of the question for three years, 2.

The Tower.—The number of persons who paid for admission to view the ruins of the armouries during the week ending Saturday last was 2,494 ; viz. on Monday, 828 ; Tuesday 519, Wednesday 136, Thursday 349, Friday 350, and Saturday 312. The sale of the relics of the fire still continues ; and most of the visitors, it is said, make a purchase of some article. The new jewel-office still remains closed, although it is stated to have been some time ready for the reception of the regalia ; and this circumstance occasions considerable disappointment to the numerous persons who visit the ruins.

Late Forgery of Exchequer Bills.—A notice was issued from the Treasury on Wednesday, stating, that applications having been made to the Exchequer Office by holders of unstamped Exchequer-bills, who had hitherto omitted or been prevented from sending them in for examination, all such bills as should be presented on Friday (yesterday), under the regulations previously in force, should be examined, and where found genuine, stamped and returned to the owners. Exchequer bills have during the week suddenly risen considerably in value ; and this has been endeavoured to be accounted for by a report that Government have it in contemplation to make an alteration in the character of these securities ; and that instead of being payable for duties at stated periods only, they will be continually payable, and bear interest from the day of their date to the day of such payment.

The Convict Smith.—On Monday, an order from the Secretary for the Home Department was received by the Governor of Newgate, for the immediate removal of Edw. Beaumont Smith, recently sentenced to be transported for life for being concerned in the Exchequer-bill forgery, to the hulks at Woolwich. It is not yet known whether this is merely the preparatory step to his final removal from the country altogether by the next convict-ship that sails, or whether Government has given orders that he shall be kept at the hulks.

Public Meetings.—On Tuesday, was held the half-yearly meeting of the London Dock Company. The Secretary, Mr. J. D. Powles, read the report, from which it appeared that the number of loaded ships that had entered the docks from foreign parts in the six months ending the 30th Nov. was 602, of the aggregate burden of 131,893 tons. In the corresponding period of 1840, there had entered the docks 581 ships, of the tonnage of 124,627 tons, showing an increase in the last half-year of 7,266 tons. The stock of goods in the warehouses of the docks on the 30th Nov. was 94,345 tons, and at the corresponding period of 1840 it was 87,127 tons. The income of the company in the last six months had exceeded the expenditure by 81,589*l*. 17*s*. 10*d*. ; and the directors, in consequence of this prosperous state of affairs, recommend that the half-yearly dividend upon the stock should be raised to 1*l* 15*s*. per cent. After paying interest and providing for the liquidation of the debt incurred for new works, there would remain a large surplus to the credit of the company. The report also stated, as has been already announced, that additional warehouses for the accommodation of the importers of East and West India produce were to be erected, which would cause an outlay of 23,000*l*. The report was adopted, as well as the proposal for an augmented dividend.—On Tuesday, a half-yearly general court of proprietors of the Colonial Bank was held, for the purpose of receiving the report of the directors, and for other business. The report, which was read by the Secretary, stated that the total debts of the bank during the half-year ending the 30th June were 1,578,653*l*., comprising 183,180*l*. as its circulation, 847,000*l*. deposits and other liabilities, 500,000*l*. paid-up capital, 24,000*l*. reserved fund, and 24,000*l*. profit. Its assets were, specie 266,437*l*., other assets 1,299,710*l*., and balance of preliminary expenses 12,500*l*. The Bank had sustained losses by the money crisis in the West Indies, but the directors were nevertheless in a situation to declare with confidence a dividend at the rate of 8 per cent. per annum. The report, after some discussion, was adopted.—On Wednesday a meeting of the proprietors of stock in the South Sea House Corporation was held, to declare a dividend, and for the transaction of other business. The Secretary read letters from the Secretary for the Home Department, and also one from the Secretary to Prince Albert, acknowledging the receipt of addresses voted by the corporation on the birth of a Prince. The accounts of the corporation for the half-year were then read ; after which, the Governor proposed that a dividend of 1¾ per cent. for the half-year should be paid, which was agreed to unanimously.

Spitalfields.—On Saturday, a general meeting of the Spitalfields silk-weavers was held at Bethnal-green, for the purpose of receiving the report of the acting committee appointed to investigate the state and condition of the silk-weavers in that district. Mr. Britten having been appointed to the chair, said that he was sorry he was under the necessity of again having to address them on the subject of their present state of distress ; which he described as still seriously increasing. He then animadverted on the conduct adopted by the guardians, under the New Poor Law, towards the distressed weavers who applied for relief, which was, he said, refused unless the applicant employed himself at stone-breaking, a work for which he was not qualified, and which had the effect of rendering him unfit to resume his former occupation for some time, in consequence of its effect on his hands. Mr. Fox said that, as had been stated at the previous meeting, three of the committee had paid a visit to the district, and visited nearly 800 families in three days, and they had found that their previous account as to the state of the distress was not at all exaggerated. He then entered into some details of the privations to which the weavers and their families were reduced, and added that an early meeting of the committee would take place to make arrangements for the distribution of the funds raised for their relief. He then made some observations on the subject of employing the poor on stone-breaking, and on other practices adopted in workhouses under the present system, which he characterised as cruel in the extreme. After some further discussion the report was received, and the following resolutions were carried unanimously :—"That this meeting, from the various accounts given by the several victims of stone-breaking, are disgusted with the practice, and further are of opinion that it is unconstitutional and unchristian ; and from the knowledge of the effect that it has on the hands of the silk-weaver, by disabling him from working, do pledge themselves to oppose this horrible system to its utmost. That copies of this resolution be forwarded to the Poor Law Commissioners, and the Board of Guardians of the Union."

Kensington.—On Tuesday, a numerous meeting of the inhabitants of St. Mary Abbott's was held, to take into consideration the working of the union, and the steps necessary to be taken by the authorities to obtain the separation of Kensington therefrom. After some discussion the following resolutions were passed :—"1. That an association of the ratepayers of the parish be formed to aid the parochial authorities in their endeavours to obtain a separation of Kensington parish from the Kensington union, and to prevent by all legal and constitutional means in their power the erection of a new union workhouse ; and further to watch the progress of the New Poor Law Amendment Act in the forthcoming Parliament. 2. That a subscription be entered into for defraying the expenses of the association.—On Thursday a numerous meeting of the inhabitants of the Brompton district of the parish of St. Mary Abbott's was held, for the purpose of taking the same subject into consideration ; and after several gentlemen had spoken in deprecation of the introduction of the New Poor Law into that parish, where, it was stated, the poor-rates had increased 2,000*l.* on the present half-year, resolutions similar to those passed at the meeting held on Monday, were unanimously adopted.

Robberies.—We noticed in previous Numbers that several frauds have been committed on different charitable institutions in the Metropolis by means of forged cheques, among which have been the Magdalen Hospital, the London Asylum for the Protection of Young Females, the Foundling Hospital, and the Seamen's Hospital. On Monday, a man named William Yates, advanced in years, was examined before the magistrate at Union Hall, charged with this offence. It seems that several letters and cheques which had been thus used were taken by a policeman, who had directions to search for the guilty party, to the Secretary of the Mendicity Society, who on examining them immediately recognised the handwriting to be that of the prisoner, a well-known begging-letter writer, who had been frequently before convicted of that offence, and had scarcely been one week out of gaol. The magistrate asked the prisoner if he had anything to say in answer to the charge, and whether he denied being the writer of the letters produced ? The prisoner said, that at present he did not wish to say anything on the subject of the accusation. He was then remanded for a week, to give the secretaries of the institutions he has defrauded an opportunity of attending.—On Sunday evening an extensive robbery of jewellery was committed at the residence of Mr. Pedder, 7, Great Cumberland-street, Hyde Park. From the examination of the premises made by the police immediately after, it was ascertained that the thieves had effected their entrance into the house through the back yard, but they have not yet been apprehended. The value of the property stolen is stated to be 200*l.*—A few nights since several vessels lying at the Scotch wharfs on the north side of the River, in the vicinity of the docks, were boarded by thieves from the River, and had the copper tops of their cabin funnels carried off. It is reported that no fewer than fourteen were stolen in one night. The Thames police have been unable to detect the thieves.—A few days since a man of respectable appearance called at the Colonial Office and inquired for Lord Stanley. He was informed that his Lordship and Lady Stanley were at the time on a visit to her Majesty at Windsor, and were not expected to return for some days. He then said that he was commissioned by the principal officers of the Custom-house to deliver to Lord Stanley a box which he had with him, and which contained a costly chandelier, intended as a Christmas present to Lady Stanley from some of the foreign Courts, and added, that 35 cases of wine had been received as a present for his Lordship, which would be delivered on the following morning. He then showed what appeared to be regular Custom-house certificates, signed "George Lamb." and stated that he was to receive 3*l.* 5s. 4d., the amount of the regular dues. The office-keeper gave him the money, for which he wrote a receipt and left. The box was removed to the residence of the Colonial Secretary; and on his Lordship's return from Windsor, was opened in his and Lady Stanley's presence, and found to consist of a few brickbats. The wine spoken of was, of course, never received. Information was immediately given to the police, and after a short time the individual, whose name is William Esworthy, was apprehended in the neighbourhood of the Custom-house, and on Wednesday underwent an examination before the magistrate at Bow-street. The facts above stated were proved in evidence ; and the prisoner being called on for his defence, denied that he was the party who committed the fraud, and said that he could call several witnesses to prove he was in the City at the hour it was alleged he was in Downing street. On being called, however, none of them answered, except the prisoner's brother-in-law, who, on being asked if he could identify the prisoner's handwriting, said that he could write six or seven different hands ; but on looking at the receipt he thought it was the writing of the prisoner. Witness went on to say that the prisoner once sent him with a similar parcel, for which he was tried at the Old Bailey and nearly transported. The prisoner was then committed to take his trial.

Fires.—On Tuesday morning a fire broke out on board a schooner in the London Dock. One of the dock police observed smoke issuing from the forecastle, and having procured assistance, they broke open a bulkhead, leading to that part of the ship, which they found on fire ; but by active exertions they soon succeeded in subduing the flames. The fire is supposed to have been caused by the ignition of a box of lucifer-matches which a boy who slept in the forecastle placed under his bed to keep them dry. The boy narrowly escaped with his life.—On Wednesday morning a fire was discovered by the police in the rear of Lowndes'-square, Pimlico, in some premises belonging to Mr. Cubitt, the builder, and which were used by the cabinet-makers in his employ. Before it could be got under, the fire had destroyed the whole range of buildings in which it originated, but it fortunately did not extend further. It is supposed to have been occasioned by a spark falling among the shavings at the time the men left work. The loss is stated to be 300*l.*

Provincial News.

Bradford (Wilts).—A daring burglary was committed a few nights since at South Wraxhall, in this county, in the house of Mr. Awdrey. It appears that after having forced their way into the house, several of the robbers remained below to keep watch, while three others proceeded upstairs, entered the rooms of the two daughters, and compelled them, under threats of murdering them, to give up all their money and jewellery. The ladies also fearful that their father, if he met the robbers, might resist, and lose his life, went into his bed-room and prevailed on him to give up all the money in the house. The robbers then demanded the surrender of the silver plate, and all the other portable valuables, which they took to the extent of half a sackful, carefully selecting the solid silver articles and leaving the plated behind. They next demanded wine and brandy, of which they drank a quantity, and finally left about four in the morning, having remained in the house between four and five hours. The plunder, in addition to 30*l.* in money, is said to have been very great in plate, jewellery, and other valuable articles. The daring character of the outrage has alarmed all the neighbourhood, more especially those inhabiting solitary houses. 25*l.* was immediately offered as a reward for the detection of the robbers, who were thought to be London thieves. A man named Roberts, a clock and watch maker, of Bath, has been apprehended with part of the stolen plate in his possession ; and eleven other men have since been taken into custody charged with being concerned in the robbery. Their apprehension, it seems, was the result of information received by the police at Bath, in consequence of which they went over to a house at Twerton, well known, it would appear, to the officers, where they found concealed a large quantity of the stolen plate, the crest upon which had, in some instances, been obliterated, whilst upon others traces of it were left ; they also found a number of articles used by thieves. On Saturday all the prisoners were examined before the magistrates. The examination was strictly private, but it is understood that they are eleven in number, eight men and three women. Miss Awdrey gave her evidence at considerable length, from which it appeared that two men, called Burge and Milsom, were the parties more immediately concerned in the robbery, and those who made her give them money and everything else of value in the house, as the condition on which the lives of the whole household were to be saved.

Brighton.—A vestry meeting of the inhabitants of this town has been held for the purpose of taking into consideration a prohibitory order issued by the Poor-law Commissioners relating to some alterations of the workhouse, and the correspondence of the Poor-law Commissioners thereon ; and also a report on the said order and correspondence adopted at a special meeting. The committee in their report complained of the interference of the Poor-law Commissioners in the contemplated outlay at the workhouse, and recommended that they should be resisted to the utmost, and that prompt steps should be taken to remove the order issued by them to this parish by *certiorari* into the Court of Queen's Bench ; but first recommending that the matter should be submitted to the inhabitants at large in vestry assembled. The Rev. J. Anderson, Chaplain to the Queen Dowager, addressed the meeting at considerable length, and said he conceived the occasion which had summoned them together was a most important one, and that every step which they took would be pregnant with consequences to the best interests and welfare of the parish. He did not come forward to oppose the law. If the prohibitory order of the Poor-law Commissioners were law, it would become them as good citizens to obey it ; but the question was whether they were justified in opposing that prohibitory order, and he thought they were. Similar orders on three or four metropolitan parishes had been quashed ; and at all events, if a doubt existed, it might be cleared up. Mr. Anderson proceeded to comment on several clauses in the New Poor-law Bill, which he considered objectionable ; more particularly the work-house test, and the uniform plan of refusing relief to out-door paupers : and concluded by moving the first resolution, expressive of the entire concurrence of the meeting in the sentiments contained in the report of the directors and guardians with reference to the introduction of the Poor-law Commissioners into this town. This resolution being unanimously carried, Mr. Evershed moved that the matter be referred back to the directors and guardians to be carried into effect, and for them to take such steps thereupon as might be advisable ; which was also carried unanimously.

Canterbury.—At the borough sessions on Monday, the appeal of Sir E. Knatchbull against a late conviction by the magistrates for refusing to pay a toll, was brought on for hearing. The case excited great interest, from the character of the party concerned, and the importance of the question involved. Mr. Deedes stated that he appeared to support the conviction made by the justices ; and as all the facts were admitted, it would be simply for the court to decide upon the merits of the case. He then briefly detailed all the circumstances connected with it, which are already well known, and added that it was unnecessary for him to detain the court with any lengthened remarks, until he saw what cases were adduced in support of the appeal. Mr. Bodkin, M.P., for the appellant, contended that the clause in the act under which his client had been convicted, was simply directed against those who, in defiance of law, wilfully and unlawfully drove through the gate at which such toll was set up, in order to avoid payment ; but that the hon. baronet had refused, upon his belief that he was exempted, and had claimed it at the time of passing through the gate. It would be seen, he said, by the conviction itself, that those who passed this act felt it necessary to introduce the very argument he was now using, for it applied to those who passed through the gate refusing to pay the toll demanded without any supposed ground of exemption. It was absurd to suppose that any one passing through on this belief, and with the intention of paying the next day, if he was wrong, was to be subjected to the penalty of 10*l.* The appellant lived at a distance of 20 miles from the place of election, and it being necessary that he should be at the nomination at an early hour, he prepared himself by leaving home on the Saturday previous ; and not liking to travel on Sunday, he proposed to spend the intermediate time at a relative's house, Sir B. Bridges, at Goodwestone Park, which was only three miles from the place of election, in order to be ready for it on the next Monday. Sir B. Bridges and the Rev. C. H. Hallett were here called to depose to the fact of Sir E. Knatchbull's paying a visit to their residences entirely unsolicited, as they supposed that he might be ready for the election, and that Lady Knatchbull accompanied him. Mr. Deedes replied at some length, and cited several cases to prove that "Privilege of Court" was not allowed to extend to instances in which parties had deviated from the direct line of their course, as in the present instance ; and further urged that if the right hon. baronet claimed the privilege for himself, he could not for his lady, who could in no way be considered as going to the election. He contended that the conviction came within the Act of Parliament provided for such cases, and therefore that the court must confirm it. The Recorder gave an elaborate decision confirmatory of the conviction, but recommended that the appellant, if dissatisfied with his view of the case, should obtain the decision of the Court of Queen's Bench. Mr. Deedes applied for costs, but these were allowed to be settled in the usual way.

Carlisle.—A public meeting was recently held for the purpose of inquiring into the distressed state of the poor in this city, at which a committee was appointed for that purpose. A public meeting has again been held, at which the report of the committee was read, which in its details presented a serious statement of suffering and distress. "The number of families without any means of subsistence, beyond a dependence on casual charity, was found to be 309, and the individuals belonging to these families, amounted to 1,146. Exclusive of those who have no visible resources, the number of persons whose weekly means of maintenance do not exceed 1*s.* per head is 1,465 ; of those who have more than 1*s.*, but not above 1*s.* 6*d.* per head, the number is 1,623 ; above 1*s.* 6*d.*, but not more than 2*s.*, 692 ; and more than 2*s.*, but below 3*s*, 635." It hence appears that there are no less than 5,561 individuals, in a population of 22,000, reduced to such a state of suffering, that immediate relief has become necessary to save them from starvation.

Chelmsford.—A serious fire has occurred at Panfield Hall Farm, belonging to Messrs. J. and R. Lambert, near Braintree, in this county. It broke out in the middle of the night, but by great exertions, and the timely arrival of the engine from Braintree, the neighbours succeeded in saving three large stacks of barley and beans, closely adjoining the barn where the fire commenced ; but the latter, together with its contents, about 200 quarters of barley, beans, and peas, was entirely destroyed. It is feared that the fire was the act of an incendiary.

Chichester.—At the Sessions held in this city on Monday, William Styles Goodeve, and William Williams, late cashiers of the old Bank, were tried on a charge of embezzlement. It will be remembered that this bank recently stopped payment ; and this charge was made by the principals of the firm against the prisoners of having, shortly before the bank closed, embezzled a considerable sum of money. The trial, which lasted ten hours, excited considerable interest, and the Court was much crowded. The prisoner Williams was tried first. The case for the prosecution having been stated, the Messrs. Ridge, partners in the firm, were examined at great length ; and from their evidence it appeared that the prisoners had almost the uncontrolled management of the cash accounts of the firm, which had not been balanced for 20 years. The method in which the business of the bank was conducted was minutely explained, and it seemed that the day before the bank stopped, an inquiry into the state of the books was made, and a balance struck, when it was found that there was a deficiency to a considerable amount : the cash account appearing to be deficient 122*l.* 7*s.*, and the notes 1,660*l.* These witnesses further deposed that on charging the prisoner Williams with the fraud, he admitted he had done wrong, and said he would explain everything; that he then proceeded to show the actual state of the cash account, and the fictitious entries that had been made, but even after this there still appeared to be a deficiency, 81*l*. 12*s*. 4*d*. Mr. Ridge said he asked the prisoner whether he had taken the general deficiency in cash or notes; and that he replied in both, and that he had taken it some years since, when his family were in distress. This having closed the case for the prosecution, the counsel for the defence addressed the jury at considerable length for the prisoner. He commented in severe terms on the management of the bank, and called the attention of the jury to the fact that for twenty years the accounts had never been balanced, nor the cash counted by any member of the firm to see that it agreed with the books. A number of witnesses were then called who gave the prisoner a good character, after which the Recorder summed up, explaining the law, and reading the evidence. The jury returned a verdict of "Not Guilty," which was received with marks of approbation by numerous persons in Court. The other prisoner was then arraigned on the same charge, but no evidence being offered for the prosecution he was acquitted.

Dorchester.—Sir James Graham has paid a visit to his constituents in this town, on which occasion a public dinner was given to him. After dinner the customary toasts were given, and on the health of the Prince of Wales being proposed, Sir J. Graham rose and said, that within the last week he had the satisfaction to hear from the lips of her Majesty, at Windsor, a pledge which he had much pride in repeating on that occasion. He heard her Majesty tell the civil and religious authorities of the realm assembled within the walls of the Palace of Windsor, that it should be her care to train up her Royal son in the paths of virtue and religion, and to instil into his mind a respect and veneration for the civil and religious liberties of the country—a pledge which, he was sure, her Majesty would fulfil. On his own health being proposed, Sir J. Graham addressed the company at considerable length. After alluding to the recent treaty concluded between the five great powers of Europe, for the total suppression of the slave-trade, effected by a Government which, he added, he was proud to belong to, he said that nothing of much importance had occurred since he last saw them. At a period of great public difficulty the present ministers came into power, and they asked for a small space of time to arrange and prepare their measures Their opponents said that their request was unreasonable; but the people of England were more reasonable, and were ready to grant what was asked. It would not be expected, and would, indeed, be improper in him to enter into detail on any measures which government might have it in contemplation to propose; but this he might say, that every feeling of gratitude would prompt them to use every exertion to meet the reasonable expectations of the best portion of the community, and so to form their measures as to meet the wishes of the public. The Right Hon. Baronet then alluded at some length to the speech recently made by Lord John Russell in answer to the address presented him by the inhabitants of Plymouth; and remarked "that certainly in the West of England the sun had gone down, the sun of Lord J. Russell had gone down amid a lowering and angry sky, probably foreboding a stormy rising in February; but assuredly he did not anticipate with much apprehension any measures for displacing the present ministers." He then alluded to the assertion made by the noble Lord on that occasion, that the former Ministry had left to the present Government "an easy task." This he endeavoured to prove untrue by entering at length into the state of the country, its relations abroad, and its conditions at home, which was such, he said, as threw on present Ministers anything but an "easy task." He should say nothing of the particular course they should pursue; but that having looked steadily at the difficulties of the country, it would be their duty manfully to meet those difficulties. The Right Hon. Baronet then animadverted on the conduct and measures of the late Ministry, and said that it was not a combination of monopolists that overthrew them, but the loss of the confidence of the people: and that loss of confidence preceded, and did not follow the loss of the confidence of Parliament. He concluded by assuring the company that speaking for himself, and he was sure that he might speak also for the head of the administration, Sir R. Peel, they would never consent to drag out a miserable official existence, like the late administration, from year to year, when the public confidence was forfeited; but relying on that confidence so long as they possessed it, they would proceed in the fearless discharge of what they considered to be their duty.

Durham.—We learn from Barnard Castle, in this county, that the carpet-weavers and others in that town, amounting to upwards of 120 families, are reduced to great distress owing to the want of employ, most of the manufactories having stopped working. The town, it is added, has been divided into districts, and the habitations of the poor visited to ascertain the nature of each case of distress; and the result has shown that for the last six or seven weeks the average incomes of the above families have been at the rate of 1s. 2½d. per head per week, and that now it will not be more than 1s., many having no employment whatever. A subscription is making amongst the neighbouring gentry and inhabitants of the town, and it is proposed, as far as it is practicable, to give employment to those able to work in improving footpaths, roads, &c., and also to afford some relief by supplying corn at a reduced price, in those urgent cases where the parties cannot be employed at outdoor work.

Hastings.—Accounts from this port inform us that the Mackerel fishery has already commenced with some prospect of success. A few days since one of the boats belonging to this place, being the first on the southern coast, put off to fish, and succeeded in catching 200, which readily sold at the price of 4*l*. 10*s*. per 100.

Hertford.—The following unusual circumstances occurred at the Quarter Sessions of this county, on Monday. A man named Godfrey, was charged with stealing a quantity of wheat, the property of his mistress, and convicted on satisfactory evidence. The verdict, however, had scarcely been recorded, when the counsel for the prisoner moved for an arrest of judgment, on the ground that an improper affirmation had been administered to one of the jurors, a Quaker, or rather that this juror had made no affirmation at all. The affirmation repeated to him by the clerk began with, "You being one of the people called Quakers do solemnly affirm," and ended with "So help you God." In addition to this informality, the clerk had neglected to require the Quaker juror to repeat the words of the affirmation after him. The Court admitted the objection of the counsel, and ordered the prisoner to be discharged. Shortly after this occurrence the jury returned a verdict, in the case of a young girl charged with shoplifting of "Guilty of stealing, but without a felonious intention." The counsel for the prisoner submitted that such a verdict was a verdict of acquittal. The Court also admitted the objection, and ordered the prisoner to be forthwith discharged.—A serious fire has occurred at Tring, in this county, in the silk factory of Mr. Evans, which is situate at New-mill-end. Several engines were soon on the spot, and the fire was speedily subdued, but not before damage had been done to the amount, it is said, of from 3,000*l*. to 4,000*l*. The fire appears to have originated in the engine-room. A number of operatives will, it is said, be thrown out of employment in consequence.

Ipswich.—On the night of Friday the 31st ult., a fire supposed to have been the act of an incendiary, broke out in the stack-yard of the Rev. H. Owen, of Haveningham, in this county; and but for the active exertions of the neighbours, it is thought that not only the stack-yard which contained 7 corn and hay-stacks, but the barn, stables, and farming-buildings adjoining, must have been burnt to the ground. The loss was confined to two stacks, which were quite consumed. The police have been active in their endeavours to discover the author of the fire, and a young man of bad character living in a neighbouring parish, who it seems has been twice committed by Mr. Owen, in his official capacity as magistrate, was apprehended on Saturday on suspicion, and will undergo an examination before the magistrates.

Liverpool.—A local paper, the *Journal*, gives an account of the arrival in this city of three Canadian Indians from Quebec. They are, it seems, on their way to the Colonial Office, bearing with them letters from Colonel O'Halloran, of the 68th Reg., who has lately, it is said, been elected great White Chief of the Micmacs. They are described as well-dressed, respectable-looking men of strong Indian features. One of them is chief of the tribe, and the other two have been deputed to accompany him. The chief writes and understands English pretty well; and the other two, although they understand the language, find it rather difficult to speak it. It does not appear to be known what is their object in coming to this country, but one part of it is said to be to solicit the aid of Government in completing the erection of a Catholic chapel, which the tribe have commenced, but for want of funds have not been able to complete.

Manchester.—On Friday night, the 31st ult., another serious fire occurred in this town, in a large warehouse forming part of Bateman's-buildings, in Blackfriars'-street. The premises, which are in the occupation of Mr. Finch, calenderer and maker-up, and Mr. Thorp, calico-printer, are situate close to the Irwell, on the Manchester side, and consist of a building six stories high. The fire was first discovered by a casual passer-by, and it is thought from the retired situation of the building, that it must have been burning for some time before it was observed. Before the engines could arrive the whole building was in flames, and there being little hope of saving it, active exertions were used to preserve the adjoining property, for which serious apprehensions were for some time entertained. Ultimately, however, the fire was got under, without destroying more than the building where it originated. The entire loss is estimated at 5000*l*. The origin of the fire is not known, the premises having appeared to be safe when the workmen quitted them a short time before.—We noticed in our last the circumstance that several persons in this town had been suddenly taken ill, after partaking of some mutton broth, which it was concluded must have been poisoned. An analysis, both of the broth and the oatmeal, has since been made, and in both the presence of arsenic has been clearly detected. The whole affair, however, still continues to be involved in mystery, although it is said that suspicion has fallen on some individuals who, some short time since, were inmates of the house. No judicial investigation, however, has taken place. All the parties who partook of the poisoned food have since recovered from its effects.

Nottingham.—The village of Mansfield near this town has been thrown into a state of alarm by the discovery of another murder. The perpetrator of the crime is a young man aged 24, named John Jones, a shoemaker in the town; and deceased was a young girl aged 19, named Mary Allen. It appears that the prisoner had some time since paid his addresses to deceased, which were at first admitted by her parents, but the prisoner becoming dissolute in his habits, they had broken off the connexion. The prisoner, it seems, was much attached to deceased, who possessed considerable personal attractions; and this interruption to their intercourse is supposed to have led him to the commission of the crime. Deceased had gone out on Thursday evening, the 30th ult., induced it would seem to do so by the prisoner, and not returning for a considerable time, her parents became alarmed, and the father went in search of her; but not finding her, he thought at last of looking in through the window of prisoner's room, and there he saw his daughter lying on the floor quite dead, with her throat cut. The prisoner was not in the room, but had, it seems, after the commission of the crime gone to a neighbouring public-house, where he continued drinking some time. On being apprehended, he confessed that he had murdered the girl; that he had first asked her if she would marry him, and on her stating that her parents would not give their permission, he said that she should marry no one else, and murdered her. He expressed no regret at what he had done, but said that he had intended to have murdered himself, but that he was afraid of the responsibility of two murders. He wished to be hanged, and hoped his example might prove a warning to others. An inquest has been held, and a verdict returned of "Wilful Murder" against the prisoner, who has been committed to take his trial.

Oxford.—We learn from a local paper, *The Herald*, that the election of a Professor of Poetry for this University, which has already given rise to so much discussion, and created such general interest, is fixed to take place on Wednesday, the 26th inst.

Shrewsbury.—John Williams and Joseph Slawson, the two men apprehended on suspicion of having murdered Emma Evans at Chirk, have undergone a final examination before the magistrates. The evidence adduced against them was only circumstantial and has already been before our readers. The strongest circumstance against them was the possession of the bundle containing articles which have since been identified as belonging to deceased. The two prisoners concurred, though their statements were taken separately, in saying that they found the parcel lying in the road, along which they happened to be walking together—that they knew nothing as to whom it belonged, and that they were innocent of all knowledge of the murder. They were committed to take their trial.

Southampton.—Intelligence has been received that Springfield House, the fine mansion of K. Digby, Esq., was on Tuesday entirely destroyed by fire. It seems that it was first discovered about two in the morning by a man-servant, who slept over the kitchen apartments, and who made his escape through a window, and alarmed the family in another part of the house, just in time to save their lives. Mr. Digby, it is stated, has lost by the fire some very valuable manuscripts.

Stockport.—A meeting was recently held at the Court-house, to adopt means of relieving the distresses of the working classes. The rector, seconded by the Rev. J. Waddington, moved that the meeting regarded with deep sympathy the present suffering of the working classes in the borough; and that to assist in relieving their distress a public subscription be entered into. Several gentlemen addressed the meeting, and resolutions were adopted for carrying their intentions into effect. A general committee was appointed; several sums of 50*l*. and 100*l*. were immediately subscribed, and a donation of 500*l*. was announced from the Manufacturers' Relief Committee in London. From statements made by different speakers during the meeting, it appeared that of 15,823 individuals, inhabiting 2,965 houses, lately visited under the direction of a committee appointed for the purpose, 1,204 only were found to be fully employed, 2,866 partially employed, and 4,148 able to work were wholly without employment. The remaining 7,405 persons were unable to work.

Windsor.—The morning papers announce, on the authority of a correspondent, that preparations have already commenced for enclosing the land intended for the Royal Gardens at Frogmore. The ground has been set out under the directions of a surveyor from the office of Woods and Forests, and comprises about twenty acres of the finest arable land on the Frogmore estate. The soil consists of a rich sandy loam upwards of three feet in depth, and is, it is said, in every respect calculated for the purposes required. The range of glass will extend upwards of eight hundred feet in a direct line; and in the centre of this will be erected a cottage, for the residence of the head gardener. On each side of the cottage there will be a handsome conservatory, and corresponding houses throughout the whole line for the production of pines, grapes, peaches, and other forced fruit. The dimensions of these houses, however, have not yet been finally determined upon. At the back of the range of glass a number of sheds will be constructed for the cultivation of mushrooms, stowage of fruit, potting, tool-houses, &c.; and this part of the garden will also be apportioned for the forcing-pits. There will be a terrace upwards of twenty feet wide in front of the hothouses, and the garden will be intersected with bold and uniform walks. The forcing department will be heated by hot-water pipes, upon a new and improved principle. The whole will be surrounded by a brick wall twelve feet high, and the garden, when complete, is expected to be one of the most perfect in the kingdom. The present gardener's residence, with the forcing and other houses and buildings in the Maestricht gardens, which are now to be observed from the north terrace, will, it is added, be pulled down, and the garden thrown into the park immediately the new gardens can be brought into a state of cultivation.

Railways.—We learn from the "Railway Magazine" that the receipts of the railways for the last week are as follows:—Birmingham, 16,907*l*.; Great Western, 12,428*l*.; Midland Counties, 2,533*l*.; North Midland, 3,975*l*.; York and North Midland, 1,577*l*.; Hull and Selby, 810*l*.; Northern and Eastern, 1,121*l*.; Great

North of England, 1,200*l.*; Eastern Counties, 799*l.*; Birmingham and Gloucester, 1,767*l.*; South Western, 4,449*l.*; Birmingham and Derby, 1,145*l.*; Manchester and Birmingham, 400*l.*; Manchester and Leeds, 4,004*l.*; Blackwall, 583*l.*—Sir F. Smith on Saturday retired from the office of Inspector-General of Railways, and was succeeded by Major-Gen. Pasley.—An inquest has been held at Reading on Richard Woolley, another of the passengers by the luggage train which met with the serious accident on the Great Western Railway noticed in our last, and who has died since the previous inquest was held. The investigation lasted upwards of ten hours, and excited considerable interest. Nothing new, however, was elicited, and the only evidence of any importance was that of the engineer, Mr. Brunel, who was again examined at great length. That gentleman stated that he arrived at the spot shortly after the accident occurred, and before the earth had been removed from the rails; that he examined the site carefully and particularly, because he was surprised at so much mischief having been produced by the comparatively small quantity of ground which had slipped, and he found some large stones which had slipped down with the clay, being part of a bed of stones, which lies a considerable height up the cutting. One of these stones, probably two feet square, appeared to have been on the rail just at the point where he thought the engine first left the line, and he had no doubt that these stones were the cause of the accident, as the engine, he considered, would have run through the clay, and the train have been stopped much more gradually. He thought that the stones and part of the slip were still moving at the time of the arrival of the train, but were nearly all down when the engine ran into it. In reply to some questions from the jury, he said that if the passengers had been in the last carriages they would have escaped of course; but, generally speaking, it was not a safe position for them, as they would there be exposed to more danger than in front. Mr. Brunel gave the same reasons for forming this opinion which were given by him when asked a similar question at the previous inquest, namely, that there was more danger of their being run into by the fast trains which followed them. He begged also to add, with respect to the relative safety of the passenger trucks, that he had frequently travelled by them himself, and at one period generally went by them once a week to Bristol, as being the last train out of London at night; and taking the speed of travelling into consideration, he considered them rather a safe train than otherwise. He concluded by saying that the whole line was particularly well watched, and that there was no railroad in the kingdom which had a stronger body of police engaged. After some further evidence of no importance, the jury returned a verdict that "Richard Woolley came by his death from a fracture on the skull, caused by the engine called the Hecla coming into collision with a mass of earth, having fallen from the slope of a cutting on the Great Western Railway, at Sonning, and they are of opinion that the accident might have been avoided had there been a night police or watch in the cutting. They therefore place a deodand on the engine and train of carriages of the sum of one hundred pounds. And further, they recommend that the passenger trucks be in future placed further from the engine."—An inquest has been held on the three men killed by the explosion of gunpowder on the Bristol and Gloucester railway, noticed in our last; and on Henry Williams, the blacksmith, who has since died of the injuries he received. From the evidence of one of the labourers present at the accident, it appeared that little precaution was taken for the security of the powder; that it was placed in the blacksmith's shop, because there was no other place for it, and to keep it dry; that there were at the time two barrels of gunpowder in the shop, one containing a hundred-weight, for the use of the miners, and the other several pounds of wet powder placed there to dry. No precautions were taken to prevent the powder from exploding. When it was opened, a small hole was made in the head of the barrel with a knife, and that was sometimes stopped up with a cork or some clay. Any person that worked at the shafts went for the powder, sometimes one, and sometimes another; and it was never locked up. This evidence having been corroborated by another of the men who suffered by the accident, the Coroner addressed the jury, and expressed his regret that they had no power to mark in an effectual manner the negligence displayed by those who had the charge of the powder. Verdict, "Accidental death, in consequence of a large quantity of gunpowder having been improperly placed in the smith's shop; and the jury regret they had it not in their power to lay a heavy deodand, and wish to express their strong feeling of the improper management on this railway."—On Wednesday night, the 22d ult., some ill-disposed person, as stated by the "Devizes Gazette," placed a number of large stones on the Great Western rails, between Box and Bath, just before the approach of the mail train. Fortunately the guard-iron of the train, which was bent double by coming into contact with them, in some measure cleared the largest stones, and the wheels crushing others, no injury was sustained.—On Thursday, a special general meeting of the Northern and Eastern Railway Company was held, for the purpose of confirming the forfeiture of certain shares on which the calls due were unpaid. The chairman, W. Crawshay, Esq., stated that the number of shares to be forfeited had been reduced to 50, the calls on the rest having been paid prior to the meeting; and that of the sum of 240,000*l.* ordered to be borrowed, 68,000*l.* had been obtained. The remainder would go towards the Hertford and Ware branch, if the proprietors should so determine, as a dispute had arisen with the road trustees. A proprietor suggested the placing of an empty carriage before and after those containing passengers, for the sake of safety; in reply to which it was stated that there was frequently one heavy carriage so placed, and sometimes two. Mr. Peto, the builder, thought the line would be opened to Bishop's Stortford by 1st April. Some conversation followed, and before the meeting adjourned a check was handed to the chairman for the calls on 40 of the above shares.

IRELAND.

Dublin.—The weekly meeting of the Repeal Association was held on Wednesday, when the Lord Mayor began the day's proceedings by handing in 11*l.* 1*s.*, 3*d.* being his own subscription for the present year; 7*l.* from his seven sons, as members, and 1*l.* 1*s.* from his twenty-one grandchildren, as associate members. The Secretary read a letter from the managers of the New York Repeal Association, inclosing an extract from the will of Felix O'Neill, deceased, who bequeathed 500 dollars to Mr. O'Connell, towards forwarding the Repeal of the Union. The Lord Mayor said that he received this bequest in the spirit in which it was offered. If he had given up the repeal question previously to this bequest, he should have been guilty of political dishonesty; but if he abandoned it now, he should be guilty of knavery. This was his retaining fee in the cause of Ireland against her oppressors, and while he had the power it should bind him to her service. He concluded by calling on the Association to join him in an expression of gratitude to the memory of the donor, and the Americans generally, for their sympathy and support. An address was also read from the Repeal Association of Norfolk, Connecticut, to the Lord Mayor, congratulating him on his election to the mayoralty, and inclosing 20*l.* towards the association. The Lord Mayor again spoke at considerable length on the subject of American sympathy, and proceeded to deliver his usual weekly address on the subject of Repeal, but no new topic of any interest was introduced.

Louth.—A repeal meeting was held at Dundalk, in this county, on Saturday, at which Mr. O'Connell was present. It was numerously attended, and Mr. O'Connell delivered an address at great length on the ordinary topics connected with the subject of Repeal. He said that he struggled for repeal because it would enable Ireland to get rid of a hostile Ministry, and every other grievance, now called a rent-charge, but which he hated under one name just as much as under another: and there was, he added, that abominable tithe rent-charge, the very reflection on which prevented him from sleeping on his bed. "The Repeal of the Union," concluded Mr. O'Connell, "would cause the exclusion from Ireland of everything that was not of Irish manufacture. It would revive and extend the manufactures of the country; it would enlarge her commerce, and give fair play to all; it would confer upon every man 21 years of age a right to vote, protect him by the introduction of the ballot, and would restore Ireland to the full noontide of justice. Every man, woman, and child, must enrol themselves in the Repeal Association. It was the easiest thing in the world. He asked only a farthing a week, a penny a month, or a shilling a year. Let them grant his request, and he pledged himself that in six months after he had obtained 3,000,000 of Repealers he would have a Parliament in College-green. It was not the shilling, but the man at the back of it, that produced the effect; and that was the way in which he wanted his exertions to operate and to tell." After the meeting there was a public dinner, at which a great number of persons were present.

Sligo.—The following murder was committed a few days ago near Grange, in this county:—Two labouring men went into a whisky-shop to drink, and after sitting some time talking, one of them pulled a knife from his breast, and stabbed his companion to the heart. He then walked out as if intending to return in a few moments; but not doing so, the landlord went into the room to see what the other man was about, when he found him lying on the ground insensible, bleeding profusely, and the knife still in the wound. The murderer has not yet been apprehended, nor is the cause of quarrel known which led to the perpetration of the deed.

Waterford.—On Wednesday, the 29th ult., the Marquis of Waterford had several of his hounds destroyed by poison, which had been laid for them while hunting in the covert of Dungan. The gentlemen who hunt with his Lordship are to hold a meeting for the purpose of trying to discover the authors of the outrage.—The following singular scene took place on Sunday, the 26th ult., in the Protestant Cathedral of this city. A member of the Society of Friends, named Joshua Jacob, accompanied by a female friend, both attired in white garments, entered the church during Divine service, and remained standing in silence close by the stalls of the dean and chapter till the service had concluded, and the congregation were preparing to depart. Mr. Jacob and his friend then advanced a few paces in front, when the former proceeded to address the congregation. After looking around the church and the persons assembled in it with an expression of concern and pity, he cried out with a loud voice—"This is not the house of the Lord Jesus Christ; this is the house of Babylon." The deep and firm tone in which this was uttered, and the singular appearance and manner of the parties, produced considerable sensation among the congregation. On being requested by the clergyman to leave the church, Mr. Jacob remonstrated, and said the Lord had sent and inspired him to raise his voice against the abominations practised there. The two friends, however, quietly retired from the church on being further urged.

Limerick.—This city was a few days since thrown into a state of considerable alarm by the report of a serious accident said to have occurred in the Shannon to the steamer plying between Portumna and this city, which was stated to have foundered with 36 persons on board. It was afterwards ascertained that she struck during the night upon Cow Island, but the flyboat and passengers escaped, having, however, suffered great privations from want of food.—A local paper, the *Chronicle*, states that this city will shortly be raised by the Customs Department to a first-class port.

King's County.—An account appeared in some of the papers last week of a serious outrage committed at Philipstown on a poor idiot, by a number of gentlemen, the majority of whom, it is said, were officers. The circumstances attending the outrage, which terminated in the man's death, were so extraordinary that the report was not at first credited. It has, however, been since confirmed, and there appears to be little doubt of the truth of the main facts, which are briefly as follows. The man, who, as before stated, was an idiot, after being subjected to various acts of outrage, was finally smeared over with oil and turpentine, and then, in order it is said to make him run, set fire to, whereby he was burnt to death. An inquest was held, when the jury returned a simple verdict of "Accidental death." The parties concerned were said to be officers, on a visit in the vicinity of the town. An inquiry is expected to be instituted into the affair.

SCOTLAND.

Edinburgh.—The directors of the railway from this city to Glasgow have made an experimental trip along the line, preparatory to its opening to the public, which, it is stated, will take place on the 1st of February.

Glasgow.—Two large establishments in this city, one that of a corn-merchant, Messrs. Bannatyne, and the other, Messrs. Wingate and Co., wholesale warehousemen, both in extensive business, have stopped payment. The debts of the two are said to exceed 400,000*l.* These failures, it is feared, will seriously affect the town of Paisley, and add to the already depressed state of the trade in that place. We also learn that an old and respectable ship-building firm in Leith has become insolvent, in consequence, it is said, of an unfortunate law-suit.

Greenock.—An accident of a serious nature has occurred in this town, at the ship-building yard of Messrs. Scott and Co. It appears that a large vessel, intended for the East India trade, was launching in the presence of a number of spectators, the deck of the ship being crowded with boys to the number of from 150 to 200. While she was gliding down the slips the ballast suddenly shifted, when she fell to one side, and sunk gradually till her masts were covered, and the water was within two feet of the hatch. Immediate assistance was afforded, by means of boats, to the lads, who were carried with the vessel into the stream, hanging on by the side which was uppermost; and fortunately the whole of them were saved without any lives being lost.

Renfrew.—We noticed in our last a public meeting which had been held by the noblemen and gentry of this county, to inquire into and propose some measure of relief for the existing distress so extensively experienced in all parts of the county, and at which it was resolved that a memorial on the subject should be forwarded to Government. Sir R. Peel has since acknowledged the receipt of this memorial, which, he says, he has read with great attention and with painful interest, conveying as it does so serious a statement of the distress which prevails in the town of Paisley and the neighbouring villages, and that he will not fail to avail himself of an early opportunity of bringing it under the notice of his colleagues. The Right Hon. Baronet adds, that he cannot close his acknowledgment of their communication without expressing his sincere satisfaction at learning that the privations to which the labouring classes have been necessarily exposed have affected the general health in a less degree than might have been expected, and without at the same time recording, as the head of her Majesty's Government, his grateful sense of those local exertions which have been made with so much perseverance, liberality, and sound judgment, for the mitigation of the sufferings of the unemployed in the neighbourhood of Paisley,

Ross-shire.—A severe shock of an earthquake was experienced at Kintail, and several of the neighbouring parishes in this county, on the 20th ult., at 4 P.M. It is said that there was nothing peculiar in the state of the weather, or the appearance of the day, excepting a calmness in the atmosphere, not uncommon even at this season of the year. There was no recurrence of the shock. The noise which usually accompanies such visitations, like the rushing of water or the rattling of a carriage, is represented as very distinct. It appears that there has been an unusual prevalence of lightning with occasional thunder in the west and north Highlands this winter, but this seems to be the only case of earthquake in the same districts which has been experienced.

Miscellaneous.

The Niger Expedition.—We are informed by the *Shipping Gazette*, that further accounts have been received of this expedition, derived from a private letter, which states that "the *Albert* alone remains in the river; that she has but twelve white men remaining, besides the captain, surgeon, and three or four other officers." Two of the twelve men spoken of by the writer, it is added, were taken ill before his letter was closed, and an early departure from the coast was anxiously looked for. In confirmation of the facts contained in this letter, another correspondent writes, that "intelligence has been received that the expedition has become dispirited; that the whole of the steamers would rendezvous at Ascension on the 1st Jan., and that the *Wilberforce*, which was intended to remain in the Niger until the next season, had already arrived at Ascension. The expedition, however, was reported to have left colonies up the Niger; but what will be their fate without any establishment to communicate with outside, it is perhaps not difficult to foretell."

Newspapers in China.—We learn from a recent number of the *Asiatic Journal*, that there exists throughout China only a single newspaper, which is published at Pekin, and bears the title of "*King-paou*," or "Messenger of the Imperial Residence." Neither in its form, which is that of a pamphlet, nor its contents, does it bear a resemblance to the political journals of Europe or America. The supreme council of the empire, in which the ministers have seats, assemble in the Imperial Palace at Pekin. Every day, at an early hour, copious extracts on the subjects decided or examined on the previous evening by the Emperor are stuck upon a board in one of the courts of the palace. A collection of these extracts composes the annals of the Government, in which are to be found the materials for the history of the Chinese empire; hence all the government boards and public establishments are required to have copies made daily of all proceedings which have been under consideration, that they may be preserved in the archives. The provincial boards receive these records through their post servants, whom they maintain in the capital for this sole object; but, in order that all the people of the empire may obtain a certain degree of acquaintance with the state and progress of public affairs, the extracts placarded are, with the permission of government, printed at Pekin entire, without changing a single word, or omitting a single article. This is the *Pekin Gazette*, or newspaper of China, which comprises all the orders that have been submitted to the approbation or examination of the Emperor by his ministers at Pekin, and by the different provincial authorities, as well as by the commanders of military corps. Appointments to posts, promotions, sentences, punishments, reports from the different departments of the public service, are, consequently, the principal matters contained in this publication; and the reports made by the Imperial officers upon particular occurrences are thus brought to the knowledge of the world. Occasionally, the provincial reports contain interesting notices of physical phenomena. This Gazette may be subscribed for by the year, or for an indefinite period, and it ceases to be forwarded as soon as notice is given that it is no longer desired. The amount of the subscription is a leang, or tael, a quarter, being about 8*s.* 4*d.* per annum. Those only who reside in the capital have the advantage of receiving the *Gazette* every day at a certain hour; but as there is no regularly established post in China, the paper does not reach distant parts of the empire till very long after publication.

Bishopric of Jerusalem.—An official statement, which may be interesting to our readers, with reference to the recently-established bishopric of the United Church of England and Ireland at Jerusalem, has just been published by authority. We are informed by it that the King of Prussia, who originated this design, had in view not only the great advantages to be derived from its adoption, with reference to the conversion of the Jews, but also the spiritual superintendence and care of such of his own subjects as might be disposed to take up their abode in Palestine, and to join themselves to the church so formed at Jerusalem; and that there is reason to expect that a considerable number of German as well as English Christians will be attracted to the Holy Land by the influence of strong religious feelings. The principal object, therefore, to which the consecration of Bishop Alexander appears to be intended as subsidiary, is the settlement of a new religious colony, consisting partly of Englishmen and partly of Germans, in the Holy Land. The Archbishop of Canterbury, having first consulted the Bishops who attended the Convocation in August last, assented to the King of Prussia's proposal, and obtained power, as our readers are aware, to carry it into effect. The practical arrangements made, and the plan laid down for the performance of the functions of the new Bishop, are detailed as follows:—The endowment of the see is to be 1,200*l.* per annum. Half of this sum consists of the interest of 15,000*l.* given by the King of Prussia; the other half is to arise from an equal amount which it is expected will be raised by voluntary contributions in England. This capital is to be invested, upon the first advantageous opportunity, in land situate in Palestine, whence it appears that the institution is to be permanent; and that the Bishop is to be independent, in point of income, of his spiritual superiors in this country. The Bishop is to be nominated alternately by the two Crowns of England and Prussia; the Archbishop of Canterbury having an absolute right of *veto* upon the Prussian nominations. The Bishop will be subject to the Archbishop of Canterbury as his Metropolitan, and his spiritual jurisdiction will extend over the English clergy and congregations, and over those who may join his church, and place themselves under his episcopal authority, in Palestine, and, for the present, in the rest of Syria, Chaldea, Egypt, and Abyssinia; such jurisdiction being exercised, as nearly as may be, according to the laws and customs of the Church of England. The statement goes on to explain the several duties of the Bishop, and the institutions which are to be established under him at Jerusalem; the more important of which are that his chief missionary care is to be directed to the conversion of the Jews, to their protection, and to their useful employment; and that a college is to be established for the purpose of educating, in strict conformity with the doctrines of the United Church of England and Ireland, Jewish converts, Druses, and other Gentile converts, and, if the funds of the college should be sufficient, the large body denominated Oriental Christians.

Statistics of Great Britain.—An interesting report has been published by the Registrar-General, containing a detailed account of the causes of death in England and Wales; from which the following abstract, embodying the chief points of interest in it, is taken. The report commences with a statement of the number of murders registered in 1838 and 1839. These were 156, of which 103 were male, and 53 females. An analysis is also given of the ages and other particulars; but the table extends to a greater length than our space will afford. Much tabular evidence is given with reference to the influence of temperature on the rate of mortality; from which it appears, by the experiments of Mr. Farr, that the degree down to which the mean monthly temperature falls in Dec., Jan., and Feb. determines to a great extent the mortality during the winter season. Of diseases affecting the organs of respiration 12,140 died in winter, 9,890 in spring, 8,433 in summer, and 11,008 in autumn. Of diseases of the organs of digestion, 1,982 died in winter, 2,139 in spring, 2,978 in summer, and 2,263 in autumn. Mr. Farr observes, that meteorologists have remarked that the mean temperature of Oct. represents very nearly the mean temperature of the year and the place; and that facts show that the mortality rises progressively as the mean temperature falls below the mean temperature of London (50 deg. 5); the deaths in the week rising to 1,000 and upwards, when the temperature of night falls below the freezing-point of water, and to 1,200 when the mean temperature of day and night descends a degree or two lower than 32 deg. The rise in the mortality is immediate, but the effects of the low temperature go on accumulating, and continue to be felt 30 or 40 days after the extremities of the cold have passed away. A long list then follows of the cases included under the term "Violent deaths;" from which it appears that there were 953 suicides, of whom 636 were males, and 307 females. Persons poisoned, 24; overlaid by mother, 32; and various other lists, from accidents and otherwise, of less interest. A valuable table is also given, representing a view of all the diseases which have proved fatal in England and Wales, classified according to their pathological characters. The following selection gives the more general affections, with the number of persons who died of them. It appears that 18,151 died of inflammation of the lungs, of which 10,000 were males, and 8,151 females. Consumption killed 59,559, of whom 28,106 were males, and 31,453 females. 25,408 died of convulsions; 14,245 males, and 11,163 females. Typhus fever was fatal to 15,666; 7,643 males and 8,023 females. 15,143 deaths were attributed to debility; 6,524 to inflammation of the stomach and bowels conjoined; 9,131 to smallpox, 10,937 to measles, 10,329 to scarlet fever, 8,165 to hooping-cough, 5,183 to asthma, 4,142 to croup, 394 to cholera, 215 to gout, 4,940 to inflammation, the part not stated; 1,151 to scrofula, 5,293 to apoplexy, 4,910 to paralysis, sudden death 3,693, 299 to the stone, 130 were starved to death, 218 died of intemperance, 424 of insanity, and 35,063 of old age. There appears to be a great disparity between the numbers of violent deaths which took place in 1839 in the mining districts, and those which occurred in the agricultural parts of the country. In the former they amounted, from all descriptions of accidents, to 1,164, among a population, according to the census of 1831, of 864,934 persons; whereas, in the latter districts (Norfolk and Suffolk), the agricultural, there were but 511 violent deaths in a population of 682,788 persons. In 1839 the deaths in the London hospitals, including St. George's, Charing Cross, Middlesex, London Fever, the Small-Pox, North London, Westminster, St. Bartholomew, London, Guy's, St. Thomas's, Greenwich, and the Dreadnought, were as follows:—Epidemic, endemic, and contagious diseases, 438; total deaths from these affections in the Metropolis, 9,588; of the nervous system in the hospitals, 161; in the Metropolis, 7,480; of the respiratory organs, 584 in the hospitals, and 13,198 in the Metropolis; of the organs of circulation, 112 and 933; of the digestive organs, 134 and 2,989; of the urinary organs, 87 and 212; of the organs of locomotion, 58 and 257; of the skin, 20 and 55; of uncertain seat, 386 and 5,172; old age, 56 and 3,428; violent deaths in the hospitals, 390; causes not specified, 50 in the hospitals, and 403 in the Metropolis. Total deaths in the Metropolitan hospitals in 1839, 2,491; in the Metropolis, 45,441. A very large proportion of the deaths in the Metropolis occurred to infants within a year old; 8,839 died at that time of life; 6,988 at one year; 3,077 at three; 2,349 at five; 860 at ten; 1,034 at fifteen; 3,060 at twenty; 3,625 at thirty; 3,772 at forty; 3,412 at fifty; 3,665 at sixty; 3,161 at seventy; 1,257 at eighty; 166 at ninety; and 3 at one hundred years of age. The remaining portions of the report consists of tables, showing the extent to which various diseases have prevailed through the agricultural and manufacturing districts of England and Wales; but they are of less interest to the general reader, and too voluminous to be given here.

Bank-note Circulation.—A statement has been published in the *Gazette* containing the monthly circulation of the Bank of England and the county banks, embracing the period of four weeks preceding the 11th Dec. From this return it appears that the total circulation in England during the above period was 25,228,023*l.*, showing a decrease, as compared with the preceding four weeks ending the 13th Nov., of 1,546,835*l.* Of this diminution in the amount of the circulation, 773,000*l.* is the decrease in the circulation of the Bank of England; 570,512*l.* is the decrease in the issues of the private banks; and 203,323*l.* is the decrease in the notes of the joint-stock banks. The returns from Scotland show a slight increase, and those from Ireland a slight decrease, but in both cases the difference is inconsiderable. As compared with the four weeks preceding the 24th July the decrease in the total circulation of England is 2,074,469*l.*, of which amount 1,684,000*l.* is the diminution of the circulation of the Bank of England. The average amount of bullion in the Bank of England during the four weeks preceding the 11th Dec. was 5,031,000*l.*, being an increase as compared with the former return of 813,000*l.*; and as compared with the return at the end of July the increase is 20,000*l.*

Law.

PREROGATIVE COURT.—*In the Goods of Ellen Leslie.*—This was an important case, affecting the validity of a will, not attested according to the forms of the new law. The deceased, a widow, died at Brighton on the 14th Nov., leaving personal property of the value of about 5,000*l.* A will of deceased, dated the 1st Oct., purported to have been executed in the presence of Mr. Gurdon, of Assington-hall, Suffolk, and Sir Matthew Tierney, Bart. From the joint affidavit of these two gentlemen it appeared that deceased, on the day the paper bore date, produced the same to Mr. Gurdon, declaring it to be her will, and requested him to sign his name thereto as a witness, which he did in her presence (the will having been previously signed by her); that within a day or two after she produced the paper to Sir Matthew Tierney, and acknowledged her signature thereto, going over the same with a dry pen, and declared it to be her will, requesting him to sign his name thereto as a witness, which he accordingly did. Deceased, however, did not sign or acknowledge her signature to the paper in the presence of the witnesses when "present at the same time," as required by the act.—Dr. Bayford moved for probate of the paper; but Dr. Daubeny (who presided for Sir H. Jenner) rejected the motion.—Several other motions were disposed of, principally cases of neglect by testators and attesting witnesses of the simple provisions of the late act, whereby the intentions of the framers appear to be constantly defeated.

TATTERSALL'S—THURSDAY.

DERBY.

The following were the only bets laid:—

200 to 50 agst Attila and Chatham
625 25 Barrier and Defier
270 10 Robert de Gorham
400 10 William de Fortibus
400 to 10 agst Auckland
1000 15 Joanna c. (taken several times)

OAKS.

35 to 1 agst Colonel Westenra's Rapture (taken to 50*l.*)

MARK LANE, FRIDAY, JAN. 7.—The Wheat trade continues exceedingly flat, and several parcels of English are left unsold, for which Monday's prices are asked. Foreign is completely neglected, and scarcely a transaction has taken place. There is some inquiry for Bonded, but the holders will not give way in prices, consequently nothing has been sold.—Barley is unaltered in value.—Peas and Beans go off slowly at our quotations.—The great decline in Oats has produced a better demand, and the trade has recovered the heaviness of Wednesday, and in some instances a trifling advance has been realised.

BRITISH, per Imperial Quarter.			s. s.		s. s.

GAZETTE OF THE WEEK.

INSOLVENTS.—H. A. Baber, Lindfield, Sussex, maltster—J. Buckett, Great Bourton, Oxfordshire, sheep-dealer—G. Barnard, Portsea, coal merchant—B. Ward, Charlotte terrace, New-cut, Lambeth, boot and shoe maker—W. H. Apsey, Globe Wharf, Rotherhithe, ship breaker.

BANKRUPTCIES SUPERSEDED.—J. Hey, jun., Halifax, carpenter—C. Ewbank, Liverpool, merchant.

BANKRUPTS.—R. Collinson and W. Brown, Oxford-street, upholsterers—T. H. Ford, Rochford, Essex, victualler—G. D. Clark, Strand, newspaper vendor—J. J. Schenck, Addle-street, City, merchant—J. Bisshopp, Westburton, Sussex, market gardener—J. Luscombe, Plymouth, maltster—W. Williams, Cowarne, Hertfordshire corn dealer—W. Gibb, Alnwick, Northumberland, currier—W. Swift, Manchester, mercer—G. Gillard, Plymouth, tea dealer—T. Wood, jun., Heathfields, Yorkshire, merchant—W. Williams, Moon-street, Bristol, builder—W. Barnfield, Mark lane, City, wine merchant—W. Durrant, Brighton, wharfinger—G. Swift, Manchester, tailor—J. Shand, Liverpool, victualler—M. Parkes, Golden-square, printseller—Samuel Tarbotton, Leeds, chemist.

SCOTCH SEQUESTRATIONS.—J. Wilson, Dundee, butcher—D. Chrystie, Glasgow, manufacturer—J. M'Millan, Newbigging, Musselburgh, grocer—N. M'Gibbon, Inverary, writer—A. Milne, Aberdeen, merchant—A. Keith and Co., Paisley, manufacturers—Wallace, Munro, and Co., Glasgow, merchants—A. M'Phail, Lawrieston, Glasgow, provision merchant—J. Roxburgh and A. Roxburgh, Paisley, manufacturers—D. Lister, Edinburgh, corn dealer.

BIRTHS.—On the 6th inst., in Grosvenor-street, the Lady Mary Farquhar, of a son—On the 6th inst., at 45, Cambridge-terrace, Hyde Park, the lady of J. Murray, Esq., jun., of Philiphaugh, of a son and heir—On the 4th inst., at 1, Chester-place, Regent's Park, the lady of F. V. Lee, Esq., of a daughter—On the 4th inst., at Crabbett, Sussex, the lady of F. S. Hunt, Esq., of a daughter—On the 5th inst., at Sompting, Sussex, the lady of S. R. Partridge, Esq., of a son—On the 6th inst., the lady of A. Beck, Esq., of a daughter—At Barnstaple, Devonshire, on the 5th inst., the lady of Major C. A. Munro, of a daughter—On the 31st ult., at Merivale hall, in the county of Warwick, the lady of W. S. Dugdale, Esq., M.P., of a daughter.

MARRIED.—On Wednesday, at Fulham Church, the Rev. J. H. Malet, LL.D., Chaplain of her Majesty's Dockyard, Bermuda, to Mary Loretta, eldest daughter of the late C. Kyte, Esq., of Berbice—On the 5th inst., at St. James's, Shoreditch, the Rev. C. S. Grueber, of St. Mary's Chapel, Lambeth, to Catherina, daughter of the late C. Appold, Esq., of Wilson street, Finsbury—On the 6th inst., at St. Mark's Church, Kennington, R. C. Barton, Esq., solicitor, Lambeth, to Sophia, second daughter of the late F. M'Gowran, Esq., of Springfield, Surrey.

DIED.—On the 29th ult., at Tregothnan, the Right Hon. the Earl of Falmouth—Suddenly, of apoplexy, on the 30th ult., Edward Howard, Esq., author of "Rattlin the Reefer" and other naval tales—On the 28th ult., at Mertoun, Berwickshire, the Right Hon. Lord Polwarth, in his 84th year—On the 29th ult., at Great Ealing, Henry John Penn, Esq., aged 59—On the 4th inst., at Chelsea, aged 71, William Sotheby, Esq., the well known book auctioneer—At Figueira, in Portugal, on the 4th ult., aged 71, Mary, wife of S. Tozer, Esq.—At Clifton, near Bristol, on the 30th ult., Catherine, relict of the late Capt. R. Bilimore, formerly of the East India Company's Bombay Marine, aged 72—At Edinburgh, on the 30th ult., H. S. Wedderburn, Esq., of Wedderbu—On the 7th inst., Lieut.-Col. Basset, Governor of the Military Knights of Windsor, aged 85.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN No. 1.

Amateur's Garden 5
Aphides described 3
Asphalte coverings at the Hort. Soc. 8
Belladonna Lily, its cultivation . 9
Bulbs, conditions of growing . 3
Chatsworth described . . . 3
Coal-shale a manure . . 6
Cratægus, the most ornamental . 4
Dahlias, striped, to keep clean . 8
Evergreens, to transplant . . 7
Ferns in a parlour-case . . 9
Filberts, selection of . . 9
Foresting, its importance . . 3
Fumigation, how performed . 6
Galvanic protectors, to make . . 7
Garden, remarks on laying out and planting 9
Gardeners and masters . . 7
Gooseberry caterpillars, their destruction 7
Hollies, to plant . . . 5
Hyacinths grown in Beet-roots . 5
Hydrangeas, to turn blue . . 9
Icehouses, their construction . 6
Ipomœa stans, its treatment . . 9
Johnson's Farmer's Encyclopædia, rev. 8
Kittens, dead, a manure . . 5
Leonotis Leonurus, its cultivation 4
Light, tendency of plants to seek 6
Lobelia cardinalis, large specimen of 8
Mice, their destruction . . 7
Nitrate of soda, Lymburn on . 7
Oaks, British, remarks on . . 5
Œnothera biennis . . . 8
Orange, remarks on some varieties 5
Oxalis Bowiei, to flower . . 9
Phædon vitellina on Willows . 6
Picotee, its variability . . 5
Potentillas, hybrids produce seed 5
Puppies, dead, a manure . . 5
Root-pruning, Hayward on . 6
Slugs, to prevent their attacks . 5
Succulents, their cultivation . 4
Trenching described . . 6
Tropæolum tricolorum, its treatment 9
Turf-edgings, to make . . 7

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, January 8, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFÉSSOR LINDLEY.

No. 3. SATURDAY, JANUARY 15, 1842. Price 6*d*.

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITIONS AT THE GARDEN for the year 1842. The Exhibitions will take place in the months of May, June, and July, upon Saturdays, under the following regulations.

EXHIBITORS.

All persons, whether Fellows of the Society or not, will be at liberty to send subjects for exhibition.

DELIVERY OF OBJECTS FOR EXHIBITION.

Exhibitors are earnestly requested to notify in writing, previously to the day of meeting, what plants they intend to supply, in order that due provision may be made for the proper distribution of the specimens, &c. on the exhibition tables. The best places will be secured for those who comply with this request.

As it is necessary that the judges should proceed to consider the respective merits of the exhibitions by 10 a. m., and as it is absolutely indispensable that the tables should be arranged by that time, it has been determined that no subject for exhibition shall be admitted into the Garden after half-past 8 o'clock in the morning; and if the owners of any locked-up boxes, or other cases, should not be in the Exhibition-tent at the said hour, such cases or boxes must be excluded from competition for medals.

All specimens, whether of fruit or flowers, will remain untouched until after 6 o'clock, when they will be delivered into the hands of the Exhibitors, who are most particularly requested not to give away their cut flowers in the tents, as much confusion has been found to arise from that practice.

ADMISSION OF EXHIBITORS.

Exhibitors, or other persons required to assist in bringing in the objects for exhibition, will be admitted before half-past 8 in the morning at the Carter's-yard entrance gate.

Every principal exhibitor of subjects for which medals are specifically offered will be furnished with one pass-ticket, which is not transferable, for which he is requested to apply before 10 o'clock, at which hour the Garden will be cleared of all persons not officially detained there.

Exhibitors may re-enter the Garden after 1 o'clock, when they will be required to give up their pass-tickets at the Carter's-yard gate.

FLOWER-STANDS.

No box or stand shall exceed eight inches in height at the back, or eighteen inches in depth from front to back. The lids of all boxes must either be loose or made to unhinge. No box with a fixed lid will, on any pretence, be allowed to stand upon the tables. If a box not constructed of the dimensions above given is sent in, it may be placed on the tables, if there is room for it, but it is liable to exclusion.

MEDALS AND REWARDS.

The Society distributes the following Medals and Rewards; namely,

			£	s.	d.
C.	The Certificate	value	0	10	0
SB.	Silver Banksian Medal		1	0	0
SK.	Silver Knightian ditto		1	5	0
LS.	Large Silver ditto		1	15	0
SG.	Large Silver Gilt ditto		4	0	0
GB.	Gold Banksian ditto		7	0	0
GK.	Gold Knightian ditto		10	0	0
LG.	Large Gold ditto		20	0	0

Exhibitors to whom any of these shall be awarded can exchange them one for another, or may receive their value in money, or in plate. If within one month after the Third Exhibition of the year no intimation shall have been received from an exhibitor of the manner in which he desires his medals to be disposed of, all the medals due to him will be prepared and transmitted to him through the usual public conveyances, without further notice.

In case an exhibitor shall receive a first prize in any one letter, he shall not be entitled to receive any other medal in the same letter.

SUBJECTS OF EXHIBITION.

These will be divided into Classes, as explained further on.

No articles not of horticultural produce will be allowed to be placed upon the tables.

Exhibitors will do well to make themselves acquainted with the arrangements described in the following list, as they will in all cases be required to sign a declaration stating under what letter their plants are to be shown; and they are particularly requested to take notice, that if errors in the awards of the judges should occur, in consequence of mistakes on the part of exhibitors in filling up such declarations, the Society cannot undertake to rectify such errors afterwards.

To enable the officers of the Society to attach names to the objects exhibited, it is requested that correct lists may be delivered to the clerk as soon as the exhibitor reaches the Garden.

Class I.—Flowers for which Nurserymen and Private Growers exhibit independently of each other.

A. Greenhouse Azaleas, to be shown in numbers not exceeding 12, GB, LS, SK.
B. Carnations, in pans of 24 blooms, LS, SK, SB.
C. Picotees, in pans of 24 blooms, LS, SK, SB.
D. Pinks, in pans of 24 blooms, SK, SB.
E. Cape Heaths, in collections of 20 species, GK, SG, LS, SK.
F. Cape Heaths, in collections of six species, GB, LS, SK.—N.B. No person who shows in E will be allowed to exhibit also in F.
G. Exotic Orchidaceæ, in collections of not fewer than six species, GB, LS, SK.
H. Exotic Orchidaceæ, in single specimens, LS, SK, SB.
I. Pelargoniums, in collections of 12 varieties, in pots, not exceeding 12 to a cast, GB, LS, SK, SB.
K. Pelargoniums, in collections of six varieties, in pots, not exceeding eight to a cast, SG, LS, SB.
L. Rhododendrons, in pots, not fewer than 12 plants, in 12 varieties, LS, SK, SB.
M. Moss Roses, SK, SB.
N. Common Garden Roses, exclusive of all Chinese or Chinese Hybrids, LS, SB. SK.
O. Chinese or Hybrid Roses, such as Bourbon, Noisette, Tea-scented, and similar varieties, LS, SB, SK.—N.B. No exhibitor of Roses can be allowed to occupy more than 15 ft. run of tables for all his Roses, which, being double, is equal to 30 ft. of boxes. If any Exhibitor gains the first medals in M, N, and in O, he will be entitled to a Gold Banksian medal instead of the three Silver ones.
P. Stove or Greenhouse Plants, in collections of from 50 to 60 plants, GK, GB, SG, LS.
Q. Stove or Greenhouse Plants, in collections of from 15 to 20 plants. GB, LS, SK.
R. Stove or Greenhouse Plants, in collections of six distinct species, LS, SK.—N.B. Persons exhibiting in P and Q will not be allowed to compete in R also.
S. Herbaceous Calceolarias, in sixes, LS, SK, SB.
T. Shrubby Calceolarias, in sixes, LS, SK, SB.

Class II.—Flowers, for which all persons are admitted to equal competition:—

U. Collections of Stove or Greenhouse Climbers, GK, CB, LS, SK.—N.B. The Gold Knightian medal is not to be awarded for fewer than 12 distinct kinds.
V. Tall Cacti in flower, LS, SK.
W. Single specimens of Ornamental Plants LS, SK, SB, C.
X. Miscellaneous Flowers, SK, SB, C.—N.B. Cockscombs, Hydrangeas, and cut flowers are altogether excluded from prizes.
Y. Seedling Florists' Flowers, SK, SB, C.—N.B. Every seedling must be shown singly, and must be marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in single trusses, with a single leaf, so far below the flowers as not to support them; and they are not to be dressed with cotton or wool, or any similar substance, but must be shown exactly as they grow on the bush.

Class III.—Fruit, for which market-gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other.—N.B. All Fruit must be ripe and well-coloured; if the contrary, it will be disqualified.

Z. Miscellaneous collections of Fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind, GK, GB, LS.—N.B. Cucumbers Tomatoes, Gourds, and similar kitchen-garden produce, are excluded from this letter.
AA. Grapes, SG, LS, SK, SB.
BB. Pine-apples, SG, LS, SK, SB.
CC. Peaches or Nectarines, in dishes of six specimens, SK, SB.
DD. Miscellaneous Fruit, SK, SB, C.

JUDGES.

The Judges have the power of increasing or diminishing the number and value of the Silver Medals offered by the Society for particular objects, and also of conferring Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

The Judges are also required to bear in mind that the Society's Medals are offered, less for new and curious objects, than for fine specimens of Horticultural skill, the design of the Council in instituting these meetings being not so much to encourage the Collector, as to reward the skilful Gardener: they are also not to make any award in cases where the objects exhibited do not appear worthy of a Medal; otherwise a bad single exhibition may obtain a prize, merely because there is no better exhibition of the same class to oppose it.

ANNUAL GARDENERS' ENTERTAINMENT.

J. WEEKS, JUN., and CO. beg to announce that their annual Entertainment to the West London Gardeners' Association, and their numerous friends and supporters in the Horticultural profession, will take place on Wednesday next, the 19th inst.

T. AND C. LOCKHART, SEEDSMEN, &c. 156, CHEAPSIDE, LONDON, beg to announce that their LIST OF SEEDS, &c. is now published, and will be forwarded Post-paid on application.—5th Jan., 1842.

MYATT'S VICTORIA RHUBARB.

J. AND W. MYATT having a good Stock of Strong Roots raised by offsets from the original Seedling, can supply them at 10*l*. per hundred.—N. B. As various spurious sorts have been sold and are now selling under the name of "Myatt's Victoria," purchasers would do well to require them warranted.—Manor Farm, Deptford, Oct. 23, 1841.

BRACHYCOME IBERIDIFOLIA SEED in small packets at 5*s*., to be had of W. J. NUTTING, Seedsman, 46, Cheapside. Lisianthus Russellianus, 2*s*. 6*d*.; Pink, from fine named flowers, 2*s*. 6*d*.; Calceolarias, from 30 varieties, 2*s*. 6*d*.; Pansies, selected from a few first-rate flowers, 5*s*.; do., from a superior collection, 2*s*. 6*d*.; Dahlia Scapigura Mexicana, 1*s*.; Clintonia pulchella, 1*s*.; Schizopetalon Walkerii, 1*s*.; Phlox Drummondii, 1*s*.; &c. &c.—Packets of the following Cucumbers at 2*s*. 6*d*.: Man of Kent (Barnes'), Victory of Suffolk (Allen's), Prize-fighter, Weedon's Frame, Roman Emperor, and Windsor Prize.

☞ A Catalogue of Seeds to be had on application.

CHAPPELL'S CREAM BROCCOLI.

CHARLES FARNES, Seedsman, No. 128, St. John-street, London, begs to inform the Public that he has purchased of Mr. Chappell, Market-gardener, Edmonton, the whole of the SEED saved by him this year of that splendid variety of BROCCOLI, which for size and flavour is not surpassed by any kind grown. Also now ready to send out—

Farnes' superior first Early Pea.
Flack's new large Victory do.
Young's do. do. Marrowfat do.
Knight's Dwarf Green do. do.
New Auvergne Pea.
American Dwarf do.
Chappell's Early White Broccoli.
Legg's Early Walcheren Broccoli.
Fine Early Frame Radish.
Ady's fine large Cos Lettuce.
True Brighton do. do.
Black-seed Bath do. do.
Imported Early Dutch Turnip.
Imported Dutch Horn Carrot.

HUGH LOW & CO. have much pleasure in submitting to the attention of their Friends and the Public the two under-named first-rate DAHLIAS. Strong Plants will be ready for delivery the first week in May at 10*s*. 6*d*. each.

WINTERTON RIVAL (Nelson), Primrose, good form, fine habit, flowers well above the foliage, height five feet. A figure will appear in the March number of the *Florists' Journal*.

DUKE OF CORNWALL, Rosy Ruby, fine habit, well up in the centre, very constant, has all the properties of Le Grand Baudin, with the additional recommendation of being of much dwarfer habit; height four and a half feet.

The last-named was raised by the person who obtained Le Grand Baudin and Conservative, acknowledged to be two of the best Dahlias of 1840, and exhibited in more winning stands than any two of the same season.

H. L. & Co. think it needless to inform those who have hitherto favoured them with their orders as to their way of doing business; but think it right, for the satisfaction of strangers, to state that should the two Dahlias now offered not answer the description given, they will most willingly deduct them.

Roots of most of the leading sorts of last year may be had on early application.

Clapton Nursery, Nov. 24th, 1841.

T. JACKSON, Nursery Seedsman, &c., Kingston, Surrey, begs to offer the undermentioned Dahlias in Ground Roots, guaranteed correct to name, at the following prices, viz.: at 42s. each—Jackson's Dowager Lady Cooper; at 31s. 6d. each—Bridesmaid (Brown's); at 21s. each—King of Roses (Thomson's), Enterprise (Langley's); at 15s. each—Eclipse (Catleugh's), Fanny Keynes, Maid of Bath; at 10s. 6d. each—Beauty (Parsons'), Constancy, Invincible (Smith's), Little Wonder (Parsons'), Rosaperfecta (Whale's), Scarlet Defiance; at 7s. each—Admiral Elliott, Bronze Unique, Brilliant (Whale's), Eclipse (King's), Flora (Stanford's), Marquis of Waterford, Revenge (Cox's).

A collection of 100 Dahlias, of 100 different sorts, in small compact dry roots, well suited for exporting, with names attached, 5*l*. A collection of 200 do., 200 different do., containing many new and choice kinds, 10*l*.

A general Catalogue of Stove, Greenhouse, and Herbaceous Plants, may be obtained on application.

Kingston Nursery, Jan. 12, 1842.

WANTS a SITUATION as GARDENER, a Married Man, aged 35, who understands his business, and can be highly recommended by the gentleman he is now about to leave. He is a native of Scotland. Direct to W. W., Post-office, Gravesend.

WANTED, a SITUATION, as GARDENER, or GARDENER and COACHMAN, a married man, aged 37, who has no objection to the care of stock or land, and can have a good character from his last place, which he has just left.—Direct to A. B., Harper-street Dairy, New Kent-road.

WANTED, a SITUATION as BAILIFF, to have the management of a Farm or Estate, a respectable and steady young married man, who perfectly understands Farming in all its branches, also the management of Timber Trees and Planting in general. Can give the most satisfactory references as to ability, and his character will bear the strictest investigation. Letters addressed to A. M., at the *Gardeners' Chronicle* Office, will be attended to.

WANTS a SITUATION, as GARDENER in a Nobleman or Gentleman's Family, a married man, about 43 years of age, with one son; has lived 17 years in a nobleman's family, and left at the death of his lord, and since lived five years in a respectable family.—Direct J. B., Mr. Palmer's, Nurseryman, Derby. Further reference can be had by applying to Mr. Stafford, Richard Arkwright's, Esq., Willersly Castle, Derbyshire.

WANTS a SITUATION, as GARDENER, a married man; 36 years of age; can be well recommended by his present employer, whom he has served 10 years as Gardener, and Gardener and Bailiff; would not object to the management of a small Farm. Wages, 75*l*., cottage, and coals.—Apply, if by letter prepaid, for A. B. C., Mr. Kernan, Seedsman, 4, Great Russell-street, Covent-garden.

TO NOBLEMEN AND GENTLEMEN.—William Cornelius, late Foreman to Mr. Lee's Nursery, at Hammersmith, where he has been for many years, having left that establishment, will be happy to engage with any nobleman or gentleman as his GARDENER; and as he perfectly understands the whole routine of a garden from the hothouse to the kitchen-garden, he flatters himself that he will be found serviceable in all the departments of horticultural business. He is a married man, and without any encumbrance. Every information as to capacity can be had from Messrs. Lee, where all letters, pre-paid, will be received and answered.

TO NURSERYMEN AND OTHERS.

WANTED, a FINE STRONG PLANT of ARAUCARIA IMBRICATA, from 18in. to 3ft. high. Any one having such to dispose of, may hear of a purchaser by stating the height in inches and the price.—Direct to W. Bassett, Westonbirt, Tetbury, Gloucestershire.

YELLOW SEEDLING DAHLIA—WATTS' "SOL."

W. WATTS, Nurseryman and Florist, Camden Nursery, Camberwell, begs to inform his friends and the public that he intends sending out early in May next, strong plants of the above SEEDLING DAHLIA, bright yellow, round cupped petal, well formed, and superior show variety; has been seen and appreciated by Mr. Neville and several other eminent judges. Price 7*s*. 6*d*. per plant

---

SEYMOUR'S SUPERB SOLID WHITE CELERY.

H. LANE and SON, Great Berkhampstead, Herts, having received the most flattering testimonials of the great estimation in which the above celebrated CELERY is held, and of the general satisfaction experienced by those to whom they supplied the seed last year, are happy in being enabled again to offer it for sale in packets at 2*s*. 6*d*. each, postage included.

N.B.—The usual allowance to the Trade.

ROSES.—H. L. and S. take this opportunity of acquainting Ladies and Gentlemen who have not yet supplied themselves with Roses, that notwithstanding the vast quantity they sent out during the autumn, they can still execute any orders with which they may be favoured to a considerable extent, by an early application.—Catalogues sent free by post.

JOHN DUNCAN, Author of Two Works on the Melon and Cucumber, and also a comprehensively Practical Treatise on Vines, in progress of publication, is at liberty to ENGAGE with any Nobleman or Gentleman requiring a GARDENER, skilled in the higher and practical departments of his business; in confirmation of which he has testimonials from the first authorities, and from his esteemed and venerable employer, Thos. Daniel, Esq., whom he has served nearly eight years. He is married, and in the 34th year of his age.—Apply, Henbury, near Bristol.

MR. KERNAN informs the friends of Henry Spare, that the appeal in his behalf, and that of his suffering family has been benevolently responded to by numerous benefactions, which with any others following will be acknowledged in the *Gardeners' Magazine* of the 1st of Feb., and in the *Gardeners' Chronicle* and *Gazette* of the 5th.—Jan. 14.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, Manor House, Manor Place, King's Road, Chelsea, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower Stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

ANNUITIES.—In the AUSTRALASIAN, COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, Annuitants participate in the Profits of the Company, and receive a rate of ANNUITY much more favourable than can be granted by any Company making its investments wholly in England. The Company is enabled securely to grant these favourable terms from the advantage it possesses of investing a portion of its Funds at a high rate of Interest.

Directors.

Edward Barnard, Esq., F.R.S.
Henry Buckle, Esq.
John Henry Capper, Esq.
Gideon Colquhoun, jun., Esq.
John Edwardes Lyall, Esq.
C. E. Mangles, Esq.
J. B. Montefiore, Esq.
J. H. Ravenshaw, Esq.
Capt. Sir Jas. Stirling, R.N.
William Walker, Esq.

Solicitors.—Messrs. Swain, Stevens, and Co.

Prospectuses, with Tables, Forms of Proposal for the purchase of an Annuity or for making an Assurance, and every information, may be obtained by application at the Office of the Company, No. 126, Bishopsgate-street, City.

By order of the Board, CHRISTOPHER COUSINS, Accountant

NEW AND SUPERIOR SEEDLING DAHLIAS FOR 1842.

JAMES EDWARD, FLORIST, LAYERTHORPE, YORK,

begs most respectfully to invite the attention of Cultivators of the Dahlia to the following Three Seedling Varieties (raised in 1840, and fully proved in 1841), which are quite distinct from any hitherto produced; of very superior habit, and constant in producing good Show Flowers throughout the season; in proof of which J. E. begs to state that he has shown above 200 blooms of the three, during the season, at various Exhibitions open to all England, and has had nine Seedling Prizes awarded for them, namely,—four 1st prizes, three second ditto, and two third ditto; they have also been shown in the following winning trays:—

In the 1st Tray	of 24	at the Horticultural Society, York, Aug. 18,
2d ,,	24	,, ,, ,,
1st ,,	18	,, ,, ,,
2d ,,	36	at the Botanical Gardens, Hull, Sept. 2d;
2d ,,	12	,, ,, ,,
1st ,,	24	at the Horticul. Soc., Scarborough, Sept. 3d;
1st ,,	12	,, ,, ,,
1st ,,	6	,, ,, ,,
1st ,,	48	at the Yorkshire Philosophical Soc., Sep. 9th;
1st ,,	36	,, Botanical Gardens, Sheffield, Sept. 15th;
1st ,,	36	,, Horticultural Soc., Barnsley, Sept. 21st;
1st ,,	24	,, ,, ,,
1st ,,	48	,, Botanical Gardens, Leeds, Sept. 22d;
1st ,,	48	,, Horticultural Society, York, Sep. 24th;
2d ,,	24	,, ,, ,,

Besides having taken other Prizes in addition to the above.

PREMIER.—Fine bronze salmon, very superior form, of excellent habit, throwing its blooms well above the foliage, and always to be depended upon in producing good show flowers. This variety obtained the first prize, in its class, at the York Ancient Florists' Society, September 20th, and had also the premier prize awarded, as the best Dahlia of any colour.—Height 4 to 5 feet.—Plants 10s. 6d.

MARY JANE.—White ground, very deeply tipped and edged with purpled carmine—constant throughout the season, well up in the centre, of excellent habit, and never fails in producing good flowers. This variety obtained the first and second prize at Scarborough, as the best light-ground flower tipped or edged, and has justly been pronounced the most distinct and attractive Dahlia ever produced in its class.—Height 4 feet.—Plants 10s. *6d.*

DUKE OF RICHMOND.—Fine light pink and yellow, colours beautifully blended together, with a light-yellow tip at the end of each petal, similar to the Duchess of Richmond, but quite distinct from that variety; very superior habit, always constant, and will prove a noble and excellent show flower.—Height 5 feet.—Plants 10s. *6d.*

Good strong plants will be sent out the first week in May; and for the convenience of parties at a distance, orders will be received, and plants supplied, by Mr. George Charlwood, Seedsman, Covent Garden, London; and Messrs. Henderson, Nurserymen, Brechin, Scotland. No allowance to the trade unless 12 plants are ordered, and a remittance or respectable reference will be required from unknown correspondents. J. E. can also supply plants of all the best Dahlias in cultivation, of which a catalogue is annually printed, and can be had on application.

We the undersigned, members of the Committee of the York Horticultural Society, do attest the correctness of Mr. Edward's description of the above Dahlias; and we strongly recommend them as distinct varieties from any yet sent out, and well worth a place in the most limited collection.

Report of the York Amateur Florist Society, held on Monday, August 9th, 1841.—The Judges and Members of this Society consider it their duty to notice a seedling Dahlia of last year (sent for inspection) raised by Mr. Edward, Nurseryman, of this city. The colour is pure white, with a dark tip of purpled carmine; the form, depth of petal, and above all, good eye, require no consideration to pronounce it one of the best Dahlias yet seen of its class; and from the evident superiority of this distinct variety over such flowers as Glory of Plymouth, Beauty of the Plain, &c., there is no doubt but the year 1842 will cause these flowers to fall in the rear when brought into competition with the seedling exhibited this day, as it may safely be pronounced a gem of the first water, and will reflect the greatest credit on the fortunate raiser, for so long as Dahlias remain in cultivation this flower must form a prominent feature in a stand of six.—*From the York Courant.*

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES,

upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HEATING BY HOT WATER, WITH THE CIRCULATION OF ATMOSPHERIC AIR.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER; see the 3rd and 37th Numbers of the *Gardeners' Chronicle.*

References may be had, and their works seen, at Mr. Perry's Nursery, Banbury; Mr. Green's, Lower Cheam; Messrs. Henderson's, Pine-apple Nursery; Messrs. Rollisson's Nursery, Tooting; Mr. Knight's Exotic Nursery, Chelsea; Messrs. Low's, Clapton Nursery; Mr. Catleugh's Nursery, Chelsea; Mr. Gaines's Nursery, Battersea; Mr. Buck's, Portland Nursery; Mr. Young's, Milford Nursery; Mr. Smith's Nursery, Dalston; Mr. Woodroff's Nursery, Kensall Green; Mr. Hopgood's Nursery, Bayswater; Mr. Willmer's Nursery, Chelsea; and at most of the Nobility and Gentlemen's Seats in the country.

Every particular to be had at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

EXOTIC NURSERY, CANTERBURY.

WILLIAM MASTERS

having for many years cultivated upwards of THIRTY ACRES of Land as Nursery Gardens, begs to submit to the public the following List of Fruits:

PEARS.—W. M. having collected in the first instance, through the kindness of the late J. Braddick, Esq., and subsequently from his own personal visits to the Netherlands, a large collection of the celebrated FLEMISH PEARS, as well as many others from various sources, planted a specimen of each variety in his Nursery, and they having for several years produced fruit, he is enabled to pronounce with certainty that many are wholly worthless—some are too tender for our exposure—and that many are of the utmost importance on account of their prolific and early bearing, as well as of their delicious flavour. Out of a very large collection W. M. confidently recommends the following, which become fit for use nearly in the order in which they stand:—DESSERT PEARS.—Madeleine, Jargonelle, Williams' Bonchrétien, Flemish Beauty, Rouppé, Capiaumont, Beurré Diel, Autumn Bergamot, White Doyenné, Marie Louise, Princess of Orange, Seckle, Monsieur le Curé, Althorp Crassane, Bezy de la Motte, Napoleon, Duchess of Angoulême, Louise bonne de Jersey, Knight's Monarch, Rouse Lench, Swan's Egg, Beurré d'Aremberg, Nutmeg, Ne plus Meuris, Passe Colmar, Winter Nelis, Hacon's Incomparable, Beurré Rance, Easter Beurré. BAKING PEARS.—Royal Coreless, Double de Guerre, Uvedale's St. Germain, Catillac. Many other sorts are still cultured, but a garden furnished with these will produce fine fruit for every season.

APPLES.—W. M. having been a Fellow of the Hort. Society nearly from its commencement, has availed himself of the privilege of selecting from that liberal establishment such sorts of Apples as appeared to merit particular notice, and which, added to the selections from the famed Kentish orchards and elsewhere, have produced a number far exceeding the point of usefulness. The whole have been fruited, and the following condensed list is particularly recommended. The sorts are arranged as nearly as possible in the order in which they become fit for use:—Juneating, Borowitski, Kerry Pippin, Quarrenden, Hawthornden, Keswick Codlin, Franklin's Golden Pippin, Summer Nonpareil, King of the Pippins, Beauty of Kent, Gloria Mundi, Downton Pippin, Hughes' Golden Pippin, Ribston Pippin, Blenheim Orange, Margil, Sam Young, Scarlet Pearmain, Dumelow's Seedling, Forman's Crewe, Beachamwell Seedling, Dr. Harvey, Lemon Apple, Pile's Russet, Screivton Golden Pippin, Cornish Gilliflower, Scarlet Nonpareil, Knight's Ganges, Court of Wick, London Pippin, Walmer Court, Canadian Reinette, Alfriston, Court Pendu, Cockle Pippin, Hubbard's Pearmain, Old Nonpareil, Downton Nonpareil, Braddick's Winter Nonpareil, Collins' Russet, Golden Harvey, Dutch Mignonne, Hunt's Green Newtown, Norfolk Beaufin, French Crab. With the above selection, fruit for all purposes and all seasons may be obtained.

CHERRIES.—Purple Griotte, Early Black, Masters' White Heart, Elton, Black Eagle, May Duke, Kentish, Black Tartarian, Canterbury Black, Bigarreau, Late Duke, Florence, Small Morello, Large Morello. The above have proved the most valuable out of a large number of sorts.

PLUMS.—Lawrence's Early, Early Orleans, Hâtive Royal, Orleans, Denyer's Victoria, Greengage, Nectarine, Washington, Black Griffin, Catherine, Coe's Golden Drop, Imperatrice, Winesour, Large Bullace, Damson, Small Bullace.

Of PEACHES the following have given most satisfaction:—Early Ann, Grosse Mignonne, Early Newington, Noblesse, Red Magdalen, Old Newington, Admirable, Royal.

Of NECTARINES—The White, Elruge, Roman, Newington, Violet Hâtive.

Of APRICOTS—The Hemskirke, Large Early, Moorpark, Breda, Orange.

Of STRAWBERRIES—Grove-end Scarlet, Roseberry, Old Pine, Keen's Seedling, Myatt's Pine, Downton, Elton.

Of GRAPES—Miller's Burgundy, Sweet-water, Muscadine, Black St. Peter, White Cluster, Esperione, Hamburgh, Frontignan, Muscat of Alexandria, Verdelho, Horsforth Seedling, Black Damascus.

Of GOOSEBERRIES, selected out of 80 kinds—Early Green, Early Red Rough, Queen of Sheba, Lady Delamore, Warrington Red, Rookwood, Roaring Lion, Gunner, Duke of York, Crown Bob, Woodward's Whitesmith, Heart of Oak.

Of NUTS—Cosford, Frizzled, Dwarf Prolific, Knight's Large.

Of RASPBERRIES—Red Antwerp, White Antwerp, Barnet.

Of FIGS—Lee's Prolific, Brunswick, Common Purple, Brown Naples, Black Ischia, French Prolific.

W. MASTERS offers the above List of Fruits, all of which are grown, and nearly the whole of which have been proved in his Nursery, as a more complete one than those usually submitted to public notice.

*** Early Commissions will insure immediate attention.

SLATE CISTERNS, SHELVES, TROUGHS, &c.,

for Horticultural purposes.—EDWARD BECK, Manufacturer, Isleworth, near Brentford. Orders, Working Drawings, &c., forwarded by post, will receive due attention.

*** Slate Edgings for Flower Borders, &c.

PATENT ASPHALTE PROTECTING MATERIAL.

—Extract from *Gardeners' Chronicle*, Dec. 25, 1841, p. 843.—"In the midst of frost it will not be unseasonable to warn all our Readers of the great importance of preventing their more tender Plants that may have been frozen from being thawed suddenly by the sun. All Gardeners know how often Peas frozen below a south wall are killed, and that if any contrivance to prevent their being suddenly thawed is made use of, they recover. What is true of Peas is, to a great extent, true of other things. A few weeks ago we had a severe frost, 16°; at that time young Araucarias exposed to the south died, while others within a few yards, but screened from the sun by stone, did not suffer at all. We may remark by the way that CROGGON'S ASPHALTE ROOFING forms a most excellent material for such screens." In page 8 of same Journal, Jan. 1, 1842, is fully described the purposes to which it is applied by the Royal Horticultural Society. Being a non-conductor it effectually protects from heat or cold.—THOMAS JOHN CROGGON, 8, Ingram-court, Fenchurch-street, London.

1. The Court of Directors of the New Zealand Company hereby give notice, that a limited number of allotments of preliminary Lands, each of which consists of three sections, viz., one acre of Town Land, fifty acres of Suburban Land, and one hundred and fifty acres of Country Land, are still open for Sale in their second Settlement of Nelson. The price of each allotment is 300*l*.

2. These allotments were unsold when the general ballot for priority of choice was held on the 30th August last; nevertheless the numbers which represent them in the original Registry of applications were placed in the wheel with all the other numbers, and the unsold numbers were drawn promiscuously with those which had been previously disposed of; consequently, to each of the unsold numbers definite rights of priority of choice (distinct in respect to each of the sections above described) have been attached by the ballot.

3. Until further notice, any party, or his agent, attending at the New Zealand House on any Thursday at three o'clock p.m., and producing the receipt of the Company's Bankers, Messrs. Smith, Payne, and Smiths, for 300*l*., will be entitled to draw in the presence of the Court of Directors, from a wheel in which the registry numbers of all unsold allotments have been deposited, with special precautions for their security and for the fairness of the proceeding. The register of the original ballot will then show to the party drawing any number, to what rights of priority of choice he is entitled.

4. Applicants, therefore, will obtain preliminary allotments, on precisely the same terms, with respect to price and the chances of priority of choice, as original purchasers.

5. A list of the registry numbers, with the rights of choice which were attached to each by the original ballot, may be seen at the New Zealand House, on application to the Secretary.

6. Present purchasers will be entitled to the same privileges, in respect to an allowance for cabin passengers (not exceeding 25 per cent. on the purchase-money), as those who bought allotments before the general ballot.

7. Purchasers not proceeding to New Zealand will be entitled to delegate their rights of choice to any agent whom they may nominate; or, if they should prefer it, such choice will be exercised on their behalf by the officers of the Company.

By order of the Court,
New Zealand House, JOHN WARD,
Broad-street-buildings, 1st Jan., 1842. Secretary.

PAXTON'S MAGAZINE of BOTANY, No. xcvi.

for January, which completes the Eighth Volume, contains the following Illustrations—1. Oncídium I'nsleayii; 2. Hardenbérgia macrophýlla; 3. Beaufórtia decussàta; 4. Gesnèra zebrìna; the usual Operations for the Month; and a copious Index, &c.

☞ Arrangements have been made for executing the Illustrations for the new volume in a very superior manner, and also for introducing other points of general interest and attraction.

London: W. S. Orr and Co. Paternoster Row.

THE GARDENER'S LIBRARY.

THE FLOWER-GARDEN—its cultivation and general arrangement,

with select Lists of the most desirable Annual, Biennial, and Perennial Flowering Plants, arranged according to their height, colour, and time of flowering, with hints and plans for laying out and arranging Garden Grounds. Price 6s. 6d. cloth, gilt edges; and 10s. 6d. with plates.

Uniform with the above in size and price,

THE ORCHARD and FRUIT GARDEN;

including the management of all Wall, Standard, and Espalier Fruit-trees, and the forcing-pit, with select lists of the most choice varieties, and their synonymes. By CHARLES M'INTOSH, F. C. H. S.

Uniform with the above in size and price,

THE GREENHOUSE, HOTHOUSE, and STOVE;

including directions for the cultivation and management of Exotic Flowering Plants, the erection and management of Greenhouses and Conservatories, and the most approved mode of warming and ventilating, with lists of the most choice species. By CHARLES M'INTOSH, F. C. H. S.

LONDON: Wm. Orr and Co., Amen-corner, Paternoster-row.
Sold by all Booksellers.

In one small volume, price 15s.

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, an Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur or Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. Andrews, Bond-street; Orr & Co., Paternoster-row.

In foolscap 8vo, price 1s. 6d.

COOLEY'S FIGURES OF EUCLID;

being the Diagrams Illustrating the "Elements," with the Enunciations, printed separately for use in the Class-room.

*** Orders received by all Booksellers.
Whittaker and Co., Ave-Maria-lane London.

This day is published, price 6s. cloth,
THE HAND-BOOK OF CHEMISTRY; with a complete Index of reference. By G. H. Caunter, Esq.
London: W. S. Orr & Co.; and W. & R. Chambers, Edinburgh.

The Gardeners' Chronicle.

SATURDAY, JAN. 15, 1842.

MEETINGS IN THE ENSUING WEEK.

Monday	Medico-Botanical (Ann.)	8 P. M.
Tuesday	Horticultural	2 P. M.
	Floricultural	7 P. M.
	Linnean	8 P. M.
Wednesday	Geological	8½ P. M.
Friday	Botanical	8 P. M.
Saturday	Royal Botanic	4 P. M.

Our remarks on Foresting will be resumed next week, with some considerations upon the rate of growth of trees.

The Whitethorn is by far the best plant for fences, in land which it likes; but it does not always answer the expectation of its planters. It will grow freely in any land that is not very poor or wet. It does not dislike heavy clay, and it succeeds admirably in rich light soils; but in marshy situations, or in sterile sands and heathy land, it is not worth planting.

The mode of multiplying it is by sowing the stones found in the haws, the preparation of which is the first subject to be considered. The haws may be gathered at any time after they are ripe. They should be beaten to pieces, and mixed with twice their quantity of sand; after which they should be formed into a cone, 3ft. or 4ft. high, and well covered over with a thick layer of soil; this must be made in a dry place. In March they may be unpacked, sifted from the sand, and sown broadcast in beds 4ft. wide, being covered about an inch with light soil. Further care they require none. Some of them will come up the first year, some the second, many the third, and some the fourth; so that the seeds need not be sown very thin; for the successive thinnings, as the plants are removed, will form room for the new seedlings, or "layer," as it is technically called.

The layer should be used when two years old, at which time, if well managed, it will be nine inches high. It is customary to pull it up with the hands, guarded by stout leathern gloves, and to shorten the roots by removing all the tap-root up to the bunch of fibres which springs from the crown. In this state it is fit for planting.

Many persons prefer to use transplanted quick in hedge-making; but we doubt whether anything is really gained by doing so; and for large operations the latter is too expensive. If, however, it is wished to prepare quick for such a purpose, it is only necessary to plant the layer, root-pruned as above described, in rows a foot apart, and to lift it partially every year, by introducing the spade on one side, until the plants are as large as is required. They must be lifted annually, or they will form coarse roots without fibres, and it will become difficult to transplant them with any certainty.

When the quick is ready for making a hedge, it is either planted on the ground level (in which case it must be guarded by hurdles), or upon the top of a bank. The latter is a bad plan, because in the summer the bank becomes very dry, and the young quick being deprived of the moisture required for its nourishment, becomes stunted and stops growing. It is far better to plant it on the level of the ground. But the necessity of ditching estates, and the convenience of banks as separations of fields, will probably always cause the preference to be given to planting upon them. In this case the quick should be placed on the top, and on no account at the sides, as is commonly practised in some of our counties.

The best way of planting is to put in the layer 12 inches apart, in double rows, a foot asunder, taking care that the plants in one row alternate with those in the other. They should not be cut back when planted, but left at full length.

The second year after planting, one row should be cut down to within five or six inches of the ground, and the other row left untouched. The next year the latter should be cut down in like manner. After this the hedge will require no other care than to cut back the leading shoots every year whenever they are becoming too strong, so as to keep the mass a compact thicket of entangled branches.

These are, in our opinion, the essential points to observe; if we are wrong, we shall be glad of the corrections of our correspondents. In addition, it should be borne in mind that the Whitethorn is greedy of manure, and that the better the soil the sooner a fence will be made. The plants, of course, should be kept quite clean by frequent hoeing and loosening the surface-soil.

We know that many persons will prefer layer more than two years old. We doubt, however, whether the advantage of employing large quicks is equal to the great additional expense; at least there is no doubt that if the Whitethorn is not allowed to become dry, but is root-pruned and planted in the autumn immediately after being taken out of the ground, a very respectable fence will be formed in four years.

We find that the election of the Librarian of the Linnean Society will not take place on Tuesday next, as was expected, but that special summonses will be issued to the Fellows whenever the day of election is appointed. In the mean while, it is gratifying to find, from the communications we receive, that the bringing forward Mr. Kippist on this occasion is generally regretted by the friends of the Society.

It is with sorrow that we announce the decease of Mr. Aylmer Bourke Lambert, F.R.S., one of the Vice-Presidents of the Linnean Society, who died at his residence at Kew, on Monday last, at an advanced age. The liberality of this gentleman in all that related to Botany, and the unreserved manner in which he placed his library and herbarium—the latter at one time the richest in this country in Siberian and South American plants—at the disposal of men of science of all nations, would have identified his name with the history of Botany for nearly half a century, even although his magnificent work on the genus Pinus, and other useful publications. had never appeared.

A correspondent has sent us the following extract from a periodical of high reputation, published in November last:—

"The yellow Rose, so rarely seen in England, is common here (at Macerata), and, we find, is easily propagated by grafting the red Rose on the common Broom!"

We all know the extreme difficulty of removing popular errors; but we must confess we were not prepared for such a statement as this in the year 1841. The Rose grafted on the Broom! We wonder the writer did not add that in Sicily the Orange grows on the Thistle, and the Grape on Groundsel. One would be just as possible as the other.

It is a universal law of nature that no plants will engraft on each other which do not belong to the same natural order; and it not unfrequently occurs that, even in the same natural order, species which are distantly related cannot be united to each other. For instance, the Rosaceous order is a small one, compared with many others; and yet who can graft an Apple on a Plum, or a Rose upon a Whitethorn? For any organic union to be effected between different species, there must be a great similarity in the organisation and secretions of the species to be united. That similarity exists between the Apple and the Crab, and between the Peach and the Plum; consequently they "take" on each other. It does not exist between the Apple and the Plum, or the Rose and the Whitethorn; and consequently they cannot be made to take. If, then, there is this physical impossibility of uniting plants of the same natural order, the belonging to which necessarily implies a great similarity of structure and constitution, how can we conceive it possible in the case of plants of different natural orders, which necessarily implies a great dissimilarity of structure and constitution? "Doves mate not with kites, nor dogs with wild foxes;" and what is true of animals is quite as true of plants.

To be sure, we are told by sundry veracious authors that Roses become black by being grafted on a Black Currant bush, and that the blood-red Oranges derive their colour from growing on Pomegranates; but these statements are of the same class as that quoted at the head of these remarks. How old such stories may be we have not learning enough to tell; but every schoolboy knows that Virgil gossips of Plum-trees bearing Cornels, and Apples Pears; and we think it is in Columella that is to be found the assertion that the Vine may be grafted on the Fig—a declaration that had its believers down to a very late period, when its impossibility was formally proved in the Garden of Plants by the late M. Thouin.

What a pity it is that the nature of an English education should be such as to leave the minds of even educated men impressed with a belief in the possibility of such absurdities!

Our readers will have occasionally remarked in our columns letters from correspondents who urge the authors of all communications to sign them with their real names. We have already given our own opinion upon this subject, and we now repeat that in many cases there is no kind of necessity for such a course. If a man indeed has a fact to state, then it is no doubt desirable that he should be known to us; but it is not requisite that he should declare himself to all the world. Diffidence, a feeling we should like to see more common, is in itself the principal cause of many writers preserving the anonymous; and we submit to our readers that it is by itself a sufficient reason. As to all other subjects, such as discussions about matters of taste, and opinions upon modes of cultivation, there is no pretence for calling upon a writer to avow himself; indeed, in many cases an argument will be conducted better when the parties to it are unacquainted with each other.

If, however, we had any doubt about the propriety of the course we have taken, it would be removed by the following letter from our excellent correspondent, "P. P.":—

"*Stat nominis umbra.* If you have not done it already, you have ample means and full power of yourself to justify your practice of giving insertion to anonymous contributions; whether of the amateur or professional character; whether strictly horticultural and practical, or merely of that discursive kind which, without departing entirely from the principal object you have in view, are at least innocent in themselves, or serve to give grace and expansion to the views of men engaged in one of the most intellectual of physical pursuits, and diversity to your agreeable miscellany. A little consideration will, I am sure, convince your correspondent 'J. H.S.,' and some others who have gone before him in the same line of objection, of their mistake, and of the better taste you show, and the politer course you take in not attempting to disturb the privacy of your friends, so long as they avoid personal appeals, or a line of argument in which personal authority was necessary to give weight to their discussions. 'J. H. S.' has doubtless made himself known to you by other means than the holy initials (they are real initials) by which he has revealed himself to your readers. But is it possible he can suppose that your memory is to be burthened with the names, habitats, and distinctions of all the 'men of letters' who crowd into your weekly correspondence?

"For myself, I am not too old or too cold not to rejoice in the little private gossips I have with you, or not to be rather proud of your recorded good opinion. But I am too chary of your disposable leisure to think of encouraging you with a name which would convey no definite sense of intellectual superiority, or artistical skill; and so perfectly unknown to fame as to be of no manner of use to your *Chronicle*,—where, indeed, it would be astonished to find itself for the first time in its life in such good company.

"If I were to declare my 'P. P.' to mean 'Peter Pratt,' the father of the pretty 'Lonicera,' or to announce myself as the lineal descendant of 'P. P., Clerk of this Parish,' it would add no weight of proof to my assertions that Hollies are best moved when they are prepared to make the spring-shoot; or that frost-bitten Bays, being dead, go the way of all flesh, or, being not so far gone, take the same course in their revival as other evergreens; or that Shakspeare was not a professional gardener—no more than it would give point to a dibble or an epigram."

CACTACEOUS PLANTS.

A knowledge of their natural climate is essential to the cultivation of most plants, but many Cacti are exceptions; for instance, Céreus speciosissimus is a native of South America, and was for many years, and is by some still, treated as a stove plant, grown in old lime, brick rubbish, and the poorest of soil, and, of course, kept constantly excited with heat and moisture; in this case, departure from the treatment that their natural localities would suggest, has rendered it a desirable plant to every person that possesses a common greenhouse. The soil that I grow the young plants in is one-half peat, with equal quantities of strong yellow loam, pigeons' or sheep's dung, and river-sand, that has been at least exposed twelve months to the weather, and frequently turned. I never mix the soil before it is wanted for use, when it is well sifted and the lumps placed over the potsherds for drainage. When the plants have attained a proper size for blooming, I add more of the loam in repotting them, particularly to C. speciosissimus, and in all cases give plenty of drainage. The best time for propagating by cuttings is when the plants are growing freely. I make them of whatever size can best be spared from the plants; and those that are of young and unripe shoots I lay on a dry shelf in the greenhouse for a fortnight, to dry up the sap, which prevents them from rotting and causes them to emit roots much sooner. I plant them singly in small pots, and place them in a moderate hotbed frame; when they have filled the pots with roots, they are repotted and placed in an intermediate or Pelargonium house, where they remain for the summer and receive a good supply of water. In the autumn they are allowed to get quite dry, and they are wintered in a dry, airy part of the greenhouse. In spring they are again removed to the Pelargonium house, and a very little water is given them, which is increased as the season advances. By the end of the second summer they will have grown to the size of good blooming plants; and in the autumn they should be placed out in a warm, airy part of the garden to ripen the shoots thoroughly. About the usual time of housing other greenhouse plants, they should be again dried and put, as before, in the greenhouse. I place the first for forcing in the intermediate stove about Feb. 1, and continue a succession till they bloom in the greenhouse, which is about June. Such plants will bear the greatest extremes of dryness and moisture, and without proper attention is paid at the season of rest to keep them quite cool and dry, they never will bloom properly. The forcing must be commenced at a low temperature, and water at first given sparingly: when they have begun to grow freely and the bloom-buds are well started, they must be watered, not by a continual dripping, but by copious applications, and at intervals of a fortnight during the growing season, with liquid manure. When the bloom-buds are sufficiently advanced, I thin out all those which are large and small, leaving them as near one size as possible, and at proper distances to allow the blooms to expand. When they have flowered, I keep the plants rather dry for a short time, and place them in a cool, shady part of the greenhouse, or under a north wall. In a few weeks they will again assume their usual firm and healthy appearance, and begin to grow; and then I clear off all the decayed blooms and seed-pods, and place the plants for the autumn in the garden in a south aspect, where there is a free circulation of air, giving them a good supply of water; after this they are moved to the greenhouse and treated as before. I train them to iron stakes, made to fit the outside of the pots or tubs, and fasten them with wire. Attention should be paid to early training, and to stopping all shoots as soon as they attain the required height; all useless side and bottom shoots I rub off, and occasionally some of the old shoots are cut out and replaced with young ones. I have raised many beautiful hybrids, some striped, with the habit of Céreus Mallissonii, and others intermediate, between Epiphyllum speciosissimum and E. Ackermanii grandiflorum, which is a strong grower and bears large scarlet blooms, with the purple tint of C. speciosissimus.—*John Green, Gardener to Sir E. Antrobus, Bart., Lower Cheam.*

DIE HOHE EICHE,

THE TALL OAK OF HARRESHAUSEN NEAR BABENHAUSEN, G. DUCHY OF HESSE DARMSTADT.

HARRESHAUSEN is a small village of the Grand Duchy of Hesse Darmstadt, about 25 English miles from Frankfort, and two from Babenhausen. A considerable tract of forest lies on the west side of these two villages, and till within the last 20 years encompassed the remarkable tree of which a sketch is annexed.

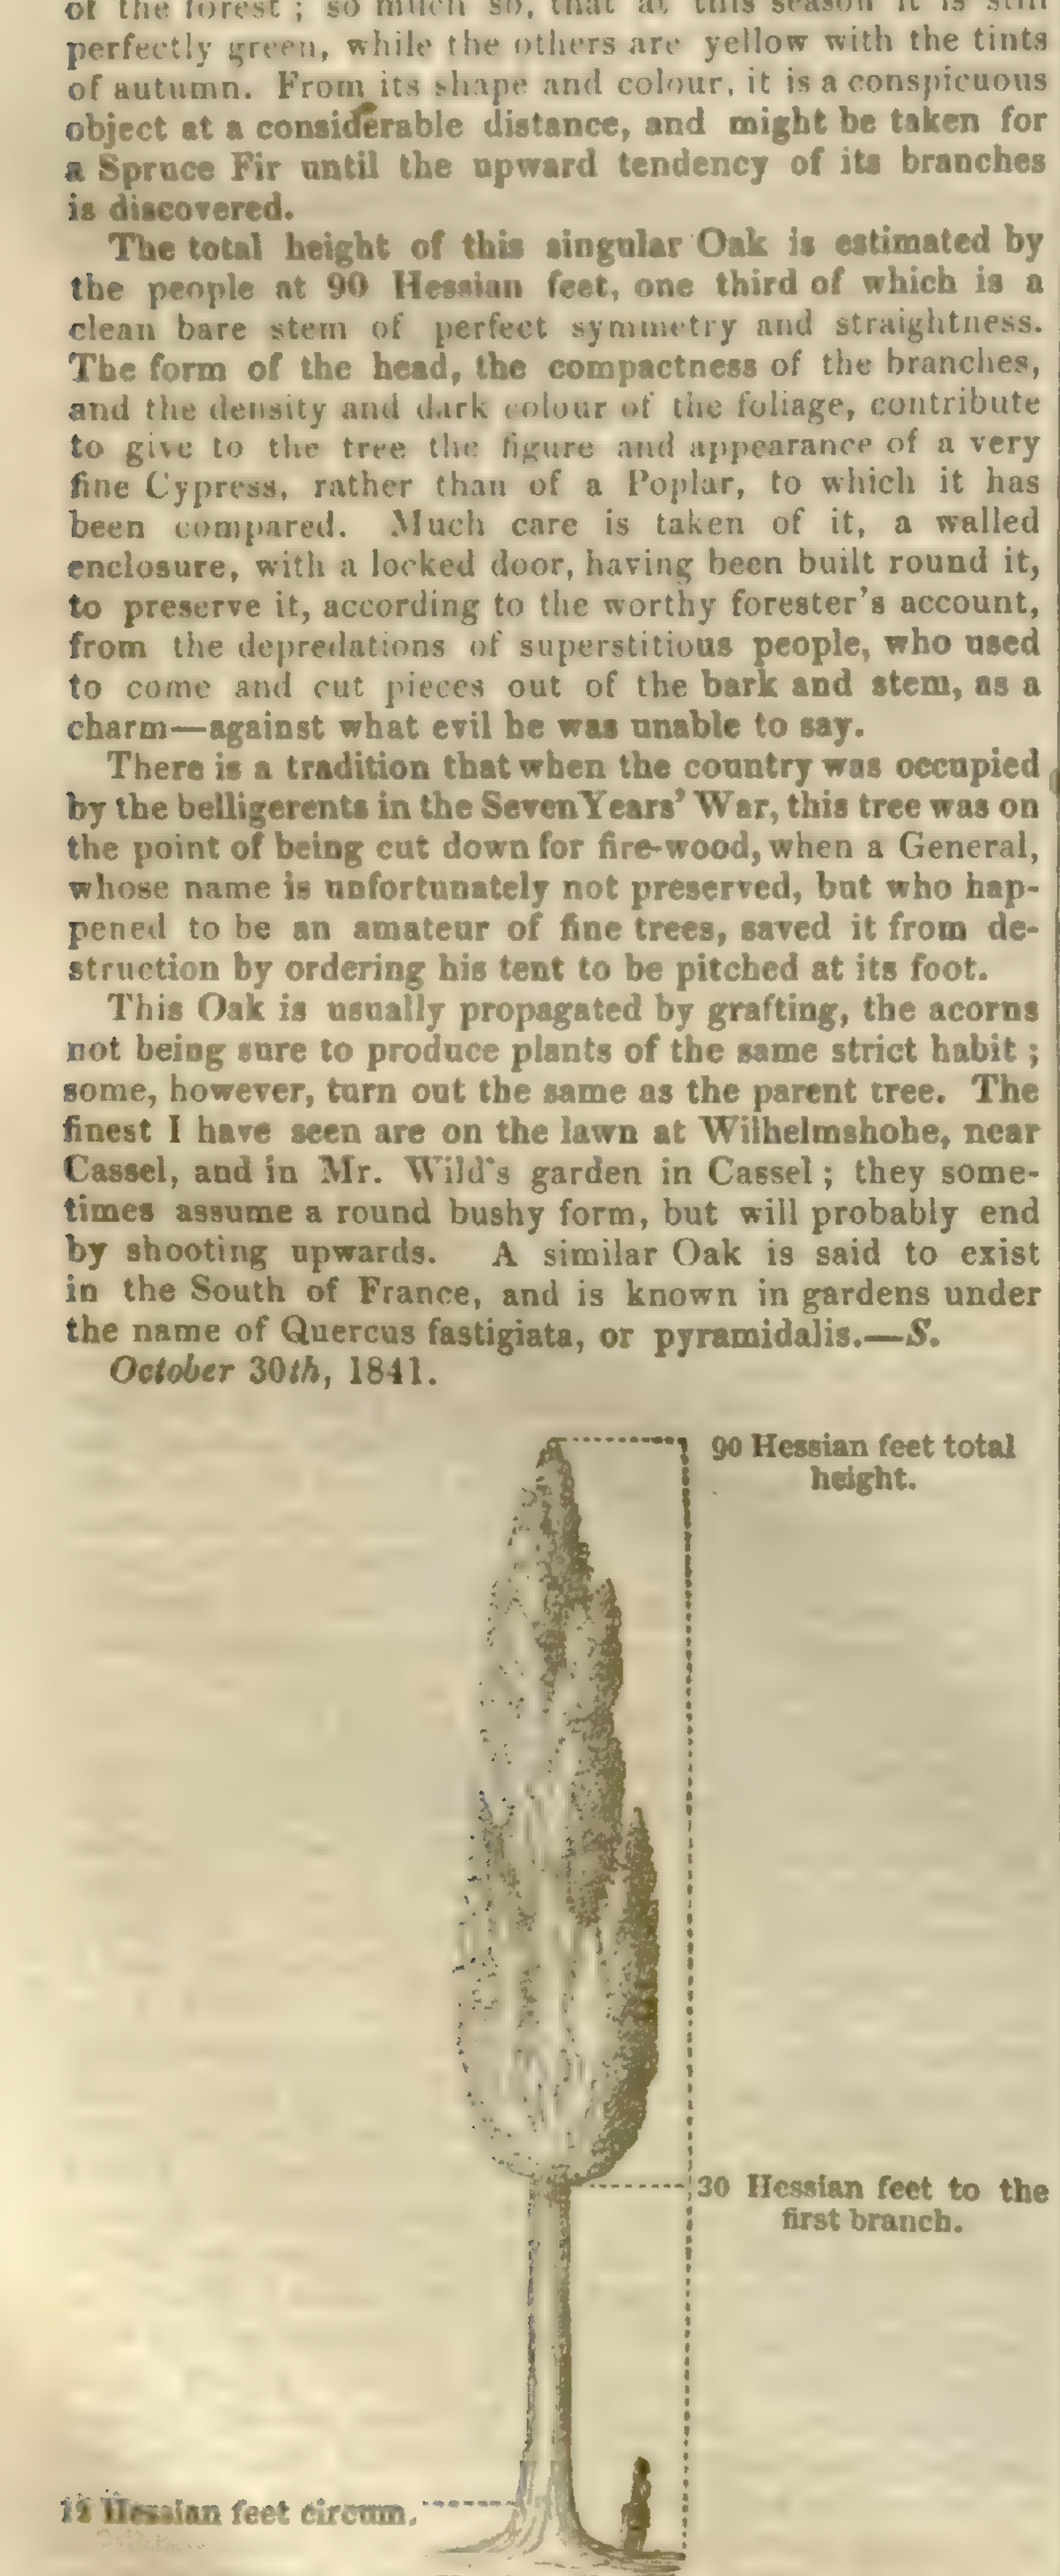
This tree stands about a quarter of a mile from the village, and about one hundred yards in front of the wood. It is an Oak, but of what species I am unable to determine, not having seen the acorns. It is deciduous, but retains its leaves very much later than the spreading Oaks of the forest; so much so, that at this season it is still perfectly green, while the others are yellow with the tints of autumn. From its shape and colour, it is a conspicuous object at a considerable distance, and might be taken for a Spruce Fir until the upward tendency of its branches is discovered.

The total height of this singular Oak is estimated by the people at 90 Hessian feet, one third of which is a clean bare stem of perfect symmetry and straightness. The form of the head, the compactness of the branches, and the density and dark colour of the foliage, contribute to give to the tree the figure and appearance of a very fine Cypress, rather than of a Poplar, to which it has been compared. Much care is taken of it, a walled enclosure, with a locked door, having been built round it, to preserve it, according to the worthy forester's account, from the depredations of superstitious people, who used to come and cut pieces out of the bark and stem, as a charm—against what evil he was unable to say.

There is a tradition that when the country was occupied by the belligerents in the Seven Years' War, this tree was on the point of being cut down for fire-wood, when a General, whose name is unfortunately not preserved, but who happened to be an amateur of fine trees, saved it from destruction by ordering his tent to be pitched at its foot.

This Oak is usually propagated by grafting, the acorns not being sure to produce plants of the same strict habit; some, however, turn out the same as the parent tree. The finest I have seen are on the lawn at Wilhelmshohe, near Cassel, and in Mr. Wild's garden in Cassel; they sometimes assume a round bushy form, but will probably end by shooting upwards. A similar Oak is said to exist in the South of France, and is known in gardens under the name of Quercus fastigiata, or pyramidalis.—*S.*

October 30th, 1841.



90 Hessian feet total height.
30 Hessian feet to the first branch.
12 Hessian feet circum.

N. B. 1 Hessian foot equal to 11¾ English inches.

CULTURE OF WHEAT IN THE WEST INDIES.

(Continued from p. 20.)

Such were the results of the first attempt, with the exception of Cuba, made to produce wheat in the Antilles, since the year 1494, with which I am acquainted. Still, however, these trials threw little light on the important problem which I was desirous of solving, namely the minimum of latitude and elevation at which this culture could be carried on with advantage between the tropics. To the solution of this I next endeavoured to apply myself, and with this view I sent some original Caracas seed, some the produce of Caracas seed planted in a garden in this town, and some English red or white Wheat, to the Hon. J. C. Lees, Chief Justice of the Bahamas, and the enlightened and energetic Secretary of the Bahama Society for the Diffusion of Knowledge, accompanied by a request that he would use his influence in obtaining a fair trial of them by some of the members of the Society, and communicate the results to me. From the reports thus obtained it appears that the success of experiments made at an elevation of not more than four feet above the sea was most complete, and subsequent experiments were successful in a still more striking degree. The number of ears produced by each grain, planted at an interval of 12 inches between each, was from 50 to 60, each ear containing from 60 to 70 grains.

Sir William Colebroke, under whose auspices the Bahama experiments were made, having been removed to the government of the Leeward Islands, I availed myself of that opportunity to extend my experiments in that quarter, but could only succeed in partially overcoming the prejudices of the planters in Antigua and Dominica. In the former, from causes connected probably with the nature of the soil, the neglect of dressing, and the character of the season, the results were by no means such as I could have wished, the grain being small and defective, and containing an undue proportion of bran and gluten. In Dominica, however, though nearer to the line, 15 grains planted by the Rev. G. Clarke, Rector of Roseau, on the east side of his garden at an elevation of not more than 30 feet above the level of the sea, came up on the 20th of Nov., 1838, three days after sowing, and produced 165 plants, yielding 3,630 grains of wheat, or 242 for 1, which came to maturity in about 104 days from the date of sowing, and exceeded the weight of the parent seed in the proportion of 1 to 1.03, or 132 to 136.

In St. Kitt's, three grains of English white wheat which were planted by the late Mr. Olpherts, at an elevation of 1200 feet in the neighbourhood of Brimstone-hill, yielded, notwithstanding the continued drought, four ears averaging 40 grains each, which were cut on the 94th day from the date of sowing. The unfortunate death of this amiable and kind-hearted individual, which took place soon after, deprived me of my only auxiliary in that quarter, and prevented the farther prosecution of these experiments. I am inclined to suspect the existence of a mistake in Mr. Olphert's report, and that the three grains which vegetated were Victoria, not English wheat, as I cannot otherwise account for the singular change of habit evinced in the acceleration of the period of arriving at maturity.

About the same time that these experiments were proceeding in the Leeward Islands, further trials were in progress in Jamaica, which furnished a complete solution of the problem which had so long engaged my attention, and demonstrated the practicability of cultivating wheat with advantage at the level of the ocean, as well as in the elevated regions of the Blue Mountains at elevations of from 2,000 to 4,000 feet. From the address of the President of the Agricultural Association we learn that the Victoria wheat succeeded equally well in the arid plains of Vere, and the humid mountains of Clarendon and St. Ann's.

"The wheat produced in Vere was planted," as the president acquaints us in his address, "at Hill-side Estate, on the 22d of March; it came up on the 27th; the first ears came out on the 9th of May (58th day); it began to ripen on the 6th of June (76th day); and was cut on the 20th (90th day), and might have been cut a day or two earlier, but for the frequent rain, which made it too wet to be taken in. The portion sown in Clarendon was on Mount Moses plantation; it was planted in March and reaped in June.

"In St. Ann's, Mr. King planted it on the 30th of March; on the 2d of April it was up, and continued to grow very fast. In about two months from the time of sowing it began to show head, and blossom and improve; on the 30th of June (the 92d day), it was quite ripe and full, and decidedly equal, if not superior, to the sample sown. The only attention it received was once weeding between the drills, which proved quite sufficient."—*W. Hamilton, M.D., Plymouth.*

To be continued.)

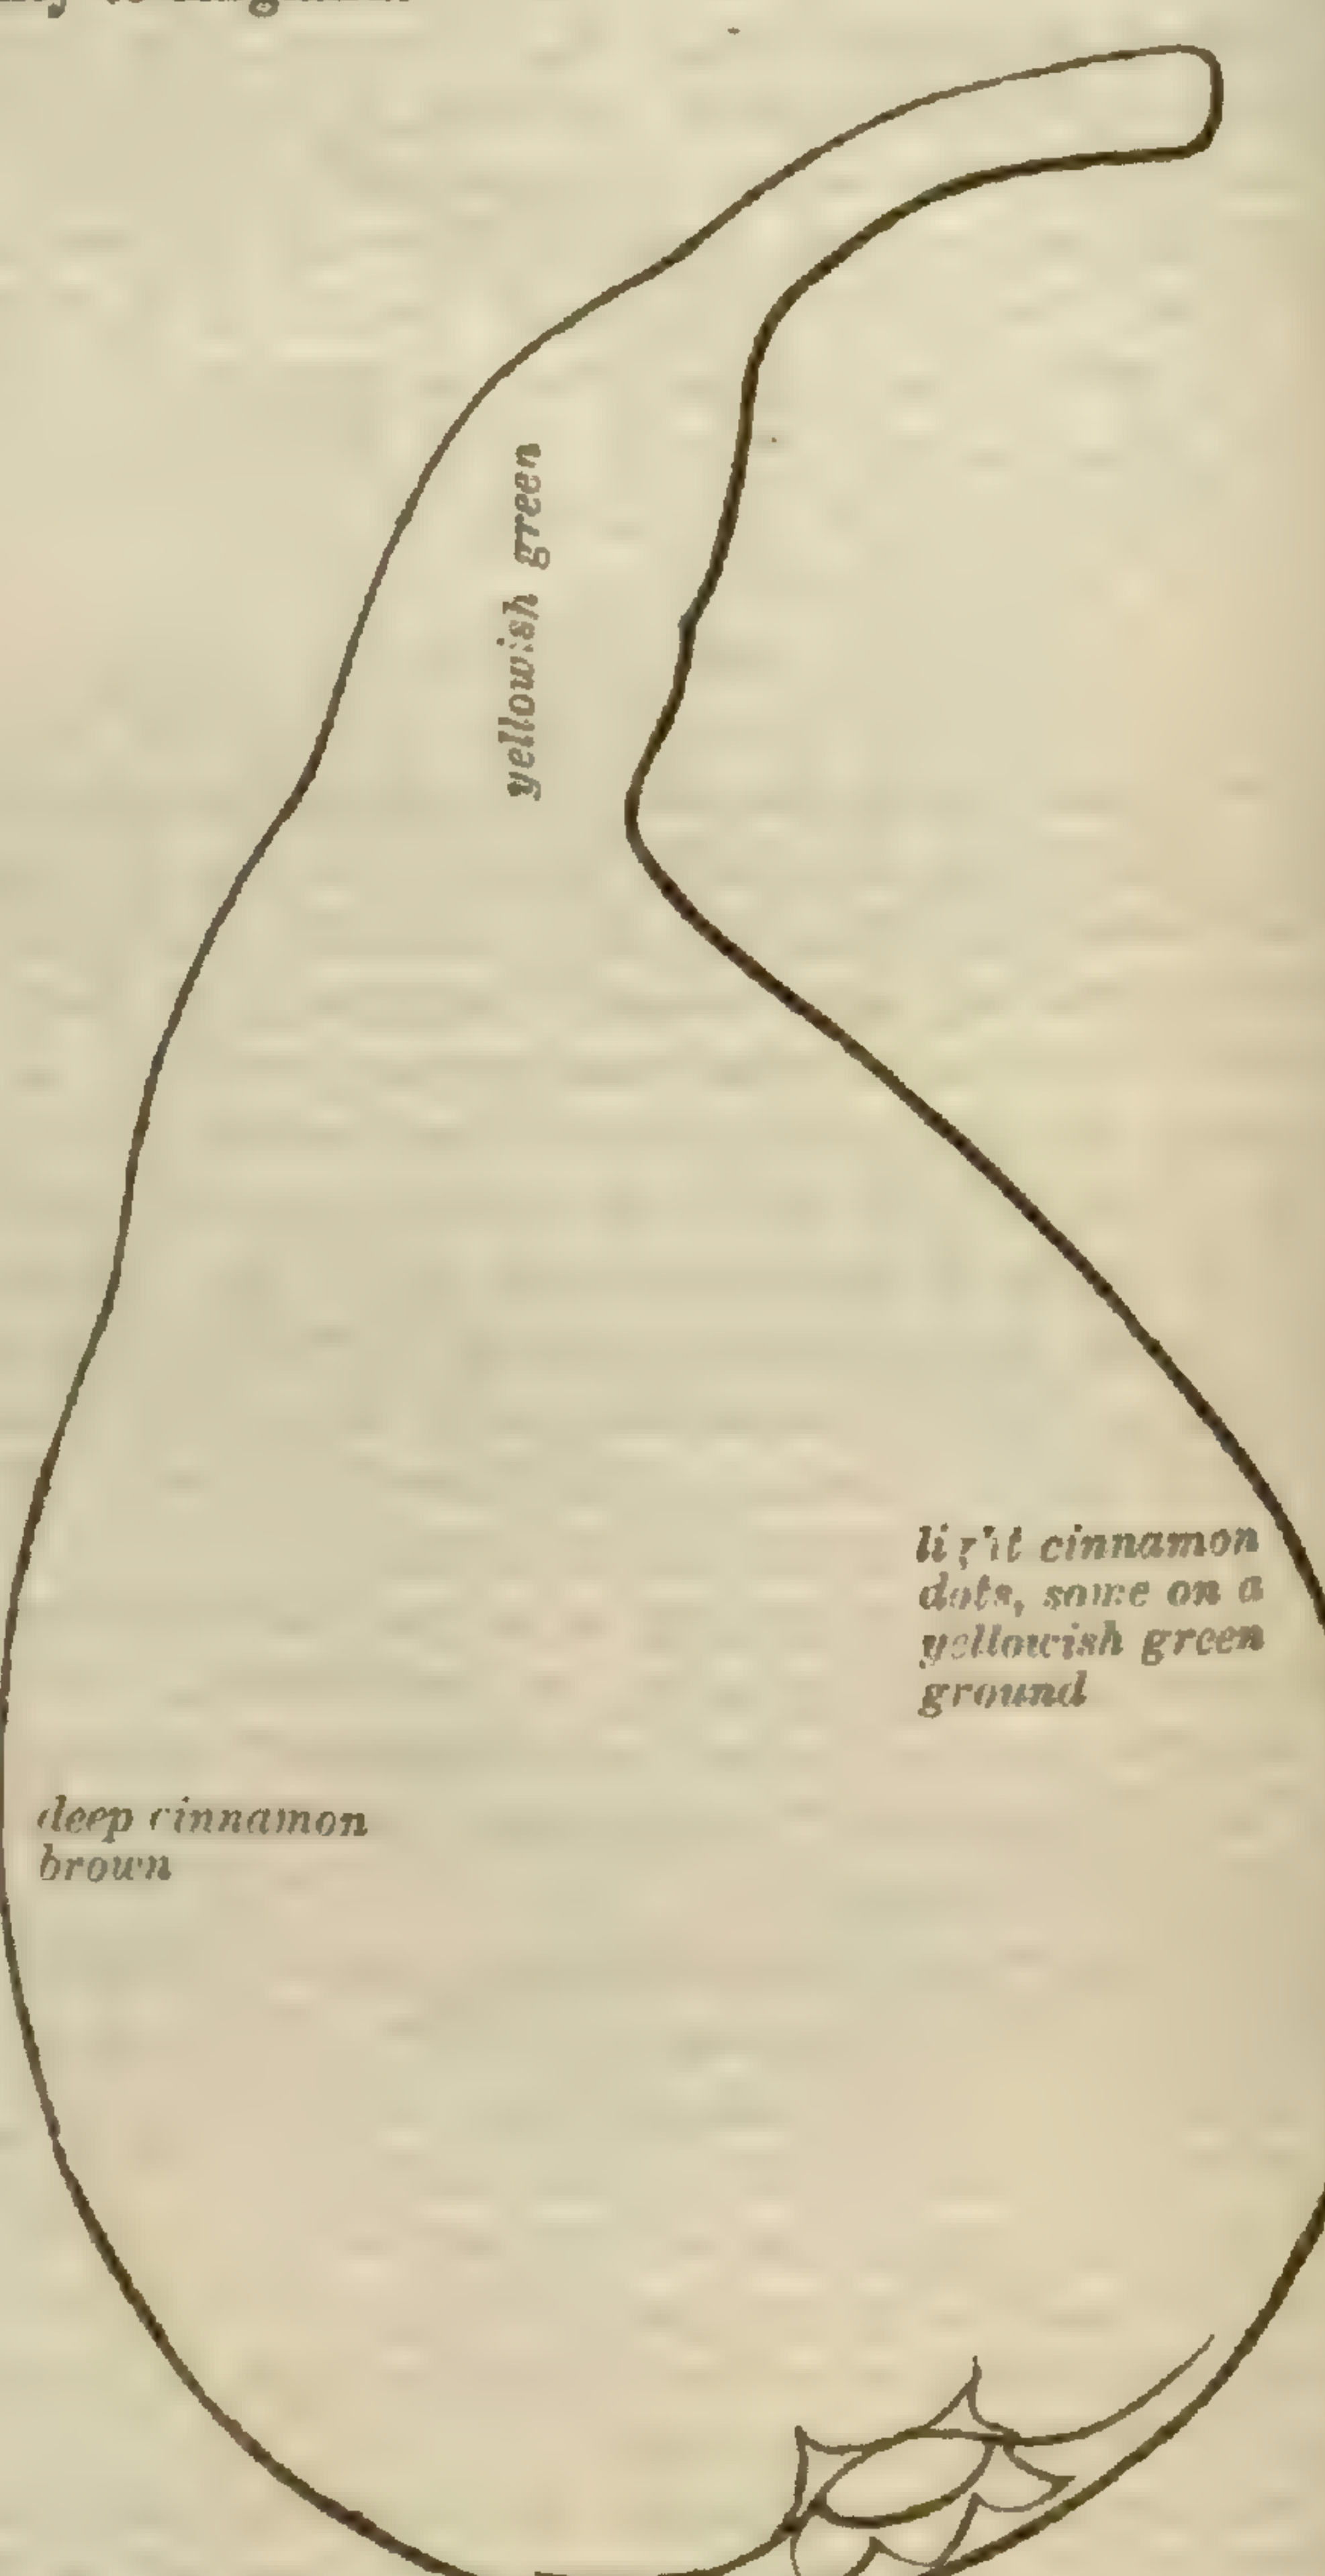
ON THE MANAGEMENT OF PLUM-TREES.

A CORRESPONDENT, "F. G. Z.," writes as follows:—I have got a Magnum-bonum Plum-tree with spurs projecting a considerable distance from the stem, and naked at the bottom. Can these be profitably shortened? and if not, must they be cut close to the stem? In pruning Plums, what mode should be pursued to keep the shoots short and fruitful? We suspect the cause of "F. G. Z.'s" Plum-tree being naked at the bottom is owing to the branches not having been properly regulated at first, so as to check the flow of sap, and prevent its being expended in the production of useless shoots, either in the middle or towards the upper part of the tree. It is, perhaps, too late now to remedy this defect, or to thin-out and shorten the projecting spurs with advantage. The latter, however, may sometimes be done successfully wherever a sound, healthy bud can be discovered near the base of the spur; but when this is not the case, the result of shortening to within an inch or two of the stem will be the same as "F. G. Z." has already experienced—the whole of the spur will die without throwing out new shoots. Under the circumstances above stated, we think the better plan for "F. G. Z." to adopt would be, to cut down his Plum-tree altogether in the beginning of February, and let it spring afresh.

With regard to the mode of pruning Plums, the same directions will nearly apply to them when trained against a wall, as those already given for the management of Espalier Apples and Pears in the *Gardeners' Chronicle*, 1841, page 797. The principal thing to attend to in either case, whether the trees are trained in the fan method, or with horizontal branches from an erect central stem, is the selection of the shoots which are best situated for retaining as bearers, and afterwards laying them in at proper distances so as to balance the tree as equally as possible without allowing those on one side to obtain an undue advantage over those on the other. This is to be done very easily in the growing season, by elevating the weaker branches a little, and depressing in the same proportion such as are strong. It is also necessary to go over the trees at least twice in the course of the summer, for the purpose of cutting out all superfluous wood, and pinching off the lateral shoots, which are to form the future fruit-spurs, to within three or four eyes of their base. This may be done in June, and again in the latter end of July, unless in the case of strong-growing trees, when it is better to defer the operation to a little later in the season. Any shoots which the spurs may throw out from time to time must also be shortened, or pruned off altogether, if they are vigorous and likely to injure the fruitfulness of the spur. If "F. G. Z." will pursue this mode of treatment, we think he will find it successful in maintaining an abundance of fruit-spurs, and in keeping them within proper limits. By pinching the shoots in summer, it is obvious little pruning will be required in winter, and the danger of the trees becoming diseased from using the knife too freely will thereby be avoided.—*M. E. H.*

MOLLET'S GUERNSEY BEURRE´ PEAR.

THIS is a new Pear of great excellence, raised by Hilary Ol. Carré, Esq., Valnord, Guernsey. Fruit middle-sized, obovate, or somewhat pyramidal, with a remarkably fleshy extension of about half an inch at the insertion of the footstalk, in addition to which the footstalk is about an inch in length, of medium thickness, and yellow. The eye is in a shallow depression, quite open, the segments of the calyx closely reclining on the fruit. The surface of the fruit is somewhat uneven; the ground-colour yellow, but this is in a great measure obscured by ferruginous russet, sometimes equally scattered, but often disposed in broad longitudinal stripes. Flesh inclining to yellow, very melting and buttery, with a very rich Chaumontel flavour. December and January may be stated as its season. Nothing is at present known of its suitability to England.



NOTES UPON SOME OF THE NEW PELARGONIUMS.

THESE elegant flowers are become objects of so much interest, and are now so generally cultivated, that we are glad to publish the following memoranda upon some of the leading varieties, in the hope that they will prove acceptable to our readers, especially to those who, residing at a distance from town, have no opportunity of personally inspecting the "new candidates for public favour," and are therefore in doubt and difficulty as to which, out of the numerous lists that are published, they shall select in order to improve their collections. The remarks were all made when the plants were in bloom; no doubt many other new varieties which have not come under our notice may possess fine qualities, but we have strictly confined our remarks to those we have seen.

1.—The most decided novelty among the new flowers is the Queen of the Fairies; this beautiful variety was raised by the Rev. R. Garth, and is remarkable for having a continuous well-defined rim of pure white surrounding the upper petals; in this peculiarity it is superior to any Pelargonium at present known; the spot is a deep rich bright maroon, with the under petals pure white; in its habit, free manner of blooming, and general character, it bears a strong resemblance to Garth's Victory; the foliage is of a deep green, which contrasting with the gaiety of the flowers, gives it a very lively and animated appearance.

2.—As a most profuse bloomer the Prince of Waterloo is conspicuous; the flowers, which are full-sized, are produced in large and numerous trusses. The upper petals are of a deep rich orange crimson, with fine dark spots; the under petals are of a deep rose colour; it bears some resemblance to the Jewess—the colour is brighter, and it is a superior variety; the general form of the flower is fine, but the petals have a slight inclination to curl. The habit is good, and it is a free grower.

3.—Lord Mayor. The habit of this flower is peculiar from being so remarkably compact; the trusses rising but little above the foliage, are seen to great advantage, from the green leaves forming a background to the flowers; the trusses are numerous and compact; the under petals are rose-coloured, with a slight marking in each; the upper petals have a large spot, surrounded by an edge the same colour as the under petals; from the compact habit of its growth, this flower requires no tying and but little training.

4.—Lady Mayoress. The ground colour is a clear rose, in all the petals alike, with a well-defined spot; this is a beautiful variety, but it has an objectionable quality as a show-flower, that of not having more than two flowers expanded at the same time upon a truss; this is in some degree compensated for by the trusses being very numerous, but they look small, and the bloom appears to be too scattered; the trusses rise well above the foliage, and the habit is compact, in the style of Lord Mayor.

5.—The ground colour of the petals of Britannia is a very delicate pink, getting gradually lighter as it approaches the centre, with a rich dark well-defined spot in the upper petals, from which bright crimson veins radiate; the form of the flower is good, and it is a very free bloomer.

6.—Jubilee has under petals of a bright pink; the upper petals are very rich, having a large dark spot softening into crimson, leaving but a narrow margin; the trusses are remarkably fine and large; it is a distinct and desirable variety, and will prove an excellent show-flower.

7, 8, 9.—The three following varieties have each a delicate French white ground. Annette is a well-formed flower with a good dark blotch in the upper petals; it is a very free bloomer, and one of the best of its class. Leila is also a good form, and is remarkable for having the petals perfectly even on the edge; the spot is rather smaller and lighter than Annette. The spot in the Witch is large, having a lighter-veined edge surrounding it; this is a fine flower, of good habit, and forms a very desirable variety.

10.—Coronation has been a favourite at the shows during the last season; it is a free bloomer, and the large trusses of flowers have a very imposing appearance; the lower petals are delicately veined, and the upper ones are furnished with a good dark spot; we consider the flower rather coarse, and prefer Corona, which we consider an improvement upon it; the lower petals are rose, with a dash of crimson surrounding the spot at the upper petals; this is also a very free bloomer, and the flower is of a more delicate texture than Coronation.

11.—Wonder throws up a fine head of bloom; the upper petals of light crimson, have a fine dark spot gradually softening to the edge; the under petals are of a warm rosy tint; in form and colour it is very fine, and will doubtless prove an excellent show-flower.

(To be continued.)

THE AMATEURS' GARDEN.—No. III.

If the greenhouse contains shrubby plants, such as Acacias and Heaths, the night temperature with artificial heat should never be raised higher than 40°, nor allowed to sink lower than 32°. Any degree above the freezing point would be high enough for such plants; but it is better when the fire is made up for the night to leave the temperature a few degrees higher than is actually necessary. If the house is filled with such plants as Pelargoniums, the thermometer may range from 40° to 45°. Pits or frames which are not heated must be carefully covered up at night; dry hay, straw, or fern leaves are excellent materials for packing round the sides of the frames and over the mats on the top. Continue to remove all damping leaves from the plants, and give air freely when the weather is mild, or when the sun shines. When the greenhouse becomes damp, a good fire should be lighted during the day, and all the ventilators opened; this dries off the moisture, and sends it out of the house at once; but if a high temperature is kept up without ventilation, the damp merely condenses upon the glass, and falls down again when the house gets cool.

Neatness is always a feature in the garden of the amateur, and therefore I consider it quite unnecessary to advert to such subjects as cutting hedges, sweeping lawns, and rolling and weeding walks; these are their own remembrancers, and every one knows how to do them.

When the weather is favourable for out-door operations, shrubberies may be dug, if not already done; new walks cut out, and any alterations made which may seem desirable; frosty days should be taken advantage of for wheeling and carting the gravel or manure which may be required. In making alterations in the shrubbery any time from autumn to spring, evergreens of a large size may be lifted and transplanted with success, thus giving at once to the altered parts the appearance of having been planted for many years. It is done successfully in the following manner:—A trench is opened all round the shrub, about two feet from the stem, or as far as the greater part of the roots extend, and the ball of earth is afterwards reduced with a fork to a more convenient size, taking care to preserve the fibrous roots. The spade is then worked round the bottom of the ball, and as much of the soil cut away as is possible without throwing it over, and afterwards the whole is bound firmly round with mats and ropes. A short board is then put down under the ball on each side, and some pieces of old mats packed in between the boards and the ball. The only thing to be done now is to draw two ropes under the short boards, fixing them to a lever on each side, and the whole is ready for lifting. If the ball has been much reduced, two men may lift it and walk away with it to its destination in the same manner as they carry a hand-barrow, but of course the number of men required depends upon its size. It is now replanted with the same care; the ropes and mats are drawn gently out, and the sides round the ball filled in with loose soil. A large basin is then made round the shrub to hold three or four tubs of water, which carries the loose soil down round the roots, and makes the plant much firmer than if the soil had been trod upon. When the soil gets firm, which is not the case until the day after the watering, the basin is then levelled down, and the operation is completed.—*R. F.*

HOME CORRESPONDENCE.

Mr. Caie's Substitutes for Turf and Box Edgings.—Mr. Caie has not given to what he recommends the consideration which the subject deserves. Surely he has shown little taste in his selection of plants for edgings for walks. If he thinks that Cerastiums, Myosotises, Corydalises, Cheiranthuses, or Fumarias will make good edgings for walks, I think that few will be found to agree with him. Why does he not name the beautiful and enlivening variety of Armerias, Bellises, Primulas, and Gentians as a substitute for turf; and for the Box edgings, those plants which would have, in some situations, a most tasteful effect, such as the varieties of the Erica cinerea, carnea, and even vulgaris; these would stand dressing, and when kept dwarf would make good edgings for walks: so would the varieties of dwarf Thyme. Plants to be used for edgings for walks should be dwarf, close growers, and such as retain their leaves.—*Clareinch.*

The Foxglove.—One evening in November I found in an open part of a wood a Digitalis purpurea in full bloom. Although it was a November night, I could not help staying to admire such a beautiful flower at such a season. Around it were many of the dead stalks of those that had bloomed in June and July, and although there had been several nights of frost and snow, yet there it was growing, at an altitude of 400 feet above the level of the Forth, with its green capsules, and between 20 and 30 expanded blooms, as beautiful as those at Midsummer; with as many unexpanded ones as would keep it in flower until Christmas, if the weather kept moderate. At this season of the year every flower is welcome, when the green of the meadow is exchanged for brown, and the soft gales of summer for the sleety blasts of winter. From the hint thus given by nature, surely the art of the gardener could prolong the smiles of Flora, so that the lover of flowers may enjoy a treat even in a winter's day.—*Peter Mackenzie.*

Ancient Castle Gardens at Stirling.—When Stirling, like Windsor at the present day, was the seat of royalty, it appears from history and tradition that the kings of Scotland at that period were not without their royal gardens. Their pleasure-ground appears to have been on the south side of the castle, and there is a piece of ground on the north-east side of the town still pointed out as forming part of the orchard and kitchen-garden that belonged to the palace. About three acres still remain as an orchard, and are occupied by Mr. Allan, nursery and seedsman, Stirling. A few months ago there was growing in it a Pear-tree said to have been planted by King James the First of England; it was named the King's Pear or Carnock Pear. For a number of years past it was rapidly decaying, one branch falling off after another; the trunk was also mouldering away: but it was still respected, and it was surrounded with props to keep it from falling, but it could not be preserved; and a short time ago the tree that was planted by that "most high and mighty prince" lay prostrate on the ground. Mr. Allan preserved what was sound of it, in order to give it away to those persons who have a desire to preserve such relics.—*Peter Mackenzie, West Plean.*

Effect of Soil on the quality of Timber.—With whatever *éclat* root-pruning has recently been brought before the public, Mr. Thompson in his quotation from Switzer has quite settled the question that it is no "new thing in the earth," had it not been settled so completely by others. My first instructor in these matters (alas! 't is 40 years ago!) was a root-pruner; although there was in those days no *Gardeners' Chronicle* nor Horticultural Society's Transactions, in which to chronicle his practice or its results. Mr. Billington has, in p. 796, given some sensible observations connected with the subject; I shall, however, at present only notice what Mr. Billington says in p. 830 about the qualities of timber, as affected by soil, climate, altitude, &c. When I offered my views about forest-tree pruning, in p. 213, I hazarded an opinion "that time was essential to quality." On giving the subject more consideration, I think that opinion ought to be in some measure qualified. I instanced the Scotch Fir, as of little value when grown rapidly; so I think still in regard to that and to Firs generally: but such an opinion will not hold with regard to our more valuable deciduous trees, such as Oak, Chestnut, and Beech. Mr. Billington's article is confirmatory of what I expressed respecting the qualities of Scotch Fir I had seen cut in Fifeshire grown upon poor gravelly soil; but were the rapid-growing Scotch Firs of some of our modern plantations in fertile soils to stand for a thousand years, I question if age would much, if at all, improve their quality, and I should be glad to have an opinion from Mr. Billington on the subject. Whatever I advanced in p. 181 was connected with the propriety or impropriety, advantage or disadvantage, of forest-pruning; my reasons for disapproving of which, as a general practice, I have stated; and as this is the time for such operations, and none of your correspondents have mooted the subject, I begin to hope it has fallen into desuetude. You stated in a former Number, that Mr. Billington's writings had never fallen in your way; nor have they in mine: but some vague notion recurring to mind that I had seen something of his reviewed, I presume he was, if not still, a forest-pruner; and further, that he was an advocate for what he termed "fore-shortening," instead of cutting close, or snagging. Now if this conjecture is right, I hope Mr. Billington will not be angry if I cannot subscribe to his views, although preferable in practice to either close-cutting or snagging. My objections to these may be stated in few words: that, with some exceptions, they all tend to frustrate the object they profess to promote; and I have formed such an opinion of Mr. Billington's experience and sense as to anticipate his concurrence, and the use of his pen and influence to put an end to so injurious a practice—*Quercus.*

Celery.—"R. C." agrees with "D. R.," at p. 781, (1841,) that Celery should be planted at such a distance as to allow the earth to be thrown up roughly, and that Seymour's Superb White Celery is worthy of being recommended. In January last "R. C." had a trench dug two feet wide and one foot deep, and on the ridges he grew his early Peas. The trench being prepared, the Celery was planted out in the first week in June, and the Peas shade the plants from the sun. "R. C." believes that the reasons why early Celery does not always succeed is the check it receives when transplanted, and in being fully exposed to the sun, and also in not having sufficient moisture at the root. At the first earthing-up "R. C." ties the leaves of the Celery together with matting, and places fine soil firmly round the plant, taking care not to let any get between the leaves. He earths up frequently, for he finds that if the heart is too deeply buried, the plant is sure to rot. On September the 2d "R. C." exhibited at the Hull Botanic Gardens four heads of Seymour's Superb White Celery, weighing 18 lb. 8 oz., the heaviest weighing 5 lb. 10 oz.; and on Sept. 22d he dug up two heads that weighed 18 lbs. 4 oz.

Thoughts on Botany.—In my opinion Botany should be studied by all Gardeners; but I am sorry to say that I have found that five out of six know no more of the classification of flowers than they do of steering a ship. I believe, however, it is only requisite to put young men in the right way, and give them some leisure time, and they will feel as much pleasure in ascending a lofty mountain to seek for Saxifragra oppositifólia, or to the beautiful lakes in Westmoreland for Lobélia Dortmanni, as they do in visiting places of amusement. I have walked with practical gardeners through fields filled with Orchis mório (Meadow Orchis), and have seen them trod down unheeded, while I have felt the greatest anxiety for their safety. I have watched with pleasure the gradual unfolding, day after day, of the stamens of Parnássia palustris, and I have gone over a patch of ground near Liverpool where the pretty Callistégia soldanella, one of the rarest British plants, has been growing, and seen it passed by unnoticed. Many gardeners will, no doubt, maintain that Botany does not constitute any part of their profession; but even admitting that a man may be a good gardener without any knowledge of Botany, yet there is something so pleasing in it, independent of its utility in determining the families of plants, that I recommend it to all gardeners, more especially the young, who will themselves become masters, and some day will take as lively an interest in the subject as I do.—*R. Towers, Gr. to D. Waterhouse, Esq., Aigburth, Liverpool.*—[To know what he ought to know, and to know no more than he can make shift with, is one of the marks that distinguish a good gardener from a bad one.]

The Season for sowing Cabbage.—In p. 784 (1841), you have given Mr. Paxton's opinion of "Price's Modern Gardening," a book which the reviewer has shown to be unworthy of the title it assumes. However deserving it may be of the account which Mr. Paxton has given of it, it nevertheless has some claims to originality; for who was ever told before that ten or eleven sowings of Cabbage were necessary to ensure a succession? Surely there is something modern in this. Though the Cabbage is a vegetable that is almost universally esteemed, yet I cannot think there are many whose appetite for Cabbage will lead them to follow Mr. Price's directions respecting that article, as stated in his book, which is another added to the many calendars that have been published since the days of Abercrombie; all of which are at best but imperfect guides, and seldom followed by any one. It would be well if every gardener were to make a calendar for himself, for the system and rules adhered to in one place cannot be expected to suit every other, especially in a country like this, where there is so much difference in the climate. I know a town whose markets are well stocked with Cabbage, Green Peas, and Strawberries full a fortnight before I can produce any one of these things, although the distance is no more than twelve miles. We gardeners living near the Mendip Hills are obliged to sow our Cabbage about the 22nd of July for our spring and early summer crop; and if we deferred it till August, which Mr. Paxton says is the time that every one sows their spring Cabbage, it would be nearly Midsummer before we had any fit for use.—*W. S.*

Cepophilus.—I have excited, and with plenty of reason, no small astonishment among your correspondents, at the latitude and longitude given of the place from which I wrote. To yourself more especially I owe some apology for such an error. It arose from my referring to a companion in the same room in which I was writing to look at a map for me, and tell me the latitude and longitude. The map being merely a county one, presented, I suppose, more minutes than degrees, for the former were all that were given to me; and stupidly enough did I write it down without any reflection. Your overlooking the absurdity yourself, lessens, in some degree, my vexation at doing the same. On reading the article in print, the blunder at once struck me; but as I had sufficiently indicated my "whereabout" by saying I was within a few miles of the north-east coast, I did not think the error sufficient to invalidate the article itself, and therefore of importance enough to require an immediate explanation. Having made the *amende honorable*, I have only to inform "A. B., of Woodbridge," that the locality, as it should have been given, is lat. 52° N., long. 1°; comprising, as he will see, the whole of the N. E. coast of Norfolk and Suffolk. May I take advantage of this opportunity of inquiring whether the Pawlónia imperialis is hardy enough to stand our winters, and where it can be purchased? I have applied to several nurserymen in vain.—*Cepophilus.*—[P. imperialis is believed to be quite hardy; but Mr. Paxton doubts it, in p. 718 (1841). It is at present extremely rare and dear. We do not know who has it for sale.]

Shakspere's Foresting.—Can any reader of the *Gardeners' Chronicle* say precisely what Shakspere had in his mind when he wrote the following lines, which have been before quoted in this Paper:—

> As knots, by the conflux of meeting sap,
> Infect the sound Pine and divert his grain,
> Tortive and errant from the course of growth.
>
> *Troilus and Cressida.*

As there can be no doubt that these words were intended to explain some popular notion, or some phenomenon which had come under the poet's own observation, it must be interesting to find their true meaning, and particularly so just now, when we are promised two new editions of the plays. The *Gardeners' Chronicle* is the best place to discuss these questions, not only because the poet has been there shown to be a gardener, but because the *Chronicle* takes precedence of Mr. Collier in publishing "Reasons for a New Edition of Shakspere."—*A.*

Melons from Cuttings.—The Masulipatam Melon is an excellent small green-fleshed variety, but, like others of its class, I have found it a shy bearer unless propagated from cuttings. Plants raised in this manner produce fruit abundantly, require little room, and not much attention. From experience I believe that all the shy-bearing Melons would be more productive, and fruit in less time, if propagated from cuttings instead of seed.—*W. Kerr.*

To Raise Early Potatoes.—Last year I succeeded in raising an early crop of Potatoes, in open ground, in the following manner:—I first dug a trench six inches deep by two feet wide, and into this put a layer four inches thick of dung from a Melon bed, composed of half leaves and half horse-dung. On this I planted the Potatoes, covering them over with four inches of soil; I bent sticks over the bed, and in frosty weather I covered them with mats, and the result was that I had a tolerable dish of young Potatoes by the 14th of May. I planted them on the 12th of March; the kind was the American Early.—*Q. F. U.*

Vitality of Seeds.—This is the heading of the first of your Miscellaneous articles of last week; and to the instance of tenacity of life there adduced, I offer you the following additional ones:—No. 1. Several years ago, in the progress of some improvements about my premises, we had occasion to remove an old privy, with its cesspool. After the removal of the soil from the cistern of the latter, a ladling or dipping-hole was discovered at one corner, completely filled with Gooseberry, Currant, and Grape seeds, and a few Cherry-stones; in all, about half-a-bushel. It was evident that these seeds had been the contributions of many summers, and that after resisting the decomposing powers of human digestion, and then of the putrid mass in which they had lain so long, they had made their way, by their superior gravity, into the hole in question, to the exclusion of all the more soluble materials. The cesspool and its superstructure were known to be at least 50 years old; and although it was occasionally cleared out, it had never been thought worth while to make the clearance so complete as to empty the hole in which this curious "depôt" had been made. The brickwork being grubbed up, and the soil and seed thrown into a compost, little more was thought of the matter till the next year, when, and for three or four years after, seedling Gooseberries, Cherries, and Currants were found springing in great numbers all about my garden, in various parts of which the manure of this compost had been distributed.—No. 2. In a particular locality in my neighbourhood (a sandy common and rabbit-warren) whenever the turf is disturbed, and particularly when embankments are thrown up, the Datura Stramonium springs up on the loose earth abundantly. And that the seed had been living in the ground many years, perhaps ages, and had not been recently imported, is evident from the fact of its springing immediately the earth is so moved. By-the-bye, this is one of the plants of our "Flora" which Sir J. E. Smith doubts of being indigenous. As the waste I speak of is of considerable extent, away from any gardens likely to grow the plant as an ornamental one, and the locality over which it prevails at least 10 or 20 acres, and the seed, as I have said above, always present in the soil, I have no doubt of its being native to it.—No. 3. The Verbascum Thapsus and V. nigrum grow in all our hedges; but there are only two localities in which I have been able to find another species — the pulverulentum. At the distance of two miles from the nearest of these, and without any appearance of the plant before or since in any part of the vicinity, on trench-digging some waste of a congenial soil, to make a plantation of Firs, several fine plants of the last-named species made their appearance the first year after the ground was dug. The turf here had not, apparently, ever been moved before; and unless, in remote times, for turf fuel, certainly had never been disturbed. Birds may have imported the seed after the soil was turned up; but the plant is not always to be found in the places I have indicated, and it is everywhere a rare one.—These cases might be easily multiplied, as every one knows; and the knowledge of the wonderful power of living matter to resist the ordinary agents of decomposition is not without its uses in a practical view. But they have still more interest when considered in illustration of that point in vegetable physiology which relates to the change of passive into active vitality. We are not warranted in supposing that any animal ovum can exist for years, much less centuries, unchanged, under the most favourable circumstances we can have any conception of, resistive of external agencies. But, setting aside the doubtful stories of the vegetation of mummy-seeds, of Herculanian and Pompeian Wheat, and the like; such instances as the above, and that of the boiled Elder-seed of your extract from the "Magazine of Natural History," would incline one to believe that in a lower order of created beings certain molecular attractions may subsist for an indefinite period conservative of the predisposition to vegetative action. This can hardly be called life; it must be merely chemical combination, with aptitude for life.—*Instinct of Plants* is the title of your next paragraph,—an extract from the *Stirling Advertiser*. We find here given a very good description of a phenomenon by no means uncommon, though not always exhibited in such prominent characters as in the Comrie Oak, in situations where cliffs and hollow ways abound; where trees standing on the verge of precipitous and rocky banks seem to have sent down foraging parties, or perhaps one single large root-trunk, into the softer and moister parts below,—a *talus*, perhaps, formed by the crumbling down of the parts from above. The fact is undoubted, and the appearances there exhibited have much of the air of an instinctive intelligence. But such an expression as "instinct of plants" must not go forth to your readers without qualification, especially as coupled with the natural operation above mentioned, which is to be explained on the simplest principles of vegetable growth. You can best tell how much affinity exists between the instinct of animals and the perceptivity of plants. Surely instinct implies volition, or is at least intimately mixed up with that quality, and some degree of intellectuality—which must be denied to plants. Sensibility to certain stimuli when presented to the parts capable of excitement, and their enlargement and extension in the direction in which these stimuli exert their influence, are no proof of intelligence, even of the lowest kind. I have studied many of these instances of subsidiary growth, and I observe that there are two natural operations at work in their formation. One is the luxuriant growth of the subsidising root, and the other the destruction, by meteoric action and other abrading causes, of the surrounding materials. A plant finds scanty rooting on the top of a wall, or at the edge of a precipice; one of its fibrils chances to creep into a depression or a crevice into which water percolates and rotten leaves discharge their soakage. This gives it growth and vigour, and if the crevice extends to the softer and moister parts below the root, insinuates itself in the course of the drainage, or rather obeys the impulse thus given just as it would in the perfect mould. By-and-bye, by its expansive power, and the natural decay of the rock around or behind it, it begins to protrude, and, as it grows, gradually acquires higher and higher relief till it stands alone and independent of the fissure or furrow that fostered it. This also is the history of all the bare roots that are seen creeping and twining in such grotesque shapes and picturesque arrangements about disintegrating rocks, and especially where veins and crevices of softer materials are interspersed. And very much on the same principle we account for the appearance of our Ashes and Beeches that

> Wreath their old fantastic roots so high.

—*P. P.*

Nitrate of Soda.—In the essay on Nitrate of Soda, in p. 7, the word "cortex" should have been "latex." If there is no proof that the nitrate does suffer decomposition after being absorbed, how does it happen that in Wheat grown on soil dressed with the nitrate there is found a greater proportion of gluten than in soil not so dressed? Is it not because the greater quantity of nitrogen furnished by the nitric acid, supplies the nitrogen wanted for the additional quantity of gluten? What more convincing proof have we of water being decomposed in the plant, than finding that hydrogen and oxygen are fixed constituents of plants? Neither sulphuric acid nor soda is the proper food of plants, and cannot so immediately benefit plants as nitrates which contain nitrogen—an essential requisite in food. They may ultimately be of benefit in the soil, when the sulphate of soda is decomposed, by becoming solvents of other substances that are food. In any experiments, however, that we have seen, no immediate perceptible benefit has been found. At Roselle, near Ayr, the seat of A. Hamilton, Esq., of Carcluie, where so many agricultural experiments are made, the sulphate of soda was found last season to produce no effect in several different trials on Potatoes, &c., when the nitrates on the rows next them, and in trials the year before, had a perceptible effect. Common salt also was found to have no effect the year before.—*R. Lymburn.*—[The exact mode in which the nitrates act as manures is unknown, and all the explanations yet proposed are imperfect, because it is not certain that in all cases the nitrogen which they contain is the most important element. Under some circumstances, other salts, not containing nitrogen, produce as good, or even better effects than the nitrates of potash or soda. Besides, it has yet to be proved that plants which have been manured with nitrate do really decompose them, and that their nitrogen is employed in the formation of gluten. Some plants absorb nitrates, and grow very well, though the nitrates are not decomposed, but may be found in the plant unaltered. If the nitrates assist in retaining plants in a healthy state, and contribute to the due performance of their functions, they may increase the formation of gluten, without directly contributing nitrogen themselves.]

Root-pruning of Vines.—In p. 780, (1841,) mention was made of shortening the roots of plants; and it has been adopted here with Vines, with perfect success. The Vines were in the 10th year of their age, growing in a border outside a range of Vineries, and were in a most pitiable condition. To restore them to health and vigour, without removal or the destruction of the crop in the subsequent year, was the real design of the following operations. To effect this purpose, it was supposed necessary to remove the whole of the soil surrounding the roots exterior to a bank of four feet close to their stems, which was left entire. The whole soil beyond that distance was removed and new added, good drainage being made at the same time. The roots extending beyond the distance mentioned were cut off smooth, leaving the Vine with merely short stumps of roots outward; but those emitted in a lateral direction, which, so far as could be ascertained, were more numerous than usual were not disturbed. It was found in a majority of the Vines, that each one had put out a leading root immediately following the foundation of the wall of the house, and some of them one on each side. These roots contributed, no doubt, to afford the proper aliment until new ones were emitted into the new soil provided for them in front. It is worthy of remark, that the business occupied the spare intervals included between autumn and spring, portions being begun and ended in one interval of time; those which were done in the autumn were much better ripened and more vigorous than those done at a later period. Some of the Vines were cut down within the house, and some were permitted to remain as usual with single canes spurred, and others with the young wood they have made in the preceding year. Those cut down developed beautiful canes, remarkable for closeness of texture and a multiplicity of buds, and for being well ripened; those not cut down bore some excellent Grapes, and made some good wood for the ensuing year, which they had never done before. All of them exhibited symptoms of weakness by flagging in the spring, when the sun shone strongly upon the foliage. Those Vines in the portions of the border not done until spring, were obliged to be cut down in consequence of the lateness of the operation, and the severity of the process, rendering a new development of roots necessary subsequently to the development of the foliage; the others not having a supply of that kind, protruded new roots into the new soil immediately the sap commenced flowing; the others did not, and were not so good. I regard this experiment as interesting to prove the soundness of the practice of root-pruning the Vine, and the season when it is most proper to do so; besides the evidence offered to prove the possibility of recovering Vines to health and fertility without removal, or the necessity of adopting more expensive or extensive methods to do it. I once saw a case tried with Vines much older than these, but it was in a less extensive way, which, in a certain degree, succeeded; but I am not satisfied how far similar operations could be effected with Vines much older than these, or whether it could be done at all with old Vines. Perhaps some of your correspondents may be able to offer some satisfactory addition to these statements. The time will come when the roots of trees and Vines will be pruned, if not so regularly, quite as systematically as the branches; I have frequently done so to vigorous-growing Pears, Peaches, and Plums, by tracing out the leading roots that fed luxuriant branches; but I have not been able to perfect my views in regard to trees of old standing, nor have I seen any remarks yet to elucidate that part of the process.—*John Duncan, Henbury Gardens.*

Salvia fulgens.—Salvia fulgens may be propagated by cuttings in the early part of June, and after being potted a short time, should be shifted into pots five or six inches across, filled with a soil composed of peat-loam and leaf-mould. They should be grown out of doors until the latter part of September, and then removed into the greenhouse, where they form a striking contrast with the Chrysanthemums in flower. From its tendency to bloom late when propagated in this way, Salvia fulgens is a great acquisition to the greenhouse at this season.—*G. G. Watson.*

Polyanthus.—I beg to add my approval of the treatise on the Polyanthus in p. 20: nothing is more easily grown than the Polyanthus, and it succeeds where nothing else will, on a northern border. When a Polyanthus ceases to throw out fine leaves and rises above the surface, it becomes pipy, and each shoot must be broken off and replanted, I recommend all young growers to watch that particular period of growth, as piping is a disease which causes the plant to degenerate, and in an early stage is easily checked; but if allowed to go on too long, the young offsets seldom recover, and they become knobby. In that case I recommend their being broken off as near to the leaves as possible, and planted in a bed with a little lime-rubbish mixed with the mould, which is liked by all the Polyanthus tribe.—*G. R. G. R.*

Salvia patens.—Salvia patens can hardly be too extensively cultivated for turning out into the flower-garden in the summer, and is by no means unworthy of being grown in pots. The following mode of treating it has been successfully adopted:—A plant was raised from a cutting in May 1840, it bloomed in September in the same year, and in nearly a dried state, was removed from the greenhouse where it had stood during the winter into a vinery, where forcing had just commenced in the early part of March 1841. The soil in the pot was stirred up at the same time and watered in such a manner as to thoroughly soak it, and in a short time a strong shoot was perceptible. As soon as this shoot was four or five inches long, the plant was taken out of the pot, the soil carefully removed from its tubers, the small fibres being injured as little as possible; it was then placed in a pot eleven inches in width, with at least two inches of broken potsherds at the bottom, covered with a thin layer of moss to prevent the soil from settling, and rendering the drainage imperfect. The soil was for the most part mixed with a little turfy loam and sand, and over the drainage was laid an inch of rotten dung two years old. After potting, the plant was replaced in the Vinery, and when about a foot long a flower-stem appeared which was carefully pinched out. The plant soon made strong lateral shoots, which were also stopped as soon as their flower-stems became visible. It was removed to the greenhouse in the first week in May; at that time the second laterals were growing vigorously, and were stopped in the same manner as the first. Water was always regularly applied, but no more was given than the plant could absorb from the soil. On the 27th of July the plant had 20 flower-stems, some of which were in blossom, forming one beautiful mass of bright blue. The dimensions of the plant were:—Height from the surface of the pot, five feet three inches; breadth of the head as it hung in one direction, four feet nine inches—on the opposite, three feet four inches.—*G. G. Watson, Stockton-on-Tees.*

Sálvia Patens from Seed.—When so much is said about Sálvia patens, perhaps it would not be uninteresting to know that it ripens seeds perfectly in the open air. In the autumn of 1840, I had a plant in an exposed situation near the sea, from which I saved some seed. I sowed it in pots at the time, but the plants not appearing before the frost set in, the pots were placed in a cool frame, protected from frost, where they remained during the winter. In the spring the pots were placed in the greenhouse, where the seedlings came up; and in the early part of May I made a bed of them along with some cuttings; here they have bloomed beautifully during the summer and autumn. For beds, they are superior to cuttings, as they grow dwarf and more bushy; when they are in bloom they form a splendid mass of brilliant blue, not to be surpassed by any other plants. I intend to have another bed of seedlings next year, and I think that if some of the dwarfer scarlet sorts were mixed with them at the time of planting, when they bloomed they would have a prettier effect.—*A Constant Reader, Ryde.*

Prizes for Horticultural Exhibitions.—Having frequently heard ladies and gentlemen observe that it is rather beneath them to contend at horticultural exhibitions for money, I beg to recommend that books be substituted, and the following appear to me suitable ones:—Illustrations of Botany, by Dr. Royle, 11*l.* 11*s.*; Dr. Lindley's works; De Candolle's Vegetable Organography, translated by Boughton Kingdon, Esq., 15*s.*, or handsomely bound 1*l.* 1*s.* 0*d.*; Paxton's Pocket Botanical Dictionary, 15*s.*, or handsomely bound 1*l.* 1*s.*; the Gardeners' Chronicle for the last year, 1*l.* 6*s.*; the London Journal of Botany for the last year; Mr. and Mrs. Loudon's works; Vegetable Cultivator, by Rogers, 6*s.*; the Handbook of Gardening, 2*s.*; the Florists' Journal for the last year, 6*s.*; the Entomologist for the last year, 6*s.* An appropriate motto may be written in the prize-books—such as "Palmam qui meruit ferat,"—Let him bear the palm who deserves it; or, "In tenui labor; at tenuis non gloria," (Virgil,)—The labour was bestowed on a small object, but the glory is not the less. Probably the presidents and secretaries of horticultural societies may think of more suitable mottoes, but these are mentioned in default of better.—*K. B. G.*

Prizes for Seedling Florists' Flowers.—The earnestness evinced by Mr. Bowly, at p. 845, (1841,) and my concurrence with the general spirit (though not entirely with the principle) of his communication, induces me to offer a few remarks on his system of offering premiums. I have always been an advocate for offering large premiums, especially in societies where the contention for them is attended with much expense to the competitors; and I think that to a certain extent high premiums would have much of the desired effect in floricultural societies; but I apprehend that in general the expenses of raising a Pelargonium, a Calceolaria, or any similar flower, are not so great but what the honour and merit attached to the procuring a first-class prize at a society such as the Horticultural Society of London, to say nothing of the pecuniary advantage afterwards derivable from it, are adequate to any moderately high pecuniary reward that could be offered. Besides which, I think the public will get no more justice done them, and the premium itself will be a greater incentive to deception and fraud than an honorary mark of approval and distinction. In addition to which, if the observation I make be not true, and the competition be for 30*l.* or 40*l.*, as the case may be, and not for merit, it is obvious that the uncertainty attending a yearly collection for this object would of itself be a great drawback. I am deceived if that would not alone defeat the object of your correspondent; and I am led to think that unless any society offering premiums has actually at its disposal the amount of such rewards, either by its own funds or by the voluntary premiums of members and others, it acts injudiciously in holding them out for competition, if it were only for this reason, that if such society were once unable to meet the just calls at the proper period, the offers of such premiums would fail to have the desired effect at the ensuing season, to which inconvenient risk a subscription list would, I apprehend, be always liable. But even supposing these objections are not good ones, the partiality of Mr. Bowly's system would be of great disadvantage to the encouragement of horticulture in general. How many premiums (first and second together 50*l.*) could a floricultural society of moderate means offer in the same year—even with the addition of the subscription-list suggested? If they could afford to give two, it would be to the exclusion of other productions; and how often, in the course of a few years, by this plan, would it come to the turn of each fancy flower to be rewarded? We must not stand still in floriculture now. Every corner of the kingdom echoes a desire to promote this pursuit; and it would be unseemly in any floricultural society to recognise so partial a system as to reward one or two flowers in each year so bountifully at the expense of so many others. The tastes of florists differ so much in their choice of favourite flowers, each one seeking for his *protégé* the same promotion and encouragement, that I think this exclusive system would occasion much discontent and dissatisfaction even among those most desirous to avoid it; and I feel confident that the pride and ambition among florists in general are such, that you would have no stronger competition in consequence of these high subscription premiums than at present. I am a strong advocate for offering premiums, whether they be honorary marks of distinction or pecuniary rewards; but I as strenuously advocate a fair and equal distribution of such premiums as far as possible. I, as an amateur, take more delight in the cultivation of two or three particular flowers than others; but at the same time, as a lover of floriculture, I desire to see the others progressing equally in their cultivation, and approaching nearer perfection every season; and this, I fear, would not be the case if the exclusive system recommended by your correspondent were carried out, as it would be three or four seasons before it came to the turn of each kind of production to be rewarded. If Mr. Bowly is so desirous of offering a premium for Pelargoniums, or Calceolarias, or anything else, let him, like others, signify his intention of doing so, to any extent he is disposed, to the Floricultural Society of London, if he approves of it as a tribunal, and many will, in all probability, follow him. I would also suggest, that if your correspondent is really anxious to offer a higher premium than is convenient to him, from the conviction that the cause will be better served, might he not make the subscription he advocates among his friends—promoters of floriculture—that it might not be sent before the Society in the form of a subscription, nor the Society itself be supposed to give rise to it?—*S. D.*

PROCEEDINGS OF SOCIETIES.

ROYAL AGRICULTURAL SOCIETY.

Jan. 8th.—The Duke of Richmond in the Chair. Twenty-one gentlemen were elected.—Col. Challoner presented to the Council the report of the Finance Committee, announcing the current cash balance in favour of the Society, on the 31st of December, 1841, as 1,028*l.* 12*s.* 2*d.*, and the amount of invested capital as 5,700*l.* stock, in the Three and a Half per Cent. Reduced Annuities.—On the motion of the Rev. W. L. Rham, seconded by D. Barclay, Esq., M.P., it was ordered "That an account be laid before the Council of all sums paid to members of the Council for any services performed for the society, from the year 1839 to the present time.—The Duke of Richmond laid before the Council a further report of the proceedings of the General Bristol Committee.—The Council having revived the former House Committee appointed in June last, and having added to it the members of the General Bristol Committee, it was referred to the United House Committee to report to the Council the best arrangements to be made in reference to an established residence for the Society.—On the motion of the Duke of Richmond, a committee was appointed to prepare and lay before the Council a design for the great seal of the Society, to be attached to all documents in which the Society by their charter contract under a common seal in their individual and corporate capacity, consisting of the Duke of Richmond, Mr. Pusey, M.P., Mr. D. Barclay, M.P., and Mr. H. Gibbs.—The Duke of Rutland, as President of the Leicestershire Agricultural Society, transmitted to the Council a memorial, signed by the Hon. H. W. Wilson, their chairman, in the name and on the behalf of the committee of that society, inviting the Society to hold its great agricultural anniversary of 1843 at the town of Leicester; and enumerating in detail the various topics of information required by the resolution of the Council of the 8th of December last; enclosing a sketch of the Leicester cricket-ground, as the site recommended as most suitable for the erection of the pavilion for the dinner, and the general purposes of the show, and a plan of the street leading to the ground from the railway station. The Duke of Rutland concluded the communication by assuring the Council that should they consider favourably this request of the Leicestershire Committee, there was no town in the north-eastern district where the endeavour would be more strenuous to afford every accommodation to the visitors, and to advance both the interests of the show and the general welfare of agriculture. The thanks of the Council were voted to the Duke of Rutland and the Leicestershire Committee for their attention to the Society, and their wishes to promote its objects; and the secretary was directed to inform the Duke of Rutland that the memorial and plan had been received by the Council, and would have the best consideration at the time when the subject of the town at which the Society would hold its annual county meeting of 1843 should come under their consideration for final decision.—E. Bullen, Esq., secretary of the Royal Agricultural Improvement Society of Ireland, transmitted to the Council the second report of the proceedings of that society, along with a list of suggestions to the local agricultural societies throughout Ireland, of such regulations as appear to the general society most calculated to perfect their organisation and ensure a uniform system of action and similarity of principle and detail in their establishment. Mr. Bullen stated that the Metropolitan society had been successful in its efforts to organise these societies and effect their correspondence with themselves, no less than 50 local societies being in communication with them already; that the society's annual show in the country would probably be held at Kilkenny, and in the month of August; and that it was the earnest hope of the Royal Agricultural Society of Ireland that such an interchange of communication would by that time have been effected between themselves and the Royal Agricultural Society of England as would result in that connexion between the members of the two national societies having a common object of usefulness to the country at large, which would lead to the attendance at their meeting on that occasion of some of the principal agriculturists and breeders of England, with their prime stock.—The Earl of Ducie presented to the Society a model of his Uley cultivator, one of the prize implements of the Liverpool show. The Rev. J. Heysham communicated a report of the epidemic; Mr. Champion transmitted a note relative to the question agitated by the Thanet Farmers' Club of the best kind of Swedish Turnip; and various presents of books were announced.

BENEVOLENT INSTITUTION FOR THE AGED AND INDIGENT GARDENERS AND THEIR WIDOWS.

Jan. 13.—The anniversary meeting was held this day at the Crown and Anchor Tavern; Mr. Sangster in the Chair. Mr. Bowler read an abstract of the accounts for the past year, from which it appears that the society is in a most flourishing condition; for in addition to paying all expenses, 200*l.* of the current year's subscriptions have been funded, which is as much as has been in the three preceding years. The sum paid for pensions for the last year is 33*l.* 8*s.* 10*d.*, which there is every reason to believe, from the growing importance of the society, will soon be very much increased. Messrs Nutting, Fairbairn, Mills, Dickson, Fraser, Gray, Sadler, and Farnes, were placed on the Committee, in the room of Messrs. Brown, Buchanan, Low, Mountjoy, Toward, and Warner. The thanks of the meeting were then voted to Mr. Bowler, for his services as honorary secretary.

Soon after five o'clock, a large number of gentlemen, including most of the members of the Floricultural Society of London, sat down to dinner. Mr. Groom took the chair. After "The Queen," "Prince Albert," "The Queen Dowager and other branches of the Royal Family," and "The President and Vice-Presidents of the Institution," had been given, Earl Ducie's health, as President of the Floricultural Society of London, was drunk. The next toast was, "Success to the Institution;" and Mr. Kernan, in proposing it, remarked that it was a great gratification to observe how progressively the institution was increasing in importance: the number of persons whom he saw around bore sufficient testimony to its value; and in concluding, he wished it might ever prosper, and prove a benefit and comfort to many of its poorer members. Mr. Bowler returned thanks, and congratulated the meeting on the advanced position of the institution, owing to the cordial support which all had given to it. He alluded to the increase made in the funded property, and he had now but little doubt of the well-doing of the Society for the future. He said the committee had determined to recommend that two more pensioners should be elected about next June. "Success to the Horticultural and Floricultural Societies of London, the Country Florists, the Continental Nurserymen, and the Press," having been given, the meeting separated.

FLORICULTURAL SOCIETY.

Jan. 13.—The annual general Meeting took place this day; Mr. Edmonds in the chair. An abstract of the accounts was read and ordered to be printed. It appears that the total sum received is 52*l.* 17*s.*, out of which 31*l.* 10*s.* has been paid for prizes at the shows, and upwards of 8*l.* for periodical works on Gardening, to form the nucleus of a library. Mr. Groom proposed, and Mr. Shears seconded, that thanks be given to Earl Ducie, for having accepted the office of President. Mr. Shears was elected treasurer for the ensuing year, and Messrs. Fox, Masters, Charlwood, and Palmer were elected on the committee, in the place of Messrs. Clark, Verity, Marnock, and Rogers; Messrs. Gaines and Mountjoy were re-elected. Messrs. Wrench, Burrup, and Barnard were elected auditors for the next year. It having been found that a 10*s.* subscription was not sufficient to carry out all the objects of the society, it was after some discussion proposed that in future the annual subscription should be 1*l.* Thanks were then given to the Secretary, the Committee of the past year, and the Chairman, and the meeting broke up well pleased at the success of the first year's enterprise.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

AQUILE'GIA SKI'NNERI. Mr. Skinner's Columbine. *(Hardy Herbaceous Perennial).*—This fine Aquilegia was sent to Woburn Abbey by G. U. Skinner, Esq., from Guatemala, a country much to the south of any which had previously been supposed to produce a species of Columbine. A. Skinneri proves to be perfectly hardy, having survived the severe winter of 1840-41, in the open ground at Woburn, and flowering in great beauty during the summer and autumn of 1841. Its nearest affinity is with A. canadensis. The flowers are drooping, yellowish green at the lower part, and prolonged into a nearly straight spur, almost two inches in length, of a lively red colour.—*Bot. Mag.*

HARDENBE'RGIA MACROPHYLLA. Broad-leaved Hardenbergia. *(Greenhouse Climber).*—This most beautiful and valuable climbing shrub is one of the numerous interesting products of the Swan River Colony, the introduction of which to our gardens was effected by Sir J. Stirling, who sent seeds to England in 1835. These were raised at the seat of R. Mangles, Esq., Sunninghill, Berks, and probably at other places. In habit Hardenbérgia macrophylla is remarkably luxuriant, growing to a considerable height, branching widely, and being well covered with its handsome foliage. The racemes of flowers, too, are particularly abundant, and often diverge into three or four branches, thus forming a large cluster. Their colour is a brilliant purple, which does not fade by drying. Its culture, though assimilating for the most part to that of H. Comptoniana, should be varied in one important particular: for, while that species seems to thrive and flower best when kept in a pot, H. macrophylla is more suitable for planting in the border of a conservatory, where it can be allowed to cling to the pillars, or to chains or wire placed purposely for the support of climbers, and spread out its branches in all directions, without having them materially shortened. So managed, it constitutes a beautiful object, with the combined appearance of a shrub and a climbing plant. It may, nevertheless, be grown in a pot, and either trained in a similar way, or fastened to any kind of trellis of adequate dimensions. We must mention, however, that when its growth is stunted and contracted by confinement at the roots, it never exhibits that vigour and beauty which are common to it under more congenial and natural treatment. The soil in which it flourishes best is a fresh light loam, to which about a third as much heath-mould and sand is added, and the whole well reduced and incorporated, but not divested of its fibrous or decayed vegetable matter by sifting. It flowers in the principal summer months. Cuttings, ordinarily treated, root with the usual facility; and, as it produces seeds abundantly, it may be extensively propagated by them.—*Mag. of Bot.*

CATASETUM FULIGINOSUM. Sooty Catasetum. *(Stove Epiphyte.)*—This singular plant has lately flowered at Sion, in the possession of His Grace the Duke of Northumberland. Its habit is quite that of C. tridentatum, but its flowers are in a dense erect raceme, and of a deep green colour, spotted with a dull blackish purple, so as to look as if they were soiled with soot. The sepals and petals are spotted, oblong, acute, and reflexed, so as to hang downwards. The lip, on the other hand, is fleshy, hooded, stained with pale purple, and either entire at the margin, or very slightly serrated; but it does not cover over the column, as is usual in the hooded Catasetums; on the contrary, it spreads away at almost right angles. The column itself is short, deep green, and produced at the point into a straight bristle, in front of which is placed a small and imperfect anther. In this masquing genus it is impossible to say what is a species, and what is not. Judging by rules found good in other genera, this is quite distinct from all species previously described; judging from the evidence we possess concerning C. tridentatum, cristatum, and viride, we should suspect it to be a mere form of C. atratum, or some such species.—*Bot. Reg.*

RIGIDELLA IMMACULATA. Spotless Stiffstalk. (*Halfhardy Bulb.*)—Bulbs of Rigidella immaculata were sent to the Horticultural Society from Guatemala by Mr. Hartweg. It differs from R. flámmea in having much smaller flowers, not spotted, and narrower leaves; otherwise they are nearly the same, except that this is the more slender and dwarf of the two. Both are half-hardy bulbs, requiring exactly the same management as the Tigridia, to which they are very nearly allied.—*Bot. Reg.*

HOULLE'TIA VITTATA. Striped Houlletia. (*Stove Epiphyte.*—This very curious plant was received by Messrs. Loddiges from Mr. Schomburgk. It has the erect raceme of Houllétia Brocklehurstiana, but the flowers are much smaller, form a pyramidal mass, and are yellow, streaked with so much deep chocolate-colour that the former is hardly seen except on the lip. From the similarity in habit between these plants and Maxillária Warreana, one would have thought they must have belonged to the same genus, but an examination of the fructification does not confirm that opinion.—*Bot. Reg.*

MISCELLANEOUS.

King Charles's Pear Tree.—A venerable object of some curiosity in Doncaster, known to several of our readers, has lately been doomed to fall under the stroke of the axe, and thus to share the fate of that unfortunate monarch, by whose hands, local tradition informs us, it was placed in the earth.—*Doncaster Gazette.*

Grant's Patent Fuel.—The patent fuel of Mr. Grant is composed only of coal-dust and a preparation of coal-tar, or other bituminous material, which is converted by the influence of heat into a substance resembling pitch; two gallons or 20 lbs. weight of this pitch (or bituminous material), when reduced to a liquid, are combined with one hundred weight of coal-dust; the composition is then moulded into the form of bricks, which constitutes the article patented by Mr. Grant, and patronised by Government.—*Herts Reformer.*

Improvement of Irish Flax.—The following extract of a letter (says the *Northern Whig*) from an extensive English flax-spinning house to a respected Irish house has just been handed to us; and we publish it, in the hope that it may serve to encourage the Northern Flax Society to persevere in their exertions, and stimulate growers to turn their attention, earnestly, to the most improved methods of treating the article, in preparing it for market:—"We are glad to see, by the Belfast papers, the exertions making to improve the Irish flax. We shall be very glad to come to your market, and be independent of the Continent. We see a great improvement in the twenty bags you sent as samples, upon that sent last year; but, even yet, though very strong, it has a tow-like appearance, when in thread, which prevents our using it, except by mixing a small proportion of it with Dutch, to make it take a good gloss in finishing. This, which is the only defect, arises, we believe, solely from the improper treatment of the flax after it is pulled."—*Londonderry Standard.*

Gigantic Turnip.—There is exhibiting, in Messrs. Drummond's Agricultural Museum, a white globe Turnip, which weighs 23lbs., and measures 3 feet 8 inches round. This fine root was grown by Mr. D. M'Laren, on Bruce Castle farm, Carnock, Stirlingshire, and is believed to be the largest grown in this district for many years.—*Stirling Observer.*

New Potato.—We have recently tasted a potato, sold by Messrs. C. and T. Chapman, market gardeners, Brentford, which seems to deserve to be made more generally known. In size and quality it bears much resemblance to young Potatoes of the best description; and, according to the vendors, "no more trouble is necessary than in growing an ordinary crop of Potatoes; glass is not required to force them under; and they will produce as good a crop as any border Potato known." There are two kinds—a round one and a kidney. It is the latter of which we are speaking as having proved excellent when cooked. In appearance it is very like what the Germans call the "Moren" Potato, and we are not prepared to state in what respect it differs from that variety, which is scarcely known in England.

GARDEN MEMORANDA.

Messrs. Henderson's, Pine Apple-place.—In the Orchidaceous-house Houllétia Brocklehurstiana has been in fine flower; the plant, which is not a large one, has thrown up a very strong stem bearing six large blossoms of a rich brown colour. The singular and pretty Trichopília tórtilis was also in flower, as well as a Maxillária, apparently a variety of, or nearly related to, aromatica: it was dull yellow, with the labellum bright orange beautifully marked with crimson. The stove was greatly enlivened by some plants of Dracæna terminalis, whose bright crimson leaves form a good substitute for flowers at this season. The broad crimson bracts of Poinséttia, the pretty scarlet star-like flowers of Euphorbia fulgens, and the brilliant blue of Eranthemum pulchellum made a display that at this season would not have been expected a few years since.—*Jan.* 11.

Review.

Chemistry, in its application to Agriculture and Physiology. By Professor Liebig. Translated from the German by Lyon Playfair, Ph. D. 2d Edition. 8vo. pp. 409. Taylor and Walton, 1842.

HAVING in the commencement of last year given a review of the first edition of this valuable work, accompanied by copious extracts, and a sketch of the view which the author has taken of the subject, it might perhaps appear unnecessary to make any further observations upon it, even though this is stated to be an improved edition, further than to repeat that it is a work of very great value, deserving most careful and attentive perusal by all who are interested in Agriculture, and likely to lead to most important results, by drawing the attention of practical men to the science of Chemistry, and pointing out to chemists a hitherto much neglected, but nevertheless extensive and most fruitful field of inquiry. The relation of chemistry to agriculture is, however, so new and so full of interest, that we shall take the opportunity of the publication of a second edition of Liebig's book to say a few words on the subject. Previously to the appearance of Liebig's "Organic Chemistry," there was no recently-written book on the subject which could be put into the hands of a practical Agriculturist that would give him much information of value. On the appearance of Liebig's book this deficiency was to some extent supplied, and it was accordingly received with the most general approbation, and eagerly read by a large number of intelligent practical men. There were some, it is true, who, averse to all alteration, whether improvement or not, set themselves against the whole subject of agricultural chemistry, and cried out against it as useless because it could not teach them everything. With these we have no sympathy.

Such persons have an erroneous idea of chemistry—they seem to consider it as a mere theoretical science, consisting of crude and uncertain speculations, and therefore unworthy of any confidence, and not to be put in competition with the experience of practical men. Now the fact is, the object of the chemist is to collect and arrange facts and observations, and by these means he is in time led to generalise or find out the laws which govern the processes he has been studying, Chemistry is by no means a theoretical science; in fact it is the least so of all the sciences, for in it nothing can be predicted, but in every step it must be the result of careful and repeated observation, and therefore leads to nothing but practical conclusions.

The object of chemistry, therefore, is not merely to theorise and suggest impracticable plans for improving the processes of the farmer, but to collect, methodise, and, as far as possible, explain those processes, and the facts observed by practical men, on sound and rational principles, not according to new and uncertain theories, but in accordance with simple rules deduced from attentive study and comparison of the results of a great multitude of similar operations. In doing this, the chemist or chemical argriculturist is led to make new experiments and observations, which, if properly conducted, well selected, and accurately recorded, are always valuable. In these experiments he cannot foretel or predict with certainty the results, but he can, by comparing his experiment with similar ones previously made, form some idea of the probable result. In so doing he theorises, or reasons by analogy: the result may prove the correctness or show the fallacy of his view, but till proved it must always be regarded as a mere supposition, and never for a moment considered as an established fact. The use of theory in this, as in all other sciences, is merely to assist in devising and making experiments. It is true that by making experiments at random we shall at last arrive at the truth; but if we for a time take up the most probable explanation of any subject, and then endeavour by a few appropriate experiments to ascertain whether or not it be correct, we shall certainly attain a satisfactory conclusion in a much shorter time, and with much less trouble.

When Liebig's book was published about a year and a half ago in the form of a report addressed to the British Association for the Advancement of Science, and intended chiefly for the use of scientific men, its appearance was eagerly hailed by practical agriculturists, who expected to find in it a clear and distinct account of the great leading facts of agricultural chemistry, so arranged that they could easily understand and apply them to practical uses. For this purpose, however, the book was not well adapted, and consequently many were disappointed in their expectations. Some believe everything in it implicitly; while others, going to the opposite extreme, doubt everything, and place no faith at all in the statements of its author. The right course to have pursued would have been somewhere between the two; but this, few except those who had already devoted a good deal of attention to the subject would have taken.

One of the great faults of the book is, that the author does not sufficiently separate those certain and well-established facts which are the results of experience—whether deduced from the daily practice of the farmer, or from the smaller trials of the chemist—from the theoretical opinions of his own which he has advanced; but gives to both the same weight and appearance of authority. Hence, as some of his views, which are apparently stated as facts, are unsupported by good evidence, and are, therefore, questionable, or evidently erroneous, readers are led to doubt others of his statements; and the value of the whole book is proportionably diminished. If we read it without carefully following up each train of argument, but with a fixed conviction that everything in it is unquestionably true, we shall greatly mislead ourselves, and in place of deriving benefit from its perusal, acquire an imperfect and unsatisfactory knowledge of the subject: whilst if it is read with attention, the arguments weighed and examined, and the statements reviewed with caution, we cannot fail to be instructed and satisfied.

It is this unfortunate style of the author which renders his book far less valuable than it would otherwise be to general readers. Those who have paid great attention to the subject, and are familar with the details of science, will readily separate the theoretical from the practical statements; but the ordinary reader will be unable to do this, and will accordingly be led into unlimited belief or unlimited scepticism.

Although we have the highest possible opinion of Liebig both as a chemist and likewise as a philosopher, and although ready to receive his views respecting the nourishment and growth of plants with all the respect due to his talents and research, we are by no means disposed to receive them blindly or believe them implicitly, and we regret that it is so much the fashion at present amongst scientific men to follow Liebig in all things, adopting his views undoubted, and unquestioned. It will be far better to examine them practically and experimentally; for those which are correct will then stand confirmed, whilst the sooner that any which are not correct are disproved, the better for the progress of science.

It would be impossible to give a condensed account of a book like Liebig's, because the matter of which it treats cannot be discussed in a cursory manner: if we were to go into the subject at all, we should be led into writing a commentary and taking up each head one by one—and we have already, in the early part of last year, given a general account of the work. In the second edition some attempts have been made to render the book more accessible to unlearned readers by a few explanatory and introductory observations, but still several parts are much in need of being simplified. In many respects the work is considerably improved by additions and alterations, but we regret still to see many of those things which appeared objectionable in the previous edition. Thus in the commencement of the book it was stated that vegetable physiologists had "without any apparent reason" assumed certain positions regarding the use of Humus, and the office which it performs in the growth and nutrition of plants. Now, this statement, however it may be applicable to German physiologists, is false when applied to those of this country; and as the book was written in the form of a report to a British society, it would have been better if the author ascertained the views of British physiologists before he made so sweeping an accusation. We were both surprised and sorry to find the same passage unaltered by the author in the second edition. A note by the translator, it is true, is added, explaining that the statement is more applicable to German than to English physiologists; but as we are not the translator, we shall at once say, what is perfectly true, that this assertion, and some others, are pieces of mere gratuitous impertinence.

Amongst the additions to the book, the most considerable are the new observations on Manures, and the supplementary chapter on Soils; the latter principally from the works of Sprengel, a laborious and zealous German chemist, whose writings are but little known as yet in this country. In the chapter on Manures much highly interesting matter will be found. Speaking of nitrate of soda, he observes, "The experiments which have hitherto been instituted with this manure do not warrant us in concluding with positive certainty, that it is the nitrogen alone to which it owes its efficacy; but they certainly render this a plausible explanation of its virtues." We are glad to observe this doubt expressed, because we have always thought the action of this manure imperfectly understood, and that the theories of chemists were somewhat questionable. As we have already said, a broad line of distinction must be drawn between facts and theories, or all will be confusion and uncertainty. Chemists may do much to improve Agriculture, but as yet they know too little of the processes of vegetation to enable them to explain with certainty the phenomena attendant on these processes; and therefore their views must be brought forward as theories to be confirmed, or rejected by the results of experiment.

CALENDAR OF OPERATIONS *for the ensuing Week.*

THE wintry weather which has prevailed since our last will have prevented many of the operations therein recommended from being carried on; nevertheless, time may have been profitably occupied out-of-doors in one or other of the departments of a large establishment, for a gardener will find it good policy to employ all his available strength in doing everything now which can be done to forward his out-work, rather than to wait for the return of more suitable weather. During frost, all heaps of compost should be turned, laying the frozen lumps at the bottom; and if the middle of the heap is tolerably dry, a good quantity might be wheeled into the potting-sheds, to be in readiness when wanted for use. Any rough ground-work, too, might be executed; for if a little time be lost by the difficulty of breaking up the frozen surface, it will be amply redeemed by the facility of wheeling.

KITCHEN-GARDEN AND ORCHARD.

In door Department.

PINERY.—The heat of the house containing the plants which you are desirous of starting into fruit should be gradually raised to 70°, in the course of the ensuing week, and the plants will most likely now require a little water at their roots. Take care that the plants so treated do not get too much bottom-heat. If the new lining causes the heat at the bottom of the pots to rise above 95°, as a precautionary measure it will be advisable to draw the tan partially away from the pots, and also to continue the temperature of the house at 65° by fire-heat. The plants in all the houses had better be now examined; for as strong fires have been necessary to keep up the required temperature, some of the plants, especially those near the heating apparatus, will probably be dry. In succession-pits heated by dung only, the plants should neither be watered nor syringed at this season.

VINERY.—Four or five degrees of uninterrupted frost, with scarcely a gleam of sunshine to brighten or warm the atmosphere, is most unpropitious weather for forcing, and all the skill and energy of the gardener is requisite to counteract its withering influence. The most critical period of Vine-forcing is when the embryo bunches are just beginning to develop their pedicles, and to assume the appearance of flowering organs. A sudden check or insufficient excitement at that stage will frequently cause abortiveness, and the young bunch, instead of expanding into blossoms, dwindles into a barren tendril. When signs of this are visible, the temperature should be kept steadily up to 70°, allowing it to rise 10 or 15 degrees by sun-heat rather than admit the external air, if cold and frosty: if, however, there is a considerable heat in the flues or pipes, a little air must be cautiously given in bright sunshine, and at all times the atmosphere of the house must be kept sufficiently humid to prevent rapid evaporation by the leaves.

PEACH-HOUSE.—Do not wet the blossoms of Peach-trees: but after the petals have fallen, the trees will be greatly benefited by a sprinkling every morning with tepid water; or if the weather is fine and open, twice a day will do them good. While the trees are in bloom, a night temperature between 50° and 55° should be aimed at, with air every day, more or less according to the state of the weather. In very cold nights the thermometer might be permitted to fall to 45° in preference to wasting fuel by extraordinary fires. Now is a good time, if not already done, to dress the trees in the late houses with the composition mentioned in p. 648 (1841).

CHERRY-HOUSE.—Trees which have been moderately excited since the beginning of December will have begun to expand their blossoms, and at this stage of their progress a supply of fresh air is indispensable. While the trees are in bloom, do not allow the temperature by artificial heat greatly to exceed that recommended last week. Although the trees would probably bear a greater heat, it would be attended with some risk, and it is best to keep on the safe side. Syringing must now be discontinued for a time.

Figs.—Any pots that stand over the heating apparatus should have pans placed beneath them to protect the roots from too great heat. A better situation is the bed of fermenting dung which has been recommended (p. 768, 1841) to be introduced into the early Vinery; and if the heat of this bed does not exceed 100°, the pots may be partly plunged into it.

Cucumbers.—If the seed-bed already made maintains a temperature between 100° and 120° in the body of the dung, it should be prepared for sowing by covering the surface regularly over with turf or slates, upon which six or eight inches of fine sand should be laid. Sow the seeds thinly in pots or pans; or, if preferred, one seed only might be put into a small pot. Plants already bedded out will probably require the assistance of strong linings of hot dung, in which case they will be liable to injury by the steam finding its way into the frame when the lights are raised to admit air. To prevent this, one of the upper squares might be taken out of each light, and a moveable piece of wood fitted into its place, which can be opened or closed as necessary.

Strawberry Plants in bloom must have all the air possible. This is esential to perfect impregnation, without which the flowers become what is technically called "blind." The plants should also be regularly watered, but not over the flowers. The temperature of the early Peach-house, at this season, is suitable for the Strawberry plant.

Asparagus.—Make a succession bed to succeed that planted in the beginning of the month: for this and other purposes, it is advisable always to have, at this season of the year, a substantial heap of dung and leaves ready mixed and prepared for immediate use.

Peas and Beans for transplanting had better now be sown in boxes, pots, or any convenient substitute. They can afterwards be advanced or retarded as found necessary.

Celery.—Sow a small quantity in heat for an early crop. The Celeri Violette, introduced from France by the Horticultural Society, and the Flat-stemmed White, are among the best.

Mustard and Cress should be sown once or twice a-week, according to the consumption.

Out-door Department.

It will be better to suspend digging and trenching, should the occurrence of a thaw make such work practicable, until the frost is fairly out of the ground, and the surface in some degree dried. Celery ground might, however, be levelled and manured; and every vacant corner not yet dug should have its allowance of dung wheeled out and spread. Pea and Kidney-bean sticks should be procured and pointed, tying them up in bundles according to their sizes, which will greatly expedite their use when wanted. See that the frost does not get into the fruit-room; and examine Onions, Carrots, Beet, and similar stored articles.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—If the thermometer indicates 60° in the morning, it will be quite high enough; or in very severe nights the temperature might be suffered to fall a few degrees lower without inconvenience, provided it is increased to 65° or 70° during the day. During cold, sunless weather, the temperature should be kept as low as is consistent with the safety of the plants. Keep the atmosphere from getting too dry with so much fire-heat; give air on fine days; use every means to eradicate insects, and make preparations for potting. Euphórbia jacquiniflora is one of the most beautiful stove plants which flower at this season.

Greenhouse and Conservatory.—Cinerarias and similar plants which require more pot-room might now be shifted, using plenty of drainage. Verbenas, Heliotropes, and other plants which it is intended to propagate for bedding out, should now be encouraged to grow, so that a plentiful supply of healthy cuttings might be obtained. See to the watering of Camellias and Orange-trees in the borders, as the constant fire required of late may have dried the soil.

Pits and Frames.—Every precaution must be used to keep out intense frost. If a remission should occur, take advantage of it to remove a succession of forcing plants to a warmer habitation.

Out-door Department.

Little can now be done with advantage in this department. Any condemned trees or shrubs might be felled, the stumps grubbed, and the tops fagotted. New beds or alterations in the form of old ones can be made if the frost be not too severe.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Take care that tender seedlings are sufficiently protected from frost. Guard also against the depredations of hares, which frequently commit great mischief during snow.

Forest and Coppice Woods.—Felling and thinning might now be carried on where there is much to be done, leaving, of course, those trees which produce valuable bark till later in the spring. New ditches and drains might be dug, and dead fences made.—*J. B. Whiting, The Deepdene.*

Erratum.—In p. 8, in the Calendar of Operations, in the article "Pinery," for "with a bottom-heat of about 90°," read, "with a bottom-heat of about 80°."

State of the Weather near London for the Week ending Jan. 13, 1842, as observed at the Horticultural Garden, Chiswick.

Jan.		Barometer.		Thermometer.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.		
Friday	7	30.450	30.445	35	28	31.5	N.E.	
Saturday	8	30.410	30.316	34	28	31.0	E.	
Sunday	9	30.233	30.140	30	27	28.5	N.E.	
Monday	10	30.125	30.027	31	25	28.0	S.E.	
Tuesday	11	30.007	29.984	34	30	32.0	S.	
Wednesday	12	30.050	29.989	36	24	30.0	S.	.10
Thursday	13	29.878	29.961	33	29	31.0	S.	.28
Average		30.164	30.123	33.2	27.9	30.2		.38

Jan. 7. Sharp frost; clear; cloudy; overcast; snow.

8. Slight snow; overcast; dry air and frosty.

9. Frosty and overcast; snow flakes; densely overcast, and very dark at night.

10. Frosty; dry cold haze; overcast.

11. Groundcovered with snow; slight thaw; drizzly; slight snow.

12. Overcast; clearing; sunshine; slightly overcast at night.

13. Snowing all day with wind from south, changing to south-east in afternoon. Snow nearly three inches deep all over the surface.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending Jan. 22, 1842.

Jan.		Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.							
							N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

Sat.	22	43.6	34.3	38.9	8	0.57	—	1	2	3	2	5	1	2

The highest temperature during the above period occurred on the 23d, in 1834—thermometer 58°; and the lowest on the night of the 19th and morning of the 20th, in 1838—thermometer 4½° below zero.

REPORT ON COVENT GARDEN MARKET.

For the week ending Jan. 14th, 1842.

The weather during the week has prevented any great difference occurring since our last Report: many articles are of rather indifferent quality, and consequently the better samples have somewhat advanced in price.—*Fruit.* Pines of good quality are plentiful, and remain at the same price as last week. The different kinds of foreign Grapes are plentiful, and generally speaking pretty good. Apples of most of the kinds in season are abundant; many good samples of American New Town Pippins have arrived. Many excellent samples of Pears are offered, but the kinds do not differ from those mentioned in a former Report. The supply of Chesnuts is by no means large, though pretty good.—*Vegetables.* Savoys and other kinds of Cabbage are tolerably plentiful. Broccoli, especially white, is scarce. Brussels Sprouts are good and abundant. Forced French Beans are excellent. Asparagus and Sea-kale are good, and considering the season the supply has been well kept up. Most of the Lettuce are injured by the frost, and good ones are scarcely to be had. Good forced Rhubarb is plentiful. Mushrooms and Truffles are excellent and tolerably abundant.—*Flowers* differ but little from last week.

PRICES, Saturday, Jan. 15, 1842.—FRUITS:—

Apples, Kitchen, per bushel, 2*s* to 7*s*
— Dessert, per bushel, 4*s* to 16*s*
Pears, dessert, per half-sieve, 5*s* to 16*s*
Pine Apple, per lb. 5*s* to 8*s*
Grapes, Spanish, per lb., 1*s* to 1*s* 3*d*
— Portugal, per lb., 1*s* to 3*s*
Oranges, per doz., 9*d* to 2*s*
— per 100, 3*s* 6*d* to 14*s*
— Bitter, per 100, 6*s* to 12*s*
Lemons, per doz. 1*s* to 2*s*
Lemons, per 100, 6*s* to 12*s*
Almonds, per peck, 7*s* to 8*s*
Sweet Almonds, per pound, 3*s*
Chesnuts, per peck, 5*s* to 10*s*
Walnuts, per bushel, 12*s* to 24*s*
Filberts, English, pr. 100 lbs. 120*s* to 130*s*
Cobbs, per 100 lbs. 150*s* to 160*s*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s* to 24*s*

VEGETABLES.

Savoys, per dozen, 6*d* to 1*s* 3*d*
Cabbage, White, per dozen, 8*d* to 1*s*
— Red, for pickling, 2*s* to 4*s*
Cabbage Plants, per doz., 3*s* to 5*s*
Brussels Sprouts, p. hf. sve., 1*s* 6*d* to 3*s*
Broccoli, White, p. bunch, 2*s* 6*d* to 5*s*
— Purple, 1*s* to 2*s* 6*d*
Potatoes, per ton, 55*s* to 80*s*
— per cwt. 3*s* to 4*s*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, p. bush. 2*s* 6*d* to 3*s*
Artichokes, Jerusalem, pr half sieve, 9*d* to 1*s* 6*d*
Turnips, pr doz. bunches, 2*s* to 5*s*
Carrots, per doz. bunches, 4*s* to 6*s*
Parsneps, per dozen, 6*d* to 1*s* 6*d*
Red Beet, per dozen, 9*d* to 1*s* 6*d*
Scorzonera, per bundle, 1*s* to 1*s* 3*d*
Salsify, per bundle, 1*s* to 1*s* 3*d*
Horse Radish, per bundle, 2*s* to 5*s*
Spinach, per half sieve, 2*s* to 3*s*
Onions, per bushel, 2*s* to 3*s* 6*d*
— for pick., per hf.-sieve, 3*s* to 3*s* 6*d*
— Spanish, per dozen, 2*s* to 6*s*
Leeks, per dozen bunches, 1*s* to 1*s* 6*d*
Garlic, per lb., 8*d*
Shallots, per lb., 1*s*
Asparagus, per 100, large, 9*s* to 11*s*
— Second or Middling, 4*s*
— Sprue, or Small, 3*s* 6*d*
Sea-kale, per punnet, 1*s* to 3*s*
Lettuce, Cabbage, per score, 9*d* to 1*s*
— Cos, per score, 2*s*
Endive, per score, 2*s* to 3*s* 6*d*
Celery, Red, p. bdle (12 to 15) 6*d* to 1*s* 6*d*
— White, per bundle, 6*d* to 1*s*
Small Salads, per punnet, 3*d*
Watercress, p. dz. small bunch. 6*d* to 9*d*
Parsley, per half sieve, 2*s* to 3*s*
Tarragon, per dozen bunches, 6*s*
Fennel, per dozen bunches, 4*s* to 6*s*
Thyme, per doz. bunches, 2*s*
Sage, per doz. bunches, 3*s*
Mint, per doz. bunches, 1*s* to 3*s*
Savory, per dozen bunches, 2*s*
Rhubarb Stalks, per bundle, 1*s* to 1*s* 9*d*
Mushrooms, per pottle, 1*s* 3*d* to 2*s*
Truffles, per pound, 2*s* to 3*s*

Notices to Correspondents.

The Publisher will be happy to give half-price for any copies of No. 9, Feb. 27, 1841.

A Gardener writes thus:—"Everybody must have observed how much trees of all sorts, particularly Beech-trees, are apt to destroy the vegetation below their boughs; and the more so if their boughs are suffered to trail on or near the ground. Indeed, at this season of the year the beauty of our gardens is very much impaired by the large bare spots which disfigure them; sometimes a little moss grows, but oftener nothing at all. Is there any remedy for this? I remember to have seen, some years ago, in an horticultural publication, this subject treated, and wood-ashes were recommended to be scattered under the trees. Has this ever been tried—and with what success? or is there any plan that you would recommend as likely to obviate this defect? [The cause of Grass perishing under trees is partly because the soil is exhausted by the roots of the trees, so as to be unable to bear herbage, and partly because of the obstruction of light, without which Grass cannot thrive. We are not aware what the effect would be of wood-ashes; but, as they are a powerful manure, they would doubtless repair the evil to a certain extent. They, however, like nitrate of soda and similar agents, can only renovate the soil. The injury derived from want of light can only be repaired by removing the cause; that is, by cutting away the branches that obscure the Grass.]

If *E. R.* will forward us a post-office order for 26*s*., we will take care he has the Paper for twelve months without further charge.

L. T. E.—We really do not see how the method of growing Hyacinths in Beet-roots can be made clearer. The apex of the root is to be cut off, and the bulb is to be inserted in a hollow scooped in the section. The leaves will then be downwards, the root being inverted; and when they push, they will turn upwards.—See Mr. M'Nab's curious paper on inverted plants in the *Chronicle* for 1841, p. 532.

* *H.* *, *Leicester.*—This has been accidentally overlooked.—We do not approve of removing Gesneras to a cool greenhouse when they are resting during winter. It is much the best plan to put them out of the way on a shelf in the dry stove and to keep them dry. Generally they will not grow much in this situation until spring, when they can be taken down, repotted, and liberally supplied with water. Your Ipomœa Learii blooms late; it ought to be resting now and started as early in spring as possible. It is a chance if your Ipomœa Horsfalliæ ever forms buds; you should graft it. We confess we are not very sanguine about success attending keeping either stove or greenhouse plants planted out in the border of a house which is kept very cold during winter and then used for forcing Vines afterwards. Any plants you may use for this purpose should be only things which you can afford to throw away every year or two. To those you have you may add Abutilon striatum, Fuchsia corymbiflora, Amphicome arguta, Geissomeria longiflora, Aphelandra cristata, Clivia nobilis, Strelitzia humilis; but we do not say you will succeed.

A. V.—The Apple with the remarkably knobby, rugged, and thickly russeted surface is in the collection of the Horticultural Society, under the name of Winter Apple. A fruit of the same sort was received from a place eight miles east of Gravesend, where it was called by the natives "Old Maids."

A Constant Reader.—Your Pears are—No. 1, Jean de Witte; 2, Bishop's Thumb; 3, a crisp-fleshed Pear, unknown; 4, Bezi de Caissoy. Apples—No. 5, Pearson's Plate; 6, Coe's Golden Drop; 7, Court of Wick; 8, Orange Pippin.

An Amateur, York.—Presuming that the wood of your Vines is sufficiently ripened, there is no danger of its being injured from exposure to the cold of any ordinary winter in this climate. Previously to forcing, however, you cannot be too careful in protecting the stems and roots. Strawberry pots do not require to be placed in saucers.

A. R.—Your Apple is the Blenheim Pippin.

No Steel Pen will change his name if he uses Charles Knight's, which are the best that are manufactured, although odd-looking; they can be had at 22, Ludgate-street, London. The only bulbs that will blossom in August and September are such as the varieties of Colchicum and Gladiolus, the Autumnal Squill, the Yellow Amaryllis, the Saffron Crocus, and the Tigridia; of these the tender kinds may be planted in the spring when the frosts are gone, and the others as soon as the present frost is broken up. If you now plant those which should have been in the ground two months ago, they will blossom, but not quite so well. All Roses will strike from cuttings; but the varieties of Gallica, Provins, Damask, and Hundred-leaved not so well as others. If cuttings of them are placed under handglasses in September, and left there all winter, many will strike in the ensuing spring. The Chrysosplénium is the Golden Saxifrage, a little plant found in damp places and by rills, common in some parts of England, but not found in others.

If *Mr. Forbes* will send us the garden-pot he speaks of as an effectual protection against slugs and snails, we shall be happy to publish an account of it.

Flora.—We fear your plan No. 1 will not answer. Very little bottom-heat is required for a conservatory, and, even if you did not dry your soil by the underground pipes you propose to employ, you would certainly force your plants into growth at a period when you should only maintain a sufficient temperature to exclude frost. We prefer your plan No. 2, with the pipes next the wall; they will do the plants no harm, for we presume you do not intend to maintain a high temperature, and they will secure the warming of the air next the glass walls, which is important. Probably, however, No. 3 would do if you prefer the arrangement of pipes under the walks.

W. B. asks why Cereus grandiflorus only flowers during night. We will answer him by inquiring why pheasants roost at night and owls by day? or why Cherries are red and Medlars brown? Who knows?

C. S. C.—It would be well that the coping should overhang the wall two inches or thereabouts, and that it should have a groove parallel with the edge; otherwise the rain will run down the face of the wall. There is no advantage in building a wall hollow, except the cheapness of it. Your spaces are well calculated.

T. S. P.—Good gardeners will produce excellent fruit upon dwarf Apples by various kinds of management. We dislike the espalier because of the expense of stakes, and prefer the common dwarf. Although a tree has been prepared for an espalier for a year or two, we should alter it again, which may be easily done by judicious pruning and by tying the shoots to a hoop. The largest growing Apples may be kept in bounds by summer pruning, that is, by pinching the shoots in the summer when three-quarters grown. Heliotropes should be headed back just when they are beginning to grow.

A Subscriber, Devonport, who asks us to publish some sketches of the manner of pruning and training fruit-trees, is informed that our excellent contributor "M. E. H." has undertaken to furnish them.

E. B.—We anticipate little success in sending cuttings of fruit-trees to South Australia; the voyage is too long for them to survive. If it is to be done at all, they should be despatched in October, packed in slightly damp Moss in a box buried in charcoal cased over. But there is in truth no object in sending cuttings of fruit-trees to distant colonies. The seeds will go safely, and without expense, and they will, if carefully selected, produce excellent varieties, though not exactly the same as the original. What does it matter whether a Peach is a Royal George, or something a little different, but just as good?

R. B. next week.

A. W.—In London, gypsum is sold by drysalters. If you saturate it with the ammoniacal liquor of the gas-works, you will, no doubt, form a valuable manure; but it will be very different from saturating it with urine. The latter would certainly be the most efficient. In either case, the only direction to be given will be to use plenty of gypsum, and not to discontinue adding it till the fluid matter ceases to exhale all odour of ammonia. We shall soon take this subject up more formally.

A. M.—The following Auriculas will suit your purpose; they may be obtained at very moderate prices, and the list contains a good variety. The other request in your letter shall receive attention.

Green-edged.
Pearson's Badajoz
Beerle's Superb
Smith's Waterloo
Thornicroft's Invincible
Warris's Blucher
Page's Duchess of Oldenburg

Grey-edged.
Grimes' Privateer
Metcalfe's Lancashire Hero
Kenyon's Ringleader
Oliver's Lovely Ann
Taylor's Ploughboy
Page's Lord Hill

White-edged.
Hughes' Pillar of Beauty
Leigh's Bright Venus
Popplewell's Conqueror
Taylor's Glory
—— Incomparable
Simson's Lord of Hallamshire

Self.
Bury's Lord Primate
Grimes' Flora's Flag
Whittaker's True Blue
Scholes' Ned Lud

C. D.'s plant seems only Gesnera bulbosa. It appears very healthy; we see no sign of the blight mentioned in our correspondent's letter.

John Kyle's plants are—1, Podolóbium staurophyllum; 2, ilicifólium; 3, trilobatum.

A Lady of Fortune.—The last edition of Sweet's "Botanical Cultivator" will best suit your purpose.

J. G.—You had better return your plant of Luculia gratissima to the house from whence you took it, unless your greenhouse is kept warmer than such places generally are. A temperature from 45° to 50° would suit it. It will grow luxuriantly in a very cold conservatory if planted out, but it does not seem to like such a dry, cold place, if grown in a pot. It is best propagated by layers, but it will also strike from cuttings. They should be taken off in summer, put out in the usual way, and covered with a bell-glass. Keep them in a place which is rather cool.

A Young Lady.—Thunbergia coccinea in many places does not bloom freely, and it is rather difficult to give a reason for it. If your plant is growing luxuriantly, you may try what effect would be produced upon it by root-pruning. Echites suberecta is more easily managed. Plant it in a large pot or box amongst free soil, and keep it in the lightest part of the stove; or if you have convenience, you may plant it out in the corner of a tan-pit, and train it up the rafters near the glass. It likes bottom heat.

Mr. Newman's letter was received too late for this week.

Flora.—We have seen a few seeds upon both Ipomœa Learii and Sellowii, but neither produces them freely.

As usual, many letters have arrived much too late for answers this week.

NEWS OF THE WEEK.

The foreign relations of France, and particularly the questions of diplomatic etiquette, which have arisen with the Courts of Madrid and St. Petersburg, are still the leading subjects of interest in our news from Paris. The dispute with Spain has assumed so serious an aspect, that the French ambassador is said to have left Madrid, notwithstanding the conciliatory instructions of his Government; his departure has given rise to much apprehension, and although it is not regarded as indicating the probability of a war, it is expected to suspend the diplomatic relations between the two countries during the minority of the Queen. The differences with the Cabinet of St. Petersburg arise out of the alleged withdrawal of the Russian Ambassador from Paris, in order that he should not be the organ of the diplomatic body in complimenting the King on New Year's day; and they have since been aggravated by the absence of the French Minister from the Russian Court, under circumstances so similar, as to suggest the idea of a reprisal. These diplomatic quarrels are regarded with dissatisfaction by the leading journals, even of the Court party, and are described as unworthy the dignity of two powerful nations; while the Opposition papers receive them as additional proofs of the unfriendly feelings with which France is still regarded by the Great Powers, notwithstanding the convention which restored her to the European alliance. At the recent sittings of the Court of Peers, the commutation of the sentence on Quénisset and his accomplices has been formally announced, and the debates on the address in reply to the King's Speech have been carried on without much show of opposition. The release of the Abbé de Lamenais after a year's imprisonment for sedition, has been made the grounds of a public manifestation against the Government; several of the ringleaders were arrested during the procession, but the populace appear to have evinced no sympathy with the movement, and order was soon restored.—Our intelligence from Spain confirms the announcement of the French papers that the Government have refused the demands of the French Ambassador: the Madrid Journals state that every concession consistent with the national dignity has been made, but that the Ambassador persisted in his refusal to deliver his credentials to the Regent, because the latter represented the Government, and not the majesty of the Throne. The Committee charged with drawing up the address in answer to the Regent's speech are still occupied with that duty; and the Chamber of Deputies have been engaged in the consideration of the various decrees issued by the Government during the late recess.—From Portugal we learn that the Cortes were opened on the 2d inst. by commission. The royal speech, read by the President of the Council, recommended to the Chambers the discussion of the budget, the organisation of the public finances, and the adoption of new measures for promoting the prosperity of the colonies, after which the Chambers were adjourned till the 21st Feb.—Letters from Vienna state that Prince Metternich has announced to the Porte that the great Powers will not allow the contemplated attack of the Turkish Government upon Greece. Advices from Athens inform us that the king has not yet returned a reply to the note addressed to him by the representatives of the three protecting Powers respecting the complaints of Turkey against his Government; and recent despatches from Constantinople, which have reached us through Vienna, announce that the Porte has given notice to the Ambassadors that if within fourteen days the Greek Government did not comply with all their just demands, the Sultan was determined to have satisfaction by force of arms. We learn, also, that the Divan contemplates the appropriation of the church property by the state, for the purpose of being sold or let on lease to purchasers or tenants without distinction of creed,—a scheme originating with the late Sultan, and requiring as much energy as his other great reforms, which constitute so remarkable an epoch in the history of the empire.—The news from the United States is chiefly confined to the proceedings of Congress, and to matters of domestic interest. The recent affair of the Creole slaver which the slaves after murdering their owner carried into one of the West India Islands, where they were allowed to go at liberty—and the question of the right of search, form the leading topics of discussion; the journals are unanimous in maintaining that the Federal Government must never concede that right to Great Britain or to any other maritime Power.

At home, the only subject requiring especial notice is the approaching christening of the Prince of Wales. The Lord Chamberlain has issued invitations, to those personages who will be present at the ceremony, for Tuesday, the 25th inst.; and the King of Prussia is expected to arrive at Windsor Castle in the course of the ensuing week.—In anticipation of the meeting of Parliament on Thursday, the 3d Feb., Sir R. Peel has issued the usual Ministerial Circular to the Conservative Members, requesting their attendance on that day, and announcing that "public business of importance will be immediately proceeded with."

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal, all continue well. The Queen and Prince Albert left Windsor Castle for Claremont on Tuesday, where her Majesty has remained a few days, and was to return to Windsor again this day. The Prince of Wales and the Princess Royal did not accompany her Majesty, but continued at the Castle. The Court Circular announces that the Lord Chamberlain has, by her Majesty's command, issued cards of invitation to the leading nobility for the approaching solemnity of the christening of the Prince of Wales at St. George's Hall. The day of the christening is now announced to be definitively fixed for the 25th inst.; and the King of Prussia will embark at Ostend for this country on the evening of Thursday next. His Excellency the Chevalier Bunsen will repair to Ostend to receive his Sovereign. His Majesty will proceed to Windsor immediately on his landing, which may be expected to take place in the course of Friday.

The Queen Dowager.—The accounts received respecting the health of her Majesty the Queen Dowager continue to be favourable. The latest intelligence from Sudbury Hall announces that her Majesty is so much better, that she contemplates returning to London at a very early period; that orders have already been issued for making preparations for her Majesty's departure; and that the 21st inst. is the day fixed, according to present arrangements, for her Majesty's return to Marlborough-house.

Parliamentary Movements.—Mr. Wolverley Attwood and Mr. Colquhoun having declined coming forward to contest the representation of the City of Dublin, Mr. Gregory has announced himself as the Candidate on the Conservative interest.—A requisition, it is said, is in course of signature, inviting Sir R. R. Vyvyan, Bart., the present member for Helston, to become a candidate on the Conservative interest for the western division of Cornwall, vacant by Lord Boscawen Rose's accession to the peerage on the death of his father, the Earl of Falmouth; and it is also stated that Sir Charles Lemon, Bart., the late member, will come forward to contest the county on the Liberal interest.—The decease of the late Earl of Elgin, by which Lord Bruce, M.P. for Southampton, succeeds to the Scottish peerage, having occasioned a vacancy in the representation of that town, Mr. H. Mildmay, son-in-law of Lord Ashburton, has announced himself as a Candidate on the Conservative interest.—The local papers contain a letter from Mr. Dawson to the electors of Devonport, resigning any future claim to the representation of that borough.

Church Preferment.—The death of Dr. Shuttleworth, Bishop of Chichester, which took place after a short illness on Friday, the 7th inst., has occasioned a vacancy in that see. Mr. Anderson and Dr. French are spoken of as likely to fill the vacant bishopric.—The Archbishop of Dublin has committed the care of the united dioceses of Ferns and Ossory, until the appointment of a bishop, to the Rev. H. Newland, D.D., Dr. Pack, and Archdeacon Stopford. The latter is mentioned as likely to be the new bishop.

Official Appointments.—It is stated that the Marquis of Exeter will be appointed Lord-lieutenant of the county of Northampton, in the place of the late Earl of Westmorland; and that Mr. G. Finch will be the new Lord-lieutenant of Rutlandshire, vacant by the Marquis of Exeter's new appointment.—Mr. Justice Bosanquet, in consequence of continued ill health, has sent in his resignation to the Lord Chancellor. His Lorship's successor, as one of the Judges of the Common Pleas, is not yet known; but Mr. Serj. Merewether, Mr. Law, Recorder of London, and Mr. Serj. Goulburn, are mentioned as likely to be raised to the bench.

Foreign.

France.—*Foreign Relations.*—The foreign relations of the country, more especially with the Courts of Madrid and St. Petersburg, continue to be the leading topics of interest discussed by the journals. With respect to the first, viz., the difference that has arisen on the point of etiquette between the French Ambassador and the Spanish Cabinet, there appeared to be an impression in Paris on Monday that the matter in dispute would be amicably adjusted; and the *Journal des Débats*, in a long article on the subject, announced that a courier had been despatched from the Foreign Office, with conciliatory instructions to M. de Salvandy, adding that it was believed that the Ambassador would not leave Madrid. The actual state of the question, however, does not appear to be considered satisfactory by the Opposition papers; not, they say, that a war between the two countries is to be regarded as probable, but because the withdrawal of the French Minister on such a ground would, they fear, suspend, during the minority of Queen Isabella at least, the diplomatic relations between the two countries. The differences with the Court of St. Petersburg, already referred to, also continue to occupy attention, and appear to be generally attributed to the withdrawal of Count Pahlen, the Russian Ambassador, from Paris; in order, as it is stated, that he should not be the organ of the diplomatic body in complimenting the King on New Year's day; and also to the absence of his representative from the Tuileries on the same occasion. The *Journal des Débats*, in an article on this subject, expresses a hope that the French Chargé d'Affaires at St. Petersburgh had not, as stated, purposely absented himself from Court on the Emperor's birthday, in reprisal for the withdrawal of Count Pahlen from Paris, and proceeds to say that it "cannot understand a war of such a kind between two powerful nations. If France deems herself affronted by the proceedings of the Russian Cabinet, she can, as is competent to her, withdraw her agents from Russia; but two great Governments never engage in a struggle of this irritating and illnatured sort. If they do not wish to plunge into a war and exchange cannon shots, they will not engage in a conflict of etiquette, and will not contend by attacks and retorts as ridiculous as impotent." The article concludes by "recommending that if the diplomatic relations between the two countries cannot be preserved on terms of reciprocal courtesy, it would be better to break them off altogether, as an open rupture would be less dangerous for peace than envenomed diplomacy." The Opposition papers also recommend Government to take high ground in this dispute, and endeavour to draw as a conclusion from the affair, that notwithstanding the Convention of the 13th July, restoring France to the European concert, she is still regarded with unfriendly feelings by the other great Powers.

The Chambers.—The Court of Peers assembled on Saturday, when the President read a letter from the Minister of Justice, announcing, as anticipated in our last, that the King had been pleased to commute the sentence of death, pronounced by the Court against Quénisset, Colombier, and Just Brazier; and that the first was to be banished for ever, and the two others condemned to hard labour for life. The commissioners appointed to draw up the address in reply to the King's Speech met on the same day to hear the explanations of the Ministers of Commerce and Marine, who, it is stated, are not disposed to second the views of Government in its objects of internal improvement. On Tuesday, the debate commenced on the Address, which contains one passage relative to commercial relations, in the form of an amendment, and is directed against the conclusion of the treaty with Belgium. The Prince of Moskwa, Marshal Ney's son, opened the debate. He entered, at length, into the Eastern Question and the Convention of the 13th July, contending that the isolation of France, from which in consequence of that Convention she had departed, was an absolute necessity for her national honour and interests, and that some striking reparation ought to have been obtained before that isolation was abandoned. Upon these grounds he opposed the Address. The Marquis Boissy spoke in favour of it, and attacked the conduct of Spain towards France, accusing the former of ingratitude. In the course of his speech he made use of strong terms in reference to the Regent, which called up M. Guizot, who protested against the word "executioner" being applied to the Regent of Spain, who was the present depository of the Royal power in a country with which France was at peace. M. Boissy then withdrew the words. M. Dumon, said to be a friend of M. Guizot, has been appointed reporter of the Commission of the Address in the Chamber of Deputies. It was expected that the Address would be ready by about Friday (yesterday), and that the debate would begin on Monday next.

The Capital.—On Friday morning, the 7th inst., several manuscript placards were affixed to the walls of the Schools of Medicine and Law, calling on the students to make a manifestation on the Abbé de Lamenais coming out of prison after a year's confinement for sedition. These placards were removed by order of the authorities; but about one o'clock, from 400 to 500 students assembled in a body, and marching four abreast, proceeded first to the Foreign Office, where they exhibited considerable feeling against the Foreign Minister, uttering cries of "Down with Guizot!" and singing the Marseillaise Hymn. They then proceeded to the house of M. de Lamenais, where a deputation was sent in to congratulate him on his release, after which M. de Lamenais made his appearance at the balcony, and was loudly cheered. At this moment a detachment of troops of the line, headed by two Commissaries of Police, made its appearance, and the mob resumed its march on its return to the neighbourhood of the schools. Some demonstration of hostility was again displayed on passing the Foreign Office and Chamber of Peers; and on arriving at the office of the *Journal du Peuple*, they stopped some time, shouting in favour of M. Dupoty. Having returned to the Place du Panthéon, they appeared inclined to remain there, and began again to sing the Marseillaise; but a detachment of the Municipal Guard, headed by a Commissary of Police, came up and dispersed them. Several persons, students and workmen, who had made themselves prominent by their shouts and turbulence, were arrested at various points, and conveyed to prison. The population, throughout the entire line traversed by the procession, seem to have evinced no sympathy with this demonstration, and in the evening everything was again quiet in the Capital.—The weather in Paris has become very severe, and the latest accounts inform us that the intensity of the cold was increasing. The Seine was nearly covered over with floating ice, and would, it was expected, should the frost continue, be soon completely frozen over. The canals of St. Denis and St. Martin are entirely frozen, and skaiting has begun on them. The thermometer (Centigrade) marked 9 degrees below zero on Friday night, the 7th inst.; on the following night it was still lower; and on Sunday the temperature is said to have been so low as 18 degrees of Fahr., or 14 below the freezing point. The sky, however, was clear, with little or no wind. Most of the mail-coaches had been detained considerably after their usual time, in consequence of heavy falls of snow in the provinces.—It is rumoured that the King of Prussia will stop in Paris a short time on his return to Berlin from London.—It has just been decided by one of the Parisian tribunals that the tenant of a house with a garden attached to it can demand the cancelling of his lease if, the trees in the said garden being planted too near the property of the next-door neighbour, the latter should order them to be cut down, and that he can claim damages as well.

The Army.—The journals have recently made frequent reports of the capital conviction of soldiers by Court Martial in Paris, for assaults on their superiors—facts which appear to be regarded by them as indicating a state of increasing disorganisation in the army. On Sunday, it appears, according to an article in the *National*, that a pitched battle took place near the Champs de Mars, between the soldiers of two regiments, forming part of the garrison of the capital. The combatants are said to have been 2,000 in number, and were armed for the greater part with sabres, the rest with stakes or bludgeons, and not only resisted and treated with contempt their officers, who threw themselves between them to induce them to desist, but disarmed the pickets of troops sent to restore order, and continued their conflict until compelled to leave off by sheer fatigue. A great number were severely wounded, and the affair caused lively alarm in the neighbourhood of the fight. The journal by which this account is given, adds that the conflict was renewed on the two following days; but its final result is not stated.

Political Trials.—M. Lenormand, ex-commissary of police at Toulouse, who was tried and acquitted on a charge of participating in the late riots of that city, has been ordered to be prosecuted for corruption and mal-practices in the discharge of his functions. The charges against him, however, are said not to be heavy. The Court of Assizes of the Bouches du Rhône has just decided, without the intervention of a jury, that all the persons implicated in the late republican movement at La Villette, near Marseilles, who have not surrendered themselves for trial, shall be liable to deportation. One of these individuals, named Deschamps, who has been pointed out as the chief of the plot, has been recently arrested at Toulon. One of the companions of Barbes, named Bourdon, condemned to imprisonment by the Court of Peers in the fort of St. Michel, has become insane, and been removed to the Lunatic Asylum of Pontorson. This, it seems, is the third case of insanity, besides one of suicide, that has occurred among the prisoners convicted with Barbes for the attempt on the King, in the space of 15 months; and all, it is stated, have been brought about by the infliction of the solitary regimen. It is said that the individuals lately arrested on the denunciation of Colombier and Brazier will not be tried by the Court of Peers, that several have been or were shortly to be released; and that the others will stand their trial before the ordinary tribunals. A file-maker, named Choquin, was arrested on Saturday under a warrant from the Chancellor, and conducted to the prison of the Luxembourg, supposed to be implicated in the attempt of Quénisset. The members of the bar of Colmar have entered a protest against the sentence pronounced by the Court of Peers in the case of M. Dupoty, and forwarded it to the chairman of the bar of Paris.

Spain.—The quarrel of etiquette between M. Salvandy and the Cabinet still continues. The latter, according to the Madrid journals, had made every concession consistent with the national dignity, in order to accommodate matters, but was still determined not to concede the point claimed by the French Ambassador. Private letters state that a last expedient, proposed by M. Gonzalez, Minister for Foreign Affairs, and which consisted in M. Salvandy's presenting his credentials by duplicates — one to the Regent, and the other tot he Queen in presence of the Regent—had been rejected ; and Government refusing to give up the principle, the plan had been abandoned. M. Salvandy, it is added, insisted on delivering his letters to the Queen in presence of the Regent, because the latter represents the Government, and not the Majesty of the throne. It was deemed probable that M. Salvandy, on receipt of the new instructions, forwarded to him from Paris, which he was expected to receive on the 10th inst., would address an ultimatum to the Spanish Cabinet, and set out for France, leaving a mere Chargé d'Affaires in his place. Notwithstanding, however, this impression prevailed in Madrid, it will be seen, under our French intelligence, that in Paris hopes were entertained that the dispute would be amicably arranged ; at the same time it appears that in the latter capital, the reason for these hopes was grounded on the expectation that the Regent would give way ; while, in Madrid, the impression was equally strong that no arrangement would be come to, unless the French Ambassador made the concession. The Committee charged with drawing up the Address in answer to the Regent's Speech met, under the presidency of M. Olozaga, on the 2d inst., and came to an understanding upon every paragraph of that document. The article relative to the events of Barcelona slightly blames the conduct and acts of Government on that occasion ; but as Ministers were yet to be heard, the Committee was not expected to terminate its labours for seven or eight days longer. The Chamber of Deputies sat on the 3d, and had fairly entered into business, three decrees having been formally laid before them for their consideration. The first, declaring the coast of Cantabria in a state of blockade during the insurrection of the Basque provinces, is now out of date ; the second, declaring all the officials who recognised the rebel Government established in Vittoria to be set aside, was expected to give rise to considerable discussion, in consequence of the pretensions of numbers of the dismissed to be considered innocent. The third is regarded as the most interesting of all—viz. "the suspension of the payment of the dowry of the Queen-Mother, Maria Christina." The question of the confirmation of this decree will, it is thought, bring to light all the yet hidden documents connected with the subject, and afford the Ministry an opportunity of vindicating the policy which they are now pledged to pursue with respect to her Majesty. The greater part of the sitting was occupied in the discussion of the report on the individual members subject to re-election, in consequence of having received employment or honours from Government. An order had been sent by the Regent to Ferrol for a frigate to put to sea without delay. Her destination was said to be Havannah, but she was previously to call at Cadiz to take troops on board. Advices from Alicant state that tranquillity had been completely restored in that city, and that the municipal elections, having been resumed on the 27th ult., were quietly proceeding "under the protection of a body of 300 infantry and 30 cavalry." Two individuals implicated in the recent riots had been apprehended ; and an oil-vendor, who had entered the Political Chief's house with the intention of murdering him, had likewise been arrested. Accounts from Bayonne, of the 3rd inst., state that Don Antonio Galiano, who had been obliged to fly from Bilboa after the repression of the Christino revolt in Navarre and the Basque provinces, had arrived on the French territory, after wandering for two months in the mountains of Biscay and Guipuzcoa.—We learn, by subsequent intelligence from Madrid of the 5th inst., that M. de Salvandy had made all his preparations to quit that city on the following day with all the *attachés* of the embassy, and that he would leave only a person to sign passports. It is added, that Mr. Aston, the British Minister, had exerted all his influence to effect an arrangement of the differences between M. de Salvandy and the Spanish Government, but ineffectually.

Portugal.—We have received intelligence from Lisbon to the 3d inst., which is of more than ordinary interest. The Cortes were opened, *pro formâ*, on the 2d inst., by commission, but with a Royal Speech, which was read by the President of the Council. The chief points recommended by it to the Chambers for their especial consideration, are the discussion of the budget, and the organisation of the public finances ; and new measures for promoting the prosperity of the Colonies are also stated to be urgently required. After the Speech had been read, the Chambers were adjourned till the 21st Feb. Government had concluded an important financial transaction, to effect which the Bank of Lisbon, the tobacco contractors, and the Confiança company of capitalists had joined in forming a new association, under the name of "Company of National Credit." This company was to advance 1,000 contos of reis (230,000*l.*) in money, viz. 500 in the next three months, and 500 more in three months afterwards, in case the Cortes should have previously authorised the present operation. Government, it is said, would also virtually receive another advance of 600 contos, as the bank had discounted to that amount for officers' pay, &c., which Government was liable to repay the bank out of the current revenues, and for which the latter will now receive inscriptions. The company was further to purchase the outstanding arrears, to the amount of 4,100 contos of reis ; and also to purchase 2,000 contos of the foreign Five per Cent. Stock, with the corresponding coupons, and to receive for all these amounts inscriptions at 5 per cent. interest, according to a scale mentioned in the contract, payable by the Board of Public Credit, by funds set aside from the revenues derived from the tobacco contract. The total amount of inscriptions to be issued would amount to 7,520 contos of reis. Government was to commence cash payments to all classes of officials from the 1st Jan. The Prince de Joinville had left Lisbon for Toulon. There had been a review of the garrison during the Prince's stay, who had been with the King to Cintra and Mafra, and the French Minister gave a ball on the eve of the Prince's departure.

Germany.—We have received German papers of recent dates, but they contain little of importance ; the Stuttgardt journals announce that the Count de Medem, Russian Ambassador to the Court of Wirtemberg, has been appointed Ambassador Extraordinary and Minister Plenipotentiary to the Court of Austria, and is to be replaced at Stuttgardt by Count Gortschakoff. It is stated that Prince Metternich has forwarded to the Turkish Minister for Foreign Affairs at Constantinople a strong note, in which he states that the Powers of Europe will not permit any attack upon Greece by Turkey.—The local news at present attracting attention in the diplomatic circles of Vienna is a duel lately fought in the suburbs of the city, between Prince Felix Lichnowsky and the Spaniard Montenegro, son of the celebrated Carlist General of that name, in consequence of some observations reflecting on the character of his father and brother, which appeared in the second volume of the Prince's "Reminiscences from Spain." Montenegro was seconded by Prince Schwartzenberg, who likewise served in Spain, and Count Blacas. The Prince was attended by Col. Rachden, formerly in Cabrera's service. Montenegro was wounded in the arm ; and Prince Lichnowsky received a ball in his side, which however has been extracted, and both combatants are now said to be out of danger.—M. de Mieg, Bavarian Minister Plenipotentiary to the Germanic Diet, died at Frankfort on the 7th inst.—The *Prussian State Gazette* of the 1st instant publishes the treaty concluded between Prussia, the Duchy of Brunswick, Hanover, and Oldenburg, for the accession of those states to the German Customs' Union. The journals also add that a manifest tendency is observed among the German cantons of Switzerland to join the Union, and that such an accession would confer considerable advantages upon the Duchy of Baden, which exports a considerable quantity of Rhenish wine to Switzerland. The north German papers say that the King of Prussia has cancelled the decree, sending Dr. Jacobi to be tried for his pamphlet before the criminal senate of Berlin, and that he will be tried by the Chamber of Justice. Accounts from Berlin inform us that while the King is absent on his visit to London, the Queen will go to Dresden on a visit to her august sister. Many decorations of the order of the Red Eagle have been commanded by the King of the Court jeweller to be taken to London, and a decoration of the Black Eagle, in diamonds, valued at 10,000 crowns (nearly 2,000*l.*) is also making ; but it is not known for whom it is intended by his Majesty. Three commissioners who were some time since sent by the Prussian Government to England, to inquire into the prison system of this country, have made their reports to the Minister of the Interior and police. Two of them, it is stated, have formally declared against the system of solitary confinement called the Pennsylvania system ; the third, Dr. Julius, recommends his Government to adopt it, but the Ministry, it is added, do not seem disposed to agree with him : the opinion of the King on the subject is not yet known. It is said that Prussia is about to fortify Luek on its eastern frontier.—It is stated by the journals that a modification of the present laws respecting the Jews in Prussia is much spoken of, and that not only will they be permitted to enjoy the worship of their religion to the fullest extent, but that they will be restored to the possession of several civil rights of which they were heretofore deprived.

Belgium.—In a previous Number we referred to the fact that extensive frauds had been committed on a Belgian bank, and that forged notes were in circulation to a large amount, both in England and in all parts of the Continent. Within the last few days some important discoveries have been made relative to this affair ; and two of the parties concerned in it have been arrested in Paris ; but a third, of the name of Theodore Romanzow, who is supposed to be the principal in the fraud, has not yet been apprehended, though the police of Paris have, it is said, information respecting his movements, and expect shortly to arrest him. The two prisoners who are in custody are a woman, named Madame Danelle, and a young man, called Pressel. The latter, it seems, has not made any confessions ; but those of Madame Danelle are understood to be very complete. All the particulars of the case are not yet made known, lest the ends of justice should be defeated. It is understood however that the prisoners form part of a very extensive body of Continental forgers and swindlers, who have been carrying on their operations for some time.

Holland.—Accounts received from the Hague inform us that the King will again visit Luxembourg in the course of this month, in order to make himself acquainted with the real state of affairs in that country. In the course of last year one hundred and ninety-seven ships arrived in the port of Ghent, of which nine came direct from the Havannah and other distant ports, laden with raw sugar, cotton, and rice. The weather is represented as having become very cold and severe, and the navigation of the canal of Charleroi and Willebroeck has been interrupted by the frost. Alfred du Rosset, a foreigner, has just been condemned to a year's imprisonment and costs for having altered his passport, which was originally authentic, or, at least, of having made use of an altered passport.

Italy.—Intelligence has been received from Naples that Sir W. Parish and Mr. Sulivan, the British Commissioners in the affair of the sulphur monopoly, have succeeded in the settlement of the various questions arising out of that matter ; and that they have done so without having had to appeal to the French arbiter.—Private letters from Florence state that the new line of road in Tuscany, and the proposed branches to Civita Vecchia and Leghorn, will be a re-establishment of the old Roman roads, the "Via Aurelia" and "Via Emilia," which afforded easy communication between Rome and the Gauls. The new roads, it is said, will touch Corneto and Montalto in the Papal States, and Orbitello, Grosseto, Follonica, and St. Vincenzio in Tuscany. At Cecina, it divides into two branches—one leading direct to Pisa, the other running along the seashore to Leghorn. The Grand Duke of Tuscany while at Follonica visited the foundries, which, it appears, have within the last few years been considerably extended and improved.

Russia.—Private accounts from St. Petersburg, of the 27th ult., state that the question of etiquette that has arisen between the French and Russian Governments was expected to be soon arranged, and that the French Chargé d'Affaires in that capital, and his attachés, purposed attending the Court festivities on New Year's day, but some doubts appeared to be entertained whether they would be invited. The same accounts state that the abrupt manner in which M. Périer, the French Chargé d'Affaires in the absence of M. de Barante, absented himself from the *fête* day of the Emperor, had caused a great sensation, and the effect of it had been to exclude M. Périer from all invitations in society which had taken part with the Czar. It is also said that M. Nesselrode, on getting into his carriage to attend the levee, received a brief and stiff note from M. Périer, accounting for his absence : that the Emperor was much moved at this, and was at first disposed to order the passports for M. Périer and suite ; but that, on the representations of Count Nesselrode and others, the retaliation was confined for the present to the instructions sent to M. Kisseleff, in Paris, not to attend the Tuileries on New Year's day, and which our readers are aware have been acted on.—On the 21st ult., an ukase was published addressed by the Emperor to the directing senate on the 28th Nov., announcing that the Minister of Finance had prepared, by his directions, a new edition of the tariffs for regulating the trade carried on along the frontier of Europe and that of Kiakhta, which had received his imperial sanction. The tariff on the European frontier was to have come into operation on the 1st inst., and the other on the 1st Nov., 1842. The ukase does not mention the changes introduced in the former tariff. The duties on wood and wooden articles, as well as those levied in the Asiatic and Transcaucasian provinces of the empire, had undergone no modification. The goods deposited in the customs stores at the above-mentioned periods were to be liable to the duties stipulated in the former regulations. No alterations are made by this ukase in the customs laws and regulations of the kingdom of Poland and of the Grand Duchy of Finland. The papers state that the annual produce of the private gold mines and gold works in Siberia has increased, since 1829, from 100 to 212 pounds ; or nearly 8,500lbs. English.—The navigation of the port of Riga was closed for the season on the 3d ult. At Cronstadt on the 18th the floating ice had appeared in the western channel, and the sea between that fort, Orianemburg, and St. Petersburg was covered with solid ice. Private accounts received from Teflis inform us that notwithstanding the bad season, by which all the difficulties of the campaign are increased, the expedition against the Circassians continues, and that a serious affair has taken place between the mountaineers and the Russians, in which about forty officers and from six to seven hundred soldiers were killed, and great numbers wounded ; the losses of the mountaineers were not known. After this engagement the Russian troops, it is stated, took possession of about five leagues of territory, and occupied a valley situated between two small forts.

Greece.—Accounts received from Athens, dated the 20th ult., inform us that the King had not yet returned a reply to the collective note addressed to him by the representatives of the three protecting Powers respecting complaints of the Turks against his Government. The latter, it appears, had declared its readiness to settle amicably the portion of the claims which referred to Turkish property retained by the state or subjects of Greece, and had accordingly proposed, 1st, to refund to the Greeks who purchased nine years ago from the Turks property illegally disposed of by the latter, and which belonged to the mosques of Thebes, the price of their acquisition, together with 8 per cent. interest on the sums they had actually paid ; 2d, to pay to the Turks of Zeitouni or Isden the remainder of the balance due to them by Government on the acquisition of their lands, together with 8 per cent. on the capital ; and 3d, to place at the disposal of the Ottoman Government a sum of 500,000 piasters (5,000*l.*), being the amount of the indemnity claimed by the Vacoufs of Eubœa, in virtue of the protocols. The point respecting the ill-treatment complained of by the Turks living in the Grecian territory still remained to be adjusted.—The editor of a journal who had been brought to trial for an article entitled "The French Million and Collettism," had been acquitted by the Court. The Christides Administration was considered to have been greatly shaken by this verdict; and the King, it is said, had written to Theocaris to return in all haste from Germany, his Majesty designing him as successor to Christides.

TURKEY.—By the arrival of the Levant mail we have recent intelligence from Constantinople, from which we learn that Baron de Bourqueney, the French envoy, arrived on the 17th ult. in that captal, in a steamer, which saluted the Seraglio by 21 guns, which was responded to from the batteries of Tophané.—Mustapha Pacha, the Seraskier, and Muhtar Bey, as Councillor, were about to leave for Syria, to put an end to the existing troubles. Tahir Pacha, Grand Admiral, was to be the Commander-in-Chief of the Army during Mustapha's absence, and Jaboub Pacha, Governor of Adrianople, was also to go to Syria. The Porte has not yet decided who shall be named to command the troops recently sent into Roumelia.—Private letters give an account of a rumoured project of the Government, which, if carried into effect, will, it is thought, constitute one of the most remarkable epochs in the history of the empire. It is the appropriation by the state of the church property, or wakoofs, to be sold or let on long leases to purchasers, or tenants, without distinction of creed or condition. The scheme, it appears, originated with the late Sultan Mahmoud, but no authentic particulars relating to the subject are yet known.—The diplomatic circles of Pera are said to have been surprised at several religious conversions which have lately occurred in that quarter. A Frenchman, it seems, has turned Turk; and the ladies of the Russian Minister. Madame Titboff, who was a Protestant, and of the Russian first dragoman, Prince Hantcherly, who was a Catholic, have simultaneously recanted and become Greeks.—Subsequent advices, received through Vienna, announce that on the 15th Dec. the Porte forwarded a note to the representatives of the five great Powers, apprising them, that if within fourteen days the Greek Government did not comply with all their just demands, the Sultan was determined to have satisfaction by force of arms. The period prescribed by the Divan in this communication consequently expired on the 1st of this month; but from the intimation given by Prince Metternich as to the intentions of the great Powers, no fear of an actual collision is entertained.

UNITED STATES.—By the packet-ship *New York*, arrived at Liverpool on Tuesday, we have received papers 7 days later than those brought by the *Acadia*. The proceedings of Congress are reported to the 20th ult., inclusive; but they are generally uninteresting to the English reader. The tariff question had been under discussion, and it seemed likely to give rise to long and animated debates. The main point was, whether it should be framed for protection or for revenue, and on it the discussions were expected to turn. The report of the Secretary to the Navy had been laid before Congress and printed. It is a long document, but the papers describe it as an able and satisfactory one. The report of the Secretary to the Treasury had also been presented and printed. To meet the deficiency in the revenue for 1842, the Secretary recommends to Congress to authorise an extension of the term of the portion of the 12,000,000 dollars loan not yet taken, and a re-issue of the Treasury notes heretofore authorised by law, amounting to 5,000,000 dollars; the balance of the deficit in the ways and means, together with 2,000,000 dollars (a surplus deemed necessary to be in the Treasury to meet emergencies in the public service), to be supplied from imposts upon such foreign articles imported into the United States "as may be selected with a due regard to a rigid restriction, in amount, to the actual wants of Government, and a proper economy in its administration." The report then goes into an argument as to the principles which ought to govern the adjustment of the tariff to the wants of Government.—The question of the right of search forms the leading topic of discussion in all the journals; which are unanimous in approving the conduct of Mr. Stevenson, late ambassador to the Court of London, in reference to that question; as well as in maintaining that the United States must never concede that right to Great Britain, or to any other maritime Power.—The Patent-office, at Washington, had been entered by false keys, and three valuable articles, to the amount of 12,000 dollars, stolen. The articles were, a snuff-box presented by the Emperor Alexander of Russia to Mr. Harris, the Chargé d'Affaires, valued at 6,000 dollars; a pearl necklace, presented by the Imaum of Muscat to the late President, Mr. Van Buren, valued at 3,600 dollars; and a gold scabbard, presented by the Viceroy of Peru to Mr. Biddle, and valued at 2,600 dollars. A reward of 1,000 dollars has been offered by the Commissioner of Patents for the recovery of the articles. The theft, it appears, was one of a very daring character; the time of its occurrence being known within 10 minutes, as the person having charge of the room containing the articles had visited it within that time.—The papers contain further particulars of the revolt of the slaves on board the *Creole*, which we have before noticed. This vessel, an American one, was, it will be recollected, on her voyage from Hampton-roads to New Orleans, with 135 slaves on board. On the voyage the slaves mutinied, murdered a passenger and part owner of themselves, wounded the captain and some of the crew, and compelled the remainder to navigate the brig to Nassau, New Providence, where the Governor, considering them as passengers, allowed them, contrary to the protest of the United States Consul, to go at liberty.

CANADA.—The invasion of the frontier by bands of men, who burn and destroy agricultural buildings and produce, has been again renewed this winter, and has produced, it is said, great heart-burnings and exasperations. The Papers recommend a system of retaliation to be practised by the Canadians; but it fortunately does not appear that this suggestion has yet been acted on.

CITY.

Money Market, Friday.—There has been a further rise in the Government securities. Consols for money closed at 89 to ⅛; ditto for the Account in Feb., 89⅜ to ½; New Three-and-a-Half per Cents., 98 to 9; Three per Cents. Reduced, 89⅜ to ½; Three-and-a-Half per Cents. Reduced, 99⅝; Bank Stock, 166½ to 167½; Long Annuities (expiring Jan. 5, 1860), 12-11-16.

Metropolis and its Vicinity.

Weather.—The weather still remains cold and severe; and, with the exception of one or two partial thaws, the frost has continued throughout the week with considerable severity. On Thursday there was the heaviest fall of snow that has occurred in the Metropolis this winter. It commenced in the morning and continued throughout the day, covering the streets and neighbourhood of town, in many places, it is stated, to the depth of ten inches; and where it had drifted, travelling has been much impeded. Several of the mails and stage-coaches have since been considerably beyond time, owing to the heavy state of the roads. The masters of several coasting vessels, arrived in the River yesterday, report having experienced for several days heavy falls of snow, accompanied with strong variable winds and squalls. In the Parks, the waters have been visited by great numbers of skaters and promenaders; and a variety of accidents, several unfortunately attended with fatal results, have occurred during the week.

Metropolitan Improvements.—It is stated that a great improvement is about to be made in the appearance of Piccadilly consequent upon the removal of the ranger's house in the Green Park, which will be taken down early in the spring. The plan, which, it is added, has been suggested by Sir R. Peel, is to consist of a terrace and public walk from the gate into the Palace-gardens at Hyde Park-corner to the junction of the houses at the lower end of the basin; the form of the ground on this line being considered favourable to picturesque effect in laying out and planting, and to architectural beauty of design in the esplanade. Fountains and statues, it is said, will also be introduced to add to the beauty of the plan.—On Monday the Bude light was for the first time applied to street illumination at the top of the Obelisk, in Waterloo-place, Pall-mall, opposite Carlton-gardens, in the presence of several of the parochial authorities of St. James's. On that occasion, and on the two succeeding evenings, the experiment was successful, and the light, it is stated, will be kept burning in future every night till 12 o'clock.

Wood Pavement.—On Saturday a meeting of the Marylebone vestry was held, when the motion carried on the previous Saturday, for postponing for three years the further extension of wood paving in that parish, was again discussed. A numerous deputation presented a memorial, signed by 58 inhabitants of Oxford-street, who had already the wood paving before their doors, detailing the advantages accruing to themselves and the public since its introduction, and praying the vestry not only not to confirm the minute, but to give the paving to their neighbours throughout the entire street. The deputation having withdrawn, Mr. Joseph moved the non-confirmation of the minute, delaring that the proposition was not only most absurd, but that it was illegal for a fluctuating body like the vestry to make a prospective resolution for three years. This motion having been seconded, a long and boisterous discussion ensued, in which Lord Nugent and several other gentlemen took part; after which the chairman put the question, and amidst considerable confusion declared the non-confirmation to be carried. A division was then demanded, and a scene of great uproar followed, occasioned principally by the endeavours made by both parties to secure the vote of a wavering vestryman of the name of Abbott, who appears to have been pulled about with little ceremony. The chairman ultimately succeeded in restoring some order, and on the division taking place there appeared—for the non-confirmation of the minute, 27; for the confirmation, 26; majority against postponing the question of wood paving for three years, 1.

Distress in the Metropolis.—It is stated that the number of applications for relief at the principal charitable institutions of the Metropolis has been much greater this season than the last, notwithstanding it has as yet been less severe. Up to Sunday night the number of applications from persons completely destitute, at the Refuge for the Houseless, in Playhouse-yard, Whitecross-street, was 1,762, being 457 more than during the corresponding number of nights last year. On the first night of last year the number admitted was 40, whilst on the first of the present season it was 112. The nightly average number of inmates has been about 360, and on the last day of the year they were 393. The great majority of applicants, it is said, are strangers to London, having no claim upon any parish. At the Western Refuge for the Houseless, in Market-street, Edgware-road, where admission is obtained only by tickets from subscribers, the number of applicants is also said to have been more numerous than in previous years; and although nightly accommodation is only provided for 100, on one night last week no less than 136 were admitted. The applications, however, at the Destitute Sailors' Asylum, Well-close-square, the other remaining institution for the reception of the houseless, have been less this season than for some years past, on account, it is supposed, of the great demand for seamen for the navy and commercial service.

Royal Mint.—On Monday a portion of the ransom paid by the Chinese for the evacuation of Canton arrived in London, and was transferred to the Royal Mint. The treasure was landed at Portsmouth from H. M. frigate Conway, and thence conveyed to Gosport, where a special train was engaged to bring it by the Southampton Railway to London, under an escort of the 32d Reg. On the arrival of the train at Vauxhall, the boxes of silver, about one hundred in number, were transferred to a number of vans and carts, guarded by the soldiers. The procession attracted much notice in the streets through which it passed; and upon its arrival on Tower-hill, the mob was so great that the guard on duty at the Mint was ordered under arms to clear a way for the carts to advance, and the treasure entered the gates of the Mint amidst the loud cheers of the populace. Its value is stated to be 550,000*l.*, sterling; and it consists of small bars and lumps of sycee silver, the whole of which, it is understood, will be melted down and refined previously to its being converted into the current coin of the realm.

Public Meetings.—On Tuesday a meeting was held of the committee of management and of the defence fund committee of the Marylebone Joint-Stock Bank, Mr. Parnell in the chair. Mr. Abrahams entered into a lengthened statement of the affairs of the bank, and of the disputes between the directors and the shareholders. He also stated that the public creditors would be fully paid if the shareholders paid an additional advance of 5*l.* on their shares, and if Mr. Hannay's estate paid but a fourth of what it had been estimated at by the official assignee; who, it seems, has announced that it would return 20*s.* in the pound. The solicitor for the shareholders read a series of letters between him and the solicitor for the directors, in which the latter did not appear to evince much anxiety for an amicable arrangement. Letters were also read from country shareholders of 40, 20, and 10 shares, expressive of their desire to pay their 5*l.* on each share towards liquidating the claims of the public creditor, which were averaged at 16,000*l.* It was ultimately resolved that a 5*l.* call should be made, that Sir C. Scott be banker for the fund, and that Messrs. Parnell, Dukes, Robinson, Jackson, and Christmas be appointed trustees. It was also resolved to pay all *bonâ fide* debts, and that nine members of the Defence Fund should form a quorum to adjudicate the claims.—On Tuesday the half-yearly general meeting of the Royal Humane Society was held, when the report was read by the secretary, from which it appeared that during the past year the receipts amounted altogether to 2,569*l.* 7*s.* 1*d.*; and the sum expended for rewards, salaries, apparatus, &c. was 1,479*l.* 10*s.* 3*d.*; the expenses in Hyde-park, 584*l.* 19*s.* 11*d.*; and the stock purchased 498*l.* 2*s.* 6*d.*, leaving a balance in hand of 6*l.* 14*s.* 5*d.* During the year 214 cases had been brought under the notice of the society, 200 of which were successful; 11 were beyond recovery; and 3 were cases of suicide. Sixteen honorary silver and twenty-seven bronze medallions had been awarded for cases of extraordinary courage; and the thanks of the Society, inscribed on vellum, had been presented to nine individuals, and pecuniary rewards had been presented to 106 claimants. It was also announced that Prince Albert had lately enrolled his name as an honorary member, and that several handsome legacies had been received.—On Wednesday the half-yearly general meeting of the shareholders of the London Joint Stock Bank was held. The chairman, G. Scholefield, Esq., read the report, from which it appeared that the paid-up capital now is 589,700*l.*, and that the directors have thought it advisable to complete the issue of the whole 60,000 shares, the remaining 1,030 of which were to be sold in the market. The accounts showed a net profit on the half-year, ending the 31st Dec., of 25,923*l.* 14*s.* 3*d.*, from which a dividend for the half-year, after the rate of 6*l.* per cent. per annum, was recommended, which would amount to 17,691*l.*, leaving 8,232*l.* 14*s.* 3*d.* to be carried to the profit of the guarantee fund, which now amounts to 81,731*l.* 1*s.* 8*d.* The report was unanimously adopted.

Accidents and Inquests.—On Saturday evening, as Mr. Aldridge, a builder residing at Shepherd's-bush, was driving on his way home, in the neighbourhood of Hammersmith, in consequence of its being very dark, and the road not being lighted, he unfortunately drove against a post, which caused him to be thrown out with great violence on his head, producing severe concussion of the brain. He was conveyed to a neighbouring house and medical assistance procured; but, it is said, he still continues in a very dangerous state.—On Monday, a fatal accident, attended by the loss of three lives, occurred on a piece of frozen water on Clapham-common. Deceased were a brother and two sisters, of the name of Dunce, of the respective ages of 17, 19, and 21. It seems that at the time of the accident the ice of the pond was much crowded with skaters, sliders, and promenaders, and the three deceased being together, the ice gave way beneath them. One of the sisters succeeded in getting out of the water, but returned to the spot and extended her hand to her struggling sister; the consequence of which was, that she was again drawn under water and perished. An inquest has been held, and a verdict returned of "Accidental death." It appears that a fatal accident occurred to a boy a few days since on the same water.—On Monday, an inquest was held at Camden-town, on William Burke, aged 98, said to have been formerly a gentleman of independent fortune, and companion of his Majesty George the Fourth, when Prince of Wales, but late an inmate of St. Pancras workhouse. There was nothing of interest in the case beyond the singular reverse of fortune referred to, and the fact that deceased's father died at the age of 102 years, his grandfather at the age of 104, and that there is now a brother living in the country at the advanced age of 101 years. From the evidence of deceased's wife, it appeared that deceased having gone out of the workhouse by permission to visit some friends, was suddenly seized with an affection of the chest, and shortly after returning to the workhouse, expired. Verdict, "Natural death."

Robberies.—A burglary and extensive robbery has been committed on the premises of Messrs. Griffin and Co., Ironmonger-lane, Cheapside, when a large quantity of silks, satins, hosiery, and goods of a similar character were stolen. Information was forwarded to the police, but the thieves have not been traced.—On Wednesday a serious charge, showing in some measure the distress existing amongst the poor in the Metropolis, came before the magistrate at the Mansion-house. A baker, living in Cannon-street, stated that on the previous evening 10 or 12 young men, some of whom were at the bar, came into his shop, seized a quantity of bread, and then returned to the street and divided what they had stolen amongst 30 or 40 others waiting outside for them. The prisoners, in their defence, said that they were in a state of starvation; that they had applied at different workhouses and charitable institutions, without procuring any relief; and that, not knowing what to do, they were obliged to take some bread. The prisoners were remanded, and expressed great satisfaction at being removed to the lock-up house. where they expected, at least, to get food and shelter.—On the following day, a similar charge was made against several other men and boys, who had been guilty of a like offence in the shop of another baker, in Bow-lane. After a long inquiry, the result of which was the same as the one on the previous day, Sir P. Laurie said that an example must be made, and committed the prisoners to Newgate. The other prisoners, against whom there was no evidence as to stealing the bread, but who had been seen dividing it outside, were then put to the bar and informed that sixteen had just been committed to Newgate, and that in all probability many of that number would be transported. The crowd of young men and boys who had been brought up as participators in the plunder outside the shops of the two prosecutors were then discharged, with an assurance that if they joined in any future criminal act of the kind, they might calculate upon the most severe infliction of punishment for the offence. It is stated that the City magistrates have under their serious consideration a suggestion, that when offenders are prosecuted for depredations committed under the impulse of hunger, after having been refused relief by the parochial authorities, although such offenders should not be permitted to escape punishment, the respective parishes should be compelled to defray the expenses of the prosecutions.

Fires.—From the annual report of Mr. Braidwood, superintendent of the London Fire Establishment, it appears that the total number of fires which have occurred in the Metropolis and its vicinity during the last year have been 855, being an increase of 15 over those of 1840. Out of this number, however, only 24 total destructions have happened; but of houses and buildings considerably damaged, there have been 234; and of those slightly damaged, 438: false alarms and chimneys on fire are stated to have been 159; of fires which happened at private houses there were 213; lodging-houses, 61; carpenters', 37; licensed victuallers', 34; drapers', 21; bakers', 18; sale-shops, 25; stables, 14; steam-mills, 6; churches, 3; wine and spirit merchants', 37; and of other trades and occupations the numbers vary from 1 to 9.—On Monday night, a serious fire broke out on the premises occupied by Mrs. Kennedy, milliner, of Stangate-street, near Astley's late Theatre. Some time elapsed before any engines arrived, and the entire destruction of the house where the fire originated being found inevitable, the exertions of the firemen were directed to save the adjacent houses, which they succeeded in doing.—On Wednesday a serious fire broke out in Myrtle-court, Bermondsey-street, a place densely populated by the lower orders of Irish. It occurred in the room of a poor woman, and was occasioned by the accidental falling of a spark on her bed, which was composed of shavings; she was so seriously burnt, that she was taken to the hospital, where she continues in a dangerous state. The fire, which at first created great alarm among the neighbouring poor, was soon subdued on the arrival of the engines, and the injury done was not great.—On Wednesday evening a fire occurred in the manufactory of Mr. Bartrum, coach and omnibus builder, Whitechapel. In consequence of the building being entirely composed of wood, and the materials contained in it of a very inflammable nature, the flames spread with great rapidity, and the manufactory was soon entirely destroyed. The fire, however, was prevented from extending further.—On Tuesday a serious fire broke out in the cabin of a foreign vessel moored in a tier of shipping off the Tower. Mr. Childs, fruiterer, and who is the Tower-hill beadle, happened fortunately to be near the spot at the time, from which he engaged a wherry, and proceeded on board the vessel, where he found her crew, all foreigners, in great confusion, and afraid to enter the cabin, which was filled with smoke. Mr. Childs immediately went below, when he discovered that the bulkheads were on fire; and having been furnished with a plentiful supply of water, he succeeded in extinguishing the flames before they had communicated with the cargo in the hold.

Woolwich.—A circular has just been received at this Dock-yard from the Ordnance Department, with particular instructions that it should be read in all departments of the ordnance service, stating that the attention of the Master-General and the Board having been drawn to the fact as disclosed by the evidence taken before the committee appointed to investigate the circumstances connected with the late fire in the Tower, that if the witness who first saw a light in the building where the fire broke out had given an immediate alarm, the disastrous result might, in all probability, have been prevented, or, at least, greatly lessened, they desire to express to the several persons resident within the Tower and other garrisons, and in the Ordnance establishments generally in the British dominions, their hope that, in the event of any unusual appearance of fire or light, however trivial it may seem, instant notice will be given by the party witnessing it to the proper authorities, so as to guard as much as possible against any recurrence of the calamity that has recently taken place. The Lords Commissioners of the Admiralty have also issued instructions that all the fire engines in this Dock-yard shall be examined every ten days, to ascertain that every part of them continues in proper working order, and be on such occasions exercised by the police force with water, to insure their efficiency in case of their services being required. One of the inspectors of police to be present when the engines are examined, and be responsible that they are in good working order.

Mortality of the Metropolis.—The following is the number of deaths in the Metropolis. from all causes, registered in the week ending Saturday, the 1st inst.:—Males, 523; Females, 514. Weekly average 1838-9-40: Males, 475; Females, 451.

Provincial News.

Abingdon.—A serious fire, which there is reason to think was the act of an incendiary, has occurred in the village of East Hanney, near this town. It commenced early in the evening, and though immediate assistance was procured, the flames were not got under until a barn, containing about 12 quarters of barley, a stable, and large barley-rick, were consumed. All the cattle, it seems, had been previously turned out of the rick-yard, as it is supposed, by the author of the fire, or several, it is thought, would have been burned to death. No clue, however, has yet been obtained to the discovery of the incendiary.

Bradford, Wilts.—The parties apprehended on suspicion of being concerned in the daring burglary committed at South Wraxhall, which we noticed in our last, have undergone another examination before the magistrates. The evidence of the two Misses Awdrey and their servants was given at great length; they identified three of the prisoners as those most actively concerned in the robbery, and other witnesses deposed to finding various portions of the stolen property in the possession of the other prisoners. After a long inquiry, the magistrates committed the following persons to take their trial for the offence: Nathaniel Burge, John Milsom, and Jonas Penny, as principals; George Hart, as an accessory after the fact; and John Roberts and Selina, his wife, for receiving the goods, well knowing them to have been stolen.

Birmingham.—A serious accident, attended with loss of life, resulting from the incautious use of fire-arms, has occurred in this town. It seems that a man, named Ezra Steapenhill, about a month ago found a gun, as he stated, and a few days after was showing it to a friend, stating that it was unloaded; his wife happened to be present, and, in joke, pulled the trigger over his shoulder, when it went off, breaking the clock-case to pieces. A few evenings since, he was cleaning the same gun, although it was heavily loaded and capped. His wife was sitting at the end of the table on which the gun rested, and when in the act of rubbing the lock it went off, and the contents entered her chest, and killed her on the spot. This appears to be the husband's statement, who is under the surveillance of the police.

Chelmsford.—A general feeling, to which we have before referred, appears to be gaining ground in the great agricultural districts, against the continuance of the present rural police, on the ground of its inefficiency and great expense. At the quarter-sessions in this town on Tuesday several petitions were presented to the magistrates against the system; one of which stated that "although the police had made a considerable addition to the burdens of the parishes, it had not answered the purpose for which it was instituted, and the petitioners therefore prayed the justices to take into their serious consideration, whether it was not expedient forthwith to report it as their opinion to the Secretary of State that the rural police force is unnecessary, and should be discontinued in this county." Another stated—"The petitioners humbly hope that the magistrates will neither suffer the present force to be increased nor continued, but that they may be allowed to appoint their own local constables, whereby they can reduce their present expenses, and at the same time detect as well as deter depredators." Some discussion having taken place, it was finally agreed that a regular notice should be given, in order that the question of augmenting the force or abolishing it might be debated and decided upon at the next session.

Derby.—An address to H.R.H. Prince Albert has within the last few days been forwarded from the silk stocking makers of this county and those of Nottinghamshire, deploring the depressed condition of their trade, and praying his Royal Highness to adopt silk stockings in ordinary wear. His Royal Highness has acknowledged, through his treasurer, the receipt of this address, adding "that it would give him much pleasure to be able to relieve a trade which is stated by so many respectable persons to be in so distressed a state. Since the accession of her present Majesty long silk stockings have been invariably worn at Court, so that no new order on that score can tend to give a lift to the trade." Two patterns of silk trousers and stockings were at the same time enclosed, which the letter stated had been made in England, and which his Royal Highness always wears, directing six pairs of each pattern to be made for his Royal Highness's use; which fashion, the letter adds, if people generally could be prevailed on to adopt it, would be far more advantageous to their trade than the stockings.

Devizes.—Another daring burglary has been committed in this county. A few days since the house of Mr. Gum, of the tithing of Seend, was broken into by three thieves, and robbed of property amounting to between 30*l.* and 40*l.* Mr. Gum, it appears, is advanced in years, and lives with his sister in a lonely house, a short distance from the turnpike road between this town and Malmesbury. The thieves, it is stated, first endeavoured to effect an entrance at the back part of the house by making a hole in the wall, but here they were unsuccessful. They then went round to the front door, which they burst open, and entered the house, after an ineffectual resistance by Mr. Gum, who, hearing the noise, had got up. They then told him that if he did not give them what he had, they would murder both him and his sister, and commenced ransacking the house, from which they took all the money and valuables they could find. Although they said they had plenty of assistance, Mr. Gum states that he is sure they were but three in number, as he afterwards traced their steps towards Melksham. The face of each was blackened. Two men, named Townshend and Clarke, have since been apprehended and committed for trial; and two others, named Aust and Townshend, the latter a brother of the prisoner, have been remanded for further examination.

Gloucester.—At a recent meeting of magistrates in this city, Mr. C. Bathurst, the chairman, stated, that after the present quarter-sessions he could not, from the impaired state of his health. any longer perform the duties of that office. It is expected that he will be succeeded by Lord Redesdale.

Hertford.—It has been announced that Government has ordered the reward of 100*l.* offered for the apprehension of the murderer Blakesley to be paid to the two constables, Dunn and Filgate, stationed at Hitchin, in this county, by whom, it will be remembered, he was taken into custody.

Liverpool.—A serious accident has happened in this city to one of the sons of the Rev. Hugh M'Neil. It seems that he was practising a pistol in the neighbourhood, when, by some inadvertency, it went off accidentally, and the ball passed obliquely through the lower part of his stomach, inflicting a dangerous wound. Some hopes, however, appear to be entertained of his recovery.

Lynn.—The Yarmouth and Birmingham mail was overturned on Saturday night within a mile and a half of this town. The passengers escaped unhurt, but the coachman had his ankle fractured. It seems that the horses took fright at a drover's dog, whose master had been hanging on behind without the knowledge of the coachman.

Maidstone.—On Monday a serious fire occurred in the farm-yard of Mr. Jackson, a county magistrate, residing at Orpington, in this county. In consequence of its breaking out early in the morning, assistance could not for some time be procured, and the result was that three stacks of wheat, one of hay, three barns, and a large quantity of agricultural implements, were totally consumed, and four other stacks of wheat and hay much damaged. The fire is supposed to have been the act of an incendiary; and it is stated as a somewhat remarkable coincidence, that the first of the incendiary fires which took place in Kent in 1836 commenced in the same village.

Manchester.—The following Post-office robbery has recently been committed in this town. It seems that an individual, whose name is not yet known, went to the Post-office, and succeeded in obtaining the letters then in the box for delivery to Messrs. Joseph Rylands and Sons, cotton-spinners and manufacturers, New High-street, of which it is ascertained there certainly were two at least, each containing a remittance, viz,, one a cash order for 20*l.* 17*s.*, and the other a draft for a larger amount on the Provincial Bank of England, and the first halves of two Bank of England notes of 10*l.* each. It has been ascertained that on the same day a man went to the Manchester and Liverpool District Bank in the town, where he presented the cash order. As, however, it was not indorsed, the bankers declined paying it, and, detaining it, gave him a check drawn for the same amount, to bring them signed by Messrs. Ryland and Sons, when they said they would cash it. The man, however, never returned, and on the following day a person went to the Provincial Bank of England, Mosley-street, where he made a similar attempt to get the draft cashed, but unsuccessfully, the bankers discovering in it some discrepancy with respect to the endorsement which induced them to decline paying it; they, however, did not detain the prisoner, but suffered him to depart, and take the draft with him. A day or two since, Messrs. Rylands and Sons received through the Post-office a letter bearing the Manchester post-mark, consisting of a blank sheet of paper, inclosing the draft and the two half 10*l.* notes which had been sent with it in the intercepted letter of their correspondents. The superscription of this blank letter was, it is said, in the same hand-writing as that of the forged endorsement on the draft. The author of the theft, however, has not yet been detected.—Another serious fire has occurred in this town, in a machine manufactory on the south side of Store-street, near the viaduct of the Birmingham Railway. The building is one of large dimensions—being seven stories high, and about 40 yards by 25 in extent. The fire originated in the upper story, in the occupation of Messrs. Curtis, Parr, and Walton, patent card manufacturers: but having been discovered early, and several engines being soon on the spot, the flames were prevented from communicating to the other portions of the building, in which, it is stated, was about 15,000*l.* or 20,000*l.* worth of property, chiefly cards, ready finished for sale. The whole of the machines, however, with the exception of six or seven that were got out before the flames had caught them, were totally destroyed, and the loss is estimated at about 8,000*l*. The origin of the fire is not known, as all appeared to be safe when the workmen left the premises a few hours before.

Newcastle.—A local paper, the "Journal," informs us that the quantity of coals carried coastwise from the river Tyne exceeds 2,500,000 tons, and that the quantity exported to foreign parts exceeds 1,500,000 tons annually.

Norwich.—A petition having for the last six months been in circulation throughout this county for the abolition of the rural police, and notice having been given by the Earl of Orford that he would present it, a general meeting has been held in this city, at which several magistrates and nearly all the great landed gentry of the county were present—among whom were the Earl of Orford, Lords Bayning, Walpole, Wodehouse, the Dean of Norwich, and many others. The usual routine of business having been disposed of, the Clerk of the Peace read the report of the Chief Constable, Col. Oakes. It stated that the force was in such an efficient state as to repay every expense the county incurred, and that the conviction of offenders was but a small part of the benefit derived from it. The regulations insured a quick return of every occurrence from every part of the county, and an accurate account was kept of every public-house and beer-shop, with the characters of all who frequented them. The report went on to state at great length the benefits derived by the county from the force; and after it had been read, the Earl of Orford rose, and said he had to present a petition, praying for exemption, in certain districts, from the operation of the new rural police, or for its entire abolition. The noble earl proceeded to say that he entertained strong hopes that the growing dislike to the measure, the general public feeling of its non-necessity, and the great expense of the whole force, would press the matter upon the attention of Parliament, which would result in the adoption of some means of modifying the Act. "Was there," his lordship said, "no other plan that could be adopted, without going so suddenly into one of the most unconstitutional methods ever proposed by a despotic administration, which had taken away from the inhabitants of the county their ancient right, and the most beneficial one—that of self-government? The measure had placed an armed and disciplined force at the disposal of the Secretary of State, robbing the public of the means they formerly had to provide for their own security. The petitioners hoped that the memorial of so large a body of ratepayers, 1,400 in number, occupiers and owners of land to a great extent in the county, would receive due consideration, and that the resolution for the establishment of the new rural police would be rescinded, and the system of parochial constables again adopted." The noble earl concluded by laying the petition before the Court, expressing his intention to call for a definitive resolution respecting it at the next sessions. Other petitions to the same effect from different parts of the county having been read, Mr. Jermy, the Recorder of this city, addressed the meeting at considerable length against the further continuance of the force, which, he contended, was unconstitutional, and said that something must be done towards an alteration. The Hon. and Rev. R. Wilson then rose, and at great length defended the new rural police; answering *seriatim* all the objections made by the preceding speakers. He said, after what had been urged by them, it was necessary that some opinion should be expressed by the Court; and he concluded his address by moving a vote of approval of the force, and of thanks to the chief constable, Col. Oakes. The meeting concurred in this suggestion, and the motion was agreed to.

Oxford.—A requisition has been published, signed by 244 non-resident members of Convocation, headed by the High Steward, the Bishop of Oxford, and five other bishops of the Church, urging upon the Committees of Mr. Garbett and Mr. Williams, the two candidates for the vacant Professorship of Poetry, that they should endeavour to procure the consent of both candidates, and of their respective colleges, to the withdrawal of their names; and that they will appoint a deputation from both committees, to confer upon arrangements to that effect, in order that an opportunity may thus be afforded for a fresh nomination to the vacant chair. In reply to this requisition, Lord Ashley, on behalf of the London committee of Mr. Garbett, has declined acceding to this proposal, stating that the committee see no mode of avoiding an election in the usual course, unless the Oxford committees of both candidates could agree on some plan by which the sentiments of Convocation could be so clearly ascertained as to decide the contest and supersede the necessity of a poll. The committee of Mr. Williams, however, have been authorised by the president and fellows of Trinity College to take steps for carrying into effect on their part the objects of the requisition, and have appointed a deputation for that purpose—at the same time announcing that they feel it due to themselves and to Mr. Williams to state, that they understand the objects of the requisition to be, peace for the University and for the Church, without the sacrifice of principles or censure of persons.

Salisbury.—At the late quarter-sessions in this county a motion was carried by a majority of 19 to 17, "for a committee to inquire into the operation of the rural police force, with a view to consider whether any alterations can be made in the system, so as to effect a reduction of the present large expenditure." An amendment was moved by Lord Radnor that all the words after the word "any" be omitted, and the following substituted, "improvement can be made in the direction and administration of the force, so as to render it more effective." After some discussion his lordship's amendment was negatived.

Sevenoaks.—We noticed some time since the details of an inquiry instituted into the working of the system pursued in the Union at this place, under the operation of the New Poor-law, when, it will be remembered, several serious facts, relative to the accommodation and attendance on the poor, came out in evidence. The affair has since been under the consideration of the Poor-law Commissioners, who have just made public their official decision on the subject. The Commissioners state that they "feel themselves called on to pronounce an opinion as to the parties who are to blame for this state of things; and, painful as the duty is, they cannot shrink from its performance. They regret that when Mr. Tufnell, the Assistant-Commissioner, became acquainted with the state of the house, on the 11th Feb., 1841, he did not make a special communication on the subject to the Commissioners, and that he should have advised the postponement of building on account of the probable erection of district schools. They, however, conclude that he acted with the best intentions." With regard to the Board of Guardians generally, the Commissioners observe that they must have known that the total number of the inmates of the workhouse exceeded that which they considered it as capable of containing; consequently their attention ought to have been directed to the increased numbers, and they would then naturally have made such inquiries of the officers of the workhouse as must have elicited the painful facts for the first time disclosed in the late investigation. The Commissioners proceed to say that they cannot acquit the visiting committee of blame in omitting to make a sufficiently close examination of all parts of the house; and they see great reason to regret that no representation was made to the Board of Guardians by the visiting committee sufficiently strong to have pressed on the former body the absolute necessity which existed for hiring another building, or providing in some manner additional accommodation. The Commissioners, however, impute the principal share of blame to David and Elizabeth Gain, the late master and matron of the Sevenoaks Union workhouse, who, it is added, resigned their situations in September, and do not at present hold any office connected with the Poor-laws. Mr. Adams also, the medical officer, is pronounced to be guilty of very great neglect, and receives a severer censure than any other person mentioned in the judgment, because he made no written report of the state of disease in the workhouse before Jan. 1841.

Sheffield.—This town has been the scene of a serious attempt at murder, followed by suicide. It seems that three sisters, named Hannah, Sarah, and Harriet Poole, dressmakers, residing at Pye-bank, had for some time been persecuted by a young man named Vaughan, a table-knife manufacturer, who paid his addresses to the second sister, but who, in consequence of his dissolute habits, had been rejected by her. Having tried for some time to induce her to revoke her determination without effect, he adopted threatening language, saying he would destroy her, and in a variety of ways continued to persecute and annoy her. The girls at length found it necessary to apply to the magistrates to bind Vaughan over to keep the peace. He was summoned to the police-office, at which he made his appearance, but without remaining to answer to his name. A day or two after this occurrence, the sisters were alarmed by deceased rushing into the house where they were sitting, when closing the door after him, he drew two pistols, declaring that he would be revenged. He immediately fired one of the pistols at the second sister, Sarah, which just grazed her forehead, but she made her escape without receiving any serious injury. Vaughan then fired a second pistol at the youngest, Harriet, who, in attempting to save her sister, had shut herself in the room with the murderer; but fortunately, though the ball struck her shoulder and grazed her cheek, it caused only a slight wound, and she succeeded in making her escape through the window. The neighbours, being by this time alarmed, hastened to the spot, and endeavoured to force the door open, when Vaughan fired a third pistol through the pannel, wounding one of the men in the thigh. The police, however, having arrived, the door was burst open; but in the mean time two other shots were heard, and on entering the house Vaughan was found dead, having, with the last pistol, shot himself. An inquest was held on Saturday, when a verdict of *Felo-de-se* was returned. The affair has created considerable excitement in the town.—A daring robbery has been committed in one of the suburbs of this town, at the Mount, the residence of Mr. Montgomery, the poet. It appears that on Sunday evening, while all the inmates, except a maid-servant, were at church, two well-dressed men called, and saying they wished to write a note and leave it for Mr. Montgomery, succeeded in getting into the house, when, having bound the servant hand and foot, and shut her up in the cellar, they proceeded to ransack the house, which they robbed of money, plate, and other valuables to a large amount. On Mr. Montgomery's return home, he was surprised to find the street-door wide open, and the servant crying for assistance in the cellar. The thieves, however, had disappeared with their plunder, and no traces of them have since been discovered. Among the articles stolen was a massive silver inkstand, presented to Mr. Montgomery by friends, principally ladies of Sheffield, as a public compliment, several years since.

Windsor.—Active preparations are now making, both at the Castle and in St. George's Chapel, for the approaching christening of the Prince of Wales, on the 26th inst. A great number of workmen have, since Monday, been occupied in the chapel, making the necessary alterations, and on Saturday the first rehearsal of the music to be performed on the occasion took place in the presence of Prince Albert, by whom, it is said, the selection of the pieces has been made. It consists entirely of Handel's compositions, viz., the overture to "Sampson," occasional overtures, a grand march from "Hercules," and the Hallelujah Chorus. It is understood that the whole ceremony will be conducted on a scale of great splendour; thirteen state carriages, with upwards of seventy horses, including the Hanoverian black and cream-coloured horses, have arrived from town; and it is expected that there will be nearly one hundred carriages in the procession from the Castle to the chapel. During the christening week, it is stated, there will be a grand review in the Great Park, when several regiments, in addition to the Royal Horse Guards (Blue) and the 72d Highlanders, are expected from the neighbourhood of London; and it is rumoured that a park of artillery will arrive from Woolwich, in order that the military display in the presence of the King of Prussia, &c., may be upon a grand and extensive scale. On the same day, it is reported, new colours will be presented to the 72d Highlanders; but it does not appear to be yet known whether that ceremony will be performed by Prince Albert or the Duke of Wellington.

Railways.—Another serious slip took place on Friday the 7th inst. on the line of the London and Croydon Railway, near a place called Finch's Bridge, and immediately contiguous to the slip which took place a short time since. The quantity of earth which fell in was considerable, covering the rails on both sides for a distance of nearly 50 yards, and to a depth of nine feet. It seems that the down-train had not long passed when the slip occurred, which was fortunately attended by no accident. A careful watch, it is stated, has been kept near this spot for the last two months, in consequence of several flakes of earth having fallen at various times, from which a slip was anticipated, though not of so serious a character as it has proved. Mr. Gregory, the resident engineer, at once repaired to the spot, accompanied by Mr. Wilkinson, the chairman, and Mr. Cubitt, consulting engineer of the company, and six hundred men were set to work to remove the soil to a place near New Cross. In the course of the day, the number of men was increased to one thousand, and a platform was erected, covered with an awning, for the purpose of conveying the passengers over the slip to the trains on that part of the line which is still free from obstruction, and the object of which is to prevent the closing of the line, and enable passengers to proceed on their journey without being detained longer than ten minutes. It is expected that the line will not be properly cleared for upwards of a month. The accident is supposed to have been occasioned by the recent sudden variations in the weather.—An accident has happened on the branch of the St. Helen's and Runcorn Gap Railway, on the line of the London and Birmingham Railway. It appears, that as a train of coal-waggons was proceeding by the Union Plate-glass Works, at Pocket Nook, the swing bridge by which it should have crossed the Sankey canal was withdrawn, to allow a flat to pass, and, it is stated, without making the usual signal. The steam was immediately thrown off the engine, and the break applied; but, finding that an accident was inevitable, the engineer and stoker jumped off without receiving any injury, and the engine, with the tender and two of the waggons, were precipitated into the canal. With the exception of the damage done to the engine, the accident was productive of no further mischief.—We are informed by the "Railway Times" that the shareholders of the London and Birmingham Railway have recently presented to their chairman, G. C. Glyn, Esq., a piece of plate, of the value of upwards of sixteen hundred pounds, as a token of their approbation of the manner in which he has presided over the affairs of the railway during the last five years.—Another accident has happened on the line of the Great Western Railway in the Sunning cutting, near the spot where the late serious catastrophe occurred to the luggage train, whereby a policeman of the name of Dixon has lost his life. It appears that he was on the railway, signalling the up-train, when the down-train approached, unperceived by him, and killed him on the spot.—An accident occurred on the Manchester and Leeds Railway on Monday, owing to a collision of a luggage train and an engine and tender, by which an engineer was dangerously injured. It was stated at the time that this accident was followed by a second of a more fatal nature, occasioned by the rushing of the early passenger train amongst the broken carriages and overturned goods; but the report was found to be without foundation—the train, though delayed in consequence of the accident, having met with no injury.

IRELAND.

Dublin.—It has been intimated, in obedience to an order from the Lord Lieutenant and the Countess de Grey, to the gentlemen who intend appearing at the approaching drawing-rooms, that they may adopt gold or silver tissue poplin for waistcoats, to be of any colour or pattern, only the usual cut or shape of Court waistcoats. This intimation, it is said, has been given in accordance with a suggestion made to the Viceroy and Lady de Grey, that it would be the means of greatly promoting employment amongst the operatives of this city. It is stated that Sir J. Burgoyne and Mr. Pym are about to proceed from this city to be present at some experiments on the Atmospheric Railway, with Sir F. Smith and Professor Barlow, at Wormwood Scrubbs, the object of which is said to be to ascertain whether there is sufficient likelihood of success to justify the directors of the Dublin and Kingstown Railway in extending their line to Dalkey upon the atmospheric principle, and whether the Commissioners of Public Works in Ireland would be justified in lending money to the directors for this purpose.—On Sunday high mass was performed for the first time in the Mansion-house, Dr. M. Doyle, chaplain to the Lord Mayor, and Archdeacon of Glendalagh, officiating. His lordship, and several members of his lordship's family and household, assembled on the occasion.—The papers state that a curious will case is likely to occupy the attention of the legal profession this term, the particulars of which are as follows: An old lady, a Roman Catholic, named Whelan, after leaving various sums to Catholic charities, directed that in case of failure of issue on the part of her son, a sum of 10,000*l.* to which he was entitled, should go to the "Archbishop of Dublin," meaning Dr. Murray, the Catholic bishop, whose name was mentioned in another part of the will, to be disposed of in charity as he might think proper. The son has died, and the money is claimed by the Commissioners of Charitable Bequests, on the part of the Protestant archbishop, inasmuch as the law does not recognise any other.—Intelligence was received on Monday that Howth Castle, the seat of the Earl of Howth, situate about nine miles north of this city, had taken fire, and that its destruction appeared inevitable. Before, however, the engines had proceeded far towards the spot, a second account reached, stating that the fire had been got under, owing to the presence of mind of the Countess of Howth, (his lordship being absent,) who, with the assistance of the domestics, threw wet blankets over the parts ignited, and thus extinguished the fire before it had done much damage. The accident is said to have been caused by the bursting of the flue of an over-heated Arnott's stove.

King's County.—No official inquiry, beyond what was given in our last, has been instituted into the circumstances connected with the death of the man Flanagan, near Philipstown, in this county. From communications, however, which have appeared in the papers, it appears that the affair was much exaggerated; that deceased, who was at the time greatly intoxicated, accidentally set his own clothes on fire with a candle, and thus received the injuries from the effects of which he afterwards died. It is also announced, that Mr. Magan, at whose house the alleged murder was perpetrated, is about to vindicate himself to his friends by an appeal in the shape of a criminal information to the Court of Queen's Bench.—A serious outrage was committed on the 28th ult. on a man named Patrick Morcan, his wife, daughter, and three sons, near Moneygall, in this county, by a party of persons from the parish of Toom, county Tipperary. The father died on the 1st inst., from the effects of the injuries he received; the eldest son's life, it is said, is despaired of; and all the others appear to have been seriously injured. An inquest has been held, and, after a lengthened investigation, a verdict was returned of "Wilful murder" against Michael Shannahan, Thady Gleeson, John Kennedy, and William Kennedy, who have been taken into custody, and committed to take their trial. There are other parties, it is said, implicated in the affair, but they have not yet been apprehended.

Tipperary.—The gentry of this county have held a meeting in Clonmel, to give expression to their regret at the late wanton act of poisoning the Marquis of Waterford's hounds, noticed in our last Number. The Chairman, Mr. Moon, of Barr, said he would not be a party to offering a reward, as that might stimulate other ill-disposed persons to commit a like offence; but he would suggest that an address be presented to the noble marquis, expressing indignation at the outrage. The proposal was agreed to, and an address drawn up, which, it is said, received several hundreds of signatures.

Ulster.—A decision which has produced general excitement in this province, has just been given in the Court of Queen's Bench, Dublin, whereby all marriages in Ireland celebrated by Presbyterian ministers, where both parties are not Presbyterians, are declared invalid. The Presbyterians in this county, it is stated, amount to upwards of 600,000, and hitherto it appears that the celebration of marriages between Presbyterians and the members of other communities by Presbyterian ministers has been very general.

SCOTLAND.

Edinburgh.—A local paper states that Ministers have intimated that they intend to grant 10,000*l.* for the establishment of two normal schools, one in this city and one in Glasgow, with 1,000*l.* a year to defray the annual charge of management in both.

Glasgow.—A case of considerable interest has been under the investigation of the magistrates of this city, involving a charge of embezzlement to a serious extent against Mr. R. Smith, one of the tellers of the Glasgow and Ship Bank. It appears that information having been given to the police, by persons connected with the bank, that there were in Mr. Smith's cash transactions deficiencies to the extent of 2,000*l.*, that gentleman was taken into custody; and the books and papers found in his lodgings having been examined, there were found numerous documents of a suspicious character, and, among others, several bank checks for various sums, from 300*l.* to 1,000*l.*, on different banks, on which was the name of Mr. Wishart, wine and spirit merchant, High-street. It also appears that on being apprehended, Mr. Smith said that "he had been made a tool of," adding that he was "a second Beaumont Smith," or expressions of a similar import. In consequence of these expressions, and the discoveries above made, Mr. Wishart was also taken into custody; and among his effects it is stated there were found certain documents inducing the belief that the sum deficient must be to a much larger amount than at first reported, reaching, it is thought, to upwards of 10,000*l.*; and that Wishart had obtained cash from Smith to the amount of 6,000*l.* The system by means of which this fraud was effected does not appear to be known. The investigation before the magistrates has been conducted in private; but the above facts have transpired, and are stated to be correct. The prisoners have been committed to prison, to await a further examination.—On Saturday an accident occurred on the Wishaw and Coltness Railway, by which two lives were lost. The particulars appear to be as follows: the railway runs on an inclined plane as far as the village of Motherwell, and the waggoners, before starting from the top of the line at New Mains, are in the habit of placing the horses in a carriage or basket, when the train moves down the rails by its own momentum. On this occasion the waggoner followed the usual custom, and at the same time gave a man and woman a drive in one of the waggons. The train had proceeded to about half a mile from Wishaw when the first waggon entered a "lye"—the tongue having been left open—and being thus diverted from the straight course at the moment it was moving with great speed, it was overturned, and killed the two passengers on the spot. The accident is said to have been occasioned in a great measure by the carelessness of the driver. Each waggoner, it appears, has a large block between the wheels of the waggons that can be immediately put into operation, and restrain the speed, by simply moving a handle at the side of the vehicle. It is further said to be the driver's duty to go slowly when approaching lyes on the line, but that none of these precautions were observed on this occasion.

Stirling.—It appears that trade in this town and the surrounding district has been for some time, and still continues, in a depressed and discouraging condition. The local journals announce that three failures of houses connected with the woollen trade have taken place in the town within the last few days, and that it is feared these are merely the forerunners of a series of similar calamities. A great number of working people have been thrown out of employment in consequence, and general distress begins to prevail among the operative classes.

Paisley.—It is stated that the Lord Advocate has requested the Procurator Fiscal for the district to forward an official report regarding the recent stoppage of payments by this town, and the institution of the savings' fund by the corporation.

Greenock.—The half-yearly meeting of the Glasgow and Greenock Railway Company has been held in this town, at which it was unanimously resolved that a dividend of four per cent. for the past six months be paid to the shareholders.

Miscellaneous.

Emigration.—The following return which has been lately published, shows that emigration is still proceeding upon an extensive scale. Emigration from the United Kingdom:—

	England.	Scotland.	Ireland.	Total.
To North American Colonies . . .	5,305	3,053	23,935	32,293
United States . .	35,309	1,246	4,087	40,642
Other parts of America	44	—	—	44
West Indies . .	745	687	159	1,591
The Cape . . .	315	8	—	323
Australia and New Zealand . . .	14,495	817	538	15,850
	56,213	5,811	28,719	90,743

The late Census.—From the recent population returns there appears to be an almost exact uniformity in the proportion of males to females in England, for the last three out of the five censuses taken during the present century. The disproportion is greater in the two first periods, which is supposed to have been occasioned by the extensive draughts of the population requisite to carry on the war. In England, in 1801, there were 47·86 males to 52·14 females; and in 1811, the proportion was 47·97 to 52·03. In 1821 there were 48·69 males to 51·31 females; in 1831 there were 48·71 to 51·29; and in 1841 the proportion was 48·82 to 51·18. No distinction of sex was made in the published returns earlier than 1821, except for England. For the whole of Great Britain, in 1821, there were 48·44 males to 51·56 females; in 1831, 48·49 to 51·51; and in 1841, the proportion was 48·64 to 51·36.—We also learn from the report of the registrar-general, that selecting the Metropolis and twenty-four of the principal town and city districts, and comparing the registration returns from these districts with similar returns obtained from counties containing a less dense population, in which the inhabitants are chiefly engaged in agriculture, Mr. Farr has ascertained that the mean duration of life in the two classes of districts differs nearly seventeen years, the average of life between fifty-five years in the country and only thirty-eight in the towns. The density of the population in the country districts referred to, compared to that in the towns, is as 10 to 245; the mortality as 100 to 144. The returns also show an increase in the number of habitable houses within the last 40 years of no less than 89 per cent., whilst the population has only increased during the same period in the average of 78 per cent. In 1811 the actual increase of inhabited houses was 231,121, in 1821 it was 328,033, in 1831 there were 421,307, and in 1841 it was not less than 593,911. With respect to empty habitable houses, however, it seems that in 1801 they were 3·45 per cent., in 1811 as low as 2·88; in 1821 they were 3·27, in 1831 they were 4·44, and in 1841 no fewer than 5·41 per cent. It appears, therefore that in the present year there are nearly one-fourth more houses empty than in 1831.

A Female Village.—The following account appears in the *Augsburg Gazette*:—"The village of Madana, which is about sixty English miles from Rustchuk, in Wallachia, offers at the present moment a curious ethnographical singularity, having been inhabited by women only for the last thirty years. At one period this feminine population amounted to 2,000. The ladies did not live as warriors, like the Amazons of old, but avoided all intercourse with men, and drove away from their territories all who approached with matrimonial intentions. This anti-social settlement is now supposed to be on the decline; at least, no more recruits are made from the disappointed or the love-crossed, and the members of the population are rapidly decreasing. These women are nearly all Mahometans."

Law.

COURT OF CHANCERY.—*Attorney-General* v. *Corporation of Plymouth.*—This was an appeal from an order of the Master of the Rolls. The plaintiff claimed, as part of a charitable bequest, the possession of the leat constructed by the celebrated circumnavigator Sir Francis Drake, a water-course running through the town of Plymouth, and supplying part of the houses with water. The corporation alleged that it was the waste water only which belonged to the charity. To determine this point, inspection of the original grant and other papers became necessary. The Master of the Rolls, however, refused leave to amend, on the ground that due diligence had not been used in the conduct of the suit, and in preparing the amendments. The Lord Chancellor briefly intimated his opinion that no unreasonable delay had occurred, and therefore the application to amend must be granted.

In re Turner.—This was an application for confirmation of the report in this case. The Lord Chancellor said that there was a reference in the report to some leases; but they were not set out as they ought to be. The better way, to save expense, would be to put in the original deeds, and verify them by affidavit before the officer. The report might then pass without further application to the Court.

VICE-CHANCELLOR'S COURT.—*Salisbury* v. *Morrice.*—This suit, which was heard at great length in Michaelmas term, was instituted by Mrs. Salisbury, daughter of the late Mr. F. Webb, who formerly carried on an extensive business as land-agent and surveyor, in partnership with his nephew, Mr. Richard Webb, and Mr. Attwood, at Salisbury, and the bill prayed an account against the representatives of Mr. R. Webb, of those sums of money which, but for his wilful default, might have been received by him in his alleged character of agent for Mrs. Salisbury in respect of her being executrix of Mr. F. Webb's personal estate, and also as land-agent for her in the management of the extensive real estate of which she was devisee for life under Mr. F. Webb's will. A cross-suit was instituted by the representatives of Mr. R. Webb against Mrs. Salisbury, and the argument was raised upon the two suits. The Vice-Chancellor, in giving judgment, entered at length into several points, which he said must be considered with regard to the form in which the decree should be made, and concluded by saying that he thought, on all the evidence taken together, Mr. R. Webb was a man of great probity, though it was shown in the correspondence, as early as 1817, complaints were made by Mrs. Salisbury of his not receiving the rents, and his backwardness was also referred to by Lord Fitzharris and other persons; but his Honour supposed the fact to be, that his talents were such, that he was employed by more people than allowed him time to execute all his business, and that a fall which he received rendered him, in some degree, physically unable to get through the load of business that was thrust upon him. His character appeared, in a moral point of view, to have been quite irreproachable, but he was certainly negligent in making out those accounts which, as agent, it was his duty to have made out from time to time. He should therefore pronounce one decree in both suits for an account to be taken, and in that account he was of opinion that R. Webb's estate ought to be charged with what he might have received but for wilful default.

M'Duff v. *Hyde and another.*—This was a motion *ex-parte* for an injunction on behalf of the plaintiff, who was an officer in the British Auxiliary Legion in Spain, to restrain the defendant, Hyde, from receiving any further instalments on a *titulo*, or certificate, given him in Spain for the amount due to him for his services. The injunction was also asked against the Spanish agent authorised to pay the money. His Honour thought it a case for an injunction.

Cockburn v. *Singleton.*—The substance of this case, which now stood for judgment, and which had already occupied the Court several days in the sittings after last Michaelmas term, was as follows:—In the year 1833, the Dean of York, the plaintiff, entered into a treaty or contract with William Henry Thompson, for the purchase of a reversionary lease for lives of property in the county of York, being the farm at Kilham, containing about 570 acres, certain money payments at Kilham, amounting to 102*l.*, in lieu of rectorial tithes, and also a moiety of the rectorial tithes of the parish of Swathorpe, in the same county. The beneficial interest in the lease was vested in an elderly lady of the name of Anne Thompson, for life, and it subsequently became vested in William Henry Thompson. The farm at the time was in the occupation of the defendant Milner, and had been so for some years. He held it as a yearly tenant under Anne Thompson, at a rent of between four and five hundred a-year. A passage had been read from one of the answers—from that of the defendant Singleton—showing that in the year 1824, the Dean, who thought the rent too low, was told by John Singleton, the younger, who was a surveyor or land agent, that he thought it was a fair rent. In April 1833, the treaty with William Henry Thompson was brought to a conclusion by a written agreement between him and the Dean, by which it was agreed that in consideration of 400*l.* paid down, and 6,000*l.* to be paid in the course of six months, the lease subject to Anne Thompson's life estate should be conveyed to the Dean. The Dean gave his bond for the 6000*l.* It was in proof between the parties that Singleton was consulted by the Dean on the subject of this purchase, and that he was to find the 6000*l.* for the Dean when the purchase-money became payable, and agreeing to give him the preference in purchasing the lease when the reversion should come into possession. Milner, in his answer, stated his belief that the plaintiff had, for some years previously to 1835, employed the defendant Singleton as his agent in the management of his affairs; but he did not find in the answer any distinct statement whether, in April 1835, Milner had or had not such belief, nor was he aware that such a question was put to him by the bill. His Honour Vice-Chancellor Bruce, in giving judgment, said it was necessary to see how far the parties stood in the same situation as they did at the close of 1835. It appeared that in 1836 Milner filed a bill for the purpose of establishing the agency of Singleton in the agreement of April, and to obtain a conveyance of the property in question. Singleton denied the agency and defended the suit, and both parties went into evidence. The Dean and others were examined, and in July 1840 a decree was made, directing an isssue to try the agency, which was found, at York, in favour of Milner. Singleton afterwards moved unsuccessfully for a new trial, and on the 21st July, 1841, a decree was made for a conveyance. The Dean was no party to the suit of Milner, nor was it necessary, for the legal estate had passed out of the Dean, and was vested in Singleton by the agreement of August 1835. Milner's suit was instituted within five months after the lease was granted; but it was not until three years after the commencement of Milner's suit that the present bill was filed: and now the Court was asked to undo or to render fruitless all that the verdict and the decree had done by taking back this property, to which Milner had been declared entitled after so much anxious and expensive litigation. His Honour, therefore, was of opinion that the plaintiff's own delay and conduct since May 1835 precluded him relief as far as Milner was concerned. Considering that the plaintiff himself did not put his case higher than inquiry—considering, too, the manner in which he had brought before the Court the main question in the cause, and, moreover, considering his delay—he felt that he must dismiss the bill against Singleton as well as against Milner; but he should not give any costs.

Walker v. *Jeffreys.*—In 1791, John Read, being the owner of certain tenements and parcels of arable, meadow, and pasture land, consisting of about 47 acres, situate at Tibbington, in the county of Stafford, which was subject to a mortgage to Abraham Cocker, and being also owner of the mines and minerals under the same land, was desirous of working such mines, for the benefit of himself and partners, W. Bancks and J. Dumaresq; and for that purpose Cocker joined with him (Read) in conveying the premises to John Carpenter, in fee, to enable Carpenter to grant a lease of the same premises to Read and his partners. The lease was accordingly granted, and was for a term of 42 years, reserving a rent for the surface and a royalty for the minerals; and it contained a covenant that the lessor would grant a renewed lease of the premises for a term of 21 years, to commence from the expiration of the first lease. The defendant refused to make a further lease, and the present bill was filed two years and upwards after the refusal for a specific performance of the covenant to grant the new lease. His Honour Vice Chancellor Wigram, after entering at length into the merits of the case, said he should direct an issue to try the question, whether the mines were drowned out by reason of any default in the lessees in not fully getting and regularly working the same mines, according to the covenants in the lease? He did not intend that these should be the exact words of the issue. It would be better to have the form of the issue discussed, so that the real question in this respect might be properly sent to trial, and at the same time the opinion of a court of law obtained upon the construction of the covenant.

Morris v. *Vivian and others.*—This was an application for an injunction to restrain the defendants, who constitute the Swansea Coal Company, from continuing open the pit or shaft on the Wernfield Colliery, which is situate in Glamorganshire, or any pit or shaft, not being sufficiently secure and made water-tight; and from continuing or using any pit or shaft, whereby the surface or crop-water should be drained into the plaintiff's colliery and works. The Vice-Chancellor did not think it was a case for an injunction, which was accordingly refused.

Faith and Another v. *Aguilar and Gibbs and Co.*—This was an application to the Court made on behalf of the defendants, Messrs. Gibbs and Crawley, to dissolve an injunction which was awarded by this Court on the 4th July, 1838, restraining the defendant Aguilar and his agents from getting-in any part of the outstanding personal estate of Dominigo Mattey, in England, and restraining the defendants, Messrs. Gibbs and Co., from paying over to Aguilar, or to any person, save under the direction of the Court, any sum or sums of money due from them to the same estate, until the said defendant Aguilar had answered the plaintiff's bill; and the present notice of motion also asked that in case the Court should not deem it fit to absolutely dissolve the injunction, that it would at least dissolve so much of the injunction as restrained the Messrs. Gibbs from proceeding in an action at law which they had brought against the plaintiffs upon certain bills of exchange in their possession. His Honour Sir L. Shadwell, decided that the injunction should remain in force against the parties, except as to that portion of it which restrained Messrs. Gibbs and Co. from proceeding in their action at law upon the bills of exchange, and which action at law his Honour thought the defendants, Messrs. Gibbs and Co., might have, under the circumstances of the case, they being merely trustees of the bills, and not the agents of Aguilar, who have hitherto prosecuted notwithstanding the injunction which in this case has been obtained against them.

Thompson v. *Derham and others.*—His Honour, Vice-Chancellor Wigram, gave judgment in this case, which had been heard in his private room on the 31st Dec. and the 4th inst. It had been brought on as a motion for an injunction to restrain the defendants, who were assignees, from paying any dividend which might be declared upon debts which had been, or hereafter might be proved against the joint and separate estate of the bankrupts until the further order of the Court, or, at all events, without reserving so much as would insure 40,000*l.*, with interest, to which the plaintiff claimed to be entitled under the will of a Mr. W. Hind, who had during his life become a partner with the bankrupts, in the trade of worsted-spinners and woolstaplers. His Honour, after reading through the articles of partnership, and the will of the testator, and also referring to the proceedings which had already taken place in the Court of Review, the details of which were wholly uninteresting, stated that he should refuse the motion.

ROLLS COURT.—*Thorp* v. *Owen and others.*—In this case the plaintiff moved for liberty to make an entry in the Six Clerks' office of a memorandum of the service of the copy of the plaintiffs' bill, which was a supplemental one, omitting the interrogating part thereof, upon John Willis Grane, one of the defendants.—Order granted.

In the matter of Browne's Charity.—This was a petition presented by Walter Hunter, John Trulock, and Walter Gandy, praying that the Rev. Hamlet Harrison, rector of St. Mary, Stratford, Bow, and William Hoile, might be compelled to transfer a sum of 1,400*l.*, so as to vest the same in the Rev. H. Harrison and William Hoile, jointly with Walter Hunter, who had been appointed a trustee. No objection, it appears, was made by the defendants to the transferring the fund, but they claimed exemption from the costs of the petition. Lord Langdale said that the costs which had been incurred had been occasioned by the rector; and therefore he must pay, not only the costs of the petitioner, but also those of Mr. Hoile.

COURT OF QUEEN'S BENCH.—*The Queen* v. *John Kemble Chapman, Printer and Publisher of the "Sunday Times."*—This was an application on the part of Mr. Grove, the police magistrate of Greenwich, for a rule calling upon defendant to show cause why a criminal information should not be filed against him for a libel on Mr. Grove, which had appeared in the *Sunday Times* newspaper of the 1st Nov., 1841. The article complained of was headed, "Heartless Conduct of Mr. Grove, the magistrate," and contained some severe animadversions on Mr. Grove's conduct as a magistrate.—Rule granted.

The Queen v. *the London and Greenwich Railway Company.*—This was an application for a rule calling upon defendants to show cause why a *mandamus* should not issue, commanding them to direct a precept to the sheriff of Surrey to empannel a jury for the purpose of assessing the amount of compensation which ought to be awarded to Messrs. Payne and Slee, vinegar-merchants, in Church-street, Bermondsey, for the injury which they had sustained in consequence of the construction of the railway.—Rule granted.

The Queen v. *the Rev. Henry Cleveland.*—This was an application on the part of Earl Fitzhardinge for a rule calling upon the defendant to show cause why a criminal information should not be filed against him for a libel on the noble Lord. The libel complained of consisted in a letter signed "Junius," addressed to her Majesty, which appeared in the *Morning Herald* on the 27th Aug., in which the writer went on to tell a story of a certain person who had seduced and carried off by force a young lady from Clifton, in the neighbourhood of Bristol. Allusions were made in the letter of such a character that the noble Earl felt satisfied he was the party referred to, and on instituting inquiries he had ascertained that the defendant was the author of the letter.—Rule granted.

The Queen v. *the Postmaster-General.*—This was a motion for a rule to show cause why a *mandamus* should not issue to the Postmaster-General, or the proper officer under him, commanding him to deliver up to the interim factor (so called in the Scotch law, but who acts in the character of an English assignee) of Arthur Strahan and Co.'s bankrupt estate, all the letters which might come to the post-office addressed to the bankrupts. The Postmaster-General, it seems, had intimated that he could not comply with the wish of the factor. Lord Denman said that the case was one of perfect novelty. If the learned counsel could find any case requiring the court to act on the future conduct of the Postmaster-General, he might renew the application, otherwise it must now be considered as refused.

The Queen v. *Thomas Rowley.*—This was an application for a rule calling upon the defendant to show cause why an information in the nature of a *quo warranto* should not issue commanding him to show by what authority he exercised the office of town-councillor of Lichfield.—Rule granted.

Jones v. *Gurdon.*—This was an action for trespass. The defendant was a justice of the peace in the county of Suffolk, and had convicted plaintiff under the game laws, for having unlawfully had a hare in his possession, not being licensed for that purpose. The information on which the defendant adjudicated had been originally laid before another justice. The plaintiff brought this action for false imprisonment, alleging that, under these circumstances, the conviction was illegal. At the trial, the jury assessed the damages at 10*l.*: but the judge nonsuited the plaintiff on some technical objections, giving him, however, leave to move the court to enter the verdict in his favour for the amount of the damages assessed. A rule had since been obtained, according to the leave reserved, and the case was argued in the course of last term. Lord Denman now delivered judgment, and said that the Court was clearly of opinion that under the game acts it was not competent for one justice to hear and determine a complaint which had previously been exhibited before another justice, and therefore the rule for entering the verdict for the plaintiff for the damages found at the trial must be absolute.

The Queen v. *Topping.*—This was a case in which a rule had been obtained to file a criminal information against the defendant for the publication, in a Hull newspaper, of a libel upon the justices assembled at the Hull sessions, in which certain slanderous imputations were cast by him upon them with relation to the matter of granting licences. The counsel for the defendant, however, having said that he was instructed by his client to apologize for the libel, the rule was discharged.

Darbon v. *Rosser.*—This was an action for a breach of promise of marriage tried last term, when the jury returned a verdict for plaintiff, with 1,600*l.* damages. An abstract of the trial was given in this paper at the time. An application was now made for a rule to show cause why the verdict should not be set aside and a new trial should not be had, on the ground that the damages were excessive. The [illegible] intimated that it would be as well for the parties to have time to consider whether they could not agree to fix some reasonable amount of damages, and therefore gave leave to the learned counsel to mention the case again in a week's time.

Brune v. *Thompson.*—This was an application for a rule to show cause why a nonsuit entered in this case should not be set aside, and a new trial granted.—Rule granted.

The Queen v. *Kenrick the elder and younger.*—This was an indictment against the two defendants for conspiracy to defraud G. W. Featherstonhaugh of a sum of 168*l.* by falsely representing a phaeton and a pair of ponies to be the property of a lady. The case was tried before Lord Denman, when a verdict of guilty was pronounced. Application was now made to set aside that verdict on several grounds.—Rule to show cause granted.

BAIL COURT.—*Doe dem. Sturt* v. *Mobbs.*—This was a motion for a rule to show cause why the plaintiff should not be at liberty to issue an execution on the judgment obtained in the cause, notwithstanding a writ of error.—Rule granted.

Exparte Bernard Cavanagh.—This was a motion for a writ of *habeas corpus*, directed to the Keeper of Reading gaol, to bring up the body of Bernard Cavanagh, who had been committed to Reading gaol under a warrant which it was submitted was illegal. The details of this case have already appeared in this paper. Mr. Justice Williams said, that he would grant a rule to show cause why a writ of *habeas corpus* should not issue. He did so on the ground that it was doubtful whether the defendant had been guilty of an offence that brought him within the provisions of the Vagrant Act. He did not think there was anything in the objection taken by the counsel of the defendant, that the false pretence that he could fast five years and a half had not been negatived.

COURT OF COMMON PLEAS.—*Avelett* v. *Goddard.*—This was an application for a rule to show cause why the verdict found by the arbitrator in this case should not stand, and the issues be entered generally for the plaintiff. The action was for a debt of 300*l.*, and defendant pleaded, in the first place, the general issue; secondly, payment; and thirdly, a set-off to a greater amount than the sum claimed in the declaration.—Rule granted.

Harrison and others v. *Heathorn and others.*—This was an application for a rule to show cause why the verdict which had been found for the plaintiffs should not be set aside, and a verdict be entered for the defendants. The action was tried before the Lord Chief Justice at the London sitting after last term, and was brought to recover a sum of money from the defendants, as the shareholders and directors of the Anglo-American Gold Mining Association. Several objections were made during the trial, but overruled; and his Lordship directed the jury to find a verdict for the plaintiffs, giving the defendants leave to move.—Rule granted.

Crawshay v. *Thompson and others.*—This action, it will be remembered, was tried at the London sittings after last term, before the Lord Chief Justice, and was brought by Mr. Crawshay, the iron-master, against the defendants, Alderman Thompson and Messrs. Foreman, his partners, on the ground that they had improperly marked their iron with the letters "W. O.," in an oval, in order that it might be taken in the Turkey market for the iron of Mr. Crawshay, which bore the mark of "W. C." in an oval. Application was now made for a rule to show cause why that verdict should not be set aside and a new trial had, on the ground of misdirection, and of its being against evidence.—Rule granted.

Bulmer and another v. *Gillman.*—This was a motion for a rule to show cause why the verdict which had been found for the plaintiff should not be set aside and a new trial had. The cause was tried before the Lord Chief Justice at the Middlesex sittings after last term, and was brought by the plaintiffs to recover a sum of money for work and labour done as parliamentary agents in carrying a bill through the House of Lords for improving the city of Norwich. The motion was made on the ground of misdirection. The Court granted the rule.

COURT OF EXCHEQUER.—*The Attorney General* v. *Pearson.*—The Attorney-General said he was anxious to obtain the opinion of the Court on a question of very great importance touching the jurisdiction of the Court. Their Lordships were aware that by a late Act of Parliament the equity province of the Court in ordinary cases between subject and subject was abolished, and all proceedings then pending at the equity side of the Court were transferred to the Court of Chancery. The question which he wished to submit to their Lordships was, whether the equity jurisdiction of the Court in revenue causes, as well as in cases between subject and subject, had been transferred to the Court of Chancery? He admitted that the language of the Act of Parliament left the matter in some doubt, but he believed that the opinion of persons best acquainted with the subject was, that the framers of the Act did not intend the equity jurisdiction of the Court in revenue causes to be transferred. Lord Abinger said that the Court would give no definite opinion on the point, but they thought it better that the matter should be argued in the first instance before the Lord Chancellor.

Neilson v. *Harford.*—This was an action for the infringement of a patent which was tried before Baron Parke, and a verdict found for the plaintiff, with one shilling damages. An application was now made on the part of the defendant for a rule calling on the plaintiff to show cause why the Master should not be directed to review his taxation.—Rule granted.

Hutchinson v. *Hughes.*—This was an application to set aside a judgment in an action on *scire facias* against the defendant as the public officer of a banking company.—Rule to show cause granted.

SHERIFF'S COURT.—*The Queen* v. *the late Theodore Hook.*—The Court sat specially on Monday for the purpose of executing a writ of extent which had been sued out at the instance of the Crown, to inquire what property the late Theodore Hook was possessed of and entitled to at the time of his death. Mr. Rowe, who appeared for the Crown, in stating the facts of the case to the jury, said that in 1813 Mr. Hook obtained an appointment under government in the Mauritius, which he continued to fill till 1818, when it was found there was a certain deficiency in his accounts, and a commission was appointed to inquire into them, the result of which was that he was found to be indebted to the Crown in the sum of 12,585*l.* 14*s.* 6*d.* The Crown issued an extent against him at the time, but on the petition of himself and some friends it was superseded. Still, however, if the Court should be of opinion that Mr. Hook was a Crown debtor, his property would be liable to be seized by the Crown, inasmuch as his other debts and liabilities were incurred at a subsequent period. It appeared that before his death, Mr. Hook, who had been in difficulties, borrowed 4000*l.* of a Mr. Joel Edwards, as security for which Mr. Hook made over to that gentleman a quarter share of the profits and stock in trade of the "John Bull" newspaper, of which he was possessed at the time, and further promised to insure his life for 2000*l.* This, however, he failed to do, and Mr. Edwards had done it for him to the amount of 4000*l.* The premium Mr. Edwards had paid out of a sum of 400*l.* a year, which he received from the "John Bull" office, upon the order of Mr. Hook, who as editor of that publication received 500*l.* a year. On the whole, Mr. Edwards admitted he had received 2300*l.* in this way, and on the death of Mr. Hook had been paid the 4000*l.* from the insurance office. Mr. Rowe said that the Crown was anxious to do justice; but if Mr. Edwards insisted upon the course he had adopted, the Crown would take the high ground of asserting its priority of claim, and the mortgage deed held on Mr. Hook's interest in the "John Bull" would be thereby rendered as valueless as a piece of waste paper. Witnesses were then called by Mr. Rowe, and their testimony established the truth of the above statement. Mr. Edwards also underwent a lengthened examination, during which he admitted the facts as stated by Mr. Rowe, but added that Mr. Hook altogether owed him 8000*l.* at the time of his death, and he had applied the 4000*l.* towards liquidating that amount. Mr. Hopkinson addressed the court on behalf of Mr. Edwards, and contended that he was justified in what he had done; and after considerable discussion, the jury returned a verdict setting forth the facts as they appeared in evidence, and leaving the parties to contest the matter hereafter in the Court of Exchequer.

TATTERSALL'S—THURSDAY.

THE DERBY.—The only bets laid were 1,000 to 25 agst Mr. G. Clark's Meteor, 1,000 to 25 agst Lord Westminster's Auckland, 2,000 to 40 agst Lord Chesterfield's Joanna colt, and 2,500 to 50 agst Mr. Pettit's Espartero. No others mentioned.

MARK LANE, FRIDAY, JAN. 14.—The new Wheat sold on Monday comes in bad condition, consequently several refusals have taken place, from which cause the market is exceedingly flat. In free Foreign there has been scarcely any business doing, but there is some inquiry for floating cargoes of yellow Polish at 50*s.*; freight and insurance included.—Barley, Peas and Beans remain as on Monday.—The Oat trade is in a state of stagnation.

GAZETTE OF THE WEEK.

INSOLVENTS.—J. Nettleton, Old Hat Inn, Ealing, Middlesex, licensed victualler—J. Coles, Victoria, Monmouthshire, surgeon and apothecary—T. Heslop, Ripley, Yorkshire, schoolmaster—J. G. Smith, Bath, common brewer—J. Cuisset, Blackfriars-road, Surrey, jeweller.

BANKRUPTS.—T. Kitchener, Arundel street, Coventry-street, Middlesex, engraver—J. Goodwin, Bishop's Stortford, Hertfordshire, innkeeper—S. Moore, King William street, London-bridge, draper—D. Stevenson, sen., 25, Compton-street, Brunswick-square, patent safety paper maker—T. Bartram, Sevenoaks, Kent, linendraper—W. Nicholls, Adam's-mews, Edgware-road, Middlesex, livery stable keeper—J. F. Buisson, Brabant-court, Philpot-lane, London, merchant—A. Strachan, Friday-street, Cheapside, warehouseman—D. B. Smith and J. W. Smith, Alton, Staffordshire, paper manufacturers—R. Turner, Northampton, shoe manufacturer—D. Davies, jun., Glanchywedog Llanidloes, Montgomeryshire, flannel manufacturer—W. Roberts, Rawmarsh, Yorkshire, grocer—J. Stephens, Menhenlot, Cornwall, ironfounder—G. Howarth, late of Halifax, Yorkshire, but now of Todmorden, Lancashire, corn dealer—W. H. Apsey, Globe Wharf, Rotherhithe, ship breaker—G. Novra, Red Lion-square, Middlesex, importer of foreign goods—J. Denniss, sen., and J. Denniss, jun., Tooley street, Surrey, linendrapers—B. Ward, Charlotte-terrace, New cut, Lambeth, boot and shoe manufacturer—W. Povey, Ashton-under-Lyne, grocer—J. Sutcliffe, Halifax, grocer—J. Ellison, Leeds, nail manufacturer—W. Carpenter, Chippenham, Wiltshire, innkeeper—E. Evans and A. Evans, Birmingham, painters—A. Spoor, sen., and A. Spoor, jun., Newcastle-upon-Tyne, builders—H. Tugwell, Fawley, Southamptonshire, farmer—J. Lane, sen., Stockport, cotton manufacturer—S. Clough and W. T. Clough, Eccleston, Lancashire, alkali manufacturers—R. Wilcock, Allithwaite, Cartmel, Lancashire, banker.

SCOTCH SEQUESTRATIONS.—J. Deans, Peacockbank, and T. Deans, Draffen, carpet manufacturers—A. Steel, Stirling, merchant—D. Millar, Glasgow, builder—W. Douglas, Glasgow, manufacturer and dyer—J. Bendelow, Kirkaldy, innkeeper—A. M'Kinlay, Glasgow, cloth merchant—D. Smith, jun., Airdrie, ironmonger—R. Campbell, Dunfermline, iron and brass founder—W. Arbuckle, Ayr, flesher—J. Lindsay, Glasgow, victualler.

BIRTHS.—On the 3d inst., at Neufchatel, in Switzerland, Mrs. F. Vulliamy, of a son—On the 5th inst., at 56, Hunter-street, Mrs. Mardon, of a son—On the 6th inst., at Stratton Strawless, in Norfolk, Mrs. Arnold Keppel, of a daughter—On the 7th inst., in the Strand, Mrs. Halse, of a son, stillborn—On the 8th inst., at G. Byng's, Esq., M.P., St. James's-square, the Lady J. Thynne, of a daughter—On the 8th inst., Mrs. J. F. Binsson, of a daughter—On the 8th inst., Mrs. Taylor, of Mecklenburgh-square, of a son—On the 8th inst., at Windsor, the wife of J. Frazer, Esq., of Alchnagairn, of a daughter—At Kensworth, Herts, on the 6th inst., the lady of F. Hamilton, Esq., of a son—On the 9th inst., the lady of W. Haigh, Esq., of a daughter—On the 9th inst., at Lower Clapton, Mrs. R. Munt, of a son—At 13, Great Coram-street, Russell-square, on the 9th inst., the lady of Lieut.-Col. C. Smyth, C.B., of a son—On the 9th inst., at the St. Katherine Dock-house, the widow of the late C. Carter, Esq., of a son.

MARRIED.—On the 16th Nov. last, at Bangalore, East Indies, Major H. Prior, commanding the 22d Light Infantry, to Georgiana Gifford, eldest daughter of Major-General James Allan, C. B., commanding the Mysore division of that army—On the 6th inst., at St. Thomas's Church, Portsmouth, the Rev. I. P. Prescott, eldest son of Capt. Prescott, C.B., R.N., to Caroline Mary, eldest daughter of the late Capt. Parke, R.M.—On the 6th inst., at Rougham, the Rev. E. J. Ash, rector of Brisley cum-Gately, Norfolk, to Jane Charlotte, third daughter of Col. Ray, of Eldo House, near Bury St. Edmunds—On the 8th instant, at Lee Church, William Atkins, Esq., surgeon, to Matilda Elizabeth, only daughter of W. Ive, Esq., ship builder, both of Deptford, Kent—On the 14th ult., at Hamburgh, George, son of the late [illegible] Jones, Esq., of the Grove, Highgate, to Anna Maria, only daughter of the late G. N. Linck, Esq., of Hamburgh.

DIED.—At Kew Green, on the 10th inst., Aylmer Bourke Lambert, Esq., the eminent botanist, in the 81st year of his age—At Vienna, on the 1st inst., Sir Samuel Hannay, Bart.—At Earl's Court-terrace, Old Brompton, on the 11th inst., Walter Henry Watts, Esq., aged 64—At Hampton Court, on the 11th inst., the Countess of Erne, mother to Lady Wharncliffe, and grandmother to the Hon. J. S. Wortley, M.P. for Yorkshire—At Cowes, on the 11th inst., Lieutenant-General Mainwaring, aged 80 years—At Harley, near Wenlock, the Rev. R. Ratcliffe, in the 70th year of his age—At Fernando Po, in the 33d year of his age, Horatio Collman, assistant-surgeon in the Niger expedition, and late surgeon, of 41, Old Broad-street, City—On the 20th Oct. last, in his 33d year, R. Davidson, Esq., of the Hon. East India Company's Madras Civil Service, fifth son of James Davidson, Esq., of Sayes-court, in the county of Surrey—On the 29th Oct., in action, between Cabul and Jellalabad, Capt. C. Wyndham, of the 35th Regiment, British Native Infantry, aged 34, third son of G. Wyndham, of Roundhill-grange, near Wincanton, and cousin of Wm. Wyndham, of Dinton, Wilts.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN No. 2.

Alkalies of plants . . . 24 a
Amateur's Garden . . . 21 b
Apples, a selection of . . 25 b
— value of root-pruning . 22 b
Bicton, noticed . . . 24 b
Bunch, described . . . 25 b
Bundle, described . . . 25 b
Butter, bad . . . 24 a
Ceratonia siliqua, noticed . 25 a
Chatsworth, described . . 20 a
Chrysosplenium as an edging . 23 a
Clay, to improve . . . 25 b
Cucumber, Allen's Victory . 22 c
Currant, black, to prune . . 25 b
— red, its improvement . 21 c
Edgings, plants for . . 23 a
Elder seeds, their vitality . . 24 a
Entomology, works on . . 23 b
Epidendrum latilabrum . . 24 a
Foresting, remarks on . . 19 b
Fruit-tree borders, their formation 22 b
Gardener, life of . . . 21 a
Gesnera elongata, a greenhouse plant . . . . . 21 c
Gesnera zebrina . . . 23 c
Hand, described . . . 25 b
Hemerocallis, treatment of . 25 b
Icehouses, to fill . . 22 b, 23 a
Kenrick's new American Orchardist, rev. . . . 24 b

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, January 15, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 4. SATURDAY, JANUARY 22, 1842. PRICE 6*d.*

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITIONS AT THE GARDEN for the year 1842. The Exhibitions will take place in the months of May, June, and July, upon Saturdays, under the following regulations.

EXHIBITORS.

All persons, whether Fellows of the Society or not, will be at liberty to send subjects for exhibition.

DELIVERY OF OBJECTS FOR EXHIBITION.

Exhibitors are earnestly requested to notify in writing, previously to the day of meeting, what plants they intend to supply, in order that due provision may be made for the proper distribution of the specimens, &c. on the exhibition tables. The best places will be secured for those who comply with this request.

As it is necessary that the judges should proceed to consider the respective merits of the exhibitions by 10 a. m., and as it is absolutely indispensable that the tables should be arranged by that time, it has been determined that no subject for exhibition shall be admitted into the Garden after half-past 8 o'clock in the morning; and if the owners of any locked-up boxes, or other cases, should not be in the Exhibition-tent at the said hour, such cases or boxes must be excluded from competition for medals.

All specimens, whether of fruit or flowers, will remain untouched until after 6 o'clock, when they will be delivered into the hands of the Exhibitors, who are most particularly requested not to give away their cut flowers in the tents, as much confusion has been found to arise from that practice.

ADMISSION OF EXHIBITORS.

Exhibitors, or other persons required to assist in bringing in the objects for exhibition, will be admitted before half-past 8 in the morning at the Carter's-yard entrance gate.

Every principal exhibitor of subjects for which medals are specifically offered will be furnished with one pass-ticket, which is not transferable, for which he is requested to apply before 10 o'clock, at which hour the Garden will be cleared of all persons not officially detained there.

Exhibitors may re-enter the Garden after 1 o'clock, when they will be required to give up their pass-tickets at the Carter's-yard gate.

FLOWER-STANDS.

No box or stand shall exceed eight inches in height at the back, or eighteen inches in depth from front to back. The lids of all boxes must either be loose or made to unhinge. No box with a fixed lid will, on any pretence, be allowed to stand upon the tables. If a box not constructed of the dimensions above given is sent in, it may be placed on the tables, if there is room for it, but it is liable to exclusion.

MEDALS AND REWARDS.

The Society distributes the following Medals and Rewards; namely,

			£	s.	d.
C.	The Certificate	value	0	10	0
SB.	Silver Banksian Medal		1	0	0
SK.	Silver Knightian ditto		1	5	0
LS.	Large Silver ditto		1	15	0
SG.	Large Silver Gilt ditto		4	0	0
GB.	Gold Banksian ditto		7	0	0
GK.	Gold Knightian ditto		10	0	0
LG.	Large Gold ditto		20	0	0

Exhibitors to whom any of these shall be awarded can exchange them one for another, or may receive their value in money, or in plate. If within one month after the Third Exhibition of the year no intimation shall have been received from an exhibitor of the manner in which he desires his medals to be disposed of, all the medals due to him will be prepared and transmitted to him through the usual public conveyances, without further notice.

In case an exhibitor shall receive a first prize in any one letter, he shall not be entitled to receive any other medal in the same letter.

SUBJECTS OF EXHIBITION.

These will be divided into Classes, as explained further on.

No articles not of horticultural produce will be allowed to be placed upon the tables.

Exhibitors will do well to make themselves acquainted with the arrangements described in the following list, as they will in all cases be required to sign a declaration stating under what letter their plants are to be shown; and they are particularly requested to take notice, that if errors in the awards of the judges should occur, in consequence of mistakes on the part of exhibitors in filling up such declarations, the Society cannot undertake to rectify such errors afterwards.

To enable the officers of the Society to attach names to the objects exhibited, it is requested that correct lists may be delivered to the clerk as soon as the exhibitor reaches the Garden.

CLASS I.—Flowers for which Nurserymen and Private Growers exhibit independently of each other.

A. Greenhouse Azaleas, to be shown in numbers not exceeding 12, GB, LS, SK.
B. Carnations, in pans of 24 blooms, LS, SK, SB.
C. Picotees, in pans of 24 blooms, LS, SK, SB.
D. Pinks, in pans of 24 blooms, SK, SB.
E. Cape Heaths, in collections of 20 species, GK, SG, LS, SK.
F. Cape Heaths, in collections of six species, GB, LS, SK.—N.B. No person who shows in E will be allowed to exhibit also in F.
G. Exotic Orchidaceæ, in collections of not fewer than six species, GB, LS, SK.
H. Exotic Orchidaceæ, in single specimens, LS, SK, SB.
I. Pelargoniums, in collections of 12 varieties, in pots, not exceeding 12 to a cast, GB, LS, SK, SB.
K. Pelargoniums, in collections of six varieties, in pots, not exceeding eight to a cast, SG, LS, SB.
L. Rhododendrons, in pots, not fewer than 12 plants, in 12 varieties, LS, SK, SB.
M. Moss Roses, SK, SB.
N. Common Garden Roses, exclusive of all Chinese or Chinese Hybrids, LS, SB, SK.
O. Chinese or Hybrid Roses, such as Bourbon, Noisette, Tea-scented, and similar varieties, LS, SB, SK.—N.B. No exhibitor of Roses can be allowed to occupy more than 15 ft. run of tables for all his Roses, which, being double, is equal to 30 ft. of boxes. If any Exhibitor gains the first medals in M, N, and in O, he will be entitled to a Gold Banksian medal instead of the three Silver ones.
P. Stove or Greenhouse Plants, in collections of from 50 to 60 plants, GK, GB, SG, LS.
Q. Stove or Greenhouse Plants, in collections of from 15 to 20 plants. GB, LS, SK.
R. Stove or Greenhouse Plants, in collections of six distinct species, LS, SK.—N.B. Persons exhibiting in P and Q will not be allowed to compete in R also.
S. Herbaceous Calceolarias, in sixes, LS, SK, SB.
T. Shrubby Calceolarias, in sixes, LS, SK, SB.

CLASS II.—Flowers, for which all persons are admitted to equal competition:—

U. Collections of Stove or Greenhouse Climbers, GK, CB, LS, SK.—N.B. The Gold Knightian medal is not to be awarded for fewer than 12 distinct kinds.
V. Tall Cacti in flower, LS, SK.
W. Single specimens of Ornamental Plants LS, SK, SB, C.
X. Miscellaneous Flowers, SK, SB, C.—N.B. Cockscombs, Hydrangeas, and cut flowers are altogether excluded from prizes.
Y. Seedling Florists' Flowers, SK, SB, C.—N.B. Every seedling must be shown singly, and must be marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in single trusses, with a single leaf, so far below the flowers as not to support them; and they are not to be dressed with cotton or wool, or any similar substance, but must be shown exactly as they grow on the bush.

CLASS III.—Fruit, for which market-gardeners or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other.—N.B. All Fruit must be ripe and well-coloured; if the contrary, it will be disqualified.

Z. Miscellaneous collections of Fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind, GK, GB, LS.—NB. Cucumbers Tomatoes, Gourds, and similar kitchen-garden produce, are excluded from this letter.
AA. Grapes, SG, LS, SK, SB.
BB. Pine-apples, SG, LS, SK, SB.
CC. Peaches or Nectarines, in dishes of six specimens, SK, SB.
DD. Miscellaneous Fruit, SK, SB, C.

JUDGES.

The Judges have the power of increasing or diminishing the number and value of the Silver Medals offered by the Society for particular objects, and also of conferring Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

The Judges are also required to bear in mind that the Society's Medals are offered, less for new and curious objects, than for fine specimens of Horticultural skill, the design of the Council in instituting these meetings being not so much to encourage the Collector, as to reward the skilful Gardener: they are also not to make any award in cases where the objects exhibited do not appear worthy of a Medal; otherwise a bad single exhibition may obtain a prize, merely because there is no better exhibition of the same class to oppose it.

IPSWICH CUCUMBER SOCIETY.

THE FIRST GRAND SHOW, OPEN TO ALL ENGLAND, will be held in the LECTURE-ROOM of the IPSWICH MECHANICS' INSTITUTION, on TUESDAY, 8th FEBRUARY. The Committee respectfully requests Exhibitors who have not already given notice, to do so by the 1st Feb., *or they cannot Exhibit for the Prizes.* The productions will be returned to the growers. Further particulars may be had on application to

3, Tavern-street, Ipswich. THOS. WILD, Hon. Sec.

T. AND C. LOCKHART, SEEDSMEN, &c. 156, CHEAPSIDE, LONDON, beg to announce that their LIST OF SEEDS, &c. is now published, and will be forwarded Post-paid on application.—5th Jan., 1842.

ORCHIDACEOUS PLANTS.—To be sold, the property of a Gentleman, a splendid collection of the best varieties of Orchidaceous plants in full flowering condition and luxurious growth. Applications to be made to X.Y.Z. (post-paid), at 36, St. James's Street, London.

APPLEBY'S "QUEEN OF LILACS."—By an unforeseen event, the whole remaining stock of *Ground Roots* of the above Dahlia are destroyed. Fortunately, however, some fine healthy *Pot Roots* are saved, a few of which will be supplied to the first applicants at 50s. each; and as the supply will now be very limited, those parties who wish to secure plants in May had better make immediate application for fear of disappointment, as the plants, so far as they will go, will be supplied to the first applicants at 10s. 6d. each.

MYATT'S VICTORIA RHUBARB.

J. AND W. MYATT having a good Stock of Strong Roots raised by offsets from the original Seedling, can supply them at 10*l.* per hundred.—N. B. As various spurious sorts have been sold and are now selling under the name of "Myatt's Victoria," purchasers would do well to require them warranted.—Manor Farm, Deptford, Oct. 23, 1841.

BRACHYCOME IBERIDIFOLIA SEED in small packets at 5*s.*, to be had of W. J. NUTTING, Seedsman, 46, Cheapside. Lisianthus Russellianus, 2*s.* 6*d.*; Pink, from fine named flowers, 2*s.* 6*d.*; Calceolarias, from 30 varieties, 2*s.* 6*d.*; Pansies, selected from a few first-rate flowers, 5*s.*; do., from a superior collection, 2*s.* 6*d.*; Dahlia Scapigera Mexicana, 1*s.*; Clintonia pulchella, 1*s.*; Schizopetalon Walkerii, 1*s.*; Phlox Drummondii, 1*s.*; &c. &c.—Packets of the following Cucumbers at 2*s.* 6*d.*: Man of Kent (Barnes'), Victory of Suffolk (Allen's), Prize-fighter, Weedon's Frame, Roman Emperor, and Windsor Prize.

☞ A Catalogue of Seeds to be had on application.

ROBINSON'S NORTHERN BEAUTY DAHLIA.

S. GIRLING having purchased the entire Stock of the above DAHLIA, plants will be sent out in May next at 10s. 6d. each; admitted to be one of the most distinct and beautiful Dahlias to be sent out next season. For particulars, refer to the *Floricultural Cabinet* of January. It took the 5th Prize at Salt-hill Open Show in Sept. last, and was generally admired.

WM. MAULE and Co., Nurserymen, Bristol.—Alex. Jas. MAULE begs to call the attention of the Floricultural world to one of the best PANSIES ever offered in the West of England — PRINCE OF WALES, warranted first-rate. Price 7s. 6d. each. Usual discount to trade. Post-office orders will be required from unknown correspondents. Forwarded free of carriage to all parts of the United Kingdom.

T. JACKSON, Nursery Seedsman, &c., Kingston, Surrey, begs to offer the undermentioned Dahlias in Ground Roots, guaranteed correct to name, at the following prices, viz.: at 42s. each—Jackson's Dowager Lady Cooper; at 31s. 6d. each—Bridesmaid (Brown's); at 21s. each—King of Roses (Thomson's), Enterprise (Langley's); at 15s. each—Eclipse (Catleugh's), Fanny Keynes, Maid of Bath; at 10s. 6d. each—Beauty (Parsons'), Constancy, Invincible (Smith's), Little Wonder (Parsons'), Rosa perfecta (Whale's), Scarlet Defiance; at 7s. each—Admiral Elliott, Bronze Unique, Brilliant (Whale's), Eclipse (King's), Flora (Stanford's), Marquis of Waterford, Revenge (Cox's).

A collection of 100 Dahlias, of 100 different sorts, in small compact dry roots, well suited for exporting, with names attached, 5*l.* A collection of 200 do., 200 different do., containing many new and choice kinds, 10*l.*

A general Catalogue of Stove, Greenhouse, and Herbaceous Plants, may be obtained on application.

Kingston Nursery, Jan. 12, 1842.

WANTS a SITUATION as GARDENER, a married man without family, aged 28. Can produce satisfactory testimonials as to ability and character. Letters to be addressed to B. Y., at Messrs. Warner's, seedsmen, Cornhill, London.

WANTS A SITUATION at Lady-day, a Young Man, 18 Years of Age, who has had four years' practice in the Propagating and Floral Department, in a respectable Nursery; and who now wishes to engage himself under the tuition of a Gentleman's Gardener in the Forcing and general routine of a Kitchen-garden, in order to qualify himself for a Situation as a Gentleman's Gardener. Wages not so much an object as a comfortable situation. He can be well recommended for sobriety and industry. Letters addressed to S. Girling, Nurseryman, Stowmarket, will meet with immediate attention.

P. S. If a situation offers in the intermediate time he would come at a short notice.

TO NOBLEMEN and GENTLEMEN.—Wants a situation as GARDENER, a steady, active Married Man, 40 years of age, who has a thorough practical knowledge of all the various branches of Horticulture, having had upwards of 25 years' experience in the growth of Pines, Grapes, Peaches, Cherries, Kitchen and Flower Garden, and well understands the growth of Cape and all other exotic plants. Can produce the most satisfactory testimonials as to moral conduct and ability as a Gardener. Address, prepaid, to A. B., 7, Albany Place, Hornsey Road, Islington, Middlesex.

RANUNCULUSES, ANEMONES, AURICULAS, CARNATIONS, PICOTEES, AND GERANIUMS.

H. GROOM, of WALWORTH and CLAPHAM RISE, near LONDON, by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and the Public, that he has a fine Selection of the above Flowers, which he can offer at the following very moderate Prices:—

	£	s.	d.
RANUNCULUSES.			
100 Roots in 100 superb sorts, with their names	5	0	0
100 ditto very fine sorts, ditto	2	10	0
Superfine Mixtures, from 7*s.* to 21*s.* per hundred.			
ANEMONES.			
100 Roots in 100 superfine sorts, with their names	3	10	0
100 ditto in 50 ditto ditto	2	10	0
Superfine Mixtures, from 10*s.* 6*d.* to 21*s.* per hundred.			
AURICULAS.			
25 superfine sorts, with their names, 1 plant of each	3	13	6
CARNATIONS.			
25 superfine sorts, with their names, 1 pair of each	3	10	0
PICOTEES.			
25 superfine sorts, with their names, 1 pair of each	2	10	0
YELLOW PICOTEES.			
12 superfine sorts, with their names, 1 pair of each	2	2	0
GERANIUMS.			
25 superfine sorts, with their names, 1 plant of each	3	10	0

THOS. D. WATKINSON, Seedsman, Florist, &c., begs to inform his Friends and the Public that he has removed from No. 24, Market-place, opposite the Fishmarket, to the more commodious premises No. 6, two doors from Market-street, and latterly in the occupation of Messrs. Blackberd and Co., where all articles connected with Horticulture and Floriculture can be had, of the first quality, and upon most reasonable terms.

Catalogues on application.

Agent for Myatt's true Victoria Rhubarb roots, Walker's Prize-fighter, and other Cucumbers; Howard's Giant Salmon-coloured, Manchester Red Solid, and Seymour's superb White Celery, &c. &c.

6, Market-place, near the Exchange, Manchester.

JAMES MAY begs to inform his Patrons and Friends that his new descriptive List of Pansies with a list of Fuchsias, is now ready, and may be had on application at the Pansy Nursery, Edmonton. At the same time he begs to say he has still a small quantity of his superior PANSY SEED left, which may be had at the following places, viz.:—Messrs. Warner's, 28, Cornhill; Messrs. Flanagan and Co.'s, Mansion-house-street, London: Mr. Watkinson's, Market-place, Manchester; Mr. Edward's, York; Mr. Parsons's, Brighton; Mr. Wm. May's, Hope Nursery, near Bedale; or at the Pansy Nursery, Edmonton; at the following prices:—2*s.* 6*d.*, 5*s.*, to 10*s.* per packet. None warranted genuine unless they bear J.M.'s seal andsignature. A remittance respectfully requested from unknown correspondents.—Pansy Nursery, Edmonton, January 1842.

FREDERICK ADOLPHE HAAGE, JUN., FLO-RIST and SEEDSMAN, ERFURT, PRUSSIA, begs to inform the Horticultural World, that he has for Sale the following FLOWER SEEDS, harvested last summer. Wholesale orders, sent to the above address, will be duly forwarded; or small orders from Amateurs, &c., to SAMUEL GIRLING, Nurseryman, Stowmarket, to both of which attention will be given.

GERMAN ASTERS, tubulous double superfine, in 30 sorts, 1 ounce, 10*s.*
Ditto ditto, dwarf superfine, 24 sorts, 1 ounce, 10*s.*
Ditto, pyramidal and tall, 12 sorts, 1 ounce, 10*s.*
GERMAN STOCKS, dwarf, 34 sorts, 1 ounce, 10*s.*
Ditto, wall-leaved, 16 sorts, 1 ounce, 10*s.*
Ditto, high, 24 sorts, 1 ounce, 10*s.*
Ditto, autumn-flowering, 12 sorts, 1 ounce, 15*s.*
Ditto, perennial, 12 sorts, 1 ounce, 10*s.*
GERMAN WALLFLOWER, dark brown, double superfine, 1 ounce, 15*s.*

F. H. also recommends his collection of fine Annual and Perennial Flower Seeds in a great choice.

NURSERY.—Mr. JOHN KING gives notice that he is instructed to SELL BY AUCTION on the premises, CAMDEN NURSERY, Southampton-street, Camberwell, on TUESDAY, 1st February, 1842, and two following days, at ten o'clock each day, on account of the number of Lots. The property comprises a fine collection of Standard and Dwarf, trained and untrained Peach, Nectarine, Pears, Plums, Cherry, Apples, and Mulberries; Vines, Gooseberries, Currants, a collection of Evergreens and Deciduous Shrubs, a large quantity of Forest-trees, Box-edging, Yews, Hollies, &c. &c. To be viewed until the sale. Catalogues to be had on the premises, of Messrs. Warner & Co., Seedsmen, Cornhill; and of the Auctioneer, Hackney-road.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained to any size of JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical. It may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple place; Mr. Knight's, King's road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

SLATE CISTERNS, SHELVES, TROUGHS, &c., for Horticultural purposes.—EDWARD BECK, Manufacturer, Isleworth, near Brentford. Orders, Working Drawings, &c., forwarded by post, will receive due attention.

*** Slate Edgings for Flower Borders, &c.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HEATING BY HOT WATER, WITH THE CIRCULATION OF ATMOSPHERIC AIR.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER; see the 3rd and 37th Numbers of the *Gardeners' Chronicle*.

References may be had, and their works seen, at Mr. Perry's Nursery, Banbury; Mr. Green's, Lower Cheam; Messrs. Henderson's, Pine-apple Nursery; Messrs. Rollisson's Nursery, Tooting; Mr. Knight's Exotic Nursery, Chelsea; Messrs. Low's, Clapton Nursery; Mr. Catleugh's Nursery, Chelsea; Mr. Gaines's Nursery, Battersea; Mr. Buck's, Portland Nursery; Mr. Young's, Milford Nursery; Mr. Smith's Nursery, Dalston; Mr. Woodroff's Nursery, Kensall Green; Mr. Hopgood's Nursery, Bayswater; Mr. Willmer's Nursery, Chelsea; and at most of the Nobility and Gentlemen's Seats in the country.

Every particular to be had at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

ECONOMIC LIFE ASSURANCE SOCIETY,

No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured *to participate in the profits*, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 6	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The BONUS declared in 1834 amounted upon an average to 16*l*. per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31*l*. per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam-vessel from any one Port thereof to another during peace, to Assurers not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

PLANTING SEASON.—EXPIRATION OF LEASE AND SALE OF NURSERY STOCK.

To Noblemen and Gentlemen, Public Companies, Nurserymen, Builders, Gardeners, and Others.

MESSRS. PROTHEROE and MORRIS have received instructions from Messrs. Buchanan and Co., to sell by auction, on Monday the 14th of Feb., and following days, at eleven o'clock precisely, on the premises, Wyndham Road, Camberwell, the lease of that portion of their Nursery having expired, and being required for building purposes—the whole of the Stock now growing in the said Nursery, comprising the greatest variety of ornamental Trees, flowering Shrubs, Evergreens, American Plants, Standard and Dwarf Roses, Fruit-trees of all descriptions, fine Standard Mulberries, Splendid Specimens of Cratægus and other ornamental Trees, fine Beech Hedges, &c., ever offered to the notice of the Public, by Auction, and worthy the attention of Noblemen and Gentlemen, the Proprietors of Public Gardens, and all those who may wish to enrich their collections with many scarce and valuable hardy Trees and Shrubs. To suit the convenience of those persons who have only a limited space adapted for Horticultural purposes, a portion of the Stock will be lotted with a suitable variety for furnishing small gardens. Small collections of different kinds of Fruit Trees, ditto Evergreens and Shrubs, collections of 100 distinct kinds of ornamental Trees in one lot, named; smaller collections of 50 kinds, and similar collections of Shrubs and Evergreens, American Plants, &c. Catalogues may be had after the 7th of Feb., of the Auctioneers, Leytonstone; Messrs. Buchanan and Co., Camberwell, and of all the principal Seedsmen in the Metropolis.

PATENT ASPHALTE PROTECTING MATERIAL.

—Extract from *Gardeners' Chronicle*, Dec. 25, 1841, p. 843.—"In the midst of frost it will not be unseasonable to warn all our Readers of the great importance of preventing their more tender Plants that may have been frozen from being thawed suddenly by the sun. All Gardeners know how often Peas frozen below a south wall are killed, and that if any contrivance to prevent their being suddenly thawed is made use of, they recover. [illegible] is, to a great extent, true of other things. [illegible] had a severe frost, 16 ; at that time young [illegible] to the south died, while others within a few [illegible] from the sun by stone, did not suffer at all. [illegible] by the way that CROGGON'S ASPHALTE [illegible] forms a most excellent material for such screens." [illegible] of same Journal, Jan. 1, 1842, is fully described the purpose to which it is applied by the Royal Horticultural Society. Being a non-conductor it effectually protects from heat or cold.—THOMAS JOHN CROGGON, 8, Ingram-court, Fenchurch-street, London.

TO NOBIEMEN and GENTLEMEN. JAMES FINLAY, upwards of five years gardener and steward to the Right Hon. Viscount Beresford, at Bedgebury Park, Kent, wishes to meet with a similar engagement. Bedgebury Mansion having been rebuilt and enlarged, and the pleasure-grounds and kitchen-gardens entirely remodelled and widely extended, many miles of roads and drives formed and completed, and the woodlands and farm greatly improved by planting, draining, &c., has given J. F. an opportunity seldom to be met with of gaining a general and practical knowledge of estate work. J. F. is a native of Scotland, is in the prime of life, will be disengaged in a few weeks, and can have the most satisfactory testimonials from his noble employer. —Address, J Finlay, Bedgebury Park, Gaudhurst.

EXOTIC NURSERY, CANTERBURY.

WILLIAM MASTERS having for many years cultivated upwards of THIRTY ACRES of Land as Nursery Gardens, begs to submit to the public the following List of Fruits:

PEARS.—W. M. having collected in the first instance, through the kindness of the late J. Braddick, Esq., and subsequently from his own personal visits to the Netherlands, a large collection of the celebrated FLEMISH PEARS, as well as many others from various scarces, planted a specimen of each variety in his Nursery, and they having for several years produced fruit, he is enabled to pronounce with certainty that many are wholly worthless—some are too tender for our exposure—and that many are of the utmost importance on account of their prolific and early bearing, as well as of their delicious flavour. Out of a very large collection W. M. confidently recommends the following, which become fitter for use nearly in the order in which they stand:—DESSERT PEARS.—Madeleine, Jargonelle, Williams' Bonchrétien, Flemish Beauty, Rouppé, Capiaumont, Beurré Diel, Autumn Bergamot White Doyenné, Marie Louise, Princess of Orange, Seckle, Monsieur le Curé, Althorp Crassane, Bezy de la Motte, Napoleon, Duchess of Augoulême, Louise bonne de Jersey, Knight's Monarch, Rouse Lench, Swan's Egg, Beurré d'Aremberg, Nutmeg, Ne plus Meuris, Passe Colmar, Winter Nelis, Hacon's Incomparable, Beurré Rance, Easter Beurré. BAKING PEARS.—Royal foreless, Double de Guerre, Uvedale's St. Germain, Catillac. Many other sorts are still cultured, but a garden furnished with these will produce fine fruit for every season.

APPLES.—W. M. having been a Fellow of the Hort. Society nearly from its commencement, has availed himself of the privilege of selecting from that liberal establishment such sorts of Apples as appeared to merit particular notice, and which, added to the selections from the famed Kentish orchards and elsewhere, have produced a number far exceeding the point of usefulness. The whole have been fruited, and the following condensed list is particularly recommended. The sorts are arranged as nearly as possible in the order in which they become fit for use:—Juneating, Borowitski, Kerry Pippin, Quarrenden, Hawthornden, Keswick Codlin, Franklin's Golden Pippin, Summer Nonpareil, King of the Pippins, Beauty of Kent, Gloria Mundi, Downton Pippin, Hughes' Golden Pippin, Ribston Pippin, Blenheim Orange, Margil, Sam Young, Scarlet Pearmain, Dumelow's Seedling, Forman's Crewe, Beachamwell Seedling, Dr. Harvey, Lemon Apple, Pile's Russet, Screivton Golden Pippin, Cornish Gilliflower, Scarlet Nonpareil, Knight's Ganges, Court of Wick, London Pippin, Walmer Court, Canadian Reinette, Alfriston, Court Pendu, Cockle Pippin, Hubbard's Pearmain, Old Nonpareil, Downton Nonpareil, Braddick's Winter Nonpareil, Collins' Russet, Golden Harvey, Dutch Mignonne, Hunt's Green Newtown, Norfolk Beaufin, French Crab. With the above selection, fruit for all purposes and all seasons may be obtained.

CHERRIES.—Purple Griotte, Early Black, Masters' White Heart, Elton, Black Eagle, May Duke, Kentish, Black Tartarian, Canterbury Black, Bigarreau, Late Duke, Florence, Small Morello, Large Morello. The above have proved the most valuable out of a large number of sorts.

PLUMS.—Lawrence's Early, Early Orleans, Hâtive Royal, Orleans, Denyer's Victoria, Greengage, Nectarine, Washington, Black Griffin, Catherine, Coe's Golden Drop, Imperatrice, Winesour, Large Bullace, Damson, Small Bullace.

Of PEACHES the following have given most satisfaction:—Early Ann, Grosse Mignonne, Early Newington, Noblesse, Red Magdalen, Old Newington, Admirable, Royal.

Of NECTARINES—The White, Elruge, Roman, Newington, Violet Hâtive.

Of APRICOTS—The Hemskirke, Large Early, Moorpark, Breda, Orange.

Of STRAWBERRIES—Grove-end Scarlet, Roseberry, Old Pine, Keen's Seedling, Myatt's Pine, Downton, Elton.

Of GRAPES—Miller's Burgundy, Sweet-water, Muscadine, Black St. Peter, White Cluster, Esperione, Hamburgh, Frontignan, Muscat of Alexandria, Verdelho, Horsforth Seedling, Black Damascus.

Of GOOSEBERRIES, selected out of 80 kinds—Early Green, Early Red Rough, Queen of Sheba, Lady Delamore, Warrington Red, Rookwood, Roaring Lion, Gunner, Duke of York, Crown Bob, Woodward's Whitesmith, Heart of Oak.

Of NUTS—Cosford, Frizzled, Dwarf Prolific, Knight's Large.

Of RASPBERRIES—Red Antwerp, White Antwerp, Barnet.

Of FIGS—Lee's Prolific, Brunswick, Common Purple, Brown Naples, Black Ischia, French Prolific.

W. MASTERS offers the above List of Fruits, all of which are grown, and nearly the whole of which have been proved in his Nursery, as a more complete one than those usually submitted to public notice.

*** Early Commissions will insure immediate attention.

In one small volume, price 15*s*.

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, an Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur or Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. Andrews, Bond-street; Orr & Co., Paternoster-row.

Price 7*s*., illustrated with Wood-cuts of Birds, Cages, &c.,

A NEW EDITION OF THE

NATURAL HISTORY OF CAGE BIRDS;

their Management, Habits, Food, Diseases, Treatment, Breeding, and the Methods of Catching them. By J. M. BECHSTEIN, M.D.

"A very delightful book of its kind. . . . . . . It seems to us an indispensable book for the bird-fancier."—*Spectator*.

"It will be welcome to every gentleman's library or drawing-room table. It is superbly got up, with an immense number of vignettes; and in fact, rivals the beauty of the Annuals."—*Weekly Dispatch*.

London: W. S. Orr & Co.; and W. & R. Chambers, Edinburgh.

Lately published,

ROUPELL ON TYPHUS.

Cloth, boards, price 8*s*. 6*d*.
Wright, 60, Pall Mall.

Publishing Monthly, price 2s. 6d., with Four coloured Engravings,

PAXTON'S MAGAZINE of BOTANY.—The No. for FEBRUARY 1842, will contain beautifully-coloured figures of *Cattleya Aclandiæ*, *Brugmansia floribunda*, *Mahonia aquifolium*, and *Loasa Pentlandica*, with the history and directions for the culture of each: also comprehensive Papers on the science of Gardening, including the phenomena of impregnation and germination in the seed of plants; the Culture of Gesnera rupestris; on Arranging and Planting Specimens in Conservatories; the Propagation of Tropæolum tricolorum; Notices of Plants figured in the floral periodicals for December and January, and of those flowering in the suburban nurseries; with a copious Calendar of Operations for the month.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed on zinc by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commences with this Number, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Amen-corner, Paternoster-row.

Handsomely bound in cloth, with 93 Wood Engravings, price 6*s*. 6*d*.

ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. TAYLOR, LL.D.

From the British Magazine.—"This is an elegant and well-executed little book, on a most interesting subject."

From the Birmingham Herald.—"A valuable and indispensable accession to the library of every Biblical student."

From the Rev. Thomas Hartwell Horne's Introduction to the Critical Study of the Scriptures.—"Nearly three hundred texts of Scripture are more or less explained in this elegantly-executed volume, and in a manner equally curious and interesting."

Post 8vo, price 6*s*.,

LETTERS FROM PALESTINE, written during a residence there in the years 1836-7-8. By the Rev. J. D. PAXTON.

The more important places in reference to Scripture History, visited by the author, were—

Damascus,
Jerusalem,
Beer,
Beyrout,
Mount Olivet,
Nazareth,
Baalbeck,
Bethlehem,
Samaria,
Mount Lebanon,
Hebron,
The Plain of Esdralon,
Jaffa,
The Valley of the Jordan,
Mount Tabor,
Mount Carmel,
Jericho,
Tiberias,
The Plain of Sharon,
The Dead Sea.

Also may be had, price 7*s*. 6*d*. cloth,

THE HISTORY OF FRANCE FROM THE EARLIEST PERIOD. By E. DE BONNECHOSE.

This History has been adopted by the Royal Council of Public Instruction for the use of the Normal Schools of France. The French Minister of War has also just subscribed for a large number of copies for distribution amongst the Regiments in the French service. The English translation of this popular work may be had of all Booksellers, price 7*s*. 6*d*., the two volumes of the French edition being comprised in the one of the English.

Price 5*s*. 6*d*. cloth,

THE HISTORY OF THE UNITED STATES OF AMERICA.

By JOHN FROST, of Philadelphia.
London: Tilt and Bogue, Fleet street.

In cr. 8vo. 4*s*. 6*d*. bd, with 220 Diagrams engraved for the work.

EUCLID'S ELEMENTS OF PLANE GEOMETRY; with Explanatory Appendix, and Supplementary Propositions for Exercise. Adapted for the Use of Schools, or for Self-instruction. By W. D. COOLEY, A.B., author of the "History of Maritime and Inland Discovery."

"This is the best edition of the Elements which has yet appeared."—*Athenæum*. "For brevity, clearness, and discerning attention to the wants of learners, cannot be easily surpassed." —*Dublin University Mag.*

Uniform with the "Elements," price 3*s*. 6*d*.

COOLEY'S GEOMETRICAL PROPOSITIONS DEMONSTRATED; or a Supplement to Euclid: being a KEY to the Exercises appended to the "Elements," for the use of Teachers and private Students. Upwards of 120 Propositions deduced from the first Six Books of Euclid, are illustrated in it by new diagrams.

"Will be found of considerable value as an aid to Teachers of the Mathematics."—*New Monthly Mag.*

In foolscap 8vo, price 1*s*. 6*d*.

COOLEY'S FIGURES OF EUCLID; being the Diagrams Illustrating the "Elements," with the Enunciations, printed separately for use in the Class-room.

*** Orders received by all Booksellers.

FUN FOR THE FIRESIDE!!

Bound in cloth, price 5*s*. 6*d*.,

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation. But that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiæ.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself, and everybody else, is perfectly familiar with its contents . . . . and yet if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."

One Volume, price 7*s*. 6*d*.,

THE LIFE AND TIMES OF RIENZI.

"Not less interesting than Sir E. Lytton Bulwer's eloquent Romance, and scarcely less romantic, is this historical record of the Conspiracy of Gabrini."—*Monthly Repository*.

"To all who have read Sir E. Lytton Bulwer's 'Rienzi,' its perusal is, in a measure, a duty."—*Spectator*.

"A curious and pleasing volume, and full of matter of historical character and illustration."—*Literary Gazette*.

"The publication of this work is well timed . . . . The Life of Rienzi is to us full of interest."—*Athenæum*.

"Those that wish to become acquainted with the true history of a man who was, in some sort, the *Napoleon* of his own age and country, would do well to consult the extraordinary narrative of the 'Life and Times of Rienzi.'"—*Tait's Magazine*.

Whittaker and Co., Ave-Maria-lane London.

It is our intention next Saturday to present our readers, in a double Number, with a complete "Cottager's Calendar," by Mr. Paxton. It will comprehend full details relating to all the gardening operations in which a cottager can have occasion to engage, and will be illustrated with woodcuts. Those who wish to secure additional copies, will be so good as to order them immediately, as we shall not print a larger number than are ordered.

The Gardeners' Chronicle.

SATURDAY, JANUARY 22, 1842.

MEETINGS IN THE ENSUING WEEK.

Monday	West London Gardeners Association	7 P.M.
	Entomological (Ann.)	8 P.M.
Tuesday	Zoological	8½ P.M.
Wednesday	Medico-Botanical	8 P.M.
	Microscopical	8 P.M.

While the melancholy tidings just received from the Niger expedition are painfully occupying the public mind, it is a great consolation to us to be able to state, that when the last advices left Fernando Po, Dr. Vogel and Mr. Ansell, the botanist and gardener to the expedition, were convalescent.

A correspondent last week proposed that the *Gardeners' Chronicle* for the past year should be given as a prize at the Horticultural Shows. It did not at the moment occur to us that the project was not feasible —for the conclusive reason, that not a single volume remains unsold. This is indeed a flattering testimony that our labours have been appreciated by the public, and a strong stimulant to future exertion. At the same time, we should mention that particular Numbers may still be had, and that our publisher is making every exertion to complete a few sets, and with that view is willing to give 1s. a-piece for Nos. 9, 10, 44, and 51.

Touching the election of a Librarian to the Linnean Society, we stated a fortnight since that Mr. Kippist, one of the candidates, is a mere boy. In this it appears, from a letter sent us by Mr. Newman, we were in error. Mr. Newman says that Mr. Kippist completed his 29th year in June last, and has been nearly twelve years employed as Mr. Don's assistant, having entered the service of the Linnean Society as Assistant Librarian on the 1st Feb., 1830. We regret very much that we should have fallen into this mistake, and we hasten to correct it; for nothing could be farther from our intention than to say one word that should be unfair towards Mr. Kippist—as is, we trust, sufficiently apparent from the manner in which we introduced the subject into our pages. In all that we have done, we have only had the good of the Linnean Society in view, and to that all other considerations ought to give way.

But while we hasten to correct an unintentional error, let it not be supposed that we in the smallest degree alter our opinion of the relative pretensions of the two candidates. One person at eighteen will be a man in manner, appearance, and knowledge of the world; another at thirty will remain a boy in these respects.

Whatever some may think of this matter, we consider it a question affecting the very existence of the Linnean Society. When the Fellows subscribed largely for the purchase of the herbarium and library of Linnæus, and when the magnificent oriental herbarium of the East India Company was presented by the Court of Directors to the Linnean Society (to say nothing of other gifts), it was upon the express understanding that these valuable collections should be freely accessible at all times to men of science, and that they should be in the custody of the most efficient officer that could be procured. The Council of the Linnean Society are bound to regard these as sacred trusts which cannot be trifled with, or made subservient to personal considerations; and we know that this is the view taken of the question by some of those in the Council to whose opinion the Fellows at large would pay the greatest deference. Should new arrangements be made that will diminish the facilities with which the herbarium and library can be consulted, or if of the candidates who are proposed for the office of keeper of these precious records the most fitting person is not taken, such proceedings will not fail to be regarded, by those whose good opinion is most worth having, as most disastrous to the welfare of the Society, which is not in a condition to bear the risk of trying dangerous experiments in the mode of managing its affairs.

In former days, the office of Librarian was regarded of such importance, that it was filled by no less a person than Mr. Robert Brown. When he was succeeded by the late Professor Don, although at an immeasurable distance, yet the appointment was given to a person of some botanical reputation. Do the Fellows of the Society suppose this to be the time for departing from the good rule hitherto observed? If so, we have the misfortune to differ very widely with them.

A correspondent, signing himself *Clericus*, asks the quantity of sulphuric, muriatic acids, and gypsum required to fix the ammonia in a given quantity of urine. This is a rather difficult question, because the composition of that fluid is, as may be supposed, variable. Upon an average, urine evolves about 4 per cent. of ammonia when in a state of putrefaction. This would require about 12 per cent. of ordinary strong sulphuric acid, or about 34 per cent. of strong muriatic acid, to neutralise it and prevent its escape. About 15½ parts by weight of gypsum are equivalent to 12 parts of sulphuric acid. Therefore 12 pounds of sulphuric acid, 34 of muriatic acid, or 15½ of sulphate of lime are required to fix the same quantity of ammonia. We give this with some hesitation, feeling sure that it will hardly be found accurate in all cases. It is, however, an approximation, and may serve as a guide until the best working proportions may have been ascertained. When urine undergoes decomposition, the organic matters which it contains evolve ammonia, and this, so long as it continues to be given off, is rendered very evident by its strong pungent smell. If sulphuric acid is added, this ammonia, which would otherwise be lost, is neutralised and fixed by the acid; if too little acid is added, the strong smell of ammonia will continue to be given off. If, on the other hand, more acid than is required be added, no harm will be done, as the excess of acid can always be removed by throwing in a little chalk. We should expect that sulphuric acid will present some advantages over gypsum in fixing ammonia, because when the latter is used in a tank—for example, when fresh urine is constantly being added—the sulphate of lime would form a mass at the bottom, and frequently require agitation or stirring up, which would not be the case with sulphuric acid. In some cases the sulphate and carbonate of lime contained in a mixture of urine and gypsum would no doubt be highly advantageous to the land, and might be mixed with the urine and sulphuric acid with good effect; but, for the above reasons, we are inclined to think sulphuric acid will be found better than gypsum, except in soils not naturally containing lime.

We have gone into this question rather fully, because we have similar inquiries from other correspondents.

We have reason to believe that Mr. Babington is no longer a candidate for the Professorship of Botany at King's College. This we regret, for the sake of the College; for it will be difficult to find so good a man. Various persons are reported to have offered themselves, but nothing has yet reached us sufficiently definite to deserve to be repeated.

A correspondent objects to our assertion at p. 19, that a crowded plantation deteriorates the quality of timber, as well as diminishes its rate of formation; and he says this is opposed to every-day experience. He moreover insists upon our having over-stated the disadvantages of leaving the trees in a plantation to run up with what he is pleased to call fine clean stems as straight as ramrods.

If the object of a planter is to obtain scaffold-poles, or hop-poles, or poles of any other kind, we admit at once the advantage of allowing trees to crowd each other; but it was to those who plant for the sake of timber that we addressed ourselves, and upon that important point we must continue to insist.

No doubt there is an opinion that the slowest-grown timber is the best; we continually hear people saying that wood cannot be good because it has been grown so fast, and we find writers on foresting following in the same line of assertion. In one place we observe the following passage:—"It is well known that the common Oak in Italy, *where it grows faster than in this country*, is comparatively of short duration; and that the Oak which grows on the mountains of the Highlands of Scotland *is much harder and closer than any produced in England*, though on these mountains it seldom attains one-tenth part of the size of English trees." Now, we are not aware of any such facts as those collected together in this short paragraph. In the first place, Oaks do not grow faster in Italy than in England; the reverse appears to be the truth, as will be seen by reference to a succeeding table, where the greatest rate of growth in Italian Oak is shown to be only 2·72-10ths per annum; some of it not more than 0·76 of a tenth, while in English Oak the growth is in one case as much as *an inch a year*. Secondly, if it were true that Italian Oak grows faster than English Oak, it would not prove that fast-grown Oak is bad; because some Italian, or at least Sardinian Oak, is of excellent quality, and because, moreover, we neither know what is meant by the words "common Oak," nor are we informed under what circumstances of soil, &c., that which is said to be bad may have been produced. A great deal of Italian Oak is Q. pubescens, and of this, whether fast-grown or slow-grown, we find no evidence as to quality. Then as to Highland Oak; in the absence of more precise data than we can discover, we must express our doubt of the facts alleged concerning it; especially when we call to mind the Oak forests formerly covering at least a part of Inverness-shire—the size of which, as reported by Dr. Walker and Sir T. D. Lauder, indicates anything rather than slow growth. In short, such loose statements as those we have quoted are a sample of the manner in which this great subject is treated by some writers on foresting, and cannot be regarded of any value whatever.

But the author from whom we are now quoting undertakes to prove, upon physiological principles, that fast-grown timber must necessarily be bad. He says that the effect of an improved soil, climate, and situation, is to *expand* the parts of the whole vegetable; that cutting off part of the vegetable above the ground will *expand* those parts that remain; and he illustrates this notion of his about timber by reference to Lettuces, Cabbages, Spinage, and other esculents, which he says are softer the faster they grow, and also to Willows, Poplars, Raspberries, &c., which he says are the fastest-growing of all woody plants, and the softest-wooded. Therefore, he continues, "whatever tends to increase the growth of a tree tends likewise to *expand* the vegetable fibre; and whenever, the vegetable fibre is *expanded*, the timber must be less hard, and more permeable by air, &c., and of course inferior for all purposes of timber." As we find these speculations described by another writer as "interesting, ingenious, and philosophical," we must suppose that they have carried conviction to some readers; to us, however, they appear a mere tissue of absurdity, evincing a total ignorance of the nature of vegetable organisation. Since, however, they have their believers, we must endeavour to explain wherefore they deserve the harsh terms we have applied to them. To do this we must go a little into particulars, which we will do next week.

CHATSWORTH.

(*Continued from page* 20.)

But the Great Conservatory itself,—how shall I describe it! Its outward aspect has something of the sublime and supernatural, well fitted to sustain those feelings of wonder and veneration with which all sincere worshippers of the Lady Flora approach her mystic precincts. No travel-toiled Mussulman at the sacred postern of Mecca—no Christian pilgrim at the foot of the Holy Sepulchre—not Mr. Beckford in view of St. Peter's, nor Capt. Harris gazing on three hundred wild Elephants in Southern Africa—not Bruce at the source of the Nile, nor Lander at the termination of the Niger,—no, nor even

> "—— Paris at the top,
> Of Ida panted stronger,"

than did the writer of these notes when the portals of the mighty plant-house at Chatsworth were thrown open to receive him. But before we enter let us look at it again from without. Let none suppose that by magnifying indefinitely (in their mind's eye) an ordinary hothouse, or even some of the largest curvilinear structure, they will be enabled to form an adequate notion, or rather any notion at all, of the wondrous thing we are now attempting to describe. The introduction of the ridge and furrow roof, and the glazing with sheet glass, together with the vast scale of the fabric, give it an aspect unlike anything that I have ever seen. There is an indescribable air of luxury, and smoothness, and delicacy about it which harmonises perfectly with one's notions of the purposes to which it is devoted, and the gay company one may expect to meet there. Neither does it glare like hothouses in general; but, on the contrary, there is a sort of neutral tint in its exterior hue on which the eye may rest with pleasure, and however fastidious, satisfy itself that, outside at least, all is right, and that there are in fact no harsh and prominent angles, and no ungraceful curves; the two heads under which all horticultural deformities may be classed.

Before we come to criticise the interior, the reader will excuse my reminding him that at the time (1836) when this conservatory was first projected, the railway mania was at its zenith, and the price of iron, in consequence, enormously high; wood was therefore adopted as the preferable material, not for the sashes merely (which are best as they are), but for the rafters also, for which metal might be substituted with advantage, as a becoming degree of lightness might then be combined with the requisite strength. These remarks will pave the way for a certain amount of disappointment which the visitor of discrimination will scarcely fail to experience when first introduced into the interior of the Chatsworth conservatory. The effect is certainly most extraordinary, but it is not altogether pleasing; a circumstance, in my opinion, to be attributed almost entirely to the wooden rafters, which in order to support an arching roof 70 feet high, and of proportionate span, are necessarily strong; and as a consequence of that again, are heavy, and out of keeping with the light, airy, and sprightly character that such a structure as this ought to maintain. Although, as I have elsewhere observed, it would be unfair to judge horticultural buildings by the ordinary laws of architecture, still there are certain properties of style and form that can never be violated without the loss of effect—properly so called. Now this building has been likened in its interior to a Gothic cathedral, to which, in its centre and side aisles, as well as the general form of its arches and roof, it bears certainly no inconsiderable resemblance; but then lightness and elegance combined with sublimity are among the essential features of the Gothic style; and thus we have another reason why the ponderous rafters suspended in mid air do violence to the feelings of a just and critical taste. A still further objection may be found in the obvious fact that heavy timbers overhead will necessarily have the effect of dwindling, by comparison, the stems and trunks of the trees below, which it were surely desirable should appear as stout and portly as possible. How much more beautiful, as respects the roof, was that luckless edifice the Brighton Anthæum, in which there was nothing like weight above or support below to destroy the enchantment of the scene!—But to return to the rafters. These are covered, it is true, with trellis-work, and are intended to be "mantled o'er" with creepers; but even then heavy opaque lines will still remain, which will attract the eye to the roof instead of permitting it to rest at once, and without molestation, on the exquisite forms of tropical vegetation which are already uprearing themselves under its shade.—*Argus.*

(*To be continued.*)

CONIFEROUS PLANTS.—No. III.

Continued from p. 561.)

SECTION IV.—ASIATIC SPECIES.

IN this section, like the preceding, few rare or new species occur, but still some of them are well worthy of notice, for to it belongs the Himalaya Cedar (Abies Deodara), one of the most valuable of forest-trees; it has, however, been so fully described in former Numbers that I shall only here notice it for the sake of stating that I have never found any variation in the species; and I think that those persons who saw what they supposed a variety or nearly allied species in the native forests, were misled by trees in different situations and of various ages, for this kind, like the Cedar of Lebanon, presents different appearances at various stages of its growth.

1st Division.—The robust two-leaved Pines, or those resembling the Cluster Pine (P. Pinaster).

35. Pinus táurica; a dense, robust, two-leaved species, very much resembling the Cluster Pine in habit, but with resinous buds. It differs from the P. Pallasiana, a species from the Crimea, in the shape and growth of its branches, which in the former are fastigiate from the ground, with all the leaves pointing to the apex; and in the old trees the bottom branches are nearly equal in size to the trunk, while the branches of the latter are horizontal, greater in number, curving, and wider apart, with the mature leaves nearly horizontal and the cones double the size. P. táurica constitutes entire forests on the western uplands of the Crimea, sometimes even descending to the shores, but never passing over to the northern declivity. It forms a handsome hardy tree, attaining the same size as P. sylvestris.

2d Division.—The slender or long-leaved Pines.

36. P. sinensis, or the Chinese Pine.—A handsome species, with the leaves mostly in threes, but sometimes in pairs, and (which may in some way account for the great confusion respecting it) with dense bright-green leaves, very much resembling P. insignis. It is the P. Khasiya of Dr. Royle, which is found on the Khasiya mountains, and of which some cones (but no leaves) were brought home by his Grace the Duke of Devonshire's collector from that portion of the Himalayas bordering on Assam, and from which young plants were raised, and are to be found in a few collections, under the name of P. Cavendishiana. It is also the P. nepalensis of the Pinetum Woburnense, as quoted in "Antoine's Monograph der Coniferen, Wien, 1840-1," on that authority. The P. nepalensis of Don is only a slight variety of the Pinaster, which is frequently found in collections under that name; and the P. Massoniana of Lambert is certainly nothing else than the true P. sinensis, drawn from an imperfect specimen. This species attains in China, and the northern parts of India, about the same size as P. sylvestris in Europe; it is very tender and requires protection in winter. P. Massoniana of Don is only the Himalayan form of the Cluster Pine, which is common both to India and China, and certainly not the plant described by Abel, which belongs to the halepensis section.

37. P. excelsa, or the lofty Bhotan Pine. This fine Pine very much resembles the Weymouth, but has the leaves nearly as long again, and the cones are double the size; it is found growing plentifully in many parts of the Himalayas, and at very high elevations (11,000 feet), forming a large tree, from 100 to 120 feet high. By the hill people, it is known under the names of Kual, Chylla, or Weeping Pine, and in some collections in England by that of P. Dicksonii. The timber is white, like that of P. Strobus, very straight, and well suited for masts; the tree is quite hardy, and one of the most ornamental of the genus.

38. P. longifolia. This species is so well known that I only mention it here for the sake of pointing out two varieties or nearly allied kinds which of late seem very much confounded. In the "Arboretum Britannicum" a good figure of the true P. longifólia is given, which differs from Chilghoza, which has more elevated or hooked scales, and sessile cones very much resembling those of P. Gerardiana, but only one-half the size; the seeds are also longer than those of the true longifólia, (a good figure of this cone is given in "Antoine's Monograph der Coniferen" under the name of P. longifólia, but with seeds of that species,) which may account for the supposition that Chilghoza and Gerardiana are the same. The young plants of Chilghoza appear much hardier than those of longifólia, and shorter in the seed-leaves. The leaves are in threes.—[*Note by Dr. Royle.*—The Chilghoza, if different from P. Gerardiana, must be more allied to it than to P. longifólia. P. longifólia is found on the southern face of the Himalaya, at low elevations, but also at considerable heights. There may be varieties of it, and I believe are. The Chilghoza is so called in Cabool and Affghanistan. The seeds sent by Mr. Griffith from Cabool under the name of Chilghoza are identical in form and size with those of the Neoza sent by Dr. Falconer. I was led to infer this identity before I had seen the seeds of the Chilghoza, as both have edible seeds which form articles of commerce, and grow in much the same kind of climate.—*J. F. R.*]

39. P. Gerardiana, or Neoza Pine.—A three-leaved species, long confounded with P. longifólia, but very distinct from it, having the leaves not more than half the length, and cones more than double the size. It was first introduced by Lord Auckland, who transmitted seeds to England shortly after his arrival in India, his Lordship being aware before he left England that the plants in nurseries or private collections were nothing more than P. longifólia. The seeds are much longer than those of P. longifólia, but not so broad, and form an article of food as well as a considerable trade for the hill people of India. Dr. Royle in his Illustrations mentions that it is entirely confined to the northern and drier face of the Himalayas; it is also found in Kunawur at an elevation of from 5,000 to 10,000 feet. The young plants grow slowly, and have much the habit of young Spruce Firs, with the points of the young shoots recurved towards the ground. This species is quite hardy, but probably, like the Stone Pine, will not attain any great size.

3d Division.—The Silver or Spruce Firs.

40. Abies Webbiana, or the purple-coned Silver Fir.—This is one of the most beautiful of all Firs; it is found growing in the Himalayas, but at lower elevations than P. excelsa, in Gossainthan and other northern parts of India; and Capt. Webb, who first discovered it, states that it is called Oumar (purple-coned), and that it grows from 80 to 90 feet high, with a trunk three or four feet in diameter, and that the wood equals, in the texture of its grain and in its odour, the Bermuda Cedar (Juníperus Bermudiana), or Pencil-wood. The young cones are said to produce by expression a purple pigment, or indigo. This species is to be found in some collections under the name of P. spectabilis, and in the Himalayas it is known by that of Chilrow. The tree is hardy, but suffers from the late spring frosts, which destroy the young shoots, which is also frequently the case with the common Silver Fir.

41. Abies Pindrow, or Royle's Silver.—This very much resembles the preceding, but differs from it in the following particulars: the leaves are narrower, much longer, and linear, sharply bidentate, and nearly of the same colour on both sides; the cones are also shorter and broader, with trapezoid-shaped scales and round notched bracteoles. It is hardier than P. Webbiana, and is found growing from 80 to 100 feet high in the mountains of Choor and Kedarkanta at elevations of from 10,000 to 12,000 feet. Its properties are the same as those of P. Webbiana. An excellent figure of this Fir is given in Dr. Royle's Illustrations, Table 86. It is sometimes confounded with the preceding when in a young state; it is very rare at present.

42. Abies Pichta, or Sibírica; the Pitch, or Siberian Silver.—This is one of the dwarfest of the Silver Fir section, not growing more than 30 or 40 feet high, and differing from the others in its darker and denser leaves, and rather small, oblong, bractless cones. It forms whole forests on the Altai mountains at an elevation of 4,000 feet, is quite hardy, but suffers from drought in most places during summer. The timber is hard and durable.

43. Abies Brunoniana; the Indian Hemlock Spruce.—This resembles the common Hemlock Spruce, but has the leaves from twice to three times the length, more glaucous on the under sides, and linear (those of the Canadian Hemlock Spruce being more oblong, broadest towards the base), and the cones rather larger, the scales also being much broader and nearly double the size of the Canadian Spruce. It is only found, according to Dr. Royle, in Nepal, on the northern descent from Sheopore, in Gossainthan and Kamaon, where it is called Thanshing. It is the Abies dumosa or Bush Spruce of Lambert, and Abies decídua of Dr. Wallich; it is said to attain in favourable situations in Nepal the height of 70 or 80 feet, and is quite hardy.

44. A. Khutrow; the large-coned Indian Spruce.—An Indian Spruce resembling the common one, but with coarser leaves, and large, oblong cones, of which a very good figure is given in the "Pinetum Woburnense," under the name of A. Smithiana, a name published by Dr. Wallich, and of which there seems a great confusion and doubt. It attains as large a size in the northern parts of India, such as Kamaon and Sirmore, as the common Spruce, and is called by the hill people Khutrow, the name adopted by Dr. Royle for the species. It is quite hardy.

45. Abies Morinda; the small-coned Indian Spruce.—This is another Spruce Fir found in the northern parts of India, with much smaller cones and of slenderer growth than the preceding; the cones are not half the size of it, but more conical, and resemble those of the common Spruce; the scales are cuneated and much divided, while those of the preceding are bluntly oblong, rounded, and nearly entire, much thicker and larger in proportion. It probably may be only a distinct variety of the preceding, and is quite hardy.

46. Abies orientalis.—This pretty Spruce resembles the American rather than the Norway Spruces, but it is much slenderer, with the leaves about half the length, and nearly all of the same size on the branches. It is found on the loftiest mountains of Imeretia, forming whole forests between Guriel and the Adshar mountains. It is a lofty tree frequently planted in the neighbourhood of churches, and quite hardy. I suspect Abies obovata of Professor Don to be the same as this, and certainly not a silver Fir, as described by Dr. Ledebour, or a variety of Abies Smithiana (Khutrow) as supposed by Mr. Don; the cones certainly are like those of that species in shape, but not one-sixth the size.—*G. Gordon.*

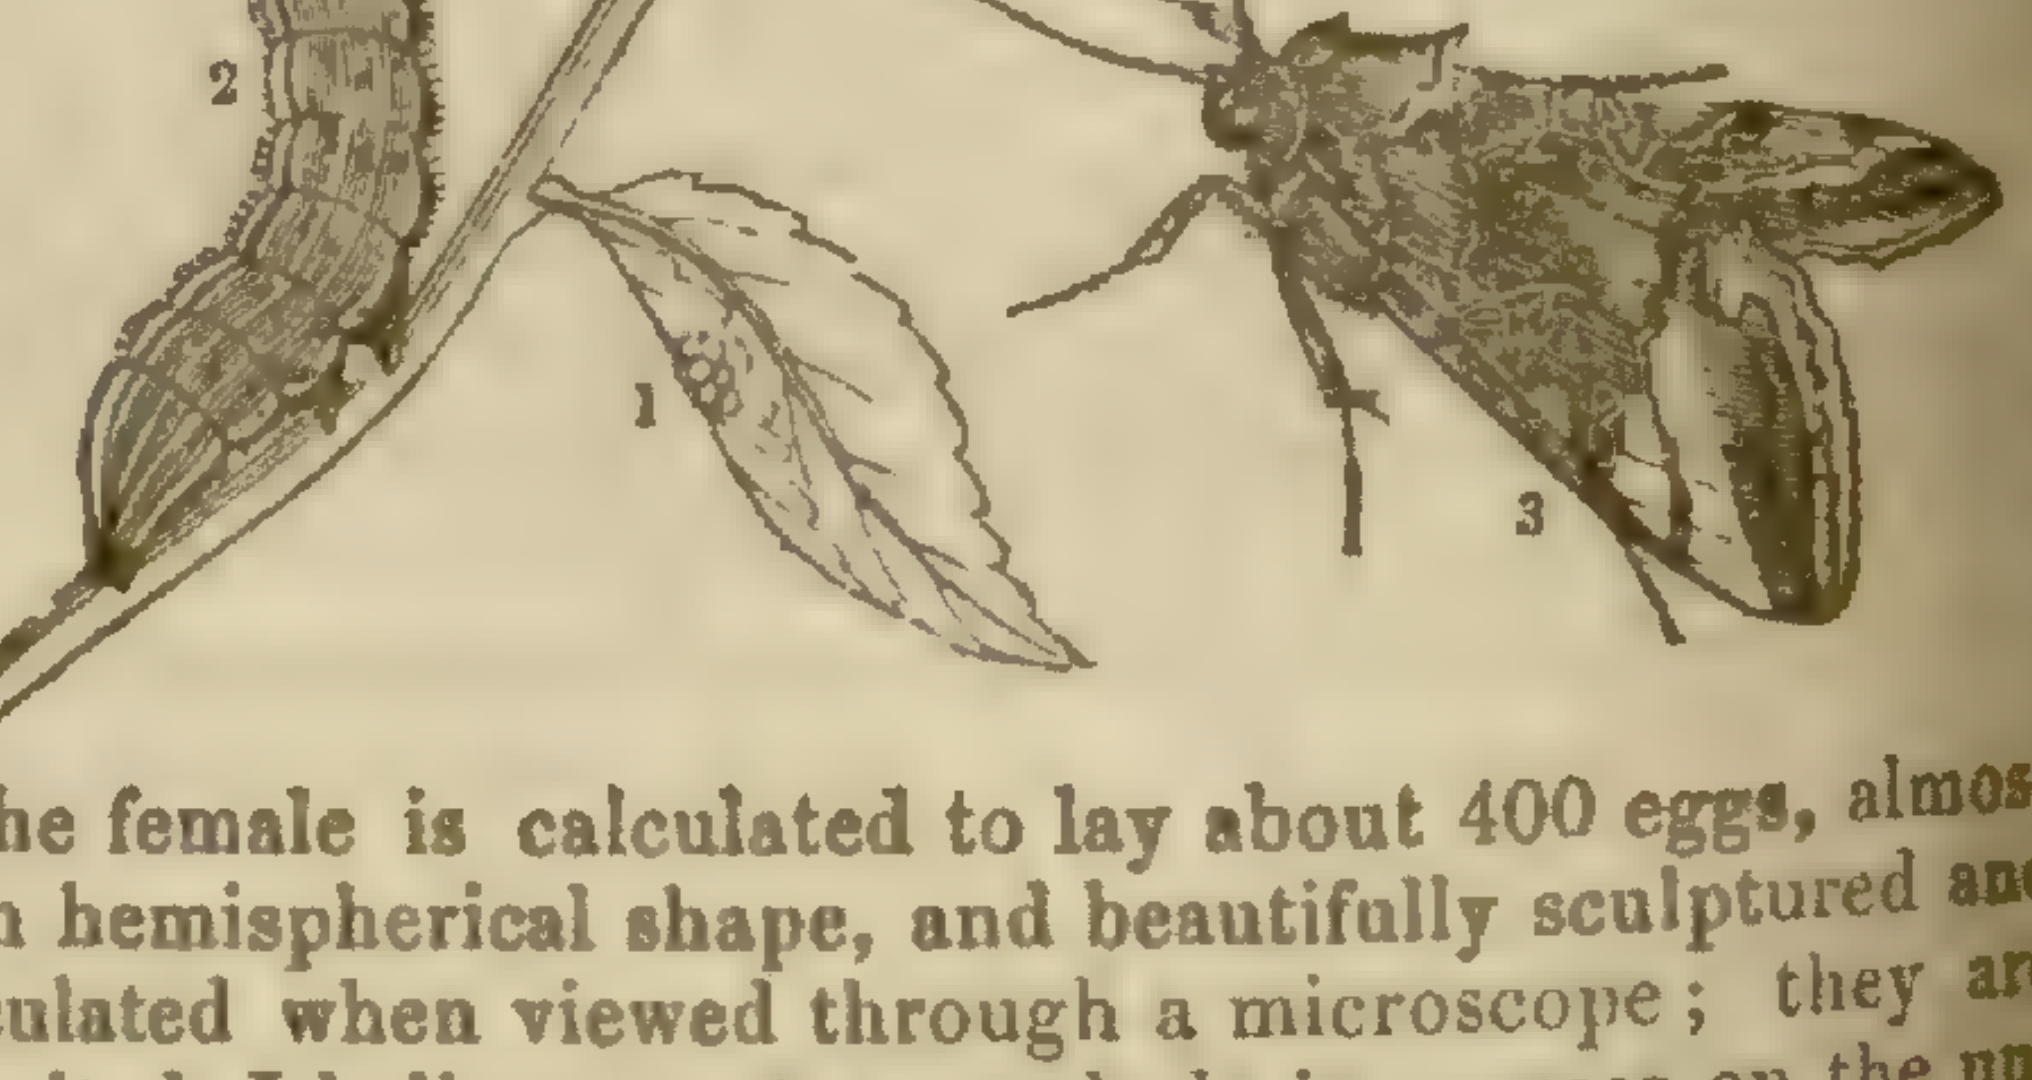
ENTOMOLOGY.—No. XXIII.

PLUSIA GAMMA, the Common Y-moth, is so abundant and extensively dispersed over this country, that it is surprising our gardens do not suffer from its destructive caterpillars, especially as it is well known on one occasion to have done immense mischief in France. We learn from Réaumur that, in 1735, the devastation these larvæ made in the market-gardens in the neighbourhood of Paris was almost incredible, and that during the month of July they ate up all the leguminous vegetables, leaving nothing but the stalks and a few scattered fragments: at that period their ravages were not limited to one district, for they were equally numerous at Tours, and likewise in Auvergne and Burgundy, where, after consuming the Cos Lettuces, they attacked the Peas, Broad-Beans, and Kidney-Beans, scarcely sparing any esculent plants; and even fields of Peas of vast extent exhibited only the stalks and pods, the leaves having been all devoured by the caterpillars. At that time they were absolutely swarming in the public roads, as they passed over from the fields which were laid waste, in search of others which promised them better subsistence. In the country they neither refused Clover nor Grasses, and Thistles, Wormwood, Burdock, and Sage afforded them a dainty repast. In some departments they destroyed the young crops of Hemp, and in Alsace they devoured the Tobacco-plants. It was remarkable, that, accommodating as their appetites were, they would scarcely touch the Lentils, even when they grew intermixed with Broad and Kidney Beans, which were so stripped that they produced no pods; and it was scarcely less singular, and far more fortunate, that they left untouched the corn-crops, as Wheat, Rye, and Barley, although, at a more advanced period, the produce of the Oat-crops was greatly diminished in various places.

Towards the end of autumn in 1816, the Y-moths were again in such multitudes in the North of France, that they rose in swarms in the fields when disturbed; yet no mischief resulted from their excess in the following summer that I am aware of; but whether that was attributable to a severe winter, frosts in the spring, or other local causes, I have no means of ascertaining. As a single moth will lay several hundreds of eggs, it might become the progenitor of 16,000,000 of caterpillars in little more than twelve months, were it not for casualties: it is, therefore, surprising that we do not frequently suffer from an invasion of these voracious animals; and it can only be from the timely aid of numerous parasite Ichneumon flies and birds, that they are prevented from increasing to a fearful extent.

There are two broods of this moth annually, and from their frequently faded and tattered condition, I expect that they are long-lived, and possibly the October specimens may hybernate; they fly by day as well as by night, are very common about fields and heaths, and frequently visit our gardens, where they hover around plants and creep over the flowers in the sunshine, searching every nectary with their fine spiral proboscis, to extract the honey; and when it becomes dark they rove about after their companions. They first make their appearance about April, and do not entirely leave us until the approach of winter. It has been ascertained that this species of moth is not only found in every country in Europe, but even on the frontiers of Siberia and China; and it is equally abundant in North America.

The Y-moth, or Noctua Gamma of Linnæus, now called Plusia Gamma,* is a beautiful creature if we examine it soon after it has emerged from the chrysalis; the upper wings have then a fine glossy surface like silk, beautifully variegated with blossom-colour and brown, having a slight coppery shade, and on the centre of each is a very good Greek γ, like pale gold; the head and thorax, which are crested with long scales, are brown with a purplish tint; the under wings are fuscous, with a broad dark-brown border, and often pale across the centre; the fringe is whitish, and there are a few dark tufts of scales down the back of the abdomen (fig. 3 represents the moth at rest).



The female is calculated to lay about 400 eggs, almost of an hemispherical shape, and beautifully sculptured and reticulated when viewed through a microscope; they are deposited, I believe, pretty regularly in masses on the under sides of the leaves of plants (fig. 1). The caterpillar, when full-grown, is green, with numerous short hairs over its body; there are five whitish lines down the back, and a broader yellow stripe extending along each side at the base of the legs (fig. 2); these larvæ are furnished with six pectoral, four abdominal, and two anal feet, and are termed semiloopers, from their curious mode of walking, when, by bringing the hinder portion of the body nearly up to the fore legs, they assume somewhat the figure of an imperfect loop; having arrived at maturity, they spin a thin white web in some secure spot amongst the leaves of stalks of the plant on which they had fed, and then change to a pitch-coloured chrysalis.

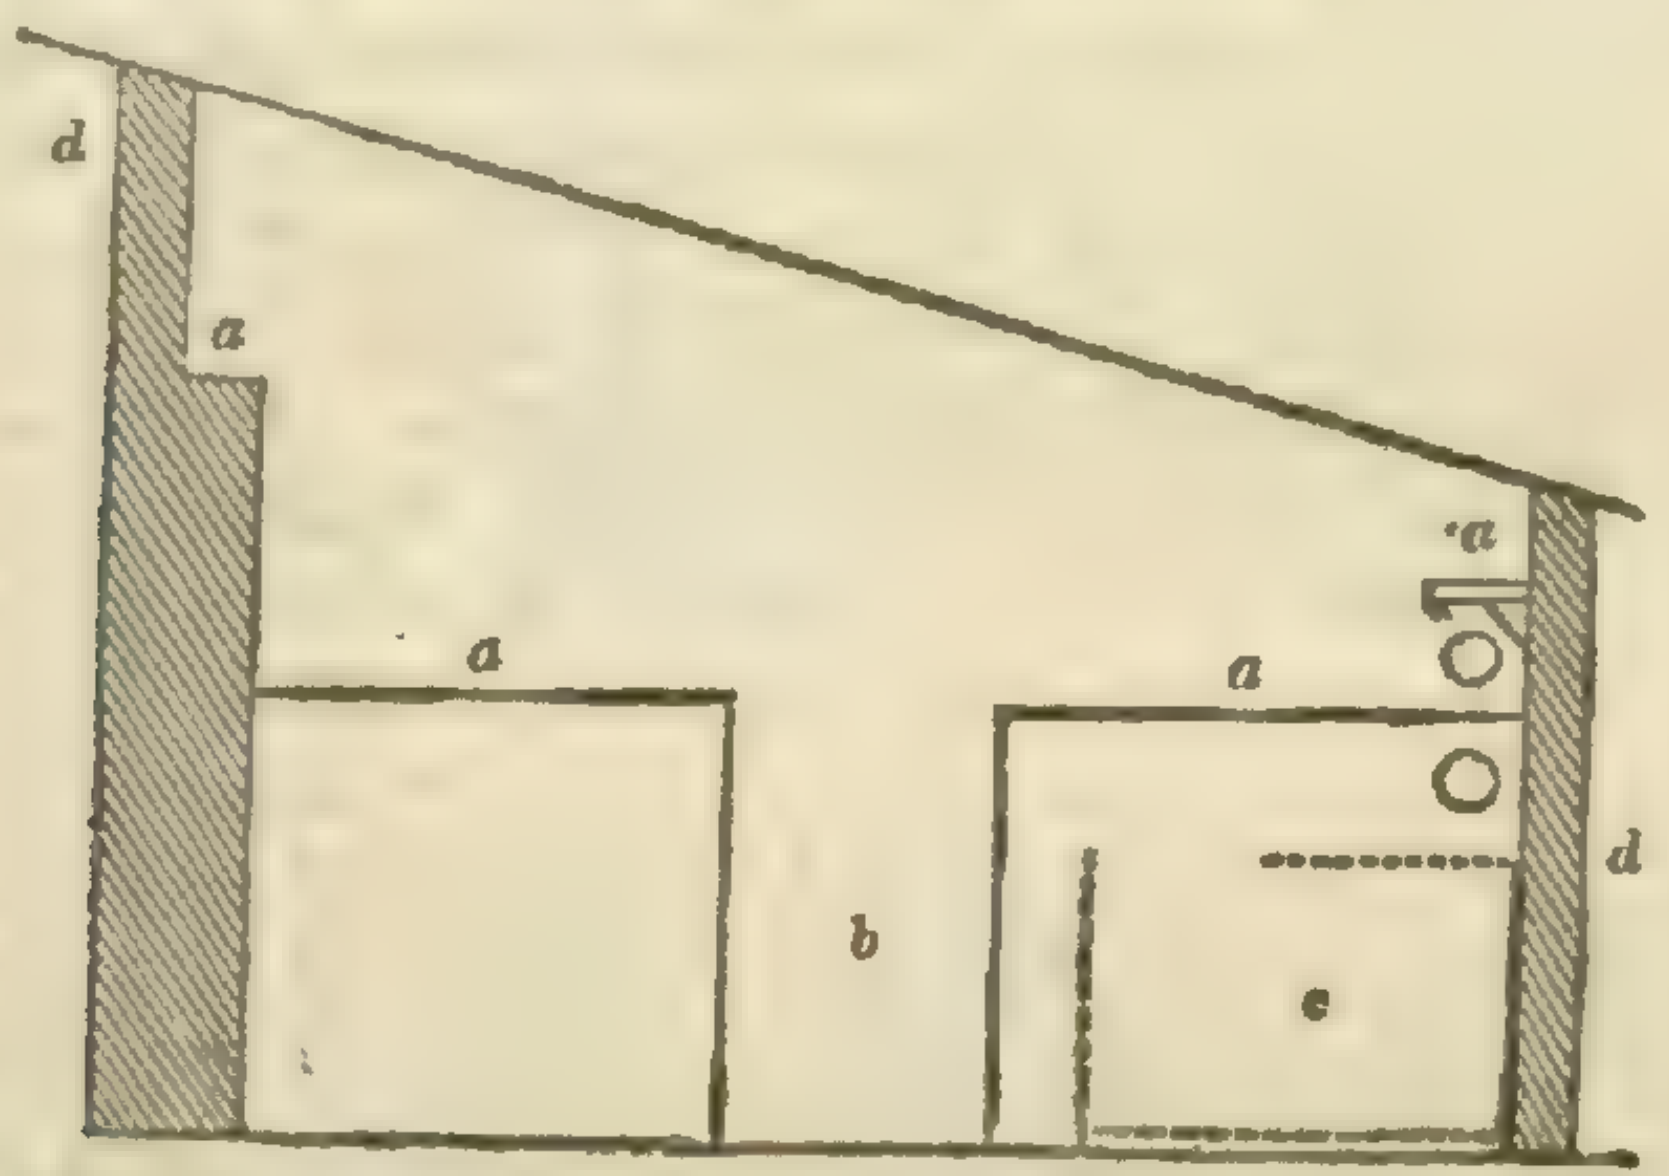
---

* Curtis's Brit. Ent., fol. and pl. 731.

The tint of these caterpillars so greatly accords with that of the plants which support them, that they pass unnoticed until their ravages lead to their detection. They soon fall down if disturbed, and may, therefore, be easily shaken off; and by placing a net or cloth under the infested plants, it is not difficult to collect and destroy them.—*Ruricola.*

DOMESTIC GREENHOUSES, NO. II.

I EXPLAINED in a former letter, (p. 763, 1841,) what I conceived to be the most proper situation in which the amateur's greenhouse should be placed, and entered into various details which ought to be considered before the commencement of the building. I send you now a transverse section of a PIT, which cannot be recommended too highly either to the amateur or to the more experienced gardener. There is nothing new in its form; but as it is easily constructed, not expensive, and most efficient, a notice of it may probably be of use to those for whom these papers are more particularly written.



a Stages and back and front shelf. *c* Proposed tank.
b Passage along the middle. *d* Proposed ventilators.

The width of the pit is 9 feet; and as the sketch is drawn from measurement, any one may easily ascertain the different proportions. The two stages are made of wood, having cross-bars, as seen at *a*, and upright bearers on each side of *b*; the small shelf in front is supported by a bracket, which also supports the hot-water pipes; and the back shelf might be supported in the same manner, although in this instance it is formed out of the thickness of the back wall. The only improvement in its construction which I would suggest is to have a large tank in some convenient place in front, as at *c*, to receive the rain which falls on the roof; and also some wooden ventilators in the back and front walls at *d*, which could be opened at those times when it is not prudent to draw down the sashes. By having the door in the back wall, and the passage along the middle, a person can go in at any time without pushing down the sashes, and reaching from the back to the front, he can water or do anything else the plants may require.

This pit is extremely useful for raising seeds or for growing small greenhouse-plants, and keeping such things as Verbenas, Petunias, and scarlet Pelargoniums, for turning out into the flower-garden during the summer months; or, by dividing it into two parts by a partition having a door in it, one-half may be used for striking cuttings, raising seeds, or keeping plants which have been newly potted off, and the other filled with well-established plants requiring more light and air—so that, with a little contrivance, it is astonishing how many things the amateur may do in a small place like this.

The greenhouses which I consider best for the amateur are so common, that very few words will describe them. They are to be seen in every small nursery-garden, a fact which is a sufficient guarantee for their utility. The most common is that with the sloping roof and back wall; the other has what is called a span roof. In both cases they ought to have upright moveable windows in front, and sliding sashes on the top, to admit as much air as is required; and the whole ought to be fitted to take off and put on as easily as a common pit or frame.

As the flues of hot-water pipes generally run along the front of the house, it is an excellent plan to have wooden ventilators in the dwarf front wall, by which means the air which is admitted in cold weather gets slightly heated before it comes in contact with the plants.

As your correspondent *Senex*, in noticing my last letter, thinks the first consideration should be the proper angle of the roof, I will now, as I have come to that part of the subject, explain my ideas upon it. Few persons, I believe, will deny the justice of the late Mr. Knight's reasoning when he pointed out the proper angle for the roof of a forcing-house, by which the greatest quantity of the sun's rays could be made available at those times when he conceived they were most required. But forcing vines or peach-trees, and growing greenhouse plants, are very different operations. In the one case, the ripening of the fruit and young wood is the principal object; in the other, handsome and well-shaped plants are required. Any experience which I have goes to prove that houses with high angles, that is, from 30 degrees upwards, having a wall behind, are apt to draw the plants too much to the front, and make them one-sided; and for this reason, I prefer houses of this description with rather flat roofs. On the other hand, as your correspondent *Senex* justly observes, the rain does not run quickly enough off a roof of this kind, and is apt to be blown through the laps into the inside. However, this objection will not be a very serious one if the house is kept in good repair, and if the laps are puttied. In my opinion, therefore, the angle for small houses of this kind should range from 20 to 28 degrees, according to their width; the section of the pit given above will be found, by applying the sector to it, to be below the minimum which I have stated, and yet no inconvenience arises from the wet; however, it ought to be remembered that it is only nine feet wide. The span-roofed greenhouse is not so liable to draw the plants to one side, and therefore these remarks do not apply to it. Where it is desirable to have a wide house, the span-roofed, or some one of its various modifications, is the best which can be employed.

Various contrivances have been invented and recommended for heating small greenhouses of this kind. Flues, Arnott's or Joyce's stove, and several others have had their advocates: but many of them, although dating their discovery from a very recent period, are already among the things that were. I believe there is nothing at present in use preferable to a good hot-water apparatus, and that the cheapest and most economical for a small house is Rogers's conical boiler. It is simple in its construction, and easily managed; it can be regulated by the stoker so as to burn the whole night without any attention, and what renders it economical to many persons is the facility with which it burns common cinders, and other refuse from the kitchen-grate. A 10-inch boiler, having a flow and return pipe along the front, would be quite sufficient for the pit which I have described, or for a small greenhouse; the cost of the boiler would be about 5*l.* 10*s.*, the fittings 1*l.* 18*s.*, and two-inch pipe about 3*s.* per yard. — *R. Fortune, Horticultural Garden.*

CULTURE OF WHEAT IN THE WEST INDIES.

(*Continued from p. 36.*)

Such is the report of the enlightened president of the Agricultural Association,—the more valuable from its presenting something like a precision of dates, which enables us to follow the experiments with more ease and satisfaction through their several stages; from its furnishing the first recorded instance of the successful cultivation of wheat at so low a level, and in so low a latitude, since the days of Columbus; and from its exhibiting a retardation of two days in the ripening of the crop at St. Ann's, resulting either from the difference of elevation or the period of sowing.

As early as November 1835 I had embraced a favourable opportunity which presented itself of transmitting a supply of Caracas seed to Sir Lionel Smith, then Governor of Barbados, accompanied by a letter explanatory of my views, and the probabilities of success. But, from causes yet to be explained, no notice was taken of the supply; and it was not till 1839 that the first experiments, of which any account has reached me, were made in that island with the most satisfactory results. These experiments were made by Mr. B. T. Young, with seed obtained by Capt. Joseph Hamilton, R.N., from Mr. J. Phillips, of Dominica. Mr. Young planted his wheat with a dibble, in holes an inch deep, and 12 inches apart, on the 15th of January, 1839, at a distance of about 2½ miles from the shore, and at an elevation but a few feet above the level of the sea. He put two grains into each hole, but is satisfied he would have had an equal return had the holes been single-seeded; by which means he would have effected a saving of one-half his seed, as every grain appeared to have vegetated, and the plants tillered profusely. The spot selected for the experiment was a cane piece trenched throughout, in which canes had been planted the previous month in the trenches, and the wheat dibbled in on the top of the bank between the trenches. Notwithstanding the general prevalence of dry weather, with sultry suns and calms, highly unfavourable to vegetation, the crop throve well, and was reaped on the 15th of the following April, the 90th day from that of planting. The ears were in general plump and well filled, containing in many instances from 50 to 60 grains each. The soil was a good loam, and no manure was employed; but as the ground must have been well dressed for the reception of the canes, this omission could not have been material. "This experience," as Mr. Young observes in his letter of the 13th of May, 1839, inserted in the *Barbadian* of the 15th of the same month, "exemplifies the fallacy of the idea generally prevailing, that Cerealia will not succeed in low situations corresponding to the level of the sea within the tropics." And farther on he adds, "When its productiveness is taken into consideration, and the short interval required for its growth and maturation, it will be found as valuable a plant to propagate as even the staple of sugar, and with half—nay, a fourth, part of the manual labour required for canes. It is now evident, from causes not necessary to be detailed or entered upon here, in an article of this kind, but which are too palpable and obvious to the most superficial observer of human events, that the staple of sugar is likely to retrograde, and it behoves the planters thus early to look abroad for other objects of cultivation, requiring the least manual labour." Mr. Young has since repeated his experiments with almost unvarying success, notwithstanding the unfavourable character of the seasons, which even the cane has been unable wholly to resist. Mr. Young has since issued a prospectus for the formation of a company for the cultivation of this wheat on an extensive scale throughout the West Indies, in 20,000 shares of 1*l.* currency each, which merits the support of every one interested in the prosperity of our West Indian possessions.

In St. Vincent the same experiments were repeated with the same success at various elevations, commencing with the level of the sea. In one instance 2 grains planted in the latter end of June produced 12 as fine ears as could be desired, which were ripe on the 10th of October. In another, some planted in the mountains near the town on the 24th of July, 1839, was ripe by the 1st of November. But besides these instances of success at considerable elevations, the editor of the *St. Vincent Gazette* states in his paper of the 16th of November, 1839, that he had at that date as fine an ear of wheat as any of the former, growing in an enclosure before his office in the town, only a few yards from the sea, furnishing a farther confirmation of the results previously obtained in Jamaica and Barbados.

At the suggestion of Sir William Colebrooke, I transmitted a few grains of Caracas wheat for trial in the island of Grenada, by the *Sheldrake Packet*, in a letter of the date of the 30th of December, 1839, but have as yet obtained no report from that quarter.

Such, with the exception of the communications lately received from Trinidad and Curaçao, the latter of which has already been noticed in your *Chronicle* for the 10th of July, is the history of the attempts now making to add wheat to the other staple productions of our West-Indian settlements; attempts, the success of which will be productive of the most important results both to the inhabitants of these quarters, and also to the mother country. From the absence of everything like an attempt at a rotation of crops, and from an injudicious perseverance year after year in the culture of the cane on the same ground for above three centuries, the ground in most of our older colonies has either become wholly unfit for its production, or only capable of yielding diminished crops at a continually increasing expenditure of labour and money; and a perseverance in the same system for some years longer will end in the total abandonment of cane cultivation in the British colonies: for as the cost of production must progressively increase, it will be impossible for them to compete successfully with the cultivators of new and undeteriorated soils in other parts of the tropics, without the protection of such a monopoly as the inhabitants of this country will not much longer submit to. From this dilemma the introduction of wheat and the adoption of a judicious system of rotation will extricate them, and be the means of restoring to profitable cultivation hundreds of acres which have for years past been suffered to relapse into their primitive wildness. Wheat will probably be found an injudicious crop to alternate directly with the cane, which belongs to the same extensive family of Grasses; but the interposition of the Dioscorea or Yam, the Caladium esculentum or Eddoe, and other tuberous-rooted plants; or the Janipha Manihot and Lœflingii, or Bitter and Sweet Cassada, and other fusiform-rooted plants; or leguminous plants, as the Arachis hypogea, Earth Nuts or Pinders, the Voandesia subterranea or Surinam Earth Nut; the Lablab purpureus or Caripe Kidney Bean; the Dolichos sphærospermos or Calavances, with a multitude of other plants indigenous to the climate, and valuable for their productions, may enable the culture both of wheat and the cane to be carried on in endless succession with advantage to the cultivator and benefit to the community. But I have extended this letter to an unreasonable length, and must hasten to a conclusion. First, however, permit me to offer one or two remarks on the information from Bermuda contained in your *Chronicle* for the 10th of last July. From the result of my trials of the average weight of the Caracas seed, 15,867 grains weigh 1 lb. avoirdupois, and a bushel, or 512 pints, weighs 49½ lbs. equal to about 785,400 grains of wheat, at which rate about 2,301 grains would measure a pint. Had these been planted in single-seeded holes 12 inches apart, in place of only 2 or 3 tillers from each hole, which appears from Mr. Fox's account to have been the produce at Bermuda, we might have expected from tolerably-manured ground at least an average of 55, as at New Providence; and with an average of 65 grains to each ear, the produce of grain when threshed out should have been 8,226,000, measuring, at 785,400 to the bushel, about 10,474 bushels. What the actual return was he does not inform us; but assuming the contents of a pint and a half to have been 2,301 seeds, and each of these to have yielded 3 ears containing an average of 52 grains, the return could not have exceeded 358,952 grains, measuring but the ·457031 part, or less than half a bushel, in place of about 10½ bushels, which it might, I think, have been possible for him to have obtained by a different course. The retardation of the ripening by no less than 43 days, may have been the result of the greater cold of the winter months in that latitude, checking vegetation; and it is probable that had the sowing been deferred for six weeks, the harvest would have ripened as soon. There can be no doubt from the calcareous nature of the soil, and the fineness of the climate, that wheat may be cultivated to great advantage in every part of the Bermuda Islands, and that the inhabitants may successfully compete with the inhabitants of the United States in the supply of flour to our West Indian Islands, should the inhabitants unhappily for themselves continue to retain their present insane predilection for their accustomed staples.

But independently of this, as a source of domestic supply placed beyond the reach of those casualties which attend agriculture in less favourable climates, and even as a subsidiary source of supply for the mother-country in seasons of scarcity, the culture of wheat in Bermuda is an object worthy the most serious consideration, and one which cannot fail to yield an ample reward to the first speculators. To whom these islands are indebted for the boon I know not, but his name deserves to be handed down to the gratitude of posterity.—*William Hamilton,* 14, *Octagon, Plymouth.*

THE AMATEUR'S GARDEN.—No. IV.

THOSE who have not much convenience for gardening are naturally anxious to make the most of what they possess, and hence we continually hear of amateurs attempting to grow too many things in one house. Stove and greenhouse plants, for example, will not succeed under the same treatment; their natures are entirely different; and although both require protection in winter, yet a temperature which will protect the one and keep them in high health is much too cold for the other. On this account, therefore, no person should attempt to grow these things together; if they do, they will most certainly fail with either the one or the other, and perhaps with both. Of course I allude to genuine stove plants, and not to those kinds which we sometimes see in some stoves. But if there are any two things which the amateur is desirous of cultivating whose habits are similar, or if one of them is hardy enough to endure the open air in winter, and only wants a glass-house to ripen the fruit and wood during summer, then there is no reason why these may not be grown successfully in the same house. This is the case with vines and greenhouse plants; and if the house is properly constructed, a most excellent crop of Grapes might be gathered out of it every autumn. As this is the time for making alterations and improvements, it may not be uninteresting to many of the amateur readers of the *Gardeners' Chronicle* to learn how this may be successfully done.

In building the greenhouse, the front wall or sashes should be constructed so that the stems of the vines, being planted in the outside border, can be taken into the house and out again at pleasure. The border should be well drained and carefully made; for if the roots of the vines are allowed to go deep into the cold and wet subsoil, no kind of after management, however good, will produce fine crops of Grapes: full directions will be found in the volume for 1841. Having raised the border rather higher than the surrounding ground, the vines must then be planted in it, one nearly opposite to each rafter, and as the buds begin to swell they may be brought through into the house. They must then be trained and pruned upon the spur system, and always taken down and drawn out of the house after the wood has been ripened in autumn.

It will thus be evident that any degree of heat can be kept up in the house, during the winter and early spring, which may be desirable for the safety of the greenhouse plants, without there being any danger of starting the vines. In the month of May, as soon as the frosts are over, all the hard-wooded plants can be removed from the house to their station out of doors, as the shade of the vines would now be injurious to them; but their places can be filled with tender annuals, such as Balsams and Pelargoniums, Calceolarias, and other flowering things that are cut down in the autumn. It will be advisable to assist the vines with a little fire-heat, particularly during the day, in autumn, to enable them to ripen their wood; but this of course will depend upon the kind of season.

If the amateur wishes to be successful, he must be careful to keep the vines perfectly clean; if the red spider is allowed to cover the leaves, it will also get upon the greenhouse plants when they are brought in, and soon render them very unhealthy. In houses where there are no means of taking out the vines during winter, a collection of Chrysanthemums may easily be kept, which could be brought in, and would produce flowers, and make the house gay during the autumn and winter. With regard to the weekly operations, a few Pelargoniums, Calceolarias, and Chinese Primroses may be shifted and more liberally watered. If the green fly appears, the house must be fumigated with tobacco. Much of the out-door work recommended formerly of course remains to be done.—*R. F.*

HOME CORRESPONDENCE.

Stocks affected by the Scion.—Allow me to ask how far the flavour of fruit is affected by the stock on which the scion has been grafted. I have heard of a gentleman possessing a Nonpareil superior to any other in the neighbourhood; his neighbours begged grafts of it, which produced fruit no better than their own. They then concluded that it was the soil which made the difference, but I think it is the stock. Some nurserymen are now selling pretty fruit-trees of low growth, which will be ornamental when covered with fruit; for example, Pear-trees no larger than Gooseberry-bushes. Such are seen in the little gardens before the cottages in the Netherlands. I presume that these pretty little shrubs are Pears on a Quince stock. But will not this stock, the natural fruit of which is so gritty, render the engrafted Pears gritty, and roughen the flavour? If I wish to improve the flavour of fruit, I sow the seeds of any cultivated sort, and pick out the best individuals produced, which, though not good enough to bear fruit themselves, are yet much better to graft scions on than a perfectly wild stock. Dr. M'Lean, of Colchester, could give us some interesting accounts of his theory and experiments on this subject; and not having the pleasure of his acquaintance, I have no other way of requesting information from him than this. The report of his endeavours to get rid of the wild stock as a mother to the cultivated scion first led me to try experiments on this subject; but my knowledge being imperfect, I should like more information from him.—*A Suffolk Gardener.*—[We can give no satisfactory information upon this subject beyond what is to be found in the "Theory of Horticulture," p. 242. Further evidence is greatly needed.]

Agricultural Vegetables.—Amongst the many excellent articles which I read in your *Chronicle* with much pleasure, I am gratified to find that you advocate a cause which I have earnestly espoused for several years, though with but little success. I allude to the paying more attention by our English and Scotch National Agricultural Societies to that subject which is the foundation of all agricultural wealth—grain and roots—or, as many would term it, vegetable produce. I had the honour—no pleasure, as it has turned out a fruitless duty—to be named president of the root and seed committees for the Highland Society in 1839-40; and in our report of 1839 I specially alluded to the absurdity of allowing so trifling a sum, only five pounds I think, for the discovery of new and superior kinds of grain or roots, whilst hundreds of pounds were voted as premiums for animals whose very existence and superiority depended entirely on the quality and quantity of the neglected roots and grain. Little attention was, however, paid to that report, and I determined that if again named president of that committee—which I was—that I would propose some names of authority to act with me, who might have more weight with our society's committee of management than I found allowed to my own opinions. Accordingly, I got the names of my two friends, Col. Le Couteur and W. Gibbs, added to our committee, and they both very kindly attended our Aberdeen meeting, and cordially agreed with me in drawing up our report, which expressed more strongly than that of the former year our opinion of the absurdity of giving 20*l.* or 30*l.* as premium to one bull or other animal, whose blood and good qualities could not be spread over any great extent of country, whilst a more perfect or earlier kind of Wheat, Barley, or other grain—or a superior Turnip, Potato, or Carrot—was almost totally neglected; though, were its merits made known by a handsome premium, it would be introduced in a short time over the whole country, benefiting thousands of our agriculturists, and through them the nation. Can such be said of prize bulls, rams, boars, or stallions, except after the lapse of a great many years? And what has been the result of our report to the Highland Society? That a larger premium was offered for a short-horned bull, 100 guineas, than had ever been given before—whilst the despicable seeds and roots were left in their former pauper condition, and the opinions of such men as Le Couteur and Gibbs cast away to the winds, because they had not the good fortune to be approved by the committee, who, of course, knew better than the sub-committee what was most valuable to the country. Will you have the kindness to admit the above statement into your columns? and pray do not let the subject sleep, as some societies do who shall be nameless. The hitherto fashion of setting a high value on animals alone would subside, and not constitute the sole object of our societies; but the public money entrusted to their care would be devoted to those subjects really of greatest value, which I consider to be our "vegetable kingdom." It is my intention this year to propose that both our Royal and Highland Societies shall devote at least as large a sum yearly in future to the discoveries of early Wheats and other improved kinds of grain—to superior Turnips, Potatoes, and other roots, as to animals; and I hope for the support of every well-wisher to our rich and prosperous Isle. I am not daunted at the reception my opinions received from the Highland Society, for I doubt not but common sense will, in Britain at least, ever prevail. The sad state to which our crops in many parts of the United Kingdom were last season reduced by a late harvest will, I trust, not be forgotten, and will call the attention of our societies earnestly to the value of discovering earlier and better kinds of grain than those now common to Britain.—*F. A. Mackenzie, Chateau de Talhouet, Brittany.*

Cucumber Exhibitions.—We have received from Mr. Wild, of Ipswich, the following form, which it is the intention of the Ipswich Cucumber Society to fill up on the occasion of their next show. It appears to be judiciously contrived, but would be improved if a column were introduced for the weight of the specimens.

THE JUDGES' DESCRIPTION OF THE FRUIT.

No.	Prize.	Exhibitor.	Sort.	Mode of	Length.	Form.	Size.	Colour.	Neck.	Spine.	Rib.	Bloom.	Blossom.	General Appearance.

} Judges.

Substitutes for Turf and Box Edgings.—I beg to state for the information of your correspondent "Clareinch," in p. 37, that I do not know two plants more alike in habit of growth than Myosotis arvensis alba and Arméria vulgaris, with this difference, that each is typical of the genus to which it belongs. So, also, is Cerástium tomentosum as compared with dwarf Thymes.—*John Caie.*

The Season for Sowing Cabbage.—In corroboration of "W. S., near the Mendip Hills," at p. 37, sowing Cabbage-seed for spring Cabbage about the 22d of July, T. Poynter, who published the "Cottage Gardener" in 1833, and who was a market-gardener at North End, Fulham, stated, "It has been an old practice among the market-gardeners of Fulham, perhaps for many generations, and it is continued to this time, to sow their Cabbage on or as near the 25th of July as possible. It is not superstition, it is not whim; it is the result of experience traditionally delivered in this parish from a successive body of careful and observant growers." He further adds, "On cold lands I would sow in the middle of July." I beg to add that for many years I have sown as near that day as circumstances would admit, and produced as early Cabbages as come to the London market.—*R. G., Old Brompton.*

A Simple Method of Producing Early Cauliflowers.—I have read in some work on gardening that the acres of ground near London which are covered with hand-glasses for protecting Cauliflower plants, give strangers a forcible idea of the wealth and luxury of the Metropolis. Every one knows that hand-glasses are useful for this purpose when they can be had; but as all are not so wealthy as you in the South are, and therefore cannot afford so many hand-glasses, it may be of some use to notice a method by which, without these aids, I have produced Cauliflowers, fit for table, somewhat earlier than others which were sown at the usual time and protected in that way. The seed was sown in the month of January under a hand-glass, and as soon as the plants were of sufficient size, they were pricked out into a piece of ground, with which a large proportion of sand had been incorporated, for the purpose of inducing them to root well. When fit for final transplanting, they were carefully lifted with good balls, which is easily done when the ground is not too wet, in consequence of the numerous rootlets which they form in the sand, and they were planted in the usual way. By this treatment they were fit for use some time before those which were sown in August; I cannot exactly say how long, but they were generally getting over before the latter came in. It is true they came into flower prematurely, and the heads were consequently small; but they are quite fit for use, and of that size which is prized in many families and preferred to those which are larger. These are not the results of one year, but of a number of years in which the same effects were invariably produced. I write these facts, thinking that they may be useful to those who have not much convenience for gardening on a large scale. As soil, situation, and particularly climate may make a difference, it may be as well to state that it was on the Borders that these effects were produced and the fact verified. All your readers of course know something of the Borders, for who has not read the Border history or heard of the Border wars? The people once so famed for their bravery and warlike spirit have now converted their spears into pruning-hooks, and are amongst the most successful cultivators of the soil.—*Wm. Falla, Lisswood House.*

Whitethorn.—I observe your Leading Article of the 15th is devoted to the subject of the Whitethorn for fences, and the mode of raising them from seed; but there is a much better and quicker mode as stated below. A gentleman resident in this neighbourhood, about 35 years ago, communicated to some society in London (I forget which) his mode of raising Whitethorns, and received from the society a valuable medal for his communication. His fences (all made with plants so raised) are the best I ever saw in any district. They appear as if you could not find a space, even near the ground, where a small dog could get through. They have been regularly cut every year with shears to about three feet high. One fence, which had been planted 40 years, and had become too wide and strong, has been cut down to within a foot of the ground, and is now as good a fence again as it ever was. All his fences were planted in single rows, and the plants 8in. or 9in. apart. Having observed that wherever the root of the Whitethorn was exposed to the light and air it threw out branches, he discovered that all the roots of the Whitethorn were full of eyes: he therefore dug up an old plant early in the spring, cut all its roots, which were from three quarters of an inch diameter, downwards to the smallest, into short lengths, of from six to nine inches, according to the thickness of the root, and planted them in a nursery-bed, with the heads not more than half an inch out of the ground, taking care to water them if the season was dry. In the autumn they had made good roots, and each had thrown out from six to ten good shoots or stems just above the ground, and was then ready to plant out into fences. By this mode you will have a good strong fence in less than one third the time in which you can get it from seed.—*A Friend to Improvement, Manchester.*—[We do not know the writer of this, and therefore cannot answer for its authenticity.]

Rot in Potatoes.—A correspondent has favoured us with the following extract from the letter of a gentleman resident at St. Helena:—"Our Potatoes, which are the great staple article of produce, and which realise so good and profitable a return for their cultivation, have of late years been visited by what is called 'the rot,' a disease, I believe, well known in England, for which we can find no remedy. This is a serious evil, and causes great misery and distress among our poor farmers, who chiefly depend upon the crop for their support. If any successful remedy has been discovered in England for the disease in question, it would be bestowing a great blessing on this people to make them acquainted with it."—[We very particularly beg to call attention to this note. Correspondents will greatly oblige us by information upon the Potatoe-rot.]

Foresting.—You are now engaged in a most excellent work, and I hope the most ignorant and prejudiced will pay some attention to your observations, and induce the owners of estates to attend more to their own interests. You state in your last, that some are impressed with only the consideration of compelling their trees to maintain a crowded growth; supposing they may be thinned at any time—a most fatal error. To confirm what you have said, I will mention a circumstance which happened in my own plantation, or young wood. My men were employed in cutting down trees which I had marked, when the agent of a neighbouring gentleman came up and remarked that I was cutting away a great many trees; and placing his hand against those which remained, was surprised to find that they were firm; and further added, that he began to thin a plantation when the trees which it was determined should remain got loose at the root: he, therefore, desisted from doing any more work. These trees must necessarily get worse and worse, and at length be placed at all angles with the ground except right angles. The above illustrates your observation, that plantations which have been allowed to remain crowded for many years cannot afterwards be thinned successfully. We have an agricultural meeting in this county, which has been formed three years, and at the beginning, when I became a member, I suggested this as a subject worthy of their consideration; and they allowed arboriculture in all branches to be discussed. This last year they did offer a premium, but they never appointed a judge to determine the claims of the competitors for the premium. It is not easy to find one competent to judge on this subject; and as we have our agricultural societies as well as horticultural, why should we not have our arboricultural also? Should you learn that any others are of my opinion, I am willing to assist in forming one at any time, to be held in each county in England in succession. Because I have ventured to cut down fine young trees, I have been termed a madman by some people. Two fine trees are too near each other: I order one to be taken out; and at my sale this last month, there were above 1,000 of as fine trees as could be seen: but there are some who think a fine tree should not ever be cut away. As well might a grazier say that all his cattle were fine ones, and he would not part with one, but let them all get fat,—a thing impossible. However some may in ignorance have disagreed with me, there are not any even of my common labourers, who have for these last five years assisted me, but are quite converts, as they say, to the principle of "cut wood and have wood." They have, year after year, observed how much more a tree increases in bulk when it has room to grow. There are some who have observed to me, that they have heard it said that one tree draws up another, and that it is good to plant thick. I admit it to a certain extent when first planting, and for some years after; but then it becomes most destructive.—*J. Hamerton.*

Oat Tea.—I have found that black tea, thickened with oatmeal, brought to the consistence of chocolate, and sweetened accordingly, is an excellent nutritious diet, cheap and easily made, and calculated to be a valuable addition to a breakfast-table for all classes of persons. I think that if the "Oat-tea" were generally adopted, it would be the means of promoting the health, and adding to the welfare and happiness of our fellow-creatures.—*T. G. Penn, Margate.*

Ice.—In p. 817, (1841,) there is a recommendation to mix salt with ice on filling a house. Having, some years ago, seen in a gardening periodical a similar recommendation, I adopted it, and, to my great annoyance, I found my ice all gone by the month of August. On considering the matter, which I should have done in the first place, I had no doubt this suggestion was not the result of experiment, but of the mere well-known fact, that adding salt to ice produces a considerable fall in the thermometer, arising, no doubt, from heat being more rapidly disengaged by the chemical action. This is, however, but of brief duration, and the ice dissolves much more rapidly. To satisfy myself on the point, I filled two ice-buckets of exactly equal size, having holes at the bottom, to convey away the water as the ice dissolves, the one with ice mixed with salt, and the other with ice alone; and the former disappeared many hours before the latter. I hope this may be in time to prevent any of your readers adopting the use of salt, excepting for the purpose of producing a greater degree of cold when the ice is taken from the house for immediate use.—*Charles Lawrence, Cirencester.*—[As the mixing salt is a very common practice, we should be glad of further information upon that point.]

Ice.—Mr. Parkins, in speaking of my plan of an ice-house (p. 814, 1841), says, "The whole of the ice, when put into the house, would of course soon form a solid mass; consequently, when the ice is wanted, it will be necessary to use a pickaxe to break it up, which could not be effected with the aperture at the bottom." These remarks deserve consideration, and to a certain extent may be true; but it does not follow as a matter of course that the pieces of ice will become frozen into a solid mass. They may be frozen at their points of adhesion, that is, where they touch or lie upon one another, but only in a slight degree. It must be borne in mind that as the air is excluded, the temperature of the house cannot be reduced below the freezing-point, and the pieces of ice within it will never be frozen together so hard as to prevent their being easily detached. Ice thrown indiscriminately into an ice-house would lie so loose, that it would rarely happen that two pieces touching, excepting on some point of their angles, could adhere with much force; and if no melting of the ice took place, which it is the main object of my plan to prevent, how could it become a solid mass? Where an ice-house is filled in the manner described by Mr. Parkins, in p. 23, the object is to get it into a solid mass, because in that case the air can only act on the upper surface and sides of the mass; but when put in loose, it presents many more points of contact for the air to act upon, and consequently a more rapid dissolution of the ice takes place. The principle I had in view when designing my plan was to provide such a house as would preserve small as well as large quantities, say from one to a few loads. Where large quantities are required, and can easily be procured, the loss of a few loads by dissolution is of little consequence; but where a family requires but small quantities, (and there are many such,) it becomes a matter of importance how to preserve the little they do require. As my plan is in some measure speculative in its principles, it may be difficult to reconcile conflicting opinions, except by direct experiments.—*H. L., Hull.*

Run Flowers.—My attention has long been drawn to the subject of run flowers, from observing that the collections of the most skilful cultivators are not free from this defect, but that the evil prevails, notwithstanding the nicest management, and the use of the most carefully prepared compost. The subject is full of interest to the florist; and in my previous remarks upon it, I stated that I do not attribute the flushing of the Carnation to the compost in whhich it was grown; that the nature of the defect appears capricious and uncertain; and that the greatest vigilance a florist can exercise in the selection of his soil is not sufficient to prevent it. To corroborate my opinion, I instanced that layers from the same clean flower would come, part of them clean, and part foul, even when subjected to precisely the same treatment, and planted in the same soil; and that frequently one flower only upon a plant appears influenced by the taint, the remainder coming perfectly clean. These instances of foulness could not, in my opinion, be satisfactorily accounted for by attributing the mischief to soil, and I therefore sought for the origin of the evil in another source. Both from experiment and observation, I come to the conclusion that the flushing of florists' flowers proceeds from some property inherent in the constitution or organisation of the plant, where, the progress towards a parti-coloured state not being sufficiently complete, there remains a tendency each season of its flowering to return to its original condition, and that constant parti-coloured flowers can only be produced by a long improvement of their race, viz., by perpetually breeding from the best parti-coloured sorts, so as to remove the seedlings as far as possible from the original self-coloured state. I believe that if this system were pursued, the result would be, that the further a parti-coloured flower was removed from its original state, the more constant it would become, and that in time constant flowers might be produced with certainty, upon which the richest soils would have but a temporary influence, and which, if flushed, would return to their clean state, when the stimulating power of the manure became exhausted. If these opinions are formed upon reasonable grounds, it will appear that the sporting of an inconstant flower is from some quality existing in the plant iself, which can only be corrected by carrying the race onward by a succession of seedlings. As a strong instance in support of this opinion, I will notice the improved condition of the Tulip-beds in the neighbourhood of London, in which the decrease in the quantity of run flowers is very manifest. The cause of this change is not to be sought in any improved mode of cultivation, or in the use of better compost than formerly; but it arises solely from the improvement in the present race of seedlings: for so long as the cultivators resorted to the self-coloured Dutch breeders, inconstancy was the result; but by raising their own seedlings from broken or parti-coloured flowers (thus carrying the race forward), permanency has in a great degree been established. The cause of flowers breaking, and the mode by which the change is effected, are impenetrable mysteries, which defy our researches; all we can do is to note the changes that occur to guide us in our operations; and if by our observations and experience we find that constancy can be ensured by the system I have mentioned, viz., by a succession of removes from the original stock, a termination to this imperfection may in time be anticipated. To effect this desirable object, great care must be taken to save seed from none but the most constant flowers, to reject even those where the original ground colour predominates, otherwise the defect we deprecate will in part be perpetuated, and only to select those flowers for seed in which the colours are equally distributed. If this is duly attended to, and the race is carried forward in the manner I have explained, I feel assured that permanently variegated flowers will be obtained.—*James Dickson, Acre Lane.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

Jan. 18.—R. W. Barchard, Esq. in the chair. A paper on the cultivation of Grapes on flued walls in the open air in Scotland, by Mr. G. Shiells, gr. to Lord Blantyre, was read. This paper was written at the request of the Horticultural Society, in consequence of Mr. Shiell's sending, in October last (see p. 663, 1841), some perfectly ripened and well-coloured Black Hamburgh Grapes. W. H. Storey, Esq., exhibited two seedling Epacrises; both were beautiful specimens, particularly one named Carnumbrata (?), to which a Banksian medal was awarded. Four seedling Epacrises were also sent by Mr. Mackett, gardener to E. Smith, Esq., of Sittingbourne. Mr. B. Fielder, gardener to W. Linwood, Esq., exhibited cut specimens of Dendróbium speciosum (Showy Dendrobium); the flowers were in great beauty, and had no doubt been produced by keeping the plant during the summer in a cool greenhouse, and afterwards placing it in a high temperature: a Banksian medal was given for this. J. Bateman, Esq., sent a spike of a new Oncidium related to Cavendishianum; the flowers are very large and yellow, and have a brown mark on their margins, which probably, if the blossoms were produced in the summer, would be richer and more conspicuous: a Banksian medal was awarded for it. From C. B. Warner, Esq., was a single blossom of a new Habranthus from South America; it was of a rich vermilion colour, more brilliant and larger than any of its congeners: a Banksian medal was given for it. Mr. Todd, of Newnham Paddox, Lutterworth, sent some bunches of Charlesworth's Tokay Grape, which he says he finds better, as a late variety, than the Muscat of Alexandria: he describes the kind as a free grower and a good bearer; and he has no doubt but he shall have a good supply of them till the latter end of February. There were two good Pines, one, a Providence, weighing 5lbs. 2oz., and the other, an Enville, weighing 4lbs. 7oz., from Mr. Bisset, gardener to Sir T. Williams, of Burwood House, Cobham: to these a Banksian medal was awarded. A certificate was given for three from Mr. Hatch, gr. to P. J. Miles, Esq., Leigh Court, Bristol; one was a Queen, weighing 3lb. 8oz., and the others were Envilles, weighing respectively 3lbs. 9oz. and 3lbs. 4oz. From Mr. Ross, of Penrhyn Castle, was a Melon called "Barker's Forcing;" it was stated to be a good variety both for an early and a late crop. Messrs. C. and T. Chapman sent a sample of their new spring Potatoe, described at p. 40, where, by mistake, it is said to be like the "Moren" Potatoe, instead of resembling the "Mouse" Potatoe. Mr. E. Beck exhibited an excellent kind of slate tub for large Orange-trees, which, from the durability of the material, is a great improvement upon wooden boxes; and also some slate pots, which he thinks for some plants, such as Pelargoniums, will answer better than porous ones, as there will be no evaporation from the sides; a Pelargonium and a Calceolaria, growing in slate pots, were exhibited, and they seemed to thrive in them exceedingly. From the garden of the Society there were Oncidium ornithorhynchum, with numerous clusters of delicate lilac blossoms; O. leucochilum, with pretty white, and green and brown flowers, and O. Cavendishianum, with large yellow blossoms. There was also a plant of Læ'lia anceps, with several spikes of flowers remarkable for the fine violet tint on their labellums. The cut flowers consisted of Lucúlia gratissima from the conservatory, where it has been flowering profusely since last November, and two varieties of Chimonanthus fragrans from the open wall.

FLORICULTURAL SOCIETY.

Jan. 18.—Mr. Groom in the chair. Mr. Shackle was elected. Some conversation occurred relative to the appointment of censors, and other points connected with the general management of the society, and the committee was requested to meet at 5 p.m., on Feb. 1st, to take them into consideration.

LINNEAN SOCIETY.

Jan. 18.—Robert Brown, Esq., in the chair. The Secretary read the address of congratulation that had been presented to the Queen and Prince Albert, on the birth of the Prince of Wales. Mr. Edward Solly, the Rev. Mr. Hawkes, and Dr. Henry Brown were elected Fellows of the Society. The resolutions of the Council on the appointment of a librarian, clerk, and housekeeper, in the room of the late Professor David Don, were laid before the meeting. Two candidates for the vacant office were announced, Dr. Leman and Mr. Kippist. The election will take place on the 15th of Feb., and the ballot will be open from half past seven o'clock to nine in the evening. The chairman announced the loss the society had sustained in the death of Mr. Lambert, one of the founders of the society. In consequence of this occurrence the meeting was adjourned, and no further business was transacted during the evening.

ROYAL AGRICULTURAL SOCIETY.

Jan. 12.—The Duke of Richmond in the chair. St. John C. Charlton, Esq., was elected a governor, and 63 gentlemen members.—The Duke of Richmond presented the Fifth Report of the General Bristol Committee, which was received and adopted by the Council. The report detailed the progress made in the preparation of the certificate and regulation sheet, for the use of competitors sending stock, implements, &c., to the meeting; the preliminary steps taken for the arrangement of the programme for the use of the members of the society; the chairman's appointment of a committee to be held on Monday, the 24th instant., for the purpose of taking into consideration the best mode of distributing the total amount of 300*l.* voted for agricultural implements into distinct prizes for the several classes of implements most required to be introduced in the counties of Somerset, Dorset, Devon, and Cornwall, as the district in which the meeting at Bristol would be held; the appointment of Mr. W. Miles, M.P., and Mr. Marmont, as stewards of the implement-yard, and of Mr. Webb Hall, Mr. Shaw, and Mr. R. W. Baker, as stewards of the trial of implements; the recommendation of the judges shall have power to order out of the show-yard, for trial, at the expense of the society, any of the implements exhibited at the meeting; and the stewards of the yard to allow the servants of exhibitors immedate access to their respective cattle as soon as the judges have completed their award; and the stewards of the trial of implements, in conjunction with the local committee, to be requested to make arrangements for keeping the ground.—That all persons who enter stock for sale by auction shall not be allowed to withdraw them from the auction, unless giving due notice to the honorary director of the yard, and at the same time paying a penalty of 5*s.* on account of every such entry.—That the medals or premiums for prize essays should be given at the general meeting, to be held at twelve o'clock on Friday the 15th of July; and the cheques for the amount of the prizes gained by competitors at the show should be drawn in London at the monthly council on the first Wednesday in August, and transmitted as usual to the various parishes by post, or delivered on personal application to the secretary; and that the implement-yard should be open on the first day, on Wednesday, at eight in the morning, and close at six in the evening; the general show of cattle and implements being open on the second (or principal) day of the show, from six in the morning, at an admission of half-a-crown each person, till two o'clock in the afternoon, and at one shilling from that hour till six in the evening, when the show would close.—Mr. H. Manning, the honorary distributor of the society's Journal for Australia, submitted to the council the various prizes he was about to send out for the York Agricultural Society, in that colony, as a proof of the progress of agricultural interest in that part of the world; and with an assurance he was authorised to state of the society's desire to enter as fully as possible into communication with the great breeders of stock in the mother country. The Council returned their thanks to Mr. Manning for this information, with an expression of the satisfaction it gave them to hear of the successful establishment of this and similar colonial associations for the advancement of agricultural improvement.—J. Cawley, Esq., of Winwick, near Warrington, transmitted to the Council a communication on the injudicious principles on which the present system of constructing cart-wheels was founded, and the evils arising from the use of the bearing-rein for horses.

AGRICULTURAL AND HORTICULTURAL SOCIETY OF INDIA.

Aug. 11.—Among the presentations to the society were four specimens of Flax grown in India, and prepared in Calcutta.—No. 1: A sample of last year's growth from English seed not acclimated. Six hundred pounds of this quality were sent to London, and were valued at 50*l.* per ton.—No. 2: A sample from Entally, from acclimated English seed sown in November, and the plant gathered in February; this was considered superior to No. 1.—No. 3: A sample from the same seed and growth as No. 2, but picked portions of plants and superior to No. 2; this was thought equal to the best produced in Belgium, and much surpassing the ordinary Belgian qualities. No. 4 was a sample from seed grown and prepared at Bowsing Factory, District of Burdwan. It was stated that the objects of the Flax Experimental Society were at present not to produce large quantities, but rather to ascertain how good a quality can readily be obtained in India.

Some fresh stalks of Hemp raised from the Russian seed sent out last year by the E. I. Company; also corresponding specimens of the Bengal indigenous Hemp plant—the former very superior in texture. A few Apple plants raised from the seeds of American Apples sent out to Calcutta in the ice-ships. Apples from Nepaul:—Mr. Hodgson mentions that the Apple crop in the Nepaul valley was this year a very favourable one; he also adds that the English garden seeds transmitted by Dr. Royle have produced excellent vegetables. Ten seers of American Maize acclimated at Allhabad. A large collection of fruit-seeds from Affghanistan.

The first discovery of the Tea Plant in Assam.—At a previous meeting of the society, Captain Charlton had solicited the society to determine to whom the first discovery of the Tea-plant in Assam was due, as it had been ascribed to Mr. Bruce, and in England the Society of Arts had therefore voted him one of their gold medals. Captain Charlton stated that he resided in Upper Assam from May 1830 to October 1831, when he quitted the province, and brought away with him the Tea-plant for presentation to the Agricultural and Horticultural Society of India; of this notice is found in the Proceedings of the Society of 21st Jan., 1832; also in Vol. ix., p. 153, of their Transactions, which was not published till 1836. On Capt. C.'s return to Assam in May 1834, in a letter to Capt. Jenkins he again brought the subject forward, and transmitted specimens of leaves and fruit, which led to the Assam plant being at last admitted to be the genuine Tea-plant, and for which important fact he received the thanks of the Tea Committee in a letter dated 6th Dec., 1834, stating that they felt no hesitation in looking upon the fact of the genuine Tea-shrub being a native of Upper Assam, as incontrovertibly proved, and in pronouncing the discovery which is entirely due to the indefatigable zeal and research of Capt. Jenkins and Lieut. Charlton, as most important and valuable.

At the present meeting documents and letters on the subject were brought forward by Dr. Wallich, by which it appears that the existence of the Tea-plant in Assam was known to the Messrs. Bruce, Mr. Scott, and Major Wilcox in 1825. Amongst them were two from the late David Scott, Esq., to Dr. Wallich: in one dated Dehkow Mookh, 2d June, 1825, he says, "I have the pleasure to forward some leaves and seeds of a plant which the Burmese and Chinese at this place concur in stating to be wild Tea." In another dated Gowahatty, 26th July, 1827, he says, "I have the pleasure to forward by this day's dak a small box containing seeds, said to be those of the Tea-plant, and which have lately been received from a Chief residing on the borders of Yunnan. About a year ago I had the pleasure of addressing you on the subject of the Assamese Tea-plant, and at the same time forwarded some seeds preserved for inspection. You will probably have met with the same plant in Ava territory, where I understand it is in great abundance, and known by the name of Lap-p'hip-pin." Letters were then read showing the connexion of the Messrs. Bruce with the discovery of the Tea-plant in Assam, and that the late Major R. Bruce, and his brother the present Mr. C. Bruce, had furnished Mr. Scott and others with both Tea plants and seeds. Two Tea-plants moreover had been received at the Calcutta Botanic Garden in May 1827, for the Countess of Amherst, while Dr. Wallich was in Burmah. Major Wilcox also, in a survey of Assam, executed from 1825-28, and published in Calcutta in 1832, at p. 448 of the 17th vol., mentioned that a Tea plant was brought to him during his stay near the head of the Irrawaddy to the east of Suddeya; and in a letter dated 22d July, 1841, states that the existence of the Tea-plant was known to Mr. Scott, to Mr. Bruce, and to himself and others, in 1826; though this he says in no wise detracts from the merit of those gentlemen who turned the discovery to valuable account or made it a second time.

The evidence at that time obtained was not considered of a sufficiently satisfactory nature by Dr. Wallich, as until ripe capsules were obtained the plant could not be distinguished from a Camellia; and this was done by means of the specimens sent by Captain Charlton. After the reading of the documents Mr. Corbyn gave the following notice of a motion to be discussed at the next meeting: "That Captain Charlton being the first to establish to the satisfaction of the Tea Committee and its Secretary that the Tea-tree was indigenous in Assam, which fact this society brought forward in its proceedings, published in the *Government Gazette* in 1832, that a gold medal be awarded to that officer in acknowledgment of the same."

WEST LONDON GARDENERS' ASSOCIATION FOR MUTUAL INSTRUCTION.

Jan. 19.—The annual dinner given by Mr. J. Weeks to the members of this society took place at the White Hart, Chelsea, and was numerously attended. Mr. Weeks took the chair; Mr. Kernan officiated as deputy. The chairman having given the health of the Queen and other branches of the Royal family, Mr. Kernan proposed the health of Mr. J. Weeks, and in doing so alluded to the improvements in heating plant structures by hot water, which that gentleman had effected. After several other toasts had been given, the chairman proposed "Success to the West London Gardeners' Association for Mutual Instruction." Mr. Caie the Secretary in acknowledging the toast adverted to the origin of the society, and said that he hoped the example, which the few had set, and which had been ultimately so well followed up by the gardeners in the neighbourhood of London, would excite his country brethren to tread in the same steps, and he doubted not that the day would come when every village should have its "Gardeners' Association for Mutual Instruction." "The Press" and several other toasts having been given, the meeting separated at a late hour, much pleased at the hospitable manner in which they had been entertained.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

CATTLEYA GRANULOSA. Rough lipped Cattleya. (*Stove Epiphyte.*) Orchidáceæ, § Epidéndreæ. Gynándria Monandria.—Of this, at present the rarest of the genus, a single small specimen exists in the garden of the Horticultural Society, where it was sent by Mr. Hartweg from Guatemala, without any intimation as to its native habits. It has a slender stem, terminated by two narrow leaves, something like those of C. bicolor, but shorter. When it flowered, only one blossom was formed; but it will probably bear a larger number when in health. The sepals were two inches and a half long, oblong, olive green, mottled with rich brown spots. The petals were obovate, very much rounded at the point, and narrowed to the base, wavy at the margin, and of the same colour as the sepals. Strongly contrasted with the dingy colours of these parts is the lip, of a pure white at the sides and point, and of a glowing orange spotted with crimson in the middle; its lateral lobes curve over the column, but are divided very deeply from the middle lobe by a wide slit; the middle lobe itself has its surface broken up into numerous granulations, something in the way of C. guttata. The high temperature and excessive moisture which suit so well the Indian Dendrobiums are most injurious to this Cattleya. A night temperature of 55° in winter and 60° in summer is quite high enough for it; and by planting it in well-drained turfy peat, and keeping it rather dry when not growing, it will be found one of the easiest to manage. —*Bot. Reg.*

GLOSSOCO'MIA OVATA. Ovate Pouchbill. (*Hardy Perennial.*) Campanulácee. Pentándria Monogýnia.—There exists in the north of India a race of climbing or half-climbing, fetid, soft, milky plants, with campanulate flowers, dull coloured like those of an Atropa, and evidently bringing the Campanulaceous and Solanaceous orders into close contact. They may be said to have the habit of Canarina on a small scale. G. ovata is a pretty hardy perennial, with spindle-shaped roots, much slenderer than G. lurida, but not inclined to twine like that species, and seldom growing more than one foot and a half high. It flourishes well in any good garden soil, and flowers in July. It is easily increased from seeds, treated like those of Campanula carpatica, and the more tender of that genus.—*Bot. Reg.*

MISCELLANEOUS.

Extraordinary Prevalence of Slugs upon Corn.—The following mode of destroying these insects, from whose ravages the young ears receive much injury, may interest our agricultural readers. Mr. Tiller, a farmer of great respectability, living at Harmondsworth, finding a prodigious number of slugs on his Wheat land, has employed 40 women three weeks in destroying them. The plan he has adopted is to scatter cart-loads of Turnip-leaves over the land, and in the morning to shake the slugs off those leaves: they have been shaken off into baskets: and however astonishing it may appear, no less than 20 bushels of slugs have been thus destroyed upon 42 acres in the three weeks. These destructive little vermin but for this precaution would have so much injured the seed in its early stage of vegetation, that there would at the most have been only half a crop, unless the land had been sown a second time—a plan at all times bad, independent of the expense.—*Merthyr Guardian.*

The Effects of Drainage.—We shall briefly recapitulate the various bad effects produced by an excess of water, all which are of course removed by having recourse to drainage. 1. One great evil produced by an excess of water in soil, is the consequent diminution in the quantity of air within it: which air we have proved to be of the greatest consequence, not only in promoting the chemical changes requisite for the preparation of the food of plants, but likewise to the roots of the plants themselves; for Saussure and Sir H. Davy have proved that oxygen and carbonic acid are absorbed by the roots; which gases, however, especially the former, can be conveyed to them only by the air. 2. An excess of water injures soil by diminishing its temperature in summer and increasing it in winter—a transposition of nature most hurtful to perennials, because the vigour of a plant in spring depends greatly upon the lowness of temperature to which it has been subjected during winter (within certain limits of course), as the difference of temperature between winter and spring is the exciting cause of the ascent of the sap. 3. The presence of a large quantity of water in soil alters the result of putrefaction, by which some substances are formed which are in all probability useless to plants,—such, for example, as carburetted hydrogen,—and diminishes the proportion of more useful ingredients, as ulmic acid. 4. An increase in the proportion of fluid in soil has a most powerful effect upon its saline constituents, by which many changes are produced diametrically opposite to those that take place in soil where the water is in much less quantity; and in this manner the good effects of many valuable constituents are greatly diminished, as for instance the action of carbonate of ammonia upon humus, and of gypsum upon carbonate of ammonia. 5. The directions of the currents which occur in wet soil are entirely altered by drainage; for whereas in undrained soil the currents are altogether from below upwards, being produced by the force of evaporation at the surface, and consequently the spongioles of the plants are supplied with exhausted subsoil water, when land is drained the currents are from the surface to the drains, and the roots are consequently in this manner supplied with fresh aërated water. Lastly, an excess of water in soil produces a constant dampness of the atmosphere, which we have shown to be injurious to plants in three distinct ways: 1. By diminishing evaporation, and thus rendering the process of assimilation slower; 2. By diminishing the absorption of the carbonic acid, and thus lessening the atmospheric supply of food; 3. By creating a tendency in the plant to produce leaves possessing a different structure from those which the same plant produces in dry situations. Thus we have six distinct methods in which an excess of water in soil has been proved to be greatly injurious to the plants cultivated by the farmer; and it hence follows as a necessary consequence, that the adoption of any method capable of affording a certain and ready means of escape for the superabundant moisture must be accompanied by the most beneficial results. That drainage has this power the experience of many years has most abundantly testified.—*Dr. Madden's Prize Essay.*

A Word to Cottagers.—Cottagers who keep cows and pigs are not aware of the loss they incur from allowing these animals to live in an uncleanly manner. Some people think they do quite enough for their cows or pigs if they only give them food and shelter; but besides this, it is certain that both require to be kept very cleanly, though seldom indulged in that luxury. The cow should be curried daily like a horse; its hide should be freed from all impurities, and relieved from everything that causes uneasiness. When you see a cow rubbing itself against a post, you may depend upon it that the animal is ill kept, and requires a good scrubbing. If well curried, the health is improved, and that improves the quality of the milk, besides increasing the quantity. A cottager might easily make two or three shillings more of his cow weekly by attention to this point; and if he at the same time took pains to preserve all the liquid refuse of the cowhouse, he might double that amount. How strange to reflect that many decent and well-meaning, but ignorant and rather lazily-disposed people, are suffering a dead loss of four or five shillings weekly from no other cause than this! It is long, however, before old habits are eradicated, and new and better ones introduced. In some parts of England the quality of pigs has been greatly improved by attention to cleanliness. The pig is not naturally a dirty animal. No animal is naturally dirty. The whole of the inferior animals possess an instinctive love of cleanliness, and will keep themselves clean, accordingly, if left to pursue their own way; they are reduced to servitude, pent up in confined houses, and have not opportunities for pursuing their inclination. The pig, if let alone, wallows in the mire: some people call this a symptom of dirtiness; it is no such thing. The animal takes this means of cleaning its skin. The mire being dried on its body, is afterwards rubbed, and with it those impurities which it is desirable should be removed. Under man's dominion, the process of cleaning can be much more effectually performed by means of a brush and water. The pig never offers any objection to this agreeable operation, and the benefit derivable from it is remarkable in the increased comfort and growth of the animal. A little less lounging and smoking, a little less drinking, a little less expenditure of thought on matters of no practical concern, would leave ample leisure for performing the useful duties we have taken the liberty of pointing out.—*Chambers' Edinburgh Journal.*

GARDEN MEMORANDA.

Loddiges' Nursery, Hackney.—In the Orchidaceous house there are several fine Dendrobiums in flower; a large specimen of D. nobile, covered with flowers of a bluish tinge, relieved by a dark mark in the centre, was particularly conspicuous; near this stood a plant of D. cœrulescens, very much like it, but having the flowers bluer in colour; D. aureum, though not so showy as the last named, was not to be passed without notice, in consequence of the powerful scent of Violets which the flowers give out; and the old D. Pierardi and its varieties depended from the roof in a graceful manner. Two kinds of Leptotes, concolor and bicolor, had produced numerous lively white flowers, with a patch of purple on the labellum. We observed Epidendrum stenopetalum had expanded a pretty rosy lilac blossom, and the curious Mormodes atropurpúreum had perfected a spike of flowers, which appeared as if they were going off, rather than in perfection. There were in flower two varieties of Cyrtochilum maculatum; one was much larger than the other, and was rendered more conspicuous by a bright primrose mark on the labellum. In the house devoted to Camellias, several of the large specimens were just opening their blossoms; the single and double stripe, and the poppy-flowered variety, were in great perfection.—*Jan.* 19.

Reviews.

The Farmer's Encyclopædia.—At p. 8 of the present volume we felt obliged to give an unfavourable character of this work. We did so with much regret, but we had no alternative. We have since received the 5th Part, and we are happy to find that it is far superior to those which preceded it. We observe no gross errors to correct; and some of the articles, such, for example, as those on Gasworks, Grass, Hop, Grains, are just what are required in a book of this sort, which, if it does not go deeply into any branch of inquiry, ought to be correct and trustworthy in whatever it states.

CALENDAR OF OPERATIONS *for the ensuing Week.*

THE frequent and sudden changes of temperature to which our climate is subject at this [illegible] leaved plants.

KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—The [illegible] dried by the constant fires necessary, [illegible] to give the whole of the bed a [illegible] usual tin tube, and afterwards the surface of the [illegible] up so as to mix the wet and dry parts of the bark; if the [illegible]

VINERY.—[illegible] A temperature [illegible] unless it is [illegible] kept up to 60° at night [illegible] be given in the day [illegible] 70° or 75°.

PEACH-HOUSE.—When the [illegible] an inch long, their [illegible] which are [illegible] be gradually done, [illegible] they [illegible]

CHERRY-HOUSE.—[illegible] as the trees are in bloom. Giving air [illegible] a strong current [illegible] the house, as that would be more [illegible] partial opening of the upper lights [illegible] better in all houses intended for early work, of [illegible] in the back wall [illegible] bast mats nailed along the top [illegible] would check the too free ingress of cold air when necessary [illegible] the sashes. A small [illegible] should therefore be [illegible]

FIG-HOUSE.—If a [illegible] now be set in [illegible] in pots in the early Peach-house or Vinery. A [illegible] is high enough to begin with; but previously [illegible] with the composition before recommended for Peach [illegible]

CUCUMBERS AND MELONS.—In foggy weather, [illegible] lately had, [illegible] culty be protected from [illegible] a strong heat by means of linings, so [illegible] air. [illegible]

KIDNEY BEANS.—[illegible] best to sow a crop about [illegible] yield a profitable return [illegible] the year. The pots may stand in [illegible] forcing-house till the plants come up, [illegible] be removed to a lighter situation.

Out-door Department.

Proceed with the work recommended last week. If the heads of any large trees in the orchard require thinning, it [illegible] bearing in mind never to make a saw-cut without [illegible] ing the edges with a knife. If it is intended to [illegible] holes, and [illegible] them if necessary; [illegible] soil [illegible] lasts.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—[illegible] if this has not been done, the plants would [illegible] it. Creepers which are beginning to show [illegible] repotted [illegible] more [illegible] bably [illegible] kept [illegible] by using [illegible] the Orchidaceous house, [illegible] now be showing flower buds [illegible] moved, and be [illegible] more liberal supply of [illegible] the plants are in, and the kind of [illegible]

GREENHOUSE.—Pelargoniums [illegible]

PITS AND FRAMES.—[illegible] as coverings for these [illegible] for while the former can be taken off every day, if necessary, to admit light to the plants, the bast mats will be frozen so hard that they cannot be moved without a great risk of breaking glass, and the plants must consequently remain in darkness for days together. Unless the pits are heated by fire, the plants need not have any water while the frost continues.

Out-door Department.

In addition to the work pointed out last week, we would advise the preparing of holes for trees in shrubbery borders, or other places where the turf is not of consequence. Shrubs of all kinds that project beyond their proper bounds might be cut in.

NURSERY AND FOREST DEPARTMENT.

Forest and Coppice Woods.—Where much planting remains to be done, all practicable work, such as felling and thinning, should be hastened, that after the breaking up of the frost there might be nothing to prevent the important business of planting from being carried on in earnest.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending Jan. 20, 1842, as observed at the Horticultural Garden, Chiswick.

Jan.	Barometer.		Thermometer.			Wind.	Rain.
	Max.	Min.	Max.	Min.	Mean.		
Friday 14	29.704	29.558	36	22	29.0	S.W.	
Saturday 15	29.953	29.919	39	20	29.5	S.W.	.02
Sunday 16	29.900	29.681	42	31	36.5	S.	.02
Monday 17	30.207	30.012	43	22	32.5	N.W.	
Tuesday 18	30.399	30.358	33	21	32.0	N.W.	
Wednesday 19	30.452	30.197	33	27	30.0	S.W.	
Thursday 20	30.098	30.028	33	32	32.5	N.E.	
Average	30.102	29.965	37.0	26 4	31.7		.04

Jan. 14. Overcast; cloudy and fine; cloudy; frosty at night.

15. Frosty and overcast; fine; sharp frost.

16. Overcast; rain with brisk wind; fine; cloudy at night.

17. Clear; fine with sunshine; clear and frosty at night.

18. Thick hoar frost with haze; frosty and foggy throughout the day; slight thaw at night.

19. Fog continuing all day.

20. Hazy; slight fog, with change of wind to north-east.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending Jan. 29, 1842.

Jan.	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.							
						N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sun. 23	44.0	34.0	39.0	5	0.12 in.	—	1	2	3	2	4	1	3
Mon. 24	43.1	33.1	38.1	6	0.51	2	2	2	1	2	4	2	1

The highest temperature during the above period occurred on the 23d, in 1834—thermometer 58°; and the lowest on the 29th, in 1839—thermometer 17°.

REPORT ON COVENT GARDEN MARKET.

For the week ending Jan. 21st, 1842.

Little difference has taken place either in the supply or the price of articles since our last Report. Considering the time of year, however, the market has been well supplied.—*Fruit.* Good Pines are plentiful. A few tolerable hothouse Grapes may still be obtained; many of the samples of foreign are excellent. Apples are abundant, but the sale is rather dull: the better kinds, however, command a fair price. Pears are plentiful, and pretty good. Chesnuts are scarce, and consequently fetching a high price.—*Vegetables.* The supply of Savoys and other kinds of Cabbage is pretty well kept up; but that of Broccoli has become much shorter, which has enhanced the price of the best samples. Forced French Beans are good, and we have never seen better Sea-kale at this time of year than that which has been this week offered. The supply of Asparagus is gradually increasing, and the quality is excellent. Lettuces and Endive are rather indifferent. Forced Rhubarb is good and abundant. Mushrooms and Truffles are plentiful and cheap.—*Flowers.* Among the cut flowers we observed Passiflora racemosa, and Cypripédium insigne.

PRICES, Saturday, Jan. 22, 1842.—FRUITS:—

Apples, Kitchen, per bushel, 2s 6d to 7s
— Dessert, per bushel, 5s to 14s
Pears, dessert, per half-sieve, 6s to 16s
Pine Apple, per lb. 5s to 8s
Grapes, hothouse, per pound, 5s to 8s
— Spanish, per lb., 1s to 1s 3d
— Portugal, per lb., 1s to 3s
Oranges, per doz., 9d to 2s
— per 100, 4s to 14s
— Bitter, per 100, 6s to 16s
Lemons, per doz. 1s to 2s
Lemons, per 100, 6s to 14s
Almonds, per peck, 7s
Sweet Almonds, per pound, 3s
Chesnuts, per peck, 5s to 10s
Walnuts, per bushel, 14s to 24s
Filberts, English, pr. 100 lbs. 120s to 180s
Cobbs, per 100 lbs. 150s to 160s
Nuts, per bushel—
— Brazil, 20s
— Spanish, 16s
— Barcelona, 20s to 24s

VEGETABLES.

Savoys, per dozen, 6d to 1s 3d
Cabbage, White, per dozen, 8d to 1s
— Red, for pickling, 2s to 4s
Cabbage Plants, per doz., 3s to 5s
Brussels Sprouts, p. hf. sve., 1s 6d to 2s 6d
Broccoli, White, p. bunch, 2s to 4s 6d
— Purple, 1s to 3s
Kidney Beans, forced, per 100, 3s 6d
Potatoes, per ton, 55s to 80s
— per cwt. 3s to 4s
— per bushel, 1s 6d to 2s 6d
— Kidney, p. bush. 2s to 3s
Artichokes, Jerusalem, pr half sieve, 9d to 1s 6d
Turnips, pr. doz. bunches, 2s to 4s 6d
Carrots, per doz. bunches, 3s to 5s
Parsneps, per dozen, 6d to 1s
Red Beet, per dozen, 9d to 1s 6d
Scorzonera, per bundle, 1s to 1s 3d
Salsify, per bundle, 1s to 1s 3d
Horse Radish, per bundle, 1s to 5s
Spinach, per half sieve, 1s 6d to 2s
Onions, per bushel, 2s to 3s 6d
— for pick., per hf.-sieve, 3s to 3s 6d
— Green, per bunch, 4d
— Spanish, per dozen, 2s to 6s
Leeks, per dozen bunches, 9d to 1s 6d
Garlic, per lb., 8d
Shallots, per lb., 1s
Asparagus, per 100, large, 11s to 15s
— Second or Middling, 4s 6d
— Sprue, or Small, 3s 6d
Sea-kale, per punnet, 1s 6d to 3s 6d
Lettuce, Cabbage, per score, 6d to 9d
— Cos, per score, 1s
Endive, per score, 1s 6d to 3s
Celery, Red, p. bdle (12 to 15) 6d to 1s 6d
— White, per bundle, 6d to 1s
Small Salads, per punnet, 3d
Watercress, per doz. small bunches, 6d
Parsley, per half sieve, 2s to 2s 6d
— per dozen bunches, 4s
Tarragon, per dozen bunches, 6s
Fennel, per dozen bunches, 4s
Thyme, per doz. bunches, 2s
— Lemon, per doz. bunches, 2s
Sage, per doz. bunches, 3s
Mint, per doz. bunches, 6s to 8s
Savory, per dozen bunches, 3s
Rhubarb Stalks, per bundle, 1s to 1s 6d
Mushrooms, per pottle, 1s 6d to 2s
Truffles, per pound, 2s to 3s

Notices to Correspondents.

☞ We regret our inability to give *Lord Tyrconnel*, and many other inquirers, any further information relating to the manure employed by Mr. Daniel, of Twerton. Our observations were founded partly upon the report given in one of the Bath papers, and partly upon private intelligence. It is to be observed that if the manure is carbonate of ammonia, as is stated, it is probably very impure, and much of its value may depend upon the other matters mixed with it. Or it may not be a carbonate at all, but a mere mixture of carbon and ammonia. What would be the effect of mixing coal-dross, such as is thrown away at the mouth of coal-pits, with urine, or with the ammoniacal liquor of the gas-works? We presume Mr. Daniel will advertise his manure for sale when he has a sufficient stock.

J. A.—The road-scrapings of districts where flint or sandstone are employed in the repairs of the road are a good material for mixing with heavy land: but where granite is broken down into roads, the scrapings are of little value, if not positively injurious. No fear of the mixture of iron need be entertained. Upon the whole, your plan appears to be well conceived. Notes upon the Dahlias of last year shall be given before the Dahlia season arrives.

An Amateur.—For your shallow-gravelly mountain soil the Grasses to select will be, Sheep's Fescue, the Alpine Foxtail, Crested Dog's-tail, Cocksfoot, and hard Fescue; to which white Clover may be added. Similar Grasses will succeed on peat; but here the Bent Grasses or Fiorins, and Alpine Poas, may be added.

Will *H. L.* favour us with the plans referred to in his paper? No doubt many of our readers would be much interested by the mode of heating, &c., he describes.

W. J. B.—No. 3 is Cacália Kleinia; 5, Veltheimia glauca; 4, Acacia verticillata; 10, an Eriostemon; 1, Othonna abrotanifólia; 9, apparently Chorozema várium; 2, Cýtisus canariensis. The rest are indeterminable from such fragments.

P. S.—Since you have no farmyard manure, you had better dress the land intended for Carrots with salt and soot in equal parts, at the rate of 12 bushels of the mixture per acre, ploughed in. Other manures would be gypsum and urine; or seaweed; or a moderate dressing of gas-lime.

A Constant Reader's plants are so very small that we cannot with certainty tell what species some of them are. No. 3 is Diosma crenata; No. 5 is Polypodium piloselloides.

T. B.—No. 1, Bupleurum rotundifólium; 4 is the common Fly Honeysuckle; 3 is Honesty; 6, Myriophyllum spicatum; 8, Eleócharis cæspitosa; 9 seems a morsel of Asplénium septentrionale; 10 is some Vernonia. The rest are not determinable. We do not understand the question about tubers. Does "T. B." mean Truffles, or Potatoes?

A Constant Reader has an old friend, a fine standard Jargonelle Pear-tree, about 50 years old, that he is anxious to renovate. The circumference of the extent of the branches is about 40 yards, and that of the stem nearly six feet. It produced, 16 or 18 years ago, about 50 or 60 pecks annually; but during the last eight or ten years it has regularly produced less and less, and in the last season not two pecks; the blossoms being less abundant, and the fruit generally dropping off when about the size of a bean. The circumstance of the fruit dropping off may be partly attributable to the series of ungenial seasons, with late frosts in spring, which have of late been experienced. As the branches are of so great extent, the roots must also have spread far and wide, and the soil within their range must be greatly exhausted. "A Constant Reader" alludes to root-pruning; but neither this operation nor any other recommended for inducing fruitfulness in young and vigorous subjects is, in the same way, applicable to the case of a tree that has long arrived at, and is now declining from a fruitful state. If it is advisable to use root-pruning in the latter case, it must be done with a view to obtain young feeders nearer home, and must be done gradually. "It were good, therefore, that men in their innovations would follow the example of time itself," is an expression of Lord Bacon's, which it is as well to remember in other things than gardening. Only a few large roots should be cut in any one season; such as are may be cut within six feet of the stem, a rich compost of loam and cow-dung being introduced for the young fibres to extend in. Bullocks' blood, diluted, or mixed with soil, is a suitable manure; as are also cows' or horses' dung, and night-soil, mixed with gypsum. The Celeri Violet, a French sort, is both solid and fine. We should be greatly obliged by your mode of growing Celery.

Totty.—Nitrate of soda is best applied to meadow-ground when the Grass is about to commence its spring growth; and the same is true of garden-plants. The quantity varies from 1 to 2 cwt. per acre. All the drysalters sell it; we buy it of Fothergill and Co., of Thames-street. Take off all scions now, and lay them with their lower ends in the ground under a north wall till wanted. Grafting-wax next week. Are you sure you are right about the law of advertisement duty? We confess we have a sort of Somerset-house-phobia.

J. W.—We have no personal experience on the subject of Vandyke roofs; but we incline to think them an improvement upon the old flat roofs, because they catch the first rays of sun in the morning, and the last of the evening.

T. M. L.—It is of no use to apply for foreign books to English booksellers. As your letter bears the postmark of Hammersmith, you can have no difficulty in calling on Black and Armstrong, Wellington-street North, or Mr. Nutt, in Fleet-street. Either will get the book.

P. A. we strongly recommend to read. We dare say he is what is called a practical gardener; that is to say, he can hoe and rake and dig, and knows how to tuck a blue apron round him in the most approved fashion; and we have some reason to think he can make Radishes grow if he will but sow their seeds less than four inches under-ground, which some authors recommend. But really when he, a gardener, asks us to tell him whether Cucumbers ought or ought not to be impregnated, we do not know what answer to give except that "to be sure they must be."

J. Skinner.—The word is cord*i*folia, not cord*a*folia.

Anti-Slip-slop.—Will you allow us to defer your criticism till we can enter into the whole subject of nomenclature? which we have for some time been intending. It is full of difficulty, and very different opinions are entertained respecting it by well-informed and sensible people. In return for this we will comply with your wishes about the Linnean classification, although we do not agree with you at all upon the subject.

A Subscriber from the Beginning.—One ounce of sulphate of copper dissolved in a gallon of water is strong enough to kill Moss on gravel-walks.

J. Bristo.—If you thoroughly fumigate your Cucumber and Melon pits with Tobacco-smoke once or twice, we have no doubt that you will destroy the aphides.

T. Hughes, and *Olitor Stocktonensis.*—We should think any respectable seedsman would supply you with seed of the Cucumbers; and if he did not possess the variety himself, he could no doubt procure it.

C. and G.—We do not know where you can procure the white Verbena exhibited at the Surrey Zoological Gardens in September last.

A Constant Reader.—Rhubarb requires soil as rich as that for Asparagus, prepared in the following way:—In an open situation, make a trench three or four feet wide and two feet deep, if the good soil will admit of it. Then place at the bottom of the trench about six inches of good rotten dung; fill up the trench with the soil which had been previously taken out; or, if the soil is not rich, mix with it a little rotten dung before filling up the trench; it will then form a bed some inches higher than the common level of the ground. As early in the year as possible, procure pieces of the old roots with only a single crown on each, and plant them in the centre of the bed at intervals of five or six feet, and cover the crown about two inches deep; when planted, throw a little long dung over each plant, to protect it from the severity of the weather. No further care is required, except to keep the plants free from weeds for some years. None of the leaves should be used the first season; and whenever they are afterwards gathered, they should always be pulled off, and not cut, as is sometimes done.

Z. T.—If the roots of your Vines that have become unfruitful are in good condition, you had probably best cut back the wood, so as to obtain new shoots from near the base. With regard to the best treatise on growing Vines in pots, before giving an opinion we would advise you to try the plan recommended by Mr. Stothard at p. 469 (1841). You will find good directions for the management of Vineries throughout the volume. Speechley's Treatise on the Vine is, in general, good. Oil-cake is not a suitable manure for Vine borders.

A Subscriber.—It is preferable to graft rather than bud Filberts; and as they push early, *now* is a proper time to cut the scions, which may consist of either one or two year old wood. The latter is best.

R. B.—The common Dog-Rose (R. canina) is the best of all the wild Roses for stocks; but much depends on the age and state of growth they have made previously to being taken from the wild state. Those taken from poor soil are stunted and bad, while those from a more favourable situation are vigorous and best. R. arvensis is sometimes mixed with the smaller stocks by those who sell them, and it is certainly of bad quality, being apt to throw up suckers. This is often the case with the standard Roses imported from France, particularly the more tender kinds, and those which are half-dwarfs. In the North of France the hairy-leaved variety of R. canina, called R. dumetorum, is most esteemed as a stock.

A Constant Subscriber, who wishes to know the best method of colouring Grapes in a hothouse, is recommended to dispose of the foliage so as to leave openings for the light; give plenty of air, and at the same time maintain a sufficiently high temperature, when the berries begin to change colour.

Crix.—All the Pears in your list are adapted for standards; but if you wish to plant some of them against a wall, the following are suitable:—Glout Morceau, Hacon's Incomparable, Nelis d'Hiver, Beurré Rance, and Passe Colmar. "Maclean's Favourite" is an Apple.

A Domestic Gardener.—The natural disposition of fruit-trees is to grow to wood, rather than produce fruit, till they approach their natural stature. Therefore, whilst young trees are in a vigorous state, they are apt to push shoots from the bases of those shortened at the winter pruning, instead of forming fruit-buds or spurs there. But as the tree gets older this disposition is less evinced, and eventually fruit-buds do begin to form on the snags, resulting from a repeated shortening of the shoots. Whatever proceeding tends to counteract the growth of wood disposes to fruitfulness, provided it is not carried so far as to cause a degree of weakness incompatible with sufficient nourishment. In this respect summer pruning, judiciously performed, is more efficacious than winter pruning, inasmuch as a shoot cut back in winter will produce one much stronger from its base than could possibly have been obtained if the shoot had been shortened in summer. Dwarf trees are best managed by a summer pruning; with a little regulation of the branches, dressing of the spurs, and of late produced wood, in winter. Summer pruning should be commenced before, and continued after Midsummer, in order that the privation of foliage may be, not suddenly and injuriously, but gradually effected. If the ultimate welfare of the tree is as much an object as its immediate produce, it is advisable in the summer management to leave some shoots at full length, some shortened one-third or one-half of their length, and others from one to three inches of their base. The Green-gage is a good bearer when favourably circumstanced, and will bear in as young a state as Plums generally. We consider the Purple-gage equal to the Green-gage in quality, and a beautiful fruit, affording a good contrast of colour. Red-coloured Apples, for a lawn, may be the Tulip Apple, Scarlet Nonpareil, Brabant Bellefleur, and Mère de Ménage; and the Louise Bonne (of Jersey) Pear.

Camellia.—From your statements we have no doubt that there is something wrong in your management of Camellias, as they are really very easily grown if the right method is followed. We will comply with your request and put you into the right way.

Clivia.—You will find ample directions for the management of Luculia gratissima at page 21 and 52 (1841), and in the "Answers to Correspondents" in our last Number. You have probably kept it in a higher temperature than is necessary; it does well in a cold greenhouse if planted out, and in a temperature of 50° or 55° if grown in a pot. Lead or zinc labels cut into the desired shape, and then painted over, are as good as any we know for plants in pots, but fancy has much to do with things of this description. We advise you to heat your Vinery with hot-water pipes, placing them along the front and ends; some remarks on this subject which will be published in our articles on "Domestic Greenhouses," will probably meet your views. Some of the best greenhouse Liliums are, L. japonicm, Thunbergianum, eximium, atrosanguineum, and L. speciosum and punctatum. The two last are the only expensive kinds.

Amateur has a hothouse 20 ft. by 12 ft.; temperature not quite, but almost that of a stove; has 12 light columns about 12 ft. in height each; and wants the names of 12 climbers for ditto—six to grow in bottom-heat and six without bottom-heat. Wants also the names of half-a-dozen Orchidaceous plants, which would do to suspend in wire baskets over the back walk. In same house, having a pit 14 ft. by 5, in the centre, with bottom-heat; wanted to know what plants would be most ornamental and handsome to grow therein?—*Climbers for bottom-heat*:—Bignonia venusta, Combretum purpureum, Pergularia odoratissima, Quisqualis indica, Echites suberecta, and Allamanda cathartica. *Without bottom-heat*:—Manettia cordifolia, Ipomœa Learii and tyrianthina, Passiflora alata and Kermelina, and Stephanotes follicularis. *Orchidaceæ*:—Odontoglossum grande, Oncidium Cavendishianum and Papilio, Stanhopea maculata, Lælia anceps, and Cattleya Harrisoniæ. The following will be ornamental in the pit:—Euphorbia splendens and jacquiniflora, Aphelandra cristata, Clerodendron squamatum, Goldfussia glomerata, Hibiscus liliflorus and splendens, Rondeletia speciosa, Russellia juncea, Justicia speciosa, Strelitzia reginæ, and Heliconia brasiliensis. We shall feel obliged to "Amateur" if he will send us the plan which he promises.

A Dibbler in Gardening.—In pruning the Rosa Banksiæ you ought to remove all the very strong shoots, and nail in the small ones. Give it as much light as you possibly can, and a slight protection in winter, particularly if you live in a cold part of the country. It blooms in great perfection when planted in a light conservatory. The roots of your Bigarreau Cherry-tree have possibly gone through your shallow soil into the gravel. In this case the only thing you can do is to take it up carefully, and replant it, adding, at the same time, a quantity of fresh soil.

D. D.—Your question requires a longer answer than we can give this week.

Mary next week.

T. S., *Clericus*, and some other correspondents, are answered in one of the leading articles of to-day. We advise the first to regard the draining from his yard as being urine.

A Constant Reader.—Ipomœa Horsfalliæ grows and flowers well enough on its own root, but it does not strike readily from cuttings; you may graft it on any of the free-striking kinds, such as I. insignis. The following Orchidaceous plants will succeed well if hung up in baskets or on wooden blocks:—Dendróbium pulchellum, cucullatum, and fimbriatum; Lælia anceps; Stanhópea tigrina and oculata; Oncídium Cavendishianum, ampliatum (large var.) and bifólium; Odontoglossum grande; Aérides odoratum, and Saccolábium guttatum. To grow in pots on the tan-pit, take Brássia maculata, Miltónia candida; Oncídium Papílio and Lanceanum; Zygopétalum intermédium; Cáttleya labiata, Mossiæ, Harrissoniæ, and crispa; Dendróbium nóbile, and Acanthophíppium bícolor. All these are ornamental and free-flowering kinds. You see what our correspondent says about nitrate of soda at page 734 (1841), but we advise you to use it with the greatest caution; as the different statements are at variance, you had better satisfy yourself.

As usual, many letters have arrived much too late for answers this week.

NEWS OF THE WEEK.

The foreign relations of France still continue in a state of serious embarrassment. The expectations expressed in our last Number that M. Salvandy, the French Minister at Madrid, would withdraw from that capital, have been realised; and little hope appears to be entertained that diplomatic relations with Spain will be restored during the continuance of the Regency. With respect to the differences with the Russian Court, nothing of an official character has yet transpired; but it is said by the Opposition journals that the Government is endeavouring to propitiate the Emperor by every means in its power. The recent prosecutions of the press, and particularly the trial and condemnation of the leading organ of the Liberal party by the House of Peers, for a breach of privilege, have occasioned great excitement in the political circles of Paris. Much apprehension prevails lest the liberty of the press be ultimately compromised; but the guarded tone in which the Opposition papers express their indignation, is a proof that even the most violent of them have been intimidated by the unusual severity of these measures. The Address of the Chamber of Peers, in answer to the Speech from the Throne, has been presented to his Majesty; in his reply, the King adverted to the confidence he felt in the salutary union of all the Powers of the State, which he described as constituting the strength of the National Institutions, and as proving the impotence of the disaffected party, which still aims at their destruction. In the Chamber of Deputies the debates on the Address still continue; the foreign policy of the Government is the chief subject of opposition, but the discussion has not yet presented any feature of general interest.—Advices from Madrid state that perfect unanimity prevails among all classes, with respect to the conduct of the Spanish Government in their contest with the French Ambassador. In the Chamber of Deputies, the leader of the Opposition and Members of every shade of political opinion were eager to manifest their approval of the conduct of the Cabinet; the Senate also, in a no less decided manner, has given expression to the same feelings. It appears, however, that the Opposition, although supporting the Government in this affair, have resolved on making a vigorous attack on their domestic and foreign policy in the debate on the Address; but the firmness with which the Cabinet has resisted the pretensions of France is said to have sufficiently increased their strength to ensure them a majority.—Our German news informs us that the Prussian Cabinet has issued an important circular relative to the Censorship of the Press, defining the duties of the Censors, prohibiting any narrow interpretation of their instructions, and permitting a free discussion of all that regards the circumstances of the country, and all fair criticism on the administration. An official proclamation, announcing the settlement of the affairs of Cologne, has just been published, together with a letter from the King, exonerating the Archbishop from the charge of being implicated, either directly or indirectly, in the late revolutionary intrigues. — From Switzerland we learn that the late political movement at Geneva has given a complete ascendency to the popular party in the canton; the Constituent Assembly has appointed a Commission to draw up a plan of a new constitution, founded upon the two general principles of a universal suffrage and the public election of municipal councils. — Advices from Egypt mention the renewed desire of Mehemet Ali to establish a communication between the Mediterranean and the Red Sea, and announce the departure of Suleyman Pacha for the purpose of ascertaining the practicability of constructing a canal or railroad across the isthmus of Suez.—From the United States we learn that the recent liberation of American slaves in British ports has been the subject of much angry discussion in Congress. The Senate has been occupied with the consideration of a series of amendments in the Constitution, for the purpose of reducing the Executive Power within safe and proper limits; and the House of Representatives has been exclusively engaged in the discussion of the Tariff question.

At home, the ceremony of laying the foundation stone of the Royal Exchange, and the preparations for the christening of the Prince of Wales, are the chief topics of public interest. The Kings of Prussia and of Belgium are expected to arrive this day at Greenwich, where H.R.H. Prince Albert, and the principal members of the Cabinet, will be in attendance to receive them. The solemnity will take place on Tuesday, in St. George's Chapel, Windsor, and every arrangement has been made to do honour to the presence of the Sovereigns, and to give additional dignity and splendour to an occasion so interesting to the country as the Christening of the Heir-apparent to the throne.

Home News.

COURT.—Her Majesty and Prince Albert returned on Saturday from Claremont to Windsor, where they still remain. The Queen has walked as usual in the gardens and neighbourhood of the Castle during the week, and on Wednesday her Majesty took equestrian exercise in the new Riding-school for the first time. Their Royal Highnesses the Prince of Wales and the Princess Royal continue in excellent health. On Monday Prince Albert left Windsor for town, to perform the ceremony of laying the first stone of the New Royal Exchange: his Royal Highness returned to the Castle the same evening. The Prince came to town yesterday by a special train, and proceeded to Greenwich; but as the King of Prussia did not arrive, the Prince returned to Windsor. It is stated by a Ministerial paper that the Prince of Wales will be named Albert Edward. It is announced that Prince Albert is to be created a Knight of St. Patrick. Lord Ormonde and Lady Lyttelton have succeeded Lord Byron and the Countess of Sandwich as the Lord and Lady in Waiting. Col. the Hon Nelson Hood has succeeded Sir F. Stovin as Groom in Waiting.

The Queen Dowager.—The health of the Queen Dowager continues to improve, though it appeared uncertain during the week whether her Majesty would be sufficiently convalescent to leave Sudbury Hall for town, according to the arrangements made for the reception of her Majesty at Marlborough House, and which, as stated in our last, was fixed for yesterday. Her Majesty, however, left Sudbury Hall yesterday morning, and arrived in town at 5 o'clock, by the Birmingham Railway, accompanied by Prince Edward of Saxe Weimar, and her suite.

Official Appointments.—It is announced that the new Judgeship, vacant by the retirement of Sir J. Bosanquet, has been accepted by Mr. Creswell. A Ministerial paper announces that Rear-Admiral Sir Thomas Cochrane has been selected by the Lords of the Admiralty to hoist his flag, and proceed immediately to China.

Parliamentary Movements.—Sir C. Lemon, Bart., has announced himself a candidate for West Cornwall, in opposition to Mr. Bassett, the Conservative candidate. The elevation of Mr. Creswell to the bench creates a vacancy in the representation of Liverpool, but no candidates are yet mentioned. The Dublin election is fixed for Monday.

Foreign.

FRANCE.—*Proceedings against the Press.*—The chief topic that now absorbs the attention of the journals is the policy of Government with respect to the press; and the leading articles of the Liberal papers display the increased fears felt by that party lest the liberty of the press be on the point of being destroyed as effectually by the system adopted against it by the present Government, as if *coups d'états* had been attempted, similar to the Royal ordonnances of 1830. The severe condemnation passed on the *Charivari*, and the trial of the *Siècle*, form the principal theme of discussion in Paris. The former paper was tried on Saturday, at the Seine Court of Assizes, for a libel on the Attorney-General, and convicted; the editor being sentenced to two years' imprisonment and a fine of 4,000f., and the printer to six months' confinement and a fine of 2,000f. The latter, it appears, prints nine journals, several of which are Ministerial ones, and is the owner and conductor of a large printing establishment, which, it is thought, will suffer severely by his confinement. The Chamber of Peers also decided on prosecuting the *Siècle*, the great organ of the Liberal party, for an article in it, reflecting on a member of their house, and which they have declared to be a breach of privilege. The affair seemed to have assumed a new appearance on Saturday, in consequence of a letter addressed to the President of the Chamber of Peers from M. Chambolle, principal editor of the *Siècle*, who is also a member of the Chamber of Deputies, declaring that the article termed a breach of privilege was written by him. The consequence of this, it was thought, would have been that the Peers would either feel obliged to take no notice of this avowal, and proceed against the publisher, or else involve themselves in a question of privilege with the Deputies, without whose permission no member of that Chamber can be prosecuted during the session. It was understood that the Cabinet had expressed their determination to support with all its strength in the Chamber of Deputies any proposition from the Peers demanding that M. de Chambolle should be put in accusation; but the Peers decided that M. Chambolle's avowal should not be taken into consideration, and that the proceedings should be confined to the responsible editor alone. The Opposition prints animadverted severely on this decision, contending that it was the result of conspiracy. They stated that the *Siècle*, which has 20,000 subscribers, was directed by two editors, MM. Perée and Dutacq—the latter on Ministerial interests; that by imprisoning and ruining the former, the journal will fall into the hands of a new editor, probably M. Dutacq; and that thus the most widely-spread organ of dynastic opposition would be neutralised or cancelled. On Tuesday, M. Perée appeared before the Chamber of Peers to answer to the charge. He stated in his defence that he had no intention to attack the prerogative of the Chamber, but he was condemned by a majority of 181 to 144 to a month's imprisonment, and a fine of ten thousand francs (400*l.*).

Foreign Relations.—The contest on the point of etiquette with the Spanish Government has ended by the withdrawal of the French Ambassador from that capital. M. Salvandy reached Paris on Monday; he was to attend the Chamber of Deputies the following day, to take part in the discussion on the Address; it being thought that M. Thiers and the Opposition would make the Spanish Question the principal object of their attack, and take little notice of Eastern affairs. The liberal prints state that the despatches of M. Salvandy in relation to this subject have been, throughout, bombastic and absurd, in proof of which they give the following extract from one of them:—"The King's Embassy in Spain, after having had an obstinate and desperate combat, has remained master of the field of battle. I bring back with me the body of France." With respect to the differences with the Court of St. Petersburg, nothing further of an official nature has transpired; but it is said that Government is endeavouring once more to propitiate the Emperor. The Opposition journals state that M. de Boutenieff, the Russian Minister, is the object of particular attention at the Tuileries; that he was invited to a grand concert given, a few days since, by the Duke of Orleans to his private friends, and add that on Thursday the King intended going to Versailles to do the honours of the Historical Museum to the Russian diplomatist. These proceedings, both with respect to the Spanish and Russian Governments, draw forth severe comments from the Liberal press; and the *Constitutionnel* declares that "to be proud with the weak, humble with the strong, inflexible towards the Regent Espartero, but ready to bear every insult from the Emperor Nicholas, constitutes the whole policy of the present Cabinet."

The Chambers.—On Saturday, the Duke de Broglie, Vice President of the Chamber of Peers, read to the King the address which had been voted by that House in answer to his Majesty's Speech, to which his Majesty briefly replied in the following words:—"You know the value I set on the sentiments which you have just expressed. They form a new pledge, added to the many you have already given to France, of the confidence which the nation has a right to place in that salutary union of all the powers of the state, which constitutes the strength of our institutions, and demonstrates the impotence of those who may still dream of their overthrow. With that union—with your local co-operation, we shall continue to follow the line pointed out to us by our duties and our oaths, and thereby secure to our country the peaceable enjoyment of all the blessings and advantages which Providence has bestowed on it." The affair of the *Siècle*, which will be found noticed above, is the only other subject which has occupied the attention of the Peers. In the Chamber of Deputies, the President having read the report of the Committee on the Address, the discussion on it commenced, with a speech from M. Bechard, a royalist, who condemned both the foreign and domestic policy of Government, particularly the treaty concluded by it for the right of search. He was followed by M. de Carne, also a royalist, who blamed all the foreign acts of the Ministry, more particularly in relation to the Eastern Question, though he expressed himself in favour of their Home policy and their vigorous proceedings against the factions. M. Berville, one of M. Thiers' party, next occupied the tribune and spoke against the Address. France, he said, had been insulted and offended, and had submitted to the offenders. The debate, which still continues, offers, however, no feature worthy of particular comment.

Algeria.—Intelligence has been received from this province to the 2d inst. It brings a long report of Gen. Negrier on the situation of the province of Constantine, announcing that perfect tranquillity prevailed in that part of the Regency. The contributions were regularly paid by the natives; seven tribes had lately made their submission; the entire country round Constantine was in a state of high cultivation, and Gen. Negrier expected that the army of occupation would subsist this year on the produce of the soil; the extensive plains of Temlouka, Talergma, Ouled-Abdelnours, which had remained waste for four years, were fast covering with farm-houses, and land had been distributed for tillage to the garrison of Constantine in the neighbourhood of that city. Works of every description were prosecuting with the utmost activity; and a barrack sufficiently spacious to accommodate 900 or 1,000 cavalry, situate at the Bardeau, together with another at El Azouch, were nearly terminated.—A private letter from Oran states, that Abd-el-Kader being aware of the importance of the events passing in the eastern provinces of the Regency, had marched towards the Tafna at the head of his regular troops, and the contingent forces of the Hachem, the Bordjas, and other tribes who remained faithful to his cause. In consequence of this intelligence, which brings Abd-el-Kader into collision with the French troops, Col. Temponire hastily collected the disposable force at Oran, and marched out at the head of a column of from 1,600 to 1,800 men, and four pieces of field artillery.—Private letters from Algiers of the 5th inst. announce that all the tribes in the province of Oran had submitted to the French, except that at Tlemcen. It was even rumoured that Abd-el-Kader had been deposed by his own troops, and had fled to the Morocco territory. It is added that the division of Gen. Lamoricière, joined by the Tafna tribes, had pursued the Emir to the frontiers, and that this result had arisen from the revolt of the Arabs. This intelligence, however, has not yet been officially announced, and seems to require confirmation.

SPAIN.—M. Salvandy quitted Madrid on the 6th inst., the communications which had passed between him and the Government having led to nothing satisfactory. He had taken with him M. Pageot, hitherto the Chargé d'Affaires, and had left behind, merely, however, for the purpose of signing passports, his second secretary of legation, the Duc de Glucksberg, son of the Duc Decazes. The arms of France have not been taken down from the hotel of the late Chargé d'Affaires, as reported to be the case. Perfect unanimity appears to prevail among all classes of every shade of political opinion, with respect to the conduct of Government in this affair. The Minister for Foreign Affairs had given to the Committee appointed to draw up the address in answer to the Regent's Speech satisfactory information relative to the subject. M. Lopez, the chief of the Opposition, had given his name, support, and praise to Government: and a proposition, approving of their conduct in this affair, had been carried almost unanimously. During the debate M. Arguelles declared that, as guardian to the minor Queen, he would not allow M. Salvandy to set his foot in the royal palace as ambassador, till he had been recognised as such by the Government of the Regent. The grounds upon which the Cortes have approved of the conduct of the Ministry in this affair are founded on the 59th article of the Constitution, according to which they contend that the Regent could not do otherwise than refuse the demand of the French Ambassador. The Senate also, in a no less decided manner, have approved of the conduct of Government, so that the feeling of the country may be regarded as unanimous on the subject. It was reported in Madrid that Mr. Aston, the British Ambassador, was shortly to leave for London; but this appears to require confirmation.—It is said that although the Opposition has been unanimous in its approval of the conduct of the Cabinet in respect to the affair of M. de Salvandy's credentials, it intended not the less to attack the Ministry on its internal policy. The address was not expected to be ready before the 13th or 14th inst., and it was rumoured that the Ministry would endeavour to procure the insertion of a paragraph to diminish, if possible, the effect on France and the rest of Europe of the circumstances which have attended the departure of the French Ambassador. The committee appointed to draw up the address had, it is stated, come to an understanding upon the paragraph relative to Barcelona, which, it was expected, would be one of the chief points of the attack contemplated by the Opposition. It would, it was believed, blame the Ministry for declaring the city in a state of blockade, and exhibiting such weakness towards the members of the Junta of Vigilance. With respect to the insurrection of October, the committee, it is also said, intended to censure the want of foresight and pusillanimity which the Cabinet had shown during the night of the 7th of that month. It was rumoured that the Regent's escort was to be increased from 260 to 500 men.

—The journals state that while Rubini was in Madrid he sung in a concert given by a society for the relief of distressed religious sisters and military invalids. The receipts amounted to more than 16,000 reals (4,000f.), and Gen. Palafox announced, in the name of the invalids, that, with the genuine spirit of Spanish gallantry, they gave up all share of the profits in favour of the religious sisters.

PORTUGAL.—By the arrival of the *Neptune* steamer at Falmouth we have received intelligence from Lisbon to the 10th inst. The new finance project occupied public attention. Considerable opposition was preparing against it for the next meeting of the Chambers, but it appears that the Lisbon capitalists were entering largely into it. The advantage to Government, independent of the cash advance, consists in its being enabled, by capitalising the arrears, and commencing cash payments to its civil and military servants, to realise the new tax of ten per cent. on salaries, &c., the levy of which was made contingent on prompt payment by Government, and which tax will, it is stated, produce a larger amount than the whole interest of the inscriptions to be created by this operation.—Lord Howard de Walden had, it is said, succeeded in getting the increased duty which, it seems, the custom-house wished to impose upon some cotton articles which they classed as linens, taken off; and a petition from the merchants for extending the time of despatching goods, imported in Portuguese shipping previously to the 19th inst., so as to get the remission of 15 per cent. under the differential duties' decree, which expires at the above date, was also understood to have been conceded.—The returns of wine exported from Oporto last year give 26,355 pipes, out of which 21,505 pipes were sent to Great Britain and British possessions.

GERMANY.—Accounts from Vienna dated the 7th inst. inform us that Sir R. Gordon has had an audience of the Emperor to notify to his Majesty the birth of the Prince of Wales. His Excellency on the same occasion expressed to the Emperor, in the name of the Queen of Great Britain, the great satisfaction felt by her Majesty on the concluding of the treaty between England, Austria, Russia, Prussia, and France, for the abolition of the slave-trade. The same accounts state that Prince Paul Esterhazy was, in the course of the week, to leave for London. The Vienna journals state that the new Bank-notes which made their appearance with the new year are of a very finished character, resembling the steel-plate engravings in the English Annuals, and increasing in beauty and elegance in proportion to the magnitude of the sums they represent. They appear to have created quite a sensation in the capital; and for several days after they were issued, the national bank was besieged by persons anxious to obtain them. They are for 5 florins, 10 florins, 20 florins, 50 florins, 100 florins, and 1000 florins; and the principal artists in Vienna are stated to have been employed in preparing the designs and executing the engravings. The paper employed for them is of a superior kind, manufactured for the purpose, and is said to be so strong, that a stripe of it half a yard long will bear 35 pounds weight. Private letters from Goritz of the 5th inst. inform us that the Duke d'Angoulême, who had been indisposed for some time, was then quite recovered, and that the Duchess, with Mademoiselle de Rosny, were in excellent health. Another letter from Vienna, of the same date, says that the Duke de Bordeaux had been out that day in a carriage; that he was able to walk down stairs to his carriage, supported by two attendants, and in all respects was going on well. The Emperor had sent one of his aides-de-camp to compliment the Prince on New Year's day.—Intelligence of recent date has been received from Berlin. The Cabinet has issued an important circular, addressed to the superior Presidents in the provinces, relative to the duties of the Censors of the Press. This document forbids the Censors to oppose any serious research after truth, or to raise any inconvenient obstacle to free trade in books. It reminds them of the edict of 1819, which bids them "repress all that outsteps the common bounds of religion, which is against morals and good habits; all fanatical introduction of religion into politics; and all that may affect the security of the State and that of the Germanic Confederation." The new instructions also "forbid the Censor to construe these orders narrowly. A free expression of all that respects the circumstances of the country is to be permitted, as well as all fair criticism on the administration, while proper attention is to be paid to the tendency, tone, and form of writings." The censorship being conducted in this liberal sense, hopes are expressed that the political literature of the daily press will be improved, and raised above cavilling and personality; and with this view it is also stated that new journals are to be encouraged.—An official announcement has at length been published of the settlement of the affairs of the Archbishopric of Cologne. A letter from the King of Prussia to the Archbishop has also been made public, from which it appears that the Prelate had promised not to return to Cologne, a promise which he has faithfully kept, and that the King now relieves him from this promise; but he is not to go to Cologne till Mons. Geissel, his coadjutor, shall have been installed, which will be in Feb. Mons. Geissen has already taken the oath of fidelity to the King. His Majesty explicitly declares in his letter that the Archbishop never took any part, directly or indirectly, in the revolutionary intrigues, and that he did nothing to encourage them.—Private letters from Berlin, of the 10th inst., state that Count Maltzahn, Minister for Foreign Affairs, had been for some days attacked with brain fever, and that but little hopes were entertained of his recovery. The Count is in his 47th year. On the 10th, several persons, composing the suite of the King, left for London, bearers, it is said, of many elegant presents in china and amber.

BELGIUM.—Accounts from Brussels, of the 13th inst., inform us that among the papers seized at the residence of M. Vandersmissen, merchant, at Etterbeck, in a domiciliary visit made by the police relative to the late plot, they found the memorial written by the ex-General Vandersmissen at the time of the revolution of 1830, and that this memorial has been added to the other documents. The ex-Colonel Borremans, accused as an accomplice in the plot against the safety of the State, has taken refuge at Rotterdam. It is said that he has written to a person at Brussels that he has fled from justice only for the present, to avoid being imprisoned; but that, as soon as the affair comes to be tried, he will present himself, being certain that he has no cause to fear a condemnation.

HOLLAND.—The Dutch papers state that the Princess Maria Sophia Louisa of Orange, who was born on the 3d April, 1824, will shortly be married to the reigning Duke of Nassau, Prince Adolphus. The accounts of the state of the rivers received at the Hague on the 12th inst., announce that the water in the Upper Rhine had fallen, and that the Dutch rivers were full of floating ice. In some places the ice was firm and passable by persons on foot, but not by carriages.—The members of the Second Chamber have received notice to resume their sittings by the 9th of Feb., or, according to some accounts, the 2d of that month.

SWITZERLAND.—The Constituent Assembly of Geneva has named a commission to draw up the plan of the new Constitution. Two general principles have been laid down for the guidance of the members, that of universal suffrage, and that of the public election of municipal councils.—The Geneva papers state that the Sardinian police authorities are now very strict in requiring passports from all persons crossing the Genevese frontier, even when they are going only a short distance into Savoy.—It is stated that the late political events in Switzerland have given such activity to the press that compositors are now wanted.

RUSSIA.—The *Malta Times*, brought by the Levant mail, states that authentic intelligence has at length been received with respect to the proceedings of the Russians in Circassia, and gives the following details of the engagement reported some time since to have taken place in favour of the Circassians, but which, as we then stated, was considered to require confirmation. The particulars are as follows:—"A great battle was in reality fought between the mountaineers and the Russians in the middle of October. It commenced in the pass of Hamish, only about six miles from the castle of Sotcha. The Russians had about 8,000 Georgian and Mingrelian cavalry, with 10,000 or 12,000 of their infantry. The former led the van, and were attacked in the pass so vigorously that they were put completely to the rout. They fell back upon the infantry, to whom their own panic was communicated, and the whole fled *en masse* to the coast, closely pursued by the victors. The slaughter was very great, no less than 3,500 of the Russians being left dead upon the field. Some escaped to the ships, which, 49 in number, were lying within gunshot of the shore; others were drowned in an attempt to swim off; and the rest of the survivors made good their retreat in great confusion to Sotcha, where they collected, and entrenched themselves. Few prisoners were made, the Circassians being less than 6,000 in number, and therefore they put to the sword nearly all who fell into their hands. All the horses, and a large quantity of arms and baggage, were taken by the mountaineers, whose loss did not, according to their own accounts, exceed 450 men killed and wounded. After this defeat the Russians sued for peace, and were answered that the Circassians would make peace if the Russians would first evacuate the fortresses on the coast—but they would not treat without intervention. They proposed that after the evacuation a delegate from the Russian General, and another from the Circassians, should be sent to Constantinople, where a treaty should be made with the concurrence and under the guarantee of the Porte and great European Powers. This proposal not meeting with the approbation of the Russians, they, after remaining before Sotcha about 20 days, embarked in their ships and sailed away, leaving the accustomed garrison in that place. The Circassians intend to attack all the castles on the coast (Anafa excepted) during the winter. The harvest having been fine, they have abundance of supplies, and expect to be very successful; since last winter, though suffering severely from the dearth of provisions, they managed to sack five castles.

IONIAN ISLANDS.—Some serious disturbances took place at Corfu on Christmas day, in consequence of the zeal of an American missionary, who it seems interrupted some religious ceremony, performing by the inhabitants. This person has been sent off to Greece. On the 26th and 27th there was a renewal of these disorders, when a soldier was killed and 12 others wounded. An order of the High Commissioner was issued, enjoining the soldiers to quit the town in the evening and keep within their barracks, and entreating the inhabitants to remain tranquil, if they would avoid the proclamation of martial law. This intelligence, however, is not noticed in the Malta papers, but was brought to Trieste on the 3d inst. by the Austrian steamer from the Levant. No further particulars are given.

TURKEY.—By the Levant mail we have received intelligence from Constantinople to the 27th ult. M. de Bourqueney, the French Minister, presented his credentials to the Sultan on that day. His Excellency, it is said, was received with marks of the highest distinction by the Sultan, who expressed a hope that the friendship and good harmony which his predecessors had ever studied to maintain with France would not be disturbed during his reign. Ali Effendi and Akif Effendi, who had been appointed, the first Minister Plenipotentiary in London, and the other in Vienna, had taken leave of the Sultan, and were to set out after the Kourban Bairam. On the 18th ult. the Sultan's second wife died. Ahmet Pacha, of Synope, had arrived at Constantinople with 4,000 men. Intelligence had been received of the arrival of five French sail-of-the-line at Smyrna; and this movement was attributed to the state of relations between the Porte and the kingdom of Greece.

EGYPT.—Our accounts received by the Levant mail from Alexandria extend to the 26th ult. The intelligence is not of great importance. Mehemet Ali had arrived at Fayoum, on his return from Upper Egypt, and had sent for his horses to Cairo, in order to make an excursion into the Oasis. He was expected at Cairo for the festival Kourban Bairam, which takes place in the latter end of this month. M. Krahmer, the Russian Consul, continued to be on the best terms with the Government. Mr. Barnet, the British Consul, was still waiting an answer to three notes which he had addressed to the Pacha on the introduction of the new tariff, which ought to have been put in force simultaneously with the abolition of the monopolies. An ordinance had been issued by Government, abolishing Constantinople coins, which had caused a general stoppage to sales of manufactures. The French Consul was still expecting satisfaction, which he had not yet obtained, for the blow given to the consular agent by an Arab. A serious disturbance took place at the Italian theatre of Alexandria on the 23d ult., during the representation of *Lucia di Lammermoor*, in consequence of a dispute between some Italians, who were vociferously applauding the *prima donna*, and some Englishmen, who wished to hear the performance. The Italians were severely beaten by the Englishmen and forced to fly. Ladies fainted, and the performance was concluded with the first act, every one having left the theatre. The Mahometans who were present were, it is said, much scandalised, and exclaimed, "These are the Europeans, who have come here to civilise the Turks!" This affair produced an unpleasant result on the morning of the 26th ult. Dr. Grassi, accompanied by M. Ceruti, the Sardinian Consul-General, and a M. Clere, were, it appears, walking on the square, when they were met by a Mr. Brooke, accompanied by some other Englishman. Mr. Brooke, addressing the Doctor in Italian, asked him if he had called him an ill-behaved person?—to which the Doctor replied that he had, because he had disturbed public order in the theatre. Mr. Brooke then struck the Doctor with his first on the face, upon which Dr. Grassi placed his hand on his sabre, but M. Clere prevented him from using it. Mr. Brooke then snatched the sword from M. Clere, and broke it into pieces. M. Ceruti then declared that he considered this a personal insult, when another Englishman replied that he was ready to give him satisfaction on the spot. The Italians then withdrew, but it was feared that the affair might lead to more serious consequences.—Private letters from Cairo state that the object of Soliman Pacha (Col. Selves), in going to Suez, is not to fortify that place, as reported, but to survey the traces of the canal, attempted to be made in ancient times, from the Red Sea to the Mediterranean, with a view to discover whether it can be again made available for purposes of communication. He is accompanied by the French engineer, Col. Gallice, and Kakyn Bey. It is further said that if the idea of a canal should be judged impracticable, it is then to be discussed whether a railroad cannot be established along the same line.

UNITED STATES.—The *Columbia* steamer arrived at Liverpool on Saturday, having made the passage from Halifax in eleven days. She brings New York papers to the 31st ult. They contain a great deal of angry discussion on the subject of the liberation of American slaves in British ports; a question which appears to have been more particularly raised just now, in consequence of the liberation of the cargo of the *Creole*, the facts of which appeared in our last. Another case of the same kind has also been a subject of discussion in Congress. A Mr. Barrow presented a memorial from the New Orleans Insurance Company, setting forth that it had insured one portion of 38 slaves, who had been taken by wreckers, carried into Nassau, and there liberated. The memorial asked for the interference of Government to obtain redress. In the course of a long discussion which arose upon the presentation of this memorial, some severe remarks were made on the conduct of this country; and Mr. Calhoun, adverting to the case of the *Creole*, characterised it as "the most atrocious insult yet offered to the nation," and talked of "making reprisals" if redress were refused. Another member of Congress, referring to the same subject, said, that it was the lawless attempts of this country in her ambitious graspings at universal domination which would render war inevitable, unless she retraced her steps, and did what was just between nation and nation. The subject was ultimately referred to the Committee on Foreign Affairs.—On the 29th ult., Mr. Clay, in pursuance of a notice he had given, laid before the Senate three joint resolutions, proposing certain amendments in the Constitution of the United States. The first of the resolutions proposed to amend the Constitution by restricting the veto power; the second, by vesting in Congress the appointment of the Secretary of the Treasury and the Treasurer of the United States; and the third, by prohibiting the appointment to office of any member of Congress during the term for which he was elected. Each resolution appears to have in view the same object—the curtailment of Executive power and influence, and its reduction within safe and proper limits. A long debate followed, the conclusion of which had not been received at New York when the *Columbia* left.—The House of Representatives had been almost exclusively engaged in discussing the tariff scheme; and the debates were expected to occupy another week. They turned on the point whether duties should be imposed for protection or revenue. The Secretary of the Treasury had submitted to Congress his reports, describing the President's plan for a new national currency, and for a final adjustment of that question. The report extends to great length, and is not of interest to the general reader.—Lord Morpeth had returned to New York.—A justice named Wiley had been convicted of having been connected with thieves and bank robbers, for whom he had negotiated rewards on the restoration of their plunder.—The Judges of the Courts at Philadelphia, to whom the grand jury had made a presentment against Nicholas Biddle and others, on the alleged ground of their having defrauded the Bank of the United States, had unanimously decided against entertaining the subject. It was rumoured that the officers of the Bank would be indicted in some way.

CITY.

Money Market, Friday.—Consols for money closed at 89⅛; for the Account, 89⅜ to ½; Bank Stock, 167 to 168; India Stock, 246½ to 247½; Exchequer Bills, 16s. to 18s. premium; Three per Cents. Reduced, 89½; Three-and-a-Half per Cents. Reduced, 98⅜; New Three-and-a-Half per Cents., 98¾; Long Annuities (expiring Jan. 5, 1860), 12⅝.

Metropolis and its Vicinity.

The Weather.—The weather since our last has been somewhat variable; at the early part of the week the frost was severe, but several partial thaws have since taken place, and the weather has become a little milder. On Wednesday a thick fog enveloped the Metropolis, which towards night became so dense that it was with difficulty the most experienced persons were enabled to pursue their route. This difficulty, however, appears to have been still greater in the environs, particularly on those roads where the lights have been withdrawn, the stages and omnibuses being compelled to proceed by torchlight. In the Parks the ice has been rendered rather dangerous by the thaws; but although many thousand persons have frequented them during the week, no accident of a fatal nature has occurred.

New Royal Exchange.—On Monday the ceremony of laying the first stone of the new Royal Exchange was performed by H. R. H. Prince Albert. The City presented a very animated scene, great preparations having been made for the event; and, the weather being favourable, a large assemblage of persons was collected together to witness the arrival of the Prince and the other distinguished individuals who were to be present on the occasion. A few minutes before two his Royal Highness arrived at the Mansion House, and was received by the Lord Mayor and by several members of the Cabinet. The procession then left the Mansion House, and advanced, amid the cheering of the assembled crowds, to the site of the new Royal Exchange, where a pavilion had been erected for the occasion. The pavilion was of considerable size, handsomely decorated in the interior, which was lit up with gas, and afforded accommodation for about 1500 persons, among whom were the Duke of Wellington, Sir R. Peel, Lord Stanley, and other members of the Administration, together with many distinguished individuals, the officers of the Corporation, and a numerous assemblage of ladies. The Prince having taken his place near the stone, first deposited in it a bottle containing the different coins of the realm, together with a medal, having the head of her Majesty on the obverse, and an inscription on the reverse. A glass brick, having on it an appropriate inscription, and four glass pillars, were likewise deposited in the same manner by his Royal Highness. A zinc plate, containing a Latin inscription composed for the occasion by the Bishop of London, with an English translation, was then placed in the stone, and over the whole another rough plate of the same metal. After a suitable address from the chairman of the Gresham Committee, Prince Albert received the trowel, which was silver gilt and of very handsome workmanship, and spread some mortar along the surface of the stone. A large block of granite, five tons in weight, which had been kept suspended by machinery, was then accurately lowered upon it, after which his Royal Highness, with an oaken mallet formed out of a portion of a beam of the old Exchange, that had been rescued from the fire, struck the stone 12 times, thrice at each corner, and afterwards proved it to be correctly laid by means of a level and plumb-rule, which were handed to him. All the necessary formalities having thus been gone through, during the performance of which the Prince was greatly cheered, the Lord Mayor's chaplain, the Rev. H. Thomas, offered up a form of prayer suitable to the occasion. The national anthem was then sung: and thus concluded the ceremony, which, considering the important purpose for which the new building is intended, the pomp which attended its foundation, and the distinguished personages present at the ceremony, must be regarded as an event of general interest to the country at large.

The Banquet at the Mansion House.—Immediately after the conclusion of the ceremony, Prince Albert and the procession again returned to the Mansion House, where a sumptuous entertainment had been prepared for his Royal Highness and a select number of distinguished guests. After dinner the health of her Majesty was first proposed, which was followed by that of the Queen Dowager. The Lord Mayor in a brief speech then proposed the health of his distinguished guest, Prince Albert; he said he felt highly honoured by his presence, and added, that though his Royal Highness's residence in England had not yet been long, it had been sufficiently so to enable him to declare, that while his Royal Highness would at all times have been received with honour as the consort of their beloved Queen, he was now received with affection and esteem for his own sake. The toast having been drunk with great enthusiasm, his Royal Highness rose, and replied in the following words:—"My Lord Mayor, Ladies, and Gentlemen, I return my most sincere thanks for this toast, and beg to express to you my lively satisfaction at the kind and flattering manner in which you have received me. It must ever be a gratifying recollection to me to have, by a trifling act of mine, connected my name with the erection of that important building of which we have laid the first stone to-day—an edifice of which it may truly be said that it will become the heart of the commerce of this great country—a country to which I feel myself attached by the dearest ties—a country in which I daily feel myself more at home—a country whose kindness I daily more appreciate. Again thanking you for the honour you have done me, I beg to propose 'The health of the Lord Mayor, whose guest I am this day, and the Corporation of the City of London.'" The Lord Mayor briefly returned thanks, and proposed the health of the Prince of Wales, which was received with loud applause, after which "The Bishop of London and the Established Church" was given, which the Bishop acknowledged in a short speech. The health of Sir R. Peel and the other Cabinet Ministers came next; upon which Sir R. Peel rose, and, for himself and his colleagues, returned thanks for the favourable manner in which their healths had been received. The right hon. baronet said that it was most gratifying to them to have the opportunity of witnessing the important ceremony of that day. It was impossible not to feel that that contracted spot on which they had stood was again destined to be, as it had been before, the centre of attraction to which the commerce of the world would gravitate. It was impossible not to feel that it was the spot to which the traffickers of all nations would resort, where they would obliterate national antipathies and national jealousies, and would form those engagements which constitute new guarantees for the general tranquillity of the world. His Royal Highness that day had laid the foundation not merely of an edifice dedicated to commerce, he had laid the foundation of a temple of peace; and it was the earnest wish of her Majesty's Government that the future progress and destiny of that edifice might correspond with the favourable auspices under which that day its foundations had been laid. The health of the Earl of Ripon was then drunk, and the honour having been acknowledged by his Lordship, was followed by that of the Duke of Wellington and the House of Peers. His Grace, who replied at some length, said that he was much pleased at having been invited on that occasion. They had met there, he said, that day to celebrate, promote, and perpetuate the arts and advantages of peace; and he trusted that he should never again hear in his time of the celebration of the arts of war. For his colleagues, the other members of the House of Lords, he also begged to return thanks, and added, that that house was in his opinion essentially the Conservative branch of the constitution of the country; and he hoped that, in modern times at least, it had fulfilled the objects of its institution. Sir R. Peel proposed the health of the Lady Mayoress, and in the course of his speech paid a high compliment to Mrs. Fry, who was sitting on his left hand. The Lord Mayor briefly responded to it, and then gave the Representatives of the people in the House of Commons, and in connexion with them the name of the noble Lord the Secretary for the Colonies. Lord Stanley spoke at considerable length in acknowledgment of the toast, and was loudly cheered at different parts of his speech, which our space will not enable us to give. He felt proud at finding his name selected as the organ of an assembly which is itself the representative of the most powerful and most important body the world ever beheld—the commonalty of the United Empire. He would venture to say that it was impossible for any one returning from the imposing ceremony of that day to have witnessed, as they had done, the countless multitudes thronging the streets of that great Metropolis, orderly, peaceably, and well-disposed in their demeanour—a scene which no other country could have exhibited in such a mass, coerced by no force except that of moral feeling and interest—it was impossible to have witnessed such a combination, beautifully graduated from the Prince-Consort of the Queen to the lowest and humblest artisan in the Metropolis, all united in doing honour to the great object of the day—the promotion and establishment of that which was the emblem, as it would be the harbour, of the commercial interests of this great country;—it was impossible to have witnessed what they had that day seen, and not return to the discharge of their public duties with an increased sense of the awful responsibilities committed to their trust, the important interests with which they had to deal, the reverence with which they should touch, the caution and love with which they should guard the institutions which in their results had produced such a prosperous and happy combination of all orders of society in the Metropolis. It was impossible to have returned without an increased sense of the magnitude of that commercial interest which, spreading from one end of the world to the other, carries with it, not only the commercial greatness of this empire, but also, under the auspices of the principal merchants of London, carries in its train the arts of civilization, the blessings of peace, and the promotion of religion. He trusted that the House of Commons would never be forgetful of the great duties intrusted to its charge; and would always feel that the best security for the permanence and liberties of the people was the maintenance of the present harmony of the Constitution, which, in all its branches, formed that happy combination which he trusted would be perpetual, the envy of the world, the constitution of the United Empire. Several other toasts were drunk, and about 9 o'clock Prince Albert left the Mansion House, amidst the enthusiastic cheers of the crowds assembled outside, and the remainder of the company shortly afterwards broke up.

Metropolitan Improvements.—The Commissioners of Woods and Forests have given orders to their architects and surveyors to commence the projected improvements at the West-end at Lady-day, or as soon after that period as possible. The line of Coventry-street, through Cranbourne-alley, will then be continued, and a large number of houses on the Marquis of Salisbury's estate will be pulled down. The line of the intended new street will, it is said, be commenced in Castle-street, where the houses will be first removed.—The sale of the external materials and internal fittings, hothouses, ice-well, &c., of the Ranger's Lodge, Green Park, has taken place on the premises, by order of the Commissioners of Woods and Forests, the site being wanted for the intended improvements in the Park. The lodge itself, it is said, will be pulled down in the course of a month.

Marylebone.—At the usual weekly meeting of the vestry on Saturday, it was agreed, on the motion of Mr. Gomm, that the poor in the workhouse should, on the day of the christening of the Prince of Wales, be treated to the same luxuries as on Christmas-day. Mr. Joseph moved, that the out-door poor, upwards of 6,000 in number, be also on that day of general rejoicing supplied with the means of enjoyment. The motion was opposed by Messrs. Gomm and Kirlyon, on the ground of the want of precedent, but was eventually carried. It was also agreed, on the motion of Mr. Foster, that a holiday should, on the same occasion, be allowed to all the poor persons in the employ of the parish, without any deduction being made from their wages. Mr. Clapp then moved, that all the poor-rate payers who had distress-warrants in their houses for the non-payment of rates should be exempted from the payment of these rates; but the motion was lost by a majority of 17 to 11.

Public Meetings.—On Saturday, a numerous meeting of the Spitalfields weavers was held to receive the answer of the Poor-law Commissioners, in reference to a communication to them, conformable to a resolution of the trade, passed at a meeting held on the 1st Jan., as reported in this Paper at the time, requesting that they would take measures to exempt the Spitalfields weavers from the employment of stone-breaking at the workhouse, and for other business connected with the destitution at present existing in that district. The answer of the commissioners was read, acknowledging the receipt of the resolution forwarded to them, and promising that inquiry should be made as to the alleged injurious effects of such a mode of providing labour for paupers. Several statements were then made relative to the existing distress in this neighbourhood, which appears still to prevail to a serious extent; and several speakers animadverted severely on the conduct adopted by the Board of Guardians of the parish in withholding relief from applicants. Several weavers stated that they had not been relieved at all, and Mr. Fox said that the numbers of the visiting committee were not sufficient; but he believed that, at the next meeting of the central committee, more visitors would be appointed, when he hoped that the relief would be general. A vote of thanks was then carried to *The Times* and *Morning Herald* for the kind assistance they had afforded to the distressed weavers, and for the manner their cause had been advocated by those journals, and also to all those other journals which have stood forward in their behalf.

Seizures by the Excise.—It is stated that a seizure has just been made of an illicit distillery, on a large scale, carried on by one of the leading wine and spirit merchants at the East end of the town. There were, it appears, 20 vats, each capable of holding 700 gallons, and about 20 tons of molasses in a state of preparation for distillation, and 900 gallons of molasses' wash. It is said that it required 14 vans to remove all the articles to her Majesty's stores. Thirty-three tons of sugar made from potatoes have also been lately seized in some premises in Princes-square, St. George's-in-the East, where more than twenty men were at work in the manufacture of that article, which, it is stated, is sold by the grocers with a mixture of the East India produce. All the men, it seems, asserted their ignorance as to who was their employer.

Robberies.—Several robberies were committed on Monday, during the bustle and confusion in the City attendant on the procession going to the New Royal Exchange. A young lady was robbed in Cornhill of a sum of money, the thieves having contrived to cut her pocket from her side. A gentleman, whilst walking along Cheapside, was hustled and robbed of a silver watch, gold pencil-case, and four sovereigns; and the thieves, it seems, cut away part of his trousers in taking the articles. Another gentleman, while standing on Cornhill, was hustled and robbed of a valuable gold pin; and notwithstanding the vigilance of the police, several other robberies of a similar kind were committed without the parties being apprehended.—On Tuesday, a well-dressed young man was detected in the act of picking a gentleman's pocket in the Court of Queen's Bench. Perceiving that he was discovered, he rushed out, and made his way to Westminster-bridge, where he sought refuge in a coal-barge. A policeman, however, had pursued him so closely from the court, that he was instantly secured and taken to the station-house.—At one of the police-offices on Monday, two men, named Deeks and Roe, apparently farmers' labourers, and who seemed to be in great destitution, were examined on a charge somewhat similar to those reported in our last, of stealing bread from a baker's shop. The baker in whose shop the theft had been committed said that the prisoners came into his shop, when one of them asked for a big loaf, and a quartern one being handed to him, he immediately broke it in two and handed a portion to Deeks, when both of them commenced eating it. They were asked for the money, to which they replied that they had none, and he might send for a policeman if he liked. They were then given in charge. On being asked what they had to say, they merely stated that they were very hungry, and could get no employment or relief. The magistrate remanded them for further examination.—William Yates, the individual charged with committing a great number of successful frauds on the different charitable institutions of the Metropolis, has undergone a final examination. Two cases were brought against him; one by the Secretary to the Society for the Protection of Young Females, who stated that the prisoner called on him, representing himself to be the steward of Sir H. W. Fletcher, of Ashley Park, Surrey; who, he added, had sent his cheque for the amount of subscription to the Society, and it being 16*s.* beyond the amount of subscription, the prisoner had received the difference. The cheque was found to be a forgery. A policeman stated that he was the prisoner's brother-in-law, and on being shown the letter and cheque, said that they were in the prisoner's handwriting. The Secretary of the Mendicity Society stated that he had seen upwards of one hundred begging-letters written by the prisoner to the nobility and gentry; that he had been transported in the year 1828; and that since his return from transportation the Society had obtained six convictions against him. He added that the prisoner was one of the most notorious begging-letter writers in the kingdom, and that the tact and ingenuity he exhibited in that species of imposition were astonishing. A similar charge was also brought against the prisoner by the Secretary of the Foundling Hospital. On being called on for his defence, he replied that at present he was not disposed to say anything on the subject, and that he should reserve his defence until his trial, if it was intended to commit him, instead of summarily convicting him. He was then committed.—A daring attempt at burglary was committed at Maida-hill, on Wednesday, in the house of a Mr. Anderson, near the Paddington Canal. It appears that the thieves ascended the top of the house, and in attempting to get down the chimney, dropped a dark lantern into Mr. Anderson's bedroom. Being awoke by the noise, he gave an alarm; but the robbers made their escape. The next day Mr. Anderson gave information at the station-house of the circumstance, when he was assured attention should be paid to his communication; it seems, however, that no additional policeman was put on the beat, and the thieves again made their appearance the following evening, attacked the policeman stationed there, and nearly murdered him. Half an hour, it is said, elapsed before any other constables made their appearance, and when they did arrive the thieves had got off. Several serious robberies, it appears, have lately been committed in this vicinity; and at one house, it is said, the whole of the plate, worth nearly 100*l.*, was stolen and carried off.

Fires.—On Tuesday, a serious fire, attended with loss of life, occurred in the Harrow-road. It broke out in a public-house, called the Bee-hive, which at the time was full of lodgers, principally navigators, most of whom slept at the top of the house. The fire commenced in the lower apartments, and spread with such rapidity that all the inmates were prevented from going down stairs, and, but for the fire-escape, the whole of them must have perished. Serious fears were at one time entertained lest the whole neighbourhood should become involved in the conflagration; but on the arrival of several engines from town, the flames were got under, and the adjoining houses saved: the "Bee-hive," however, was entirely destroyed. After all danger was over, an inquiry as to what had become of the inmates was made, when the pot-boy was missed, and it has since been discovered that he perished in the flames —On Monday night, a fire occurred at the residence of Mr. A. A. Goldsmid, Cavendish-square. It appears that it originated through the over-heating of a stove in the study. A beam on a level with the flooring had been burned completely through, and the flames had reached the wainscoting of the dining-room, to get at which the firemen had some difficulty, and the fire was not extinguished until considerable damage had been done.—On Tuesday night a fire, attended with loss of life, occurred in a house in the Horseferry-road. It originated in the second floor, occupied by an elderly female, who was burnt to death before she could be rescued.—On Wednesday, a serious fire broke out on the premises of Mr. Ashby, blind-maker, Commercial-road; and the house was completely destroyed before the fire was got under.—Yesterday a fire broke out in the Reform Club-house, and was not extinguished until a portion of the roof was burnt through.

Accident. — On Monday evening a serious accident occurred to Sir Henry Webster, residing in Dorset-place, Regent-street. It seems that Sir Henry, accompanied by his groom, was proceeding from Pimlico into St. James's Park, in a cabriolet, drawn by a high-spirited horse, when he accidentally drove the wheel over a high loose stone, whereby he was thrown out with great violence. Sir Henry, it is said, sustained some severe injuries, but was enabled to walk home.

Mortality in the Metropolis.—The following is the number of deaths that have occurred in the Metropolis, from all causes, registered in the week ending Saturday the 8th inst.:—Males, 450; Females, 521: Total, 971. Weekly average, 1838-9-40-1—Males, 467; Females, 445; Total, 912.

Provincial News.

Birmingham.—We noticed in our last an accident, said to have resulted from the incautious use of fire-arms, whereby a woman of the name of Steapenhill lost her life. The circumstances as then detailed were simply given on the authority of the husband of deceased, the only person present when the alleged accident occurred. An inquest, protracted throughout four days, has since been held, when doubts were entertained of the husband's statement; and a surgeon, who had examined the body, said it was a literal impossibility for such a wound and its consequences to be produced by a gun. The other principal facts adduced in evidence against the prisoner were, that he had frequently quarrelled with and beat deceased, and that she had repeatedly expressed a dread of being murdered by her husband, from having found, as she alleged, a carving-knife and pistol concealed by him under the mattress of their bed. The jury ultimately brought in a verdict of "Wilful murder" against the husband, Ezra Steapenhill, who was accordingly committed to take his trial.

Brighton.—On Monday, a solicitor applied to the magistrates at the Town-hall, for a summons against the Rev. J. M. Wagner, the vicar of this town, on the following singular charge. It appears that for some time past an ill feeling has existed in the town against certain parties for stopping St. Peter's clock, occasioned by a dispute respecting the churchwarden's accounts, and the making of a new church-rate. On Saturday, as the vicar was proceeding on horseback up North-street, two boys, about eight years of age, called out, "Who stopped the clock?" This, it seems, so incensed Mr. Wagner, that he dismounted, and pursued the boys, who rushed into their houses. The vicar, however, still followed one, who succeeded in bolting himself in an inner room; and having refused admission to the vicar, the latter broke open the door, and severely horsewhipped him. A mob soon collected, and would, it is thought, have inflicted summary punishment on Mr. Wagner, had he not mounted his horse and escaped. The above facts having been sworn to, the magistrates granted a summons.—On Thursday Mr. Wagner was examined before the magistrates. The Court was greatly crowded, and considerable excitement prevailed, in consequence of the singular nature of the charge. The child and its mother were examined, and the facts of the case were proved in evidence to be as above stated. During the inquiry some angry recrimination passed between the solicitors for the two parties. The magistrates retired to consider their decision, and during their absence the Court presented a scene of great uproar. On their return, Mr. Wigney, M.P., the senior magistrate, said they had come to the conclusion that the defendant was guilty of the assault, and must be fined 40s. and costs. He thought the words that had been used by the professional gentlemen had been done so inadvertently, and hoped they would both recall their offensive expressions. He considered it a great act of indignity to the bench when such language was used. The two solicitors then apologised to each other. —An address to the Archbishop of Canterbury has been forwarded to his Grace from this town, praying his Grace to discountenance as much as possible the doctrines propounded in the "Tracts for the Times."—The mackarel-boats from this port have been very successful in their take of fish; some of them, it is said, having caught as many as 1400 at one time. Most of them are at once despatched to the London market by the Southampton Railway; but a quantity have also been sold in this town at from 6*d.* to 9*d.* each.

Bristol.—Considerable excitement prevailed in this city during the latter part of last week, in consequence of its being known that a person named Charles Southwell, late one of the principal "Social Missionaries," was to take his trial for a series of blasphemous articles published in a periodical. The trial terminated on Saturday, having occupied the whole of that and the preceding day, the defendant's address to the jury alone occupying ten hours. The indictment contained the extracts from the defendant's works which formed the subject of the charge. The publication of the articles having been brought home to the prisoner, the jury returned a verdict of "Guilty," and he was, after an impressive address from Sir C. Wetherell, the recorder, sentenced to 12 months' imprisonment and a fine of 100*l.*

Cheltenham.—On Saturday a man of the name of Edw. Keerser, who represented himself to be a butler in the service of Capt. Oakland, came into this town and hired Gloucester Lodge, in the Promenade, in the name of his master, who, he said, was a gentleman possessed of 35,000*l.* a-year. His next step was to dispense his orders on his master's account liberally among the various tradesmen; but the suspicions of one of these being excited, the impostor was defeated in his designs, and made a hasty retreat from the town.

Chester.—On Saturday night, a young man employed in the gardens at Northwick, the seat of the noble Lord of that name, and who sleeps on the premises, was returning home from Blockley, when he perceived an unusual smoke issuing from a building which encloses an apparatus for airing his Lordship's picture-gallery. He gave the alarm, and by great exertions on the part of the household the fire was subdued without the neighbourhood being alarmed; although it seems that when the servants reached the burning edifice the roof was falling in. His Lordship was at Cheltenham at the time of the accident. The damage done is inconsiderable.

Chichester.—Several meetings have been held in this city before the commissioners for the examination of the bankrupts Messrs. Ridge of the Old Bank, and for proof of debts against that firm. After a long inquiry, which however elicited no facts of general interest, the proceedings were adjourned to the 16th Feb. The total amount of debts proved is 122,646*l.* 15*s.* 11*d.*

Gloucester.—At the last sessions in this city the following prosecution for felony took place, brought by a person named Samuel Raisher against Sarah Taylor, of Kingstanley, in this county. It appeared that the prisoner persisted in gleaning or leazing before the field of wheat had been cleared, thus, it seems, in law committing a felony. At the trial the prisoner set up a defence that she considered she had a right; and the jury, by the chairman's direction, supposing she might consider such to be the case, found her not guilty; after which the chairman seriously cautioned the prisoner against acting so in future: and trusted that all persons would be warned from such a proceeding, as they would otherwise certainly expose themselves to the risk of conviction, and consequent punishment.

Huddersfield.—A meeting has been held of the ratepayers of the parish of Kirkheaton, comprising the following townships — Kirkheaton, Lepton, Dalton, and Whitby, for the purpose of petitioning against the New Poor Law. One of the churchwardens was in the chair, and after some discussion the following resolutions were passed unanimously:—"1. That it is the just and inalienable right of the ratepayers of England to appoint the distribution of the money arising from their parish-rates, whether for the use of the poor or otherwise. 2. That the New Poor Law Amendment Act has taken away that right, and placed the expenditure of the rates in the hands of persons non-resident, who consequently cannot be proper judges of the real necessities of the poor, and who have also much increased the expenditure of the rates by the many salaries paid to clerks, relieving-officers, auditors, &c., which offices were formerly performed by the rate-payers themselves. 3. That this meeting is of opinion that persons living at a distance cannot be proper judges of the wants and requirements of the poor in their several localities; and therefore deem the three commissioners of Somerset-house an unnecessary incubus, and their salaries and expenses a wanton waste of the taxes of the country. 4. That the whole system of union of parishes is bad in itself, both for the guardians and poor, the former having to leave their homes at great distance and expense, and the latter often fail in the very attempt to obtain relief, having to tell their tale to strangers, who cannot possibly be acquainted with their case. 5. That the Poor Law Amendment Act is unjust and oppressive in its nature, and contrary to the true spirit of Christianity and the constitution of our country, and therefore ought immediately to be repealed, and the 43d of Elizabeth returned to. 6. That a petition be sent to Parliament requiring the immediate repeal of the New Poor Law Amendment Act, and embodying the above resolutions. 7. That the petition be sent to the West Riding representatives, to be presented to Parliament by them, and requesting their support to the prayer thereof." The above townships form a considerable portion of the Huddersfield Union; and it is expected that the whole of the parishes constituting this union will soon follow the above example.

Leeds.—A numerous meeting of the working-men of this town has been held, to hear the statements of a deputation lately appointed by the Short Time Committee to lay their views and feelings before her Majesty's Government. The chairman, Mr. Hobson, in introducing the business of the meeting, said that it was necessary for him to premise that on the 10th Oct. last, the Leeds Short Time Committee received a communication from their friends in London, engaged in watching over and promoting the interests of the factory workers, recommending that deputations from the Short Time Committees of Yorkshire should be appointed to proceed to London, and there seek interviews with the ministry, particularly Sir R. Peel, and lay before him or them the state of public feeling generally throughout the country with reference to the short-time measure. On the 13th Oct. the Leeds committee met to take this letter into consideration; the result was, that himself and Mr. Fleming were appointed as the deputation from this town, and they accordingly went to London. He should, however, leave to Mr. Fleming to state to the meeting how the deputation had been received. Mr. Fleming then addressed the company at considerable length, detailing the conversation they had had with Sir R. Peel and the other members of the cabinet on the subject, and speaking in high terms of the manner in which they had been received. He concluded by saying that the report of the committee would soon be published, and that it had been thus long delayed only in order that it might appear just before the opening of Parliament, when it was expected to excite more attention, and produce a greater effect. A resolution was then moved, proposing a vote of thanks to the Short Time Committee, and the deputation sent by them, for their exertions in behalf of the working classes. A Mr. Jones proposed an amendment, "That the deputation, not having been appointed by the people themselves, could not be considered as expressing the views of the working classes; and, therefore, the meeting is of opinion that no countenance should be given to that deputation, and that rather they are entitled to censure for not having pressed the subject of the people's charter upon the Ministers." This having been seconded, the chairman put the two propositions to the meeting, when the original motion was carried almost unanimously, there appearing only about 20 hands in favour of the amendment.

Liverpool.—The accident which we reported in our last as having occurred to one of the sons of the Rev. Hugh M'Neil, of this city, has terminated fatally. An inquest has been held, when two youths who were with deceased at the time of the accident were examined at length; after which the jury returned a verdict "That deceased came to his death by misadventure," declaring the pistol to be forfeited to the Crown, further adding, 'that they cannot separate without expressing their earnest hope, that this melancholy event will operate as an impressive lesson to parents and guardians against entrusting firearms to persons too young to use them with safety."—A serious fire has occurred on board one of the ships lying in the King's dock. She was laden with grain, rags, tallow, and furniture; and the flames spread so rapidly, the wind blowing with some violence at the time, that great apprehensions were felt for several large vessels lying not far off, laden with spirits and cotton. Had these ships taken fire, the consequences would have been very serious. By the great exertions of the firemen, however, there being no less than nine engines on the spot, the flames were ultimately subdued, after continuing three or four hours; and no further damage was done.

Lynn.—A serious accident has occurred to the mail coach running between this town and London, which was overturned between Melbourn and Roy-ston, and the coachman killed upon the spot. The cause of the accident appears to have been a quantity of mud which had been scraped to the side of the road, and being covered with snow, was not perceived by the coachman. There were four inside passengers and one outside, all of whom, as well as the guard, escaped without injury.

Maidstone.—A numerous meeting of the farmers and gentry of the neighbourhood has been held at Orpington, in consequence of the late incendiary fire which occurred in that village. The chairman, Mr. Mosier, made a few remarks expressive of the indignation felt by the meeting at the act which had been the reason of calling them together, after which the following resolutions were unanimously adopted:—"After mature consideration of all the circumstances connected with the late event which has destroyed the barns, stacks of corn, hay, and other property, in the Gravel Pit Farm, in the occupation of Mr. Joseph Jackson, this meeting is of opinion that it was the act of an incendiary. This meeting, therefore, cannot sufficiently express its utter abhorrence of such a wicked act, the more so when the sufferings which it must inflict upon the labouring population, many of whom will necessarily be thrown out of employ, is contemplated. That a reward of 100*l.* be offered for the apprehension and conviction of the offender or offenders, and that a subscription be entered into for the purpose." The above resolution was accompanied with another to the effect, "That the Home Secretary be requested, through the Police Commissioners, to offer a further reward, together with a pardon to any accomplice." It was mentioned that, so far from its being likely that the act had originated with any poor person or others in distress, that in the parish of Orpington the lower classes were in full employment, very few instances of persons applying for relief being known. The extent of damage done is under 2,000*l.* The event appears to have created considerable excitement in the county.

Newcastle.—On Sunday the master of a ship, the *Commodore Napier*, arrived at North Shields from Dundee, reported that when off the Coquet, during very foggy weather, his vessel came into collision with a vessel belonging to Southampton, the crew of which took to the rigging, but before any assistance could be rendered, they all perished, with the exception of the mate, who fortunately succeeded in getting on board his vessel, and has since been landed at North Shields.

Oxford.—At a meeting held on Thursday before the Vice-Chancellor, for the purpose of ascertaining the number of votes respectively promised to the candidates, it appeared that there were for Mr. Garbett, 921; for Mr. Williams, 623; upon which the friends of the latter gentleman immediately withdrew him from the contest.—A few nights since, as a gentleman named Travers, of this town, was returning from dining with a friend, he was struck with a stone or stick, close to Triford-heath, whereby he was for a time rendered insensible. On recovering himself, he discovered that two or three men were engaged rifling his pockets, and being unarmed, he pretended to be unconscious of what was going forward. The thieves having, as they supposed got all the booty they could, ran off, leaving him on the ground. Mr. Travers then found that he had been robbed of his purse, containing two or three pounds, and a pencil-case; his gold watch and a guard-chain, which he found broken, having escaped the attention of the robbers, of whom no traces have been discovered.

South Shields.—A fire has occurred in the Trinity Church, in this town, in consequence of one of the flues having become heated, and igniting the boards above it. Fortunately it was discovered about the time the congregation were assembling for Divine Service, and, by prompt assistance, was speedily got under without much damage.

Windsor.—The preparations at the Castle and in St. George's Chapel for the important ceremony which will take place on Tuesday are nearly completed; her Majesty, accompanied by Prince Albert, having during the week taken much interest in the proceedings, and personally directed several of the arrangements. A portion of the suite of the King of Prussia arrived at the Castle at an early part of the week, his Majesty himself being expected to arrive this afternoon. The line of the procession from the Castle to St. George's Chapel has been determined upon as follows:—The Royal carriages, eight in number, will leave the grand quadrangle through George the Fourth's gateway, entering the Park opposite the Long Walk; thence down Castle-hill, pass by the top of Castle-street, into the Lower Ward by Henry the Eighth's gateway. It is feared that the late wet and unfavourable weather, rendering the park unfit for a military display, will cause the grand review, which had been decided upon, to be postponed; or should it take place, that it will not be on so extensive a scale as had been contemplated. It is not believed that any troops will be ordered here from the neighbourhood of London, Ipswich, and Hounslow, as rumoured; but that the military upon the occasion will consist only of the Royal Horse Guards (Blue) and the 72d Highlanders. The 1st Regiment of Foot Guards, of which the Duke of Wellington is Colonel, will arrive from town on the morning of the Christening, to be in attendance upon her Majesty during the day as a guard of honour. They will, however, it is stated, return to London the same evening. Wednesday, the day succeeding the Christening, has been fixed on for the consecration and presentation of new colours to the 72d Highlanders. The colours will be presented by the Duke of Wellington in the Quadrangle, in the presence of her Majesty and Prince Albert, and the whole of the Royal and illustrious visitors at the Castle. It is reported among the best-informed circles that his Prussian Majesty during his visit will be invested as a Knight Companion of the order of the Garter. Her Majesty has invited the Lord Mayor and Sheriffs of London to be present at the ceremony and at the banquet in the evening. Sleeping apartments at the Palace have been commanded to be prepared for the civic functionaries. On Thursday after the Royal dinner-party had broken up at the Castle, a rehearsal of the sacred music to be performed during the ceremony of the christening took place in the music-room by command, and in the presence of her Majesty, for the first time, by the Queen's private band. The pieces performed were a march from the oratorio of *Joseph*, preceded by a martial symphony from the oratorio of *Belshazzar*, and "Handel's Occasional Overture." A change in these compositions has since been determined upon by Prince Albert, and a grand march from the oratorio of *Judas Maccabeus* has been commanded to be substituted for the martial symphony and the march in *Joseph*. Extensive preparations are in progress for a general illumination throughout the town on the evening of the christening. Numerous flags, banners, and other appropriate devices, will be displayed by the inhabitants during the day, which is expected to be one of universal rejoicing and festivity.

Woburn.—On the evening of the 13th inst., a fire was discovered in one of the servants' rooms at the Abbey. The floor was much burnt, but the fire having been early discovered, and every exertion used to subdue it, the flames were fortunately extinguished before any considerable damage was done.

York.—A few days ago, as Mr. Butler, a farmer, residing near Whitwell, was returning home from this city, in a spring cart, he was accosted by an apparently well-dressed lady, who wore a muff, veil, &c., and who desired him to let her have a ride, as she was benighted. Mr. Butler agreed to do so, and after they had proceeded some distance, and had arrived at rather a secluded spot, the lady desired him to get out, as she had lost her glove. The farmer, however, declined, being suspicious that all was not right. His companion then alighted from the vehicle, and Mr. Butler at once put his horse into a gallop, when immediately several shots were fired after him, but without taking effect. On arriving home, he found the muff in his cart, and discovered within it a brace of loaded pistols and a clasp-knife.

Railways.—The following is said to be the correct account of the accident noticed in our last as having occurred on the Leeds and Manchester Railway, which we copied from the local papers, and respecting which there appeared to be at the time several conflicting reports. It seems that as one of the luggage-trains was passing between the Sowerby-bridge and Elland stations, a spark fell upon and set fire to a portion of the goods, when the engine-driver, in order to extinguish it, exhausted the whole of the water which he had to supply the boiler, whereby the fire was put out; and on attempting to proceed, he found that all the steam was gone, in consequence of which the train stopped. At that moment another luggage-train came up at great speed, when a collision took place, and one of the engines and tender was much damaged, as was also a quantity of the goods. No lives, however, were lost, although one man had his thigh severely fractured. The damage is supposed to be nearly 1,000*l.*—An inquest has been held on John Dixon, the policeman who was killed on the line of the Great Western Railway, in the Sunning cutting, whilst signalising one of the up-trains, as stated in our last. The jury returned a verdict of "Accidental death;" at the same time adding, that they entirely exonerated the company, and those in their employ, from the least share of blame in connexion with the occurrence.—A man named Jupp, who kept the Star public-house at Reigate, threw himself under the Brighton train, at Redhill, on Monday, and was killed on the spot. The cause of this determined suicide is not yet known.—It is stated that the survey of the contemplated line of railway between Lancaster and Carlisle is proceeding rapidly; and on Monday the survey of the portion of the line between Carlisle and Glasgow was commenced.—The Great Western Railway Company have resolved on altering their second-class carriages, by boarding up the backs of the several compartments, so as to render them more comfortable than they have hitherto been.—On Tuesday the following accident occurred to one of the passenger-trains on the London and Brighton Railway: It appears that a gentleman engaged for the conveyance of his carriage to Brighton, and the truck on which it was placed was the last in the train. The owner, although advised to the contrary, persisted in riding in his own carriage. On the train reaching Balcombe tunnel, by some means the truck became disengaged, and left the carriage in the middle of the tunnel. The gentleman perceiving the train leaving him, called after them, but in vain; and, finding they proceeded on their journey, became seriously alarmed, being afraid to alight, and not knowing whether in a few minutes he might not be dashed to pieces by the next train. He had not been long in this suspense when an engine entered the tunnel, and the gentleman thought his fate inevitable; but fortunately it proved to be a pilot one, sent to look after him, the truck and carriage having been missed on the train arriving at the next station. The carriage and occupant were then conveyed to Brighton, where they arrived soon after the train.—On Thursday the half-yearly meeting of the shareholders of this company was held, J. Harman, Esq. in the chair. The directors' report, and that of Mr. Rastrick, the engineer, were read, from which it appeared that in the second week after the opening of the line to Brighton, the traffic amounted to 3,6999*l.* 17*s.* 8*d.*, and for the half-year ending the 31st Dec., 34,182*l.* 2*d.*, against which there was an expenditure of 24,400*l.* 3*s.* 4*d.*, which left a balance of 9,781*l.* 16*s.* 10*d.* The passengers conveyed on the main line were 98,539. At the last meeting it was stated that the line would be completed for 2,289,081*l.*, but the accounts showed that the gross expenditure had reached to 2,269,359*l.* already, and the company had become liable since to the extent of 371,318*l.*, which was for the railway 186,318*l.*; for extra workshops, wharfs, &c., 100,000*l.*; and the London-bridge station, 85,000*l.*; which sums it was proposed to raise by loan-notes payable at the end of five years, giving the holders the option, at the end of three years, to convert them into quarter shares of the company under the powers of an Act to be obtained. In concluding their report, the directors alluded with regret to the obstructions that had occurred on their own line, and the slip on the Croydon Railway, which had been a great interruption to the Brighton traffic; but they were still of opinion that the traffic will ultimately realise the most sanguine expectations. A long discussion took place among the proprietors respecting the necessity of the further demands made on them, which led to a motion by Mr. Parsons, seconded by Sir I. L. Goldsmid, Bart., for an adjournment of the question till the accounts could be examined by a committee. Several gentlemen having expressed a wish for an inspection of the accounts, a committee of five shareholders was appointed for that purpose.

IRELAND.

Dublin.—A trial has taken place in this city of a man named John Delahunt, for the murder of a boy named Thomas Patrick Maguire, which was committed under circumstances of unusual atrocity. It appeared in the course of the evidence, that the boy, who was only nine years of age, was decoyed away from some companions with whom he was playing, by the prisoner, who took him about to different places, where they were seen together by several of the prisoner's own relations, who were the principal witnesses against him. Shortly afterwards the body of the boy was found dead near one of these spots, with his throat cut; and a knife, belonging to the prisoner's brother, and which the prisoner had been seen sharpening the previous day, was found near the place. Under these circumstances, the prisoner was arrested: the evidence against him was entirely circumstantial; it does not appear that he was actuated by any feeling of hatred or revenge, and his motive for committing the crime appears to be wrapt in mystery; the only one suggested by the counsel for the prosecution being the hope that a reward might be offered for the apprehension of the murderer. The crime of the prisoner was still further aggravated by his subsequent conduct, as by the minute account he gave at the station-house of the transaction, which he alleged he had only witnessed, he had nearly caused the mother of the boy to be arrested upon a charge of being the murderer of her own child. It was, however, satisfactorily proved that this could not have been the case; as, on the evening the murder was committed, she was confined at the Lying-in Hospital. After a long and patient investigation, the jury found the prisoner guilty, and sentence of death was passed upon him, the Judge informing him that he must not hope for any mitigation of the sentence.—A serious fire, attended with loss of life, has occurred in this city. It broke out in the house of a cabinet-maker in Bride's Alley, and was so rapid in its progress that, out of eleven inmates, nine only succeeded in making their escape: the other two, both of whom were women, one 60 and the other 19 years of age, were burnt to death.—The usual weekly meeting of the Repeal Association was held on Monday. The Secretary announced the receipt of 19*l.* 5*s.* from the repealers of Manchester and Salford. Mr. J. O'Connell, M.P., apologised to the meeting for his father's absence, and addressed the meeting in an harangue of some length on the prospects of the country under the present Government. Shortly afterwards the Lord Mayor arrived, and handed in 100*l.* from Albany, in the State of New York, and also 20*l.* from New York. He directed the letters and addresses, accompanying these remittances, to be read, and observed that if every individual present had a hundred pair of ears he could not think he had one too many to listen to these sweet sounds of liberty coming from America. The letters professed a deep interest in the struggle for the Repeal of the Union. His Lordship then addressed the meeting at great length. He postponed detailing his plan for the agitation of repeal this year, and occupied the remainder of his speech with observations on the approaching election for the city. The whole rent for the week was announced to be 266*l.* 16*s.* 6*d.*—The Queen's Advocate has received directions from the Attorney-General to prepare forthwith the draft of a bill to legalise all the marriages solemnised by a Presbyterian clergyman between an Episcopalian Protestant and a Presbyterian, such as was declared last week to be invalid by a majority of the twelve judges. This measure, it is thought, will serve to allay the alarm which appears to have been raised in the north of Ireland by the decision of the judges.

Belfast.—A serious fire has occurred in this town, whereby the extensive provision stores, belonging to Mr. Duffield, in James's-street, have been entirely destroyed. The building, it seems, was 150 feet in length and three stories in height; and the whole of it being in a short time one mass of flame, presented, it is said, a very imposing spectacle. Crowds of persons, though it was night, and the weather very inclement, were assembled to witness the conflagration, which it was some considerable time before the engines succeeded in getting under. The extent of the damage done is not yet accurately known, but it is supposed to be very great.

Londonderry.—A few days since, a dispute arose between two men of the names of Mackinteggart and Winny, both neighbours, at Derrymacrow, near Crom, about the right of pass through part of the lands of Derryraharty, which they agreed to decide by a boxing-match, out of which arose the following serious affray. Several personal friends of either party, to the number of forty, assembled, armed with spade-shafts and other weapons, and a general fight ensued, when a man named Daniel Maguire received a blow on the temple, of which he died a few hours after; two others, named Maguire and Mackinteggart, were dangerously wounded, and several more received severe contusions. An inquest has been held, and after a long investigation the jury returned a verdict of "Wilful murder" against certain of the parties, who however have fled, and have not yet been apprehended.

Limerick.—A murder has been committed in this county on the person of Mr. Shine, a wealthy farmer, of Carrigparson. It seems his house was broken into by four men, who had their faces blackened, whilst several others remained outside. Mr. Shine offered resistance, and was knocked down with a blunderbuss by one of the robbers; and on his saying that he knew who they were, one of them deliberately put a gun to his side, and killed him on the spot; after which they went off. Several persons in the neighbourhood, it being about eight in the evening, were alarmed by the shot, and hastening to the scene, at once pursued the murderers, but were unable to overtake them. The police, also, have since been actively in search of them, but no traces of them have yet been found. The only cause assigned for the murder is, that Mr. Shine had lately taken a farm, from which the former tenant had been ejected.—Another attack has been made on the house of a farmer named Quane, at Tullavin, in this county, by several armed men. One of them broke in the door, and was immediately seized by Mr. Quane, who succeeded in shutting the door before the others entered, and wresting the gun from the robber; the party outside, hearing the struggle, appear to have thought that the police were inside, and ran off, leaving their comrade a prisoner. He has since been committed to take his trial.

Ulster.—The local papers inform us that active preparations are making in this province for emigration in the spring on a large scale, and that numbers of the Protestant yeomanry of the north are about to adopt Australia as the future scene of their industry. In Monaghan, Cavan, and Louth several respectable and wealthy farmers, it is added, are preparing to take this step.

SCOTLAND.

Edinburgh.—An Anti-Corn-law conference has been held in this city, at which the speakers were chiefly the ministers of dissenting congregations, of whom, it is said, 712 had promised to attend; namely, 384 of the Secession, 130 of the Relief, 110 Independents, 52 Baptists, and 36 of smaller sects; and it is supposed that there were nearly this number present. The statements made by these gentlemen referred to the distressed state of the country, the misery of the poor, and the depressed condition of every branch of trade; the results, as they considered, of the present state of the Corn-laws. The Rev. Mr. Marshall, of Cupar Angus, affirmed, "that the peace of the country would with difficulty be preserved. They had met, he said, in order, if possible, to avert the direful consequences of a continuance of the evils that afflicted them. These consequences he would not pourtray; but he would ask, was it to be imagined that the masses of our population would always submit to the injustice and oppression of which they considered themselves the victims, and the bitterness of which they were at present so keenly feeling? Ought they always to submit to them? was a second question; and a third was, if they did not attain speedy and effectual relief by constitutional and peaceful means, what would be the consequence of their resorting to other means of attaining them? He would not answer these questions, but his answer to them would imply that he considered the peace of the country, and the safety of its institutions, to be in imminent peril. Several other speakers expressed themselves in similar language; and one of them, the Rev. J. R. M'Gavin, of Dundee, affirmed that the people were sternly applying the measuring line of justice to all the institutions of the country, so that they looked scornfully at sundry appliances, and breathed a purpose of extensive changes. He had shuddered at hearing the fearful truths which he had often been told by them; but he would not follow these statements to their conclusion: he would not utter what men might dream when they are rendered reckless by wrong. But he would ask, was a country safe which contained elements like these? Most of the other speeches were of a similar character; and resolutions, expressive of the feelings of the meeting on the subject of the distress prevailing throughout the country, and of a determination to effect, by every means in their power, some alteration in the present state of the Corn-laws, were unanimously adopted.—At a meeting of the Highland and Agricultural Society of Scotland, held on the 11th inst., the gold medal was voted to W. Walton, Esq., of London, for an Essay on the means and advantages of naturalising the *alpaca* in this country; a paper (adds the report) abounding in much curious information with reference to this interesting animal.

Glasgow.—Messrs. Smith and Wishart, the prisoners in custody on a charge of having committed extensive frauds on the Bank in this city, the circumstances of which were given at length in our last, have undergone their final examination, and have been committed to take their trial for the offence.—An Anti-Corn-law demonstration which had been announced to take place for some time past, has also been held in this city. It commenced its sittings on Friday, the 14th inst., in the Trades' Hall, where it had been arranged to receive the reports of the deputies from various parts of the country, as to the condition of trade, and the operation of the corn and provision laws upon the state of the country. The reports of the different deputies from the manufacturing towns all contained statements of the most serious distress, more especially that of Provost Henderson, from Paisley, who said "the injuries inflicted on that town by the Corn Laws were beyond description; to say it had suffered, to say it was ruined, were but inadequate terms; it had literally been martyred by the Corn Laws." Somewhat similar reports were read by the deputies from Dundee, Aberdeen, and all the manufacturing districts; detailing the distressed condition of the poor, the number of establishments that had stopped work, and the general depression that prevailed among all classes and in all departments. A number of speeches were also delivered, the object of which was to prove that the mass of the working population of the kingdom have reached that point in depression, and that trade and credit are in that disorganised position, which must call for an immediate remedy; otherwise anarchy, ruin, and national bankruptcy will be the certain result. Resolutions embodying the feelings of the meeting on the subject of the Corn Laws were adopted unanimously. In the evening there was a banquet, at which, it is said, upwards of two thousand persons were present.

Perth.—The college about to be formed in connexion with the Episcopal Church in this county, to which we have before referred, will, it is said, be established without delay. The site will be north of the Frith of Forth, and, it is thought, in the neighbourhood of this city, it being proposed that the students shall become boarders in the establishment. The purposes to which the funds will be devoted are said to be the erection of a chapel, with halls, and other suitable buildings. It is also intended to found a number of bursaries, or scholarships; and it is proposed that subscribers to the amount of 100 guineas and upwards shall have a perpetual right to nomination in favour of young men, a deduction of 10 per cent. being allowed in such cases from the current rate of annual payments for board and education. Committees have been appointed to carry the object into effect, and the bishops, it is stated, have given their consent to the plan. At the last meeting of the members of the Society for Promoting Christian Knowledge a grant of 1,000*l.* was voted in furtherance of the design.

Linlithgow.—At a meeting of the town council, held on Monday, the Provost moved, that the council communicate to the Directors of the Edinburgh and Glasgow Railway Company their approval of running mail trains on Sunday, morning and evening, care being taken in doing so to give as little hurt to public feeling as possible. The motion being seconded, was carried by a majority of fourteen to four, two declining to vote; the minority of four being of opinion that the council should not interfere in the matter.

THEATRICALS.

COVENT-GARDEN.—On Saturday Miss Adelaide Kemble, after her long-continued success in *Norma*, made her appearance in another character, namely, that of *Elena Uberti*, in an opera so called and composed by Mercadante. The opera is entirely new to this country; and its plot is founded upon a passage in one of those revolutions of power in the Italian sovereignties which marked the thirteenth and fourteenth centuries, with the factious contests of the Guelphs and Ghibelines. The heroine is a high-born damsel, whose father is imprisoned by a tyrant, in whose power she also is. She loves and is beloved by a faithful knight, but is compelled, for the sake of her father's life, to accept the hand of the tyrant's minion, on which her lover, enraged at being thus jilted, as he thinks, marries another lady. The poor heroine, while gazing in a corner at the wedding procession going to church, and forlornly listening to the distant music which accompanies her lover's marriage ceremony, is told that the faithless tyrant, instead of liberating her father according to promise, has just cut off his head; whereupon she runs mad and stabs herself at the moment when the bridal party reappear on the stage, which they do in order that they may join their voices to the general *finale*. Such is a brief outline of the plot. The opera, on the whole, was successful; and at the fall of the curtain Miss Kemble was called for and enthusiastically cheered. The other performers, especially Messrs. Harrison, Stretton, and Leffler, sustained their parts well; and the scenery, with all the different appointments of the stage, were, as usual at this theatre, of a superior description. The opera was announced for repetition, amid the applause of a very crowded house.

Miscellaneous.

The Niger Expedition.—We have received some further intelligence respecting this expedition by the ship *Lady Combermere*, which arrived at Liverpool on Tuesday from the coast of Africa. She sailed from Bonny on the 19th Oct., and from Clarence, Fernando Po, 26th Oct.; and reports that she left her Majesty's steam-ships *Albert* and *Soudan* at Clarence, returned from the expedition, with all hands sick; and that Capt. Bird Allen, R.N., died at Clarence on the 25th Oct.

Capture of Slave Vessels.—The following is an extract of a letter from the Cape of Good Hope, dated Nov. 9, 1841:—"H.M.S. *Fantome* returned to Simon's-bay on the 24th ult., after a six months' cruise on the coast of Angola, for the suppression of the slave-trade, having had the *Brisk* and *Waterwitch* under her orders, during which period they have captured 33 slave vessels, and liberated 3,427 negroes—viz., *Fantome*, 16 vessels, and 1,340 negroes; *Brisk*, 10 vessels, and 1,136 negroes; and *Waterwitch*, 9 vessels, and 957 negroes.

New Royal Exchange.—The following is the English translation of the Latin inscription composed by the Bishop of London, and deposited in the foundation-stone of the new Royal Exchange, which was laid by Prince Albert on Monday, and the perusal of which may be interesting to our readers:—

Sir Thomas Gresham, Knight,
erected at his own charge
a building and Colonnade,
for the convenience of those persons
who in this renowned mart
might carry on the commerce of the world,
adding thereto, for the relief of
Indigence,
and for the advancement of Literature
and Science,
an Almshouse and a College of Lecturers;
the City of London aiding him,
Queen Elizabeth favouring the design,
and when the work was complete,
opening it in person with a solemn
procession.
Having been reduced to ashes,
together with almost the entire city,
by a calamitous and widely-spreading
conflagration,
they were rebuilt in a more splendid form
by the City of London
and the ancient Company of Mercers,
King Charles the Second commencing the
building
on the 23d October, A.D. 1667;
and when they had been again destroyed
by fire
on the 10th January, A.D. 1838,
the same bodies undertaking the work
determined to restore them at their own cost
on an enlarged and more ornamental plan,
the munificence of Parliament providing
the means of extending the site
and of widening the approaches and crooked
streets in every direction,
in order that there might at length arise,
under the auspices of Queen Victoria,
built a third time from the ground,
an Exchange
worthy of this great nation and city,
and suited to the vastness of a commerce
extended to the circumference
of the habitable globe.

His Royal Highness
Prince Albert of Saxe-Coburg and Gotha,
Consort of her Sacred Majesty,
laid the first stone,
on the 17th January, 1842,
in the mayoralty of the right hon. John Pirie.

Architect, William Tite, F.R.S.

May God our Preserver
ward off destruction
from this building
and from the whole city.

Consumption of Tea.—The Bombay papers contain a statistical account of the quantities of tea exported to Great Britain from China since the opening of the trade in 1834 to the present time, and also of the quantities of tea exported to the United States from China from the 1st July, 1833, to June 1841. The tea exported to Great Britain from the 31st March, 1834, to the 30th Sept. of the same year, amounted to 3,383,263 lbs.; in the season 1833-35, it had increased to 47,690,928 lbs.; in that of 1835-36, it declined to 45,860,193 lbs.; in 1836-37, it further declined to 37,828,791 lbs.; in 1837-38, it increased to 42,545,951 lbs.; in 1838-39, it decreased again to 32,697,370 lbs.; in 1839-40 it further decreased to 29,116,140 lbs.; but in 1840-41, increased again to 30,280,218 lbs. The quantity of tea exported to the United States in 1833-34 was 18,854,403 lbs.; in 1834-35, 14,122,906 lbs.; in 1835-36, 17,511,912 lbs.; in 1836-37, 16,581,463 lbs.; in 1837-38, 16,615,729 lbs.; in 1838-39, 15,184,066 lbs.; in 1839-40, 19,333,597 lbs.; and in 1840-41, 9,079,424 lbs. The great falling off observable in the last three seasons is attributed to the restricted state of trade, consequent on the present character of our relations with China.

Law.

VICE-CHANCELLOR'S COURT.—*The Corporation of Dartmouth* v. *Holdsworth.*—The bill in this case was originally filed by the Corporation of Dartmouth, praying to be relieved against the payment of a bond for 1,249*l.*, which had been given to the defendant, Mr. Holdsworth, in May 1833, by the governing body of the Corporation. The Vice-Chancellor having considered all the circumstances of the case, felt bound to dismiss the plaintiffs' bill with costs.

Perkins v. *Bradley.*—His Honour Vice-Chancellor Wigram delivered judgment in this case, which related to conflicting claims to a small amount of stock, which had been assigned by a prisoner whilst in custody, and previously to his conviction for felony. He thought that the defendant, an attorney, had a charge of 50*l.* on the fund, being for money *bona fide* advanced, and also for other costs; but as to the greater sum, it belonged to the plaintiff, the brother of the accused. The Crown, he thought, under all the circumstances of the case, was not entitled to make any claim, the assignment to the brother having been for a *bona fide* debt, prior to conviction.

The Corporation of London v. *Combe.*—This was a bill by the Lord Mayor and Corporation of London, and the members of the company of Porters of Billingsgate, against Messrs. Combe and Co., brewers, of Castle-street, Long-acre, praying that it might be declared that the extensive right of porterage and carriage of all grain and other articles landed from or carried into any vessel in the port of London, or delivered and conveyed from any such vessel to any place within the limits of that port, was vested in the plaintiffs, to be exercised in their behalf and for their benefit; that an account might be taken of all the malt belonging to the defendants which had been landed by workmen not members of the Fellowship Porters, at the Savoy-wharf, in Middlesex; and that an account might be taken of the sums of money due to the Fellowship Porters in respect of such malt landed and delivered. After the case had been argued by the respective counsel, his Honour Vice-Chancellor Wigram said that he should direct four issues. First, whether the Corporation was entitled to the full extent which they claimed; secondly, whether they were entitled except as to metage or measurage; and, thirdly and fourthly, whether the sums charged were reasonable; and if in the third or fourth, or in either of them, the jury found the amounts therein stated to be reasonable, let the jury be called to state what were the reasonable amounts in these respects, and let the same be indorsed in the *postea* with any other special circumstances. The issues to be tried at Winchester, at the Midsummer Assizes, 1842.

ROLLS' COURT.—*Munn* v. *Timewell.*—This suit was instituted to obtain an account, with a view to a dissolution of partnership. It appeared that the plaintiff and defendant carried on the business of corn chandlers, at No. 96, Connaught-terrace, under the firm of Timewell and Co., and in Dec. 1840 entered into a verbal agreement that the profits should be divided in equal moieties. The defendant subsequently became entitled to certain premises in Stanhope-terrace, Uxbridge-road, and an agreement was entered into that the plaintiff should carry on business upon those premises, and hold them for 28 years at 65*l.* a-year rent, until the business in Connaught-terrace was disposed of, when it was to be increased to 185*l.* a year. The defendant, however, had brought an action against Mr. Munn for 150*l.* rent due in respect of the premises in Stanhope-terrace. Mr. Munn had pleaded the general issue, he having been advised that his only means of defence was in equity. In consequence of this the present bill was filed, but in the meantime Mr. Timewell had obtained a judgment in the action, and the object of the present application was to restrain him from suing out execution, which, unless the injunction now asked for was granted, would issue the following day. Lord Langdale said that the plaintiff, after he was aware that the question could not be tried at law, had delayed to apply to this Court, he must, therefore, refuse the motion, with costs.

Wright v. *Maunder.*—This suit was instituted to compel the specific performance of an agreement which the defendant had entered into for the purchase of certain premises situate in High-street, Chatham, in the county of Kent. These premises, it appeared, formed part of the estate of Stephen Hughes, who, in the year 1839, became insolvent; the plaintiff was appointed his assignee, and upon its being determined to dispose of the premises, a meeting of the creditors was held, at which a resolution was passed that the premises in question should not be disposed of for less than 325*l.*, but at the auction they were knocked down to the defendant for 310*l.* He subsequently, however, refused to complete the purchase, on the plea that a good title could not be made out, as the resolution of the creditors had not been complied with. Lord Langdale, after adverting to the facts, said that it was insisted that the sale was invalid, and ought not to be carried into effect, as it was contrary to the resolution of the creditors; that was the only question. The Act of Parliament did not invalidate the contract; but if the assignee acted contrary to his directions, he remained responsible, and the creditors would be entitled to relief for any injury they had sustained. Considering, therefore, what had taken place, he considered the clause in the Act to be only a directory clause, and he could not think that a slight deviation from the resolution was to invalidate the sale; if that were so, the parties would have a right to call upon the plaintiff to prove that all the minute directions given had been complied with. In the present case there was no collusion between any of the parties, and the contract was valid and must be performed; but as the question was entirely new, the decree must be made without costs.

COURT OF QUEEN'S BENCH.—*Ex-parte William St. Thomas Clarke.*—This was an application for a rule to show cause why a writ of *habeas corpus* should not issue to the Warden of the Fleet, to bring up the body of the applicant, that he might be discharged from custody. The applicant had been a party to a suit in Chancery, and not having put in an answer in proper time, was declared to have been guilty of contempt of Court, and ordered to be committed to the Fleet. There were certain circumstances, however, connected with the case which, it was urged, rendered the applicant's further detention illegal, and the Court granted the rule.

The Queen v. *Anderson.*—Mr. Justice Williams delivered judgment in this case. He said that this was a motion for a *quo warranto*, calling on the defendant to show by what authority he claimed to have his name on the burgess roll of the borough of Ludlow. Under all the circumstances of the case he thought that the rule must be discharged.

Howard v. *Gossett and Others.*—This was an action of trespass in which the plaintiff complained of the defendants breaking into his dwelling-house and disturbing his family there, under a pretence of searching for the plaintiff to arrest him, for which were laid damages of 10,000*l.* The defendants pleaded, first, not guilty; and secondly, that at the time Parliament was sitting, and on the 27th Jan., 1840, it was resolved by the House of Commons that the plaintiff should forthwith attend the said house on the charge of having been guilty of a contempt and breach of the privileges of the said house. The speaker issued his warrant to Sir W. Gossett, the then Serjeant-at-Arms, who proceeded to act upon it; and it was contended that they were thus lawfully entitled to break into and enter the house as they had done. The Court considered there was some force in an objection made by the plaintiff's counsel to the plea urged by the defendants, namely, that the entry was justified, on the ground that the party would return to his dwelling-house, and might be there arrested. Was it to be contended that a trespass like this could be justified on a mere expectation of this kind? The Attorney-General said that if the Court felt a strong doubt of the goodness of the plea on that point, he should at once propose to amend. After some conversation, this was allowed, but it was understood that the amendment was to be made within a week: and the amendment was to be made on the usual terms of payment of costs.

The Queen v. *Greene.*—In this case a rule had been obtained for a *quo warranto*, calling on the defendant to show by what authority he claimed to exercise the office of town-councillor of the borough of Lichfield. The relator in the case was Mr. Brassington, also a town-councillor of the same borough. The ground of objection was, that the defendant was a trustee of one of the paving-boards of the borough, and that he was, besides, a partner in a banking house which was the bank of the corporation. A cause was now shown against the rule. The Court expressed a clear opinion that this rule must be discharged. The act of Mr. Brassington must be considered as a voluntary act of concurrence on his part in the election of the present defendant as a town-councillor. The act of administrating the declaration might have been performed by any other town-councillor, and he could not have been compelled by a *mandamus* to administer it. This was not like the case in Lord Kenyon's time, for there the election of mayor was absolutely necessary to preserve the existence of the corporation; and Lord Kenyon had, therefore, treated it as an act of public necessity and duty which did not in any way affect the rights of those who joined in it. Such was not the case here, and therefore the present rule must be discharged.

COURT OF EXCHEQUER.—*Watling* v. *Dewey.*—This was a rule to show cause why a verdict obtained for the plaintiff, for 75*l.*, should not be set aside, and a nonsuit entered, on the ground that no action could be maintained upon the circumstances as disclosed at the trial. It was a question connected with a gambling affair that took place at the last Epsom races, but the Court being of opinion that the transaction between the plaintiff and defendant was not necessarily illegal, thought the verdict ought not to be disturbed.—Rule discharged.

Billon v. *Clappison.*—This was an application on behalf of the defendant to set aside a writ of *capias*, on the ground of irregularity.—Rule granted.

Glaire v. *Wentworth.*—This was an action tried at the last assizes for Yorkshire, when there was a verdict for the plaintiff, for the value of some furniture alleged to have been illegally seized by the defendant as sheriff of Yorkshire, under a writ of execution. A rule having been obtained to set aside the verdict, and for a new trial; the counsel for the plaintiff now showed cause why a new trial should not be granted. The Court, however, was of opinion that the verdict was against evidence, and the rule for a new trial must be made absolute.

COURT OF COMMON PLEAS.—*Ivate* v. *Mann.*—This case related to a right of common in the parish of Brampton, in Cambridgeshire, and in which a rule *nisi* for a new trial had been granted. The details were uninteresting. The Court saw no ground to disturb the verdict which had been found for the defendant, and, therefore, discharged the rule.

Baxter v. *Gray and Others.*—This was a motion for a rule to show cause why the verdict found for the plaintiff should not be set aside, and a new trial had, on the ground of misdirection. The cause had been tried before the Lord Chief Justice, and was brought by the plaintiff, a surgeon, to recover the sum of 500*l.*, for medical attendance on an old lady named Bostock, of whom the defendants were the executors. The jury found a verdict for the plaintiff—Damages, 217*l.* The Court saw no reason to disapprove of the manner in which the case had been left by the Lord Chief Justice, and therefore refused the rule.

Evans v. *Pratt.*—In this case cause was shown against a rule *nisi* to set aside the verdict which had been found for the plaintiff, and to enter a nonsuit, or to arrest the judgment. The cause was tried before Mr. Justice Coltman, at the last Shrewsbury Assizes, and was brought to recover 100*l.*, the amount of a wager on a mare named Matilda, in a steeple-chase. The trial was given in a former Number of this Paper. The Court was of opinion that it was unnecessary to determine upon the legality of steeple-chasing, as the state of the record in this case did not call upon it to decide that this race was a steeple-chase. The rule must, therefore, be discharged.

BAIL COURT.—*Weadon* v. *Lord Huntingtower.*—This was an action on a bill of exchange for 1,000*l.*, accepted by Lord Huntingtower. The only plea set up for the defence was non-acceptance; to prove which a witness was called, who swore that he had frequently seen Lord Huntingtower write, and that the acceptance to this bill was in his hand. Verdict for the plaintiff.

The Queen v. *O'Connor and White.*—Mr. Justice Williams stated that in this case the Court would grant the rule to show cause why a criminal information should not be filed against the defendants for a libel on the Rev. R. Anstey, which had appeared in the *Northern Star* newspaper.

The Queen v. *the Magistrates of Middlesex.*—Mr. Addison moved the court for a *mandamus*, directed to the magistrates of Middlesex, commanding them to amend their return to a *certiorari*, issued for the purpose of having the proceedings in the case of a licensed victualler, named Long, who had been refused a license at quarter sessions, removed into this court. The Court was of opinion that a *mandamus* was not necessary; it would be sufficient to grant a rule calling on the magistrates to show cause why their return to the *certiorari* should not be amended.

The Queen v. *Arrowsmith and Knight, Proprietors of the "Worcestershire Chronicle."*—This was an application for a rule calling on the defendants to show cause why a criminal information should not be filed against them, as proprietors of the "Worcestershire Chronicle," for a libel which had appeared in that newspaper on the character of Mr. Elms, a magistrate in that part of the country, accusing him of the most gross and disgraceful jobbing in his official capacity, in regard to the erection of a police station-house, advantages connected with which he was alleged to have thrown into the hands of a relative of his own, and certain other persons of his political party, to the utter prejudice of the public interests. Rule granted.

PREROGATIVE COURT.—*Dawes* v. *the Baron Feuchères.*—This was a business of granting letters of administration to the effects of the late Baroness de Feuchères, who died on the 15th Dec., 1840, intestate, leaving a brother and two sisters, who are entitled to her property, and who are parties in the cause. The other party is Adrien Victor Baron de Feuchères, late the husband of deceased, and who opposes the interest of the brother and two sisters of deceased. The question before the Court was the admissibility of an allegation offered on behalf of the brother and sisters of deceased, setting up their right to have the administration granted to them. The allegation was of great length, consisting of 38 articles, pleading the relationship of the parties to deceased, &c. The Court directed the allegation to be reformed, and then admitted to proof. An appearance was also given for the Queen in this case, but Sir J. Dodson said all opposition by her Majesty's proctor would be withdrawn on the fact of next of kin being established.

COURT OF BANKRUPTCY.—*In re the bankruptcy of William Hitchcock.*—The examination of this bankrupt's case, the well-known draper of Regent-street, was commenced a few weeks since, and excited much attention at the time; but having been brought to an abrupt termination before any satisfactory conclusion could be arrived at by the Court, we delayed our notice of the subject, and of the extraordinary disclosures that came out during the inquiry, until the case should again come before the commissioners, and the real state of the transactions be more satisfactorily determined. On Monday the examination of the bankrupt was resumed. The principal feature in the previous examination was the fact, as stated by the bankrupt, of a collusion having been practised between him and a large firm in the same trade, of the name of Cook and Gladstone, to secure themselves at the expense of the other creditors of the estate. It was stated that the bankrupt was indebted to the firm in question, for goods advanced, upwards of 20,000*l.*; that on discovering the embarrassed state of his affairs this firm refused to give him further credit, and in order to secure themselves, and liquidate their debt, induced the bankrupt to endeavour to obtain goods on credit from other large houses, who, if they required any references, were to be referred to them; that having in this manner obtained the requisite credit with the houses applied to, the bankrupt succeeded in getting goods to a large extent, which he disposed of at once for cash, under invoice price, and appropriated the proceeds to the liquidation of the debt of the said firm. These and other facts which were stated in evidence by the bankrupt produced considerable excitement at the time. The statement, however, appears at present only to rest on the assertion of the bankrupt; but as two of the assignees appointed by the Court to the estate have petitioned for leave to bring an action against Messrs. Cook and Gladstone for the amount of goods said to have been thus fraudulently obtained, and as the petition has been granted, the defendants, it is said, being themselves anxious to have the case tried for the vindication of their own characters, the public, it is expected, will soon be put in possession of the real facts of the case. The remainder of the examination was occupied with less interesting inquiries into the affairs of the bankrupt, and into the circumstance of his having kept back some property, not specified in his schedule. The inquiry, which lasted a long time, was again adjourned without the Court having come to any decision.

SECONDARIES COURT.—*The Queen* v. *Theodore Hook.*—This was a writ of inquiry issued on the part of the Crown for the purpose of ascertaining the amount of property the late Mr. Theodore Hook was possessed of within the city of London at the period of his death. As similar proceedings have already been instituted in the Sheriffs Court, and an account of them given at length in our last, it will be unnecessary to repeat them. The Court, after hearing the evidence, summed up at considerable length, and the jury found for the Crown, subject to the debt due from the deceased to the remaining proprietors in the *John Bull* newspaper, amounting to between 1,500*l.* and 1,600*l.*

TATTERSALL'S, THURSDAY.—*The Derby.*—Several offers to back Auckland had the effect of springing him to 27 to 1, any advance upon which would have been taken by two or three parties; the only bet laid against him was at 30 to 11, and that to a very small amount. Wiseacre also rose half-a-dozen points, and is likely to become a better favourite. Some other horses were mentioned, and a few scores, &c., laid out, but without causing any material change in the quotations. Latest odds:—

DERBY.

7 to	1 agst	Attila (take 15 to 2)	50 to	1 agst	Pharold (taken and afterwards offered)
25	1	Robert de Gorham			
27	1	Auckland	60	1	Palinurus (taken)

Sporting Extraordinary.—Some gentlemen who were enjoying the customary festivities during the past Christmas at the hospitable mansions of Warren's Court and Warren's Grove, in this county, shot in the space of three days 195 head of game, including 52 brace of woodcocks. The weather was most auspicious, and everything conduced to render the time peculiarly attractive alike to the lovers of the field sports and of social intercourse.—*Cork Constitution.*

MARK LANE, FRIDAY, JAN. 21.—There were several runs of English Wheat left over from Monday, and our currency of that day was with difficulty maintained. In Foreign there was a very limited business transacted, and the same prices are demanded. We did not hear of any sale of Bonded.—Fine Barley was in better demand; other descriptions sell slowly.—White Peas improve in value; in Maple and Grey there is no alteration, neither is there any improvement in the price of Beans.—The Oat trade is flat at Monday's quotations.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, January 22, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 5. SATURDAY, JANUARY 29, 1842. PRICE 6*d*

HORTICULTURAL SOCIETY OF LONDON.

NOTICE is hereby given that the EXHIBITIONS in the GARDEN of the SOCIETY will this year take place on the following Saturdays, viz. May 14, ; June 11 ; and July 9.

CARNATIONS AND PICOTEES.

MESSRS. W. and F. YOUELL have a few pairs to spare of that most beautiful Rose Flake, Wilson's Harriet, which is considered by the first judges in the kingdom to be decidedly the most perfect flower of its class ever raised. Also that splendid Red Picotee, Anacreon. The above will be forwarded per post, free, to any part of the kingdom by inclosing a post-office order for 18s.—For their extensive Collection see Catalogue, which can be obtained by inclosing two post-stamps.

Great Yarmouth Nursery.

NEVILLE'S CYCLOPS DAHLIA.—Bright Crimson Petals (margined with fiery crimson, imparting to the Flower a most brilliant appearance), stout, cupped, close, and of first-rate form, with fine rising centre, filled with petals before the first tier are expanded, and constant show flower; warranted equal to the description. A few Ground Roots, with two or more crowns, in fine condition, at 2*l.* 12*s.* 6*d.* each. Plants may be had of the Trade in Spring.—Peckham, Jan. 26, 1842.

MYATT'S VICTORIA RHUBARB.

J. AND W. MYATT having a good Stock of Strong Roots raised by offsets from the original Seedling, can supply them at 10*l.* per hundred.—N. B. As various spurious sorts have been sold and are now selling under the name of "Myatt's Victoria," purchasers would do well to require them warranted. —Manor Farm, Deptford, Oct. 23, 1841.

ROBINSON'S NORTHERN BEAUTY DAHLIA.

S. GIRLING having purchased the entire Stock of the above DAHLIA, plants will be sent out in May next at 10s. 6d. each; admitted to be one of the most distinct and beautiful Dahlias to be sent out next season. For particulars, refer to the *Floricultural Cabinet* of January. It took the 5th Prize at Salt-hill Open Show in Sept. last, and was generally admired.

BRACHYCOME IBERIDIFOLIA SEED in small packets at 5*s.*, to be had of W. J. NUTTING, Seedsman, 46, Cheapside. Lisianthus Russellianus, 2*s.* 6*d.*; Pink, from fine named flowers, 2*s.* 6*d.*; Calceolarias, from 30 varieties, 2*s.* 6*d.*; Pansies, selected from a few first-rate flowers, 5*s.*; do., from a superior collection, 2*s.* 6*d.*; Dahlia Scapigera Mexicana, 1*s.*; Clintonia pulchella, 1*s.*; Schizopetalon Walkerii, 1*s.*; Phlox Drummondii, 1*s.*; &c. &c.—Packets of the following Cucumbers at 2*s.* 6*d.*: Man of Kent (Barnes'), Victory of Suffolk (Allen's), Prize-fighter, Weedon's Frame, Roman Emperor, and Windsor Prize.

☞ A Catalogue of Seeds to be had on application.

NEW WHITE DAHLIA—BIANCA (WILDMAN'S).

MESSRS F. and A. SMITH and Co. beg respectfully to announce to the Floricultural Public that they have purchased the above splendid Dahlia, and, should the root break well, intend sending out plants on the 24th of May next, at 21s. each.

The constant qualities of this variety need no comment, being well known as the best white of last season, having obtained the following awards:—It was placed as a first-class flower, Aug. 3, 1841, Floricultural Society of London; 2d prize, Sept. 14, 1841, South London Floricultural Society of London; 1st do., Sept. 23, 1841, Floricultural Society of London, Grand Show.

Orders executed in rotation as received.—A general Catalogue of Dahlias, &c. (containing nearly every variety worth cultivation) will be ready early in February.—Hackney, London, Jan. 27, 1842

STROOD NURSERY, ROCHESTER.

G. C. MASTERS begs to offer his choice, showy, and carefully-selected assortment of FLOWER SEEDS, chiefly saved on his own ground, at the following prices:—

	£	s.	d.
100 distinct kinds, by name	0	16	8
50 Newer do.	0	12	6
50 Newest and tender Annuals	1	5	0

Also KITCHEN-GARDEN SEEDS of all the leading sorts at London prices.

Ash, Chesnut, strong Quicksets, Horse-Chesnuts, and a great variety of Shrubs, Trees, and Evergreens.

A very choice and extensive collection of Greenhouse Plants, new Chrysanthemums, choice Border and Prize Dahlias, Pansies, &c., &c.—N. B. In all cases where orders are to be sent to a distance, and exceed 1*l.*, Seeds or Plants will be given to compensate for carriage.

NEW DAHLIAS.

GEORGE WHEELER, Nurseryman, &c., Warminster, Wilts, begs to announce the following for the ensuing Season:—ASMODEUS (Davis's), a Seedling of last year, colour nearly black, shape "the mould of form," rich velvet petal; obtained the 1st Prize at Bath, 1st at Chippenham, and 4th at Salt Hill, the only Shows at which it was exhibited; and from the confidence the raiser has of its being a first-rate flower, it is offered this season at 10*s.* 6*d.* per Plant. All orders to be executed immediately after the 20th of May. This flower was raised by Mr. Davis, whose "Maid of Bath" is so well known to all growers, and which by the *Gardener's Gazette* is shown to have been the most successful Dahlia of last season, having been exhibited in 51 winning stands, whereas the next in point of success came not within 20 of that number.

PRINCE ALBERT (Adams's), fine shaded bronze, quite a distinct variety, most perfect in petal, and altogether a noble, first-rate show flower. Strong Plants early in May, 10*s.* 6*d.* each.

WESTBURY RIVAL (Hall's), fine bright puce, very constant, a full high centre; a decided improvement on "President of the West;" one of the finest selfs of the season, and a first-rate show flower. Strong Plants early in May, 10*s.* 6*d.* each.

G. W.'s Catalogue of first-rate Show Dahlias will very shortly be ready, and will be forwarded, post-paid, on application.—G. W. embraces this opportunity of acquainting his friends and the public in general, that by the kindness of the Rev. Mr. Rous, the raiser of those beautiful Cinerarias, Prince Albert, and Lavertonense, he is enabled to offer good Plants of each kind at 5*s.* each. The stock of Seed of that fine and very superior long-frame Cucumber cultivated by Mr. Hamlett, and universally admired by the numerous growers who saw the fruit, is in G. W.'s possession, and will be sold at 6*s.* per dozen seeds; warranted to be all good, and of the genuine kind.

ASH-LEAVED KIDNEY POTATOES.

R. LAING has a great qaantity of the above-named Potatoes to dispose of at a low price. Warranted true and good.

A collection of Standard and Dwarf Roses, Geraniums, and Fuchsias, of the newest varieties, and a general assortment of Nursery Stock, always on sale.

Twickenham Nursery, Middlesex.

JOHN BETHAM, Custom-House and General Forwarding Agent, Cox and Hammond's Quays, Lower Thames-street.—J. B. having been established many years, begs to offer his services to Nurserymen, and others connected with Agricultural and Botanical pursuits, assuring them of every attention being paid, and prompt despatch given to their consignments, combined with moderate charges.

Every information, upon addressing above, given as to the arrival and departure of Steam and Sailing Vessels to or from Hamburgh, Rotterdam, Ostend, Antwerp, Calais, Havre, or Boulogne; also the United States, &c. &c.—London, Jan. 1842.

LANGELIER'S WHITE DEFIANCE DAHLIA.

RENE' LANGELIER, Nurseryman and Florist, Clarendon Nursery, St. Helier's, Jersey, has the honour to inform the trade and amateurs, that there are only a very few Ground Roots of the above Splendid White DAHLIA to dispose of, at 10*l.* Plants in May, 15*s.* Jersey Maid, a Splendid Blush, can only be sent out in May, there being but two roots: it is also a most splendid Dahlia, first-rate Show Flower, always constant and well-cupped; plants, 10*s.* 6*d.* R. L. has also the honour to inform the trade that he has a small quantity of fine Quince Stock well rooted, fit for budding Pears next season, at 7*s.* 6*d.* per 100, an opportunity not often met with. Also a splendid collection of Pears. The trade supplied with great advantage. Apply as above. Remittance or reference from unknown correspondents.—24th Jan.

JOSEPH BAUMANN, Horticulturist at his Grace the Duke of Devonshire's Garden at Chatsworth, has much pleasure to announce that Messieurs Joseph Baumann, at Fils de Bolliviller, Poste restante, Seultz, Haut Rhin, France, have Plants of Paullovnia Imperialis for sale. This most hardy, splendid ornamental Tree was propagated from the Tree which was the last autumn in splendid flower at the Jardin des Plantes, at Paris. It is also used as an Esculent Vegetable, as well as by Druggists.

Good strong Plants will be sent out the first week in May; last year's Plants from Four to Five Guineas each; this season's Plants, from Two to Three Guineas each. Remittance or respectable reference will be required from unknown Correspondents.—Chatsworth, Jan. 20, 1842.

FLORICULTURAL SEEDS, DAHLIAS, &c.

THE Undersigned begs leave to inform the Nobility, Gentry, and his customers in general, that his new Catalogue of FLOWER SEEDS for 1842 is now ready, and may be had on application. Also the following DAHLIAS in Pot Roots:

Amato, Dandy's, Purple	1	0
Argo, Widnall's, yellow	1	0
Andrew Hofer, crimson	1	0
Beauty of the Plain, white-edged	2	0
Constancy, Keynes', fine purple	2	6
Countess of Pembroke, peach	1	0
Duchess of Richmond, bronze	1	0
Egyptian King, shaded bronze	1	6
Fanny Keynes, shaded rose	5	0
Grace Darling, rose	1	6
Le Grand Baudine, rosy bronze	1	6
Lewisham Rival, white	1	0
Maria, Wheeler's, fine rose	1	6
Maid of Bath, light, edged with purple	3	6
Nicholas Nickleby, bronze shaded with pink	1	0
President of the West, crimson	1	6
Queen, Widnall's, peach	3	6
Scarlet Defiance, light scarlet	3	6
Uxbridge Magnet, mottled purple	2	6
Unique, Ansell's, yellow	0	9
One of each of the above	35	0
Fined mixed sorts, Pot-roots, per dozen	10	0

James Carter, Seedsman and Florist, 238, High Holborn, London.—Jan. 29, 1842.

J. KERNAN begs to inform his Friends that he has now completed his selection of FLOWER-SEEDS, among which will be found every novelty worthy of cultivation recently introduced, as well as the seeds from first-rate collections of Calceolarias, Mimulus, Ipomœas, Stocks, Asters, Balsams, Zinnias, Thunbergias, &c. &c.; as also all the better and more esteemed Vegetable Seeds: Grainge's Early White Broccoli, Mercer's Cauliflower, Brussels Sprouts (foreign seed), Seymour's superb Giant Celery; Kerrison's Hothouse, Syon House, Roman Emperor, Horticultural, and Windsor prize Cucumbers; as well as Seeds of the very choicest Melons, all the better early and succession Peas, principally saved by the most select growers, who supply this unequalled market.

4, Great Russell-street, Covent Garden.

All the better kinds of Agricultural Grasses, separate or mixed. Selected Field Turnips, White Carrot, Winter and Spring Tares, Ash-leaved and Early Frame Potatoes, New Globe Mangold Wurzel, &c. &c., Mats, and Mushroom Spawn; Pruning and Budding Knives.

RANUNCULUSES, ANEMONES, AURICULAS, CARNATIONS, PICOTEES, AND GERANIUMS.

H. GROOM, of WALWORTH and CLAPHAM RISE, near LONDON, by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and the Public, that he has a fine Selection of the above Flowers, which he can offer at the following very moderate Prices:—

RANUNCULUSES.	£	s.	d.
100 Roots in 100 superb sorts, with their names	5	0	0
100 ditto very fine sorts, ditto	2	10	0
Superfine Mixtures, from 7*s.* to 21*s.* per hundred.			
ANEMONES.			
100 Roots in 100 superfine sorts, with their names	3	10	0
100 ditto in 50 ditto ditto	2	10	0
Superfine Mixtures, from 10*s.* 6*d.* to 21*s.* per hundred.			
AURICULAS.

CARNATIONS.			
25 superfine sorts, with their names, 1 pair of each	3	10	0
PICOTEES.			
25 superfine sorts, with their names, 1 pair of each	2	10	0
YELLOW PICOTEES.			
12 superfine sorts, with their names, 1 pair of each	2	2	0
GERANIUMS.			
25 superfine sorts, with their names, 1 plant of each	3	10	0

FOUNTAIN NURSERY, CAMBERWELL GROVE.

MESSRS. PROTHEROE & MORRIS are instructed by the Trustees of Mr. Ferry to offer to public auction on the premises, early in March, if not previously disposed of by private contract, the valuable Lease; also the Stock, consisting of three newly-built Greenhouses, Pits, Frames, &c.; about 8000 Greenhouse Plants, comprising Geraniums of the first class, Camellias, Fuchsias, Verbenas, &c. May be viewed, and particulars had on the premises, and of the Auctioneers, Leytonstone.

WANTS a SITUATION as GARDENER, a married man without family, aged 28. Can produce satisfactory testimonials as to ability and character. Letters to be addressed to B. Y., at Messrs. Warner's, seedsmen, Cornhill, London.

WANTED immediately, in a large Provincial Nursery, 40 miles from London, a steady, active Young Man, as PROPAGATOR. The most unexceptionable reference will be required.—Apply by letter, prepaid, to Messrs. Wm. Wood and Son, Nurserymen, Woodlands, Maresfield, near Uckfield, Sussex.

WANTS a SITUATION as GARDENER, a respectable unmarried Man, about 38 years of age; is of industrious habits; has a perfect knowledge of, and has had extensive practice in every department of his profession, and has recently left the service of a Nobleman. The most satisfactory references as to character and ability. Apply, prepaid, to Mr. Cuthill, Florist, Denmark Hill, Camberwell.

WANTED, by a middle-aged Man, a SITUATION as SHOPMAN or FOREMAN to a Nurseryman or Seedsman, who has had considerable experience in the above capacities, having had the management of a large and extensive Nursery and Seed Business for the past twenty years. Reference can be given as to character and ability. Apply by letter, prepaid, to A. B., Messrs. Henderson and Co.'s, Pine-apple Nursery, Edgeware-road.

WANTED a SITUATION as PRINCIPAL GARDENER by a Married Man without incumbrance, who is thoroughly acquainted with Gardening in all its branches. He can manage a farm if required, and understands Accounts: lived in his last place 5 years; left on account of the decease of his employer.—Address F. D., at Mrs. Gunn's opposite the World's-End, Old Road, Stepney.

WANTS a SITUATION as GARDENER, a Married Man, aged 28, who understands Hothouse, Greenhouse, Early Forcing, and Kitchen Garden, and the management of Cattle and Meadow land, if required. He can have a good character, of nearly two years, from the place he has just left; also a recommendation of nine years from his previous situation in the country.—Direct to J. D., Mr. Sawtell's, grocer, Ball's Pond, Islington.

WANTS a SITUATION as GARDENER a Middle-aged Married Man, who understands his business in all its branches. He has had considerable practice in laying out Pleasure Grounds, arranging Fruiteries, Greenhouses, &c.; is about leaving an extensive place, where he has lived 12 years, and is desirous of obtaining a first-rate situation. He would have no objection to the management of a little land in conjunction with the garden, if required. The highest references can be given. The Advertiser requires a good salary, with a house. Address to P. P., Post Office, Plymouth.

WANTS a SITUATION, a Young Man who has been brought up to the Seed Trade, and who has taken for the last three years an important part in the management of one of the first businesses out of London. His character will bear the strictest investigation. Letters addressed W. S., *Gardeners' Chronicle* office, London, will have immediate attention.—26th Jan., 1842.

THOS. D. WATKINSON, Seedsman, Florist, &c., begs to inform his Friends and the Public that he has removed from No. 24, Market-place, opposite the Fishmarket, to the more commodious premises No. 6, two doors from Market-street, and latterly in the occupation of Messrs. Blackberd and Co., where all articles connected with Horticulture and Floriculture can be had, of the first quality, and upon most reasonable terms.

Catalogues on application.

Agent for Myatt's true Victoria Rhubarb roots, Walker's Prize-fighter, and other Cucumbers; Howard's Giant Salmon-coloured, Manchester Red Solid, and Seymour's superb White Celery, &c. &c.

6, Market-place, near the Exchange, Manchester.

JAMES MAY begs to inform his Patrons and Friends that his new descriptive List of Pansies with a list of Fuchsias, is now ready, and may be had on application at the Pansy Nursery, Edmonton. At the same time he begs to say he has still a small quantity of his superior PANSY SEED left, which may be had at the following places, viz.:—Messrs. Warner's, 28, Cornhill; Messrs. Flanagan and Co.'s, Mansion-house-street, London: Mr. Watkinson's, Market-place, Manchester; Mr. Edward's, York; Mr. Parsons's, Brighton; Mr. Wm. May's, Hope Nursery, near Bedale; or at the Pansy Nursery, Edmonton; at the following prices:—2*s.* 6*d.*, 5*s.*, to 10*s.* per packet. None warranted genuine unless they bear J.M.'s seal and signature. A remittance respectfully requested from unknown correspondents. —Pansy Nursery, Edmonton, January 1842.

FREDERICK ADOLPHE HAAGE, JUN., FLORIST and SEEDSMAN, ERFURT, PRUSSIA, begs to inform the Horticultural World, that he has for Sale the following FLOWER SEEDS, harvested last summer. Wholesale orders, sent to the above address, will be duly forwarded; or small orders from Amateurs, &c., to SAMUEL GIRLING, Nurseryman, Stowmarket, to both of which attention will be given.

GERMAN ASTERS, tubulous double superfine, in 30 sorts, 1 ounce, 10*s.*
Ditto ditto, dwarf superfine, 24 sorts, 1 ounce, 10*s.*
Ditto, pyramidal and tall, 12 sorts, 1 ounce, 10*s.*
GERMAN STOCKS, dwarf, 34 sorts, 1 ounce, 10*s.*
Ditto, wall-leaved, 16 sorts, 1 ounce, 10*s.*
Ditto, high, 24 sorts, 1 ounce, 10*s.*
Ditto, autumn-flowering, 12 sorts, 1 ounce, 15*s.*
Ditto, perennial, 12 sorts, 1 ounce, 10*s.*
GERMAN WALLFLOWER, dark brown, double superfine, 1 ounce, 15*s.*

F. H. also recommends his collection of fine Annual and Perennial Flower Seeds in a great choice.

NURSERY.—Mr. JOHN KING gives notice that he is instructed to SELL BY AUCTION without reserve, as the Lease has expired, on the premises, CAMDEN NURSERY, Southampton-street, Camberwell, on TUESDAY, 1st February, 1842, and two following days, at ten o'clock each day, on account of the number of Lots. The property comprises a fine collection of Standard and Dwarf, trained and untrained Peach, Nectarine, Pears, Plums, Cherry, Apples, and Mulberries: Vines, Gooseberries, Currants, a collection of Evergreens and Deciduous Shrubs, a large quantity of Forest-trees, Box-edging, Yews, Hollies, Sea-kale, Asparagus, &c. &c. To be viewed until the sale. Catalogues to be had on the premises, of Messrs. Warner & Co., Seedsmen, Cornhill; and of the Auctioneer, Hackney-road.

NEW AND SUPERIOR SEEDLING DAHLIAS FOR 1842.

JAMES EDWARD, FLORIST, LAYERTHORPE, YORK, begs most respectfully to invite the attention of Cultivators of the Dahlia to the following Three Seedling Varieties (raised in 1840, and fully proved in 1841), which are quite distinct from any hitherto produced; of very superior habit, and constant in producing good Show Flowers throughout the season; in proof of which J. E. begs to state that he has shown above 200 blooms of the three, during the season, at various Exhibitions open to all England, and has had nine Seedling Prizes awarded for them, namely,—four 1st prizes, three second ditto, and two third ditto; they have also been shown in the following winning trays:—

In the 1st Tray of 24 at the Horticultural Society, York, Aug. 18,
2d ,, 24 ,, ,, ,,
1st ,, 18 ,, ,, ,,
2d ,, 36 at the Botanical Gardens, Hull, Sept. 2d;
2d ,, 12 ,, ,, ,,
1st ,, 24 at the Horticul. Soc., Scarborough, Sept. 3d;
1st ,, 12 ,, ,, ,,
1st ,, 6 ,, ,, ,,
1st ,, 48 at the Yorkshire Philosophical Soc., Sep. 9th;
1st ,, 36 ,, Botanical Gardens, Sheffield, Sept. 15th;
1st ,, 36 ,, Horticultural Soc., Barnsley, Sept. 21st;
1st ,, 24 ,, ,, ,,
1st ,, 48 ,, Botanical Gardens, Leeds, Sept. 22d;
1st ,, 48 ,, Horticultural Society, York, Sep. 24th;
2d ,, 24 ,, ,, ,,

Besides having taken other Prizes in addition to the above.

PREMIER.—Fine bronze salmon, very superior form, of excellent habit, throwing its blooms well above the foliage, and always to be depended upon in producing good show flowers. This variety obtained the first prize, in its class, at the York Ancient Florists' Society, September 20th, and had also the premier prize awarded, as the best Dahlia of any colour.—Height 4 to 5 feet.—Plants 10*s.* 6*d.*

MARY JANE.—White ground, very deeply tipped and edged with purpled carmine—constant throughout the season, well up in the centre, of excellent habit, and never fails in producing good flowers. This variety obtained the first and second prize at Scarborough, as the best light-ground flower tipped or edged, and has justly been pronounced the most distinct and attractive Dahlia ever produced in its class.—Height 4 feet.—Plants 10*s.* 6*d.*

DUKE OF RICHMOND.—Fine light pink and yellow, colours beautifully blended together, with a light-yellow tip at the end of each petal, similar to the Duchess of Richmond, but quite distinct from that variety; very superior habit, always constant, and will prove a noble and excellent show flower.—Height 5 feet.—*Plants 10s. 6d.*

Good strong plants will be sent out the first week in May; and for the convenience of parties at a distance, orders will be received, and plants supplied, by Mr. George Charlwood, Seedsman, Covent Garden, London; and Messrs. Henderson, Nurserymen, Brechin, Scotland. No allowance to the trade unless 12 plants are ordered, and a remittance or respectable reference will be required from unknown correspondents. J. E. can also supply plants of all the best Dahlias in cultivation, of which a catalogue is annually printed, and can be had on application.

We the undersigned, members of the Committee of the York Horticultural Society, do attest the correctness of Mr. Edward's description of the above Dahlias; and we strongly recommend them as distinct varieties from any yet sent out, and well worth a place in the most limited collection.

John Robinson.

Report of the York Amateur Florist Society, held on Monday, August 9th, 1841.—The Judges and Members of this Society consider it their duty to notice a seedling Dahlia of last year (sent for inspection) raised by Mr. Edward, Nurseryman, of this city. The colour is pure white, with a dark tip of purpled carmine; the form, depth of petal, and above all, good eye, require no consideration to pronounce it one of the best Dahlias yet seen of its class; and from the evident superiority of this distinct variety over such flowers as Glory of Plymouth, Beauty of the Plain, &c., there is no doubt but the year 1842 will cause these flowers to fall in the rear when brought into competition with the seedling exhibited this day, as it may safely be pronounced a gem of the first water, and will reflect the greatest credit on the fortunate raiser, for so long as Dahlias remain in cultivation this flower must form a prominent feature in a stand of six.—*From the York Courant.*

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HEATING BY HOT WATER, WITH THE CIRCULATION OF ATMOSPHERIC AIR.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER; see the 3rd and 37th Numbers of the *Gardeners' Chronicle.*

References may be had, and their works seen, at Mr. Perry's Nursery, Banbury; Mr. Green's, Lower Cheam; Messrs. Henderson's, Pine-apple Nursery; Messrs. Rollisson's Nursery, Tooting; Mr. Knight's Exotic Nursery, Chelsea; Messrs. Low's, Clapton Nursery; Mr. Catleugh's Nursery, Chelsea; Mr. Gaines's Nursery, Battersea; Mr. Buck's, Portland Nursery; Mr. Young's, Milford Nursery; Mr. Smith's Nursery, Dalston; Mr. Woodroff's Nursery, Kensall Green; Mr. Hopgood's Nursery, Bayswater; Mr. Willmer's Nursery, Chelsea; and at most of the Nobility and Gentlemen's Seats in the country.

Every particular to be had at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

HENRY SPARE much regrets not being able to acknowledge the kindness of those Benefactors who have relieved his family's distress, in the next *Gardener's Magazine*, from not having made out his List in time for the printer.

EXOTIC NURSERY, CANTERBURY.

WILLIAM MASTERS having for many years cultivated upwards of THIRTY ACRES of Land as Nursery Gardens, begs to submit to the public the following List of Fruits:

PEARS.—W. M. having collected in the first instance, through the kindness of the late J. Braddick, Esq., and subsequently from his own personal visits to the Netherlands, a large collection of the celebrated FLEMISH PEARS, as well as many others from various sources, planted a specimen of each variety in his Nursery, and they having for several years produced fruit, he is enabled to pronounce with certainty that many are wholly worthless—some are too tender for our exposure—and that many are of the utmost importnnce on account of their prolific and early bearing, as well as of their delicious flavour. Out of a very large collection W. M. confidently recommends the following, which become fit for use nearly in the order in which they stand:—DESSERT PEARS.—Madeleine, Jargonelle, Williams' Bonchrétien, Flemish Beauty, Rouppé, Capiaumont, Beurré Diel, Autumn Bergamot, White Doyenné, Marie Louise, Princess of Orange, Seckle, Monsieur le Curé, Althorp Crassane, Bezy de la Motte, Napoleon, Duchess of Angoulême, Louise bonne de Jersey, Knight's Monarch, Rouse Lench, Swan's Egg, Beurré d'Aremberg, Nutmeg, Ne plus Meuris, Passe Colmar, Winter Nelis, Hacon's Incomparable, Beurré Rance, Easter Beurré. BAKING PEARS.—Royal Coreless, Double de Guerre, Uvedale's St. Germain, Catillac. Many other sorts are still cultured, but a garden furnished with these will produce fine fruit for every season.

APPLES.—W. M. having been a Fellow of the Hort. Society nearly from its commencement, has availed himself of the privilege of selecting from that liberal establishment such sorts of Apples as appeared to merit particular notice, and which, added to the selections from the famed Kentish orchards and elsewhere, have produced a number far exceeding the point of usefulness. The whole have been fruited, and the following condensed list is particularly recommended. The sorts are arranged as nearly as possible in the order in which they become fit for use:—Juneating, Borowitski, Kerry Pippin, Quarrenden, Hawthornden, Keswick Codlin, Franklin's Golden Pippin, Summer Nonpareil, King of the Pippins, Beauty of Kent, Gloria Mundi, Downton Pippin, Hughes' Golden Pippin, Ribston Pippin, Blenheim Orange, Margil, Sam Young, Scarlet Pearmain, Dumelow's Seedling, Forman's Crewe, Beachamwell Seedling, Dr. Harvey, Lemon Apple, Pile's Russet, Screivton Golden Pippin, Cornish Gilliflower, Scarlet Nonpareil, Knight's Ganges, Court of Wick, London Pippin, Walmer Court, Canadian Reinette, Alfriston, Court Pendu, Cockle Pippin, Hubbard's Pearmain, Old Nonpareil, Downton Nonpareil, Braddick's Winter Nonpareil, Collins' Russet, Golden Harvey, Dutch Mignonne, Hunt's Green Newtown, Norfolk Beaufin, French Crab. With the above selection, fruit for all purposes and all seasons may be obtained.

CHERRIES.—Purple Griotte, Early Black, Masters' White Heart, Elton, Black Eagle, May Duke, Kentish, Black Tartarian, Canterbury Black, Bigarreau, Late Duke, Florence, Small Morello, Large Morello. The above have proved the most valuable out of a large number of sorts.

PLUMS.—Lawrence's Early, Early Orleans, Hâtive Royal, Orleans, Denyer's Victoria, Greengage, Nectarine, Washington, Black Griffin, Catherine, Coe's Golden Drop, Imperatrice, Winesour, Large Bullace, Damson, Small Bullace.

Of PEACHES the following have given most satisfaction:—Early Ann, Grosse Mignonne, Early Newington, Noblesse, Red Magdalen, Old Newington, Admirable, Royal.

Of NECTARINES—The White, Elruge, Roman, Newington, Violet Hâtive.

Of APRICOTS—The Hemskirke, Large Early, Moorpark, Breda, Orange.

Of STRAWBERRIES—Grove-end Scarlet, Roseberry, Old Pine, Keen's Seedling, Myatt's Pine, Downton, Elton.

Of GRAPES—Miller's Burgundy, Sweet-water, Muscadine, Black St. Peter, White Cluster, Esperione, Hamburgh, Frontignan, Muscat of Alexandria, Verdelho, Horsforth Seedling, Black Damascus.

Of GOOSEBERRIES, selected out of 80 kinds—Early Green, Early Red Rough, Queen of Sheba, Lady Delamore, Warrington Red, Rookwood, Roaring Lion, Gunner, Duke of York, Crown Bob, Woodward's Whitesmith, Heart of Oak.

Of NUTS—Cosford, Frizzled, Dwarf Prolific, Knight's Large.

Of RASPBERRIES—Red Antwerp, White Antwerp, Barnet.

Of FIGS—Lee's Prolific, Brunswick, Common Purple, Brown Naples, Black Ischia, French Prolific.

W. MASTERS offers the above List of Fruits, all of which are grown, and nearly the whole of which have been proved in his Nursery, as a more complete one than those usually submitted to public notice.

⁂ Early Commissions will insure immediate attention.

HOT-WATER APPARATUS, upon the most improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, annex the following list of prices of Hot-water Pipes of the best description, to assist persons desirous of adopting this mode of heating in their calculations of the probable expense, and respectfully solicit an opportunity of tendering their price for the completion of any work required. Socket-pipe for Hot Water, of two, three, and four inches diameter, at 2*s.* 3*d.*, 3*s.* 3*d.*, and 4*s.* 3*d.* per yard. Ditto, with Troughs for Orchidaceous-houses, three and four inches diameter, at 4*s.* 9*d.* and 6*s.* 9*d.* per yard.

The much-approved Conical Boilers made of strong plate-copper, and which require no furnace or setting in brickwork, from 5*l.* 5*s.* upwards. Also, every other description of Boilers of the most approved construction. Further particulars may be obtained at the Warehouses, Gracechurch-street, where also may be seen a variety of patterns of Iron and Strained-wire Fencing, Hurdles, Brass and Iron Bedsteads, &c. &c.

PATENT ASPHALTE PROTECTING MATERIAL.—Extract from *Gardeners' Chronicle*, Dec. 25, 1841, p. 843.—"In the midst of frost it will not be unseasonable to warn all our Readers of the great importance of preventing their more tender Plants that may have been frozen from being thawed suddenly by the sun. All Gardeners know how often Peas frozen below a south wall are killed, and that if any contrivance to prevent their being suddenly thawed is made use of, they recover. What is true of Peas is, to a great extent, true of other things. A few weeks ago we had a severe frost, 16°; at that time young Araucarias exposed to the south died, while others within a few yards, but screened from the sun by stone, did not suffer at all. We may remark by the way that CROGGON'S ASPHALTE ROOFING forms a most excellent material for such screens." In page 8 of same Journal, Jan. 1, 1842, is fully described the purposes to which it is applied by the Royal Horticultural Society. Being a non-conductor it effectually protects from heat or cold.—THOMAS JOHN CROGGON, 8, Ingram-court, Fenchurch-street, London.

This day is published, price 6*s.* cloth,

THE HAND-BOOK OF CHEMISTRY; with a complete Index of reference. By G. H. CAUNTER, Esq.

London: W. S. Orr & Co.; and W. & R. Chambers, Edinburgh.

NEW GARDEN ALMANACK.

Just published, in foolscap 8vo, price 1*s.*,

HARRISON'S GARDEN ALMANACK, or Floral Calendar for 1842. By JOSEPH HARRISON, Editor of the Floricultural Cabinet.

London: Frederick Lover, Aldine Chambers, Paternoster-row.

PUNCH; or the LONDON CHARIVARI.—On Saturday, January 29, will be published Part VII. of this popular work. It contains "PUNCH'S ALMANACK" complete: forty pages of closely-printed matter, full of Wit, Satire, and Jokes; and upwards of One Hundred and Fifty Wood-cut Illustrations. Price Sixteenpence, stitched in a Wrapper.

A Number is published every Saturday, price Threepence. Office, 13, Wellington-street, Strand; and sold by all Booksellers and Newsmen.

Now ready, No. II. (February 1842), price 2*s.* 6*d.*, to be continued monthly, containing 56 pages of letterpress and 2 plates engraved,

THE LONDON JOURNAL OF BOTANY: being a new series of "The Journal of Botany." By Sir W. J. HOOKER, K.L., LL.D., F.R.A. and L.S., and Director of the Royal Botanic Garden of Kew.

London: H. Baillière, Foreign Bookseller to the Royal Society and the Royal College of Surgeons, 219, Regent-street.

Now ready, price 4*s.* 6*d.*, neatly half-bound (with numerous Woodcuts,

THE COTTAGER'S MONTHLY VISITOR, for the year 1841.—This Work is continued in Numbers, price 4*d.* each, and forms a Manual of Religous Instruction and Domestic Economy, suited to Family Reading, the Parochial Library, and the Servants' Hall. Its contents include Scriptural Exposition, Instructive Tales, Hints on Gardening and Agriculture, short Extracts from the best Authors, and occasionally from the Public News. The volumes are included in the List of Books recommended by the Society for Promoting Christian Knowledge.

Rivingtons, St. Paul's Churchyard, and Waterloo-place.

COTTON'S NEW TRACTS FOR COTTAGERS.

In 12mo., price 6*d.*, or 5*s.* per dozen (with Wood-cuts),

THE VILLAGE SCHOOL. Part I. (For Boys and Girls who go to School.) By the Rev. W. C. COTTON, M.A., Student of Christ Church, Oxford; author of "My Bee-Book."

Lately published, by the same Author,

THE VILLAGE. Price 6*d.* Also, in the press, THE VILLAGE SCHOOL. Part II. (To Parents.)

Rivingtons, St. Paul's Churchyard, and Waterloo-place.

Handsomely bound in cloth, with 93 Wood Engravings, price 6*s.* 6*d*

ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. TAYLOR, LL.D.

From the British Magazine.—"This is an elegant and well-executed little book, on a most interesting subject."

From the Birmingham Herald.—"A valuable and indispensable accession to the library of every Biblical student."

From the Rev. Thomas Hartwell Horne's Introduction to the Critical Study of the Scriptures.—"Nearly three hundred texts of Scripture are more or less explained in this elegantly-executed volume, and in a manner equally curious and interesting."

Post 8vo, price 6*s.*,

LETTERS FROM PALESTINE, written during a residence there in the years 1836-7-8. By the Rev. J. D. PAXTON.

The more important places in reference to Scripture History, visited by the author, were—

Damascus,
Jerusalem,
Beer,
Beyrout,
Mount Olivet,
Nazareth,
Baalbeck,
Bethlehem,
Samaria,
Mount Lebanon,
Hebron,
The Plain of Esdraion,
Jaffa,
The Valley of the Jordan,
Mount Tabor,
Mount Carmel,
Jericho,
Tiberias,
The Plain of Sharon,
The Dead Sea.

Also may be had, price 7*s.* 6*d.* cloth,

THE HISTORY OF FRANCE FROM THE EARLIEST PERIOD. By E. DE BONNECHOSE.

This History has been adopted by the Royal Council of Public Instruction for the use of the Normal Schools of France. The French Minister of War has also just subscribed for a large number of copies for distribution amongst the Regiments in the French service. The English translation of this popular work may be had of all Booksellers, price 7*s.* 6*d.*, the two volumes of the French edition being comprised in the one of the English.

Price 5*s.* 6*d.* cloth,

THE HISTORY OF THE UNITED STATES OF AMERICA. By JOHN FROST, of Philadelphia.

London: Tilt and Bogue, Fleet-street.

In one small volume, price 15*s.*

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, an Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur or Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. Andrews, Bond-street; Orr & Co., Paternoster-row.

In cr. 8vo. 4*s.* 6*d.* bd. with 220 Diagrams engraved for the work,

EUCLID'S ELEMENTS OF PLANE GEOMETRY; with Explanatory Appendix, and Supplementary Propositions for Exercise. Adapted for the Use of Schools, or for Self-instruction. By W. D. COOLEY, A.B., author of the "History of Maritime and Inland Discovery."

"This is the best edition of the Elements which has yet appeared."—*Athenæum.* "For brevity, clearness, and discerning attention to the wants of learners, cannot be easily surpassed."—*Dublin University Mag.*

Uniform with the "Elements," price 3*s.* 6*d.*

COOLEY'S GEOMETRICAL PROPOSITIONS DEMONSTRATED; or a Supplement to Euclid: being a KEY to the Exercises appended to the "Elements," for the use of Teachers and private Students. Upwards of 120 Propositions deduced from the first Six Books of Euclid, are illustrated in it by new diagrams.

"Will be found of considerable value as an aid to Teachers of the Mathematics."—*New Monthly Mag.*

Whittaker and Co., Ave-Maria-lane London.

THE COTTAGER'S GARDEN CALENDAR, by Mr. PAXTON, gardener to the Duke of Devonshire, will appear on Saturday next (Feb. 5). This Calendar will comprehend full details relating to all the Garden Operations which concern a cottager. It will be illustrated with woodcuts, and will be printed in this cheap form, that every gentleman may, if he pleases, distribute copies among his cottage neighbours and dependants. The EXTRA copies must be ordered at once either of the regular News Agents, or direct from the office (3, Charles-street, Covent-garden, London), by forwarding a post-office order for the Numbers required. The GARDENERS' CHRONICLE of the 5th of February will be enlarged, to include the Cottager's Calendar, but will still go free by post, being stamped, and may be ordered of all Newsvendors, price 6*d*. each.

The Gardeners' Chronicle.

Wednesday	Geological	8½ P.M.
Friday	Botanical	8 P.M.

WE resume the subject of the effect of rapid growth on timber.

All plants consist of one or other of two substances—the one cellular, the other fibro-vascular. The former is composed of little bladders, the latter of long tubes; both are termed tissue by physiologists. The cellular tissue, or substance, is brittle, has little force of adhesion, and gives to the parts in which it occurs the texture of a mushroom, or of the pith in an Elder bush. On the other hand, fibro-vascular tissue is tough and strong in various degrees, but in all cases much more tough and strong than the cellular; its nature, in a separate state, may be compared to that of hemp, flax, or other vegetable fibres, which are always composed of this fibro-vascular substance.

Timber consists of these two different tissues intermixed; when it grows fast, it produces a large quantity of fibro-vascular tissue, and but little cellular; when it grows slowly, it is more cellular than fibro-vascular. There is never any expansion of the fibro-vascular parts; all that happens is that the aggregate number of them is increased; thus, suppose a stick an inch in diameter contains 500 tubes; if you make it grow twice as fast, it will not expand those tubes, but it will add 500 more to its original number. As regards the cells, they may possibly be somewhat larger in plants of a very soft texture when highly cultivated, than when wild, but this is doubtful, and the difference between wild and cultivated esculents principally depends upon the greater quantity of the cells, and especially of the fluid matter contained in them. Expansion, in the sense in which the writer above-mentioned uses the word, has no existence.

Now, the difference between esculent herbs and woody plants consists mainly in this, that the former are composed principally of cellular substance, and the latter of fibro-vascular. Any addition to, not expansion of, the cellular tissue, renders plants more brittle and more succulent, and therefore more fit to eat. But it is most absurd to say that, therefore, any augmentation of the quantity of fibro-vascular tissue wil also render plants more brittle; on the contrary, as it is in truth an addition of toughness and flexibility, the only conceivable effect its augmentation can have will be to render timber yet stronger than before.

With regard to Willows, Poplars, and other plants of that character, they are not soft, because they grow fast; for they are just as weak when they grow slowly, and weaker. Their want of strength and durability arises from their being unable to consolidate their tissue by depositing within it matter of lignification. The sap-wood of the Oak is as soft and perishable as Lime-wood, and for the same reason, namely, because that peculiar matter which the Oak deposits in its tissue, and which gives its heartwood strength, is not separated and deposited in the sapwood.

The fact is, that so far as vegetable physiology is able to throw, of itself, any light upon this curious subject, it would lead to the conclusion that fast-grown timber is tougher than slow-grown, and superior for all purposes of utility.

Before proceeding further, we will beg the reader to observe that in making these remarks we intend them to apply only to the same kind of wood *under the same circumstances*. Wood grown fast *in one place* may be worse or better than wood grown slowly *in some others*; but that is a question to be considered on another occasion.

We are not, however, disposed to imitate others in making these statements without adducing evidence to substantiate their accuracy; nor is it necessary; for evidence enough is to be found by those who look to facts instead of books, and we shall, for the present, conclude with what we regard as conclusive proof, that Oak, at least, is best when fastest grown, and worst when slowest grown.

In the highly interesting collection of naval woods which has been formed by Sir William Symonds, at the Admiralty Offices in Somerset-House, there exists an abundance of specimens of Oak-timber whose quality has been ascertained by actual experience. To this distinguished officer we are under great obligation for the opportunity of examining them; and the result of that examination is given in the following table, which shows the annual rate of growth of 23 samples of timber, given in tenths of an inch for the sake of comparison, together with their respective qualities, as ascertained in Her Majesty's dockyards:—

Name or Locality.	Annual rate of Growth computed in tenths of an inch.	Ascertained Quality.
Duke of Wellington's estate	10.	Very good for Plank.
English	6.66	Good for Plank.
Out of Ship "Gibraltar"	6.44	Good.
Do. do.	4.61	Very good.
Sardinian	4.28	Good.
French	4.	Bad.
Styrian, 1st class	3.33	Indifferent and light.
Dantzic, 1st class	2.85	Tolerable for Plank.
Tuscan, Q. ischia	2.72	Good for Plank.
Istrian, 1st class	2.57	Bad.
Polish	2.50	Indifferent.
American Live Oak	2.39	Good.
English, seasoned	2.37	Good.
American White Oak	2.15	Bad.
Russian	2.07	Bad.
Hainault	2.	Bad.
Circassian	1.79	Indifferent.
Tuscan	1.33	Good.
East Prussian	1.17	Indifferent.
Podolian	1.17	Bad.
Canadian	1.07	Bad.
Crimea	0.96	Tolerable.
Tuscan, Q. Farnia	0.76	Bad.

We also find, upon looking to evidence of another kind, that the following are the rates of growth of various other specimens of Oak which we have elsewhere examined:—

Name or Locality.	Annual rate of Growth, computed in tenths of an inch.	Apparent Quality.
Ruins of York Minster	7.78	Excellent, hard and heavy.
Arundel	3.33	Best quality on the Duke of Norfolk's Estate.
Penrhyn, N.W., White Oak	2.50	Inferior.
Do. do. Red Oak	2.35	Very good.
Wainscot	2.0	Good.
Northumberland	1.81	Good.
Arundel	1.48	Inferior.
Yorkshire	1.43	Tolerably good.
Wainscot	1.25	Average of several specimens, including good and bad.
Moss Oak, Ayrshire	0.99	Light and bad.
Wainscot	0.80	Brittle and bad.

Want of space compels us to break off for the present. We shall next week proceed to comment upon this evidence.

MR. WEBB HALL, in a letter to the Editor of the *Times*, has formally, in the following words, repeated his statement respecting the produce of Mr. Daniel's land, alluded to in p. 19:—"I am just returned from inspecting the first manufactured portion, for sale, of a manure that has enabled Wheat to be grown on a poor soil four successive years on the same land, and of superior quality of grain—the history of which I have communicated already to the agricultural world." This important fact has now received the direct testimony of a gentleman whose known acquaintance with agricultural affairs and high position in society place his evidence beyond the reach of doubt.

Now that the Assam Tea trade promises to become of great commercial importance, a difficulty has been found in determining to whom is due the honour of first discovering the shrub in the dominions of the East India Company; and in India, where men's tempers seem to be as peppery as their sauces, an acrimonious dispute upon this subject has been engendered. In another column we publish a letter from Mr. Griffith, a most distinguished botanist, and one of the tea deputation, who maintains the claims of Captain Charlton; while, on the other hand, these claims are disputed by Dr. Wallich and his friends, who allege that the merit really belongs to others.

Although this is hardly a home question, yet, as we doubt not the several claimants of the honour have their friends in England, we may be permitted for once to state our own view of the case, especially since we may be regarded as impartial judges standing aloof from the disputes that have taken place in India.

It may be assumed that all the positive information that exists upon the subject is to be found in the Proceedings of the Agri-Horticultural Society of India—the documentary evidence that has been produced in which, leaves little to desire. Judging from that evidence, we can come to no other conclusion than that the real discoverers of the Tea-plant were Mr. C. Bruce, and his brother the late Major R. Bruce. These gentlemen were among the earliest residents in Assam, and are said to have obtained a canoe full of plants and seeds before the Burmese War. Unfortunately no precise evidence appears to exist upon that point, the statement depending upon the assertion of Mr. Bruce; but it is confirmed by Dr. Wallich, and no one seems to dispute it. But so long ago as June 1825, the late Mr. David Scott sent an account of it to Dr. Wallich, with seed-vessels (called by him seeds) and leaves, and also a drawing of a seed-vessel, a copy of which drawing has been published. Dr. Wallich did not, however, consider this information sufficient to prove the newly-discovered plant to be Tea; and as he returned to Europe in 1828, the subject seems to have been almost forgotten,—although in May 1827, two living Tea-plants from Chinese Shawn were actually received at the Botanic Garden, Calcutta, for the Countess of Amherst, during Dr. Wallich's absence in Burmah.

It is not till October 1831 that Captain Charlton's name appears connected with the discovery of Tea. At that time this officer is proved to have brought live plants to the Agri-Horticultural Society of India, and to have written with them in these explicit terms: "The Tea-tree grows in the vicinity of Suddiya, the most remote of the British provinces towards the east in Assam. Some of the natives are in the habit of drinking an infusion of the dried leaves, but they do not prepare them in any particular manner. Although the leaves are devoid of fragrance in their green state, they acquire the smell and taste of Chinese Tea when dried." And again, in November 1834, he sent leaves and ripe fruit, which Dr. Wallich then (Dec. 1834) officially informed the chairman of the Tea Committee had removed his doubts about the Assam plant being *most unquestionably* the real Tea, adding, that "a more interesting, a more valuable fact has never been brought to light in Indian agriculture than has thus been established beyond dispute by Lieut. Charlton." Further than this it seems useless to trace the evidence.

To us it appears that the facts we have adduced prove that the Assam Tea was first discovered by the Messrs. Bruce; that Mr. David Scott soon afterwards sent home leaves, seed-vessels, and a drawing of the latter, which, however, Dr. Wallich did not consider satisfactory evidence upon the point; that in 1827 the same gentleman sent live plants to Calcutta, still, however, without producing conviction that they were Tea; and, finally, that in 1834, Captain Charlton sent home evidence which was regarded for the first time as conclusive.

To whom under these circumstances should be assigned the honour of having established the important fact of the Tea-tree growing wild in British territory, will naturally be disputed. We should give it to Mr. Scott, who first furnished evidence of its existence, but was not fortunate enough to obtain credence. Had his proofs been regarded as satisfactory, it is quite clear that no opportunity could have been afforded Captain Charlton for again inquiring into the matter. But as Mr. Scott's investigations produced no result, we think that Captain Charlton, whose information at last produced conviction upon the authorities deputed to judge of its value, must be considered, in fairness, as deserving the same credit as would have attached to him if Mr. Scott's proceedings, of which he was unaware, had had no existence; and that, therefore, he is entitled to the gold medal which has been awarded him.

In all these questions it is well to bear in mind the following sensible observations made by a writer in the last *Quarterly Review*:—

"A philosophical inquirer into the history of a science would inquire, not by whom, or at what time, an apple was seen to drop to the ground, or steam to issue from boiling water, or sand to melt into glass, or hard bodies to produce corresponding impressions upon soft; but under what circumstances these simple facts, dropped like seeds into a suitable soil, became for the first time prolific, and brought forth the theory of germination, and the steam-engine, and the telescope, and the printing-press."

It is too often the custom to neglect this view of such questions, and to require for a mere accidental observation, the credit which only attaches to the man who connects a fact, valueless in itself, with other facts, so as to give them some great practical application.

If our correspondents about root-pruning will weigh them well, they will see how idle is the controversy they seek to raise upon that subject. The first person who took the necessary means to bring that practice into use, and to give it a general application, is in our minds the man to whom attaches any credit connected with it. If antiquity is to be looked to, it is absurd to talk of Hitt or Switzer, for a little consideration will take us back far beyond them and their contemporaries.

As our Paper was going to press, we received the mournful news of the death, at Montpelier, of M. Guillemin, a zealous and amiable French Botanist, whose loss will be deeply lamented by those who had the happiness of his acquaintance. His Report upon the cultivation of Tea in Brazil, to which country he was specially sent by the French Government, is one of the latest acts of his useful life.

CHATSWORTH.

(Continued from page 52.)

Having now adverted to what is perhaps an irremediable and unavoidable blemish, it remains that I should express my humble but sincere gratitude to the noble owner of this giant store for the inestimable boon he has conferred upon the botanical world in causing its erection. "Quæ regio in terris nostri non plena laboris!" if true in any case, is eminently so as regards the labours of the botanical collector; and yet the fruit of all his researches, carried on for centuries, and pushed into every quarter of the earth, may be seen concentrated here. Yes, here are the *élite* of all the great vegetable tribes from East to West, "from China to Peru," associated for the first time under shelter of the same roof. Can the imagination picture to itself a sight more perfectly lovely that such a combination of beautiful forms may in due season be expected to produce? Nor is their time so far distant as some may suppose, for the plants are evidently quite at their ease, and giving promise of luxuriant growth; nay, already some of our old hothouse familiars can scarcely be recognised in their new domains, plenty of space for their roots and branches having in a few months effected a complete metamorphosis. The scene in this world most nearly akin to enchantment will, I venture to predict, be enjoyed —say ten years hence—from the gallery which is carried round the entire of this conservatory, and from which the spectator will look down upon a tropical grove in all its wild magnificence. How can the botanist, chained by domestic ties to his native land and its humble Flora, sufficiently express his sense of the spirit, taste, and munificence which have brought to his own door, as it were, a field of enjoyment so rich and rare, and enabled him to realise scenes which sounded in his ears until lately like fables of fairy-land?

The view of the interior as presented to me last autumn was somewhat desolate, for the mass of the plants were small and only just recovering from the effects of removal, and to add to the bleakness two giant Palms (Phœnix dactylifera, and Sabal Blackburniana), which were carried thither with such prodigious labour from Lord Tankerville's (vide the newspapers, *passim*), were completely ensconced in enormous canvas screens to preserve them from the excessive action of light and sun until they had somewhat recovered from their journey and transplantation. These are the most magnificent specimens of their kinds that this country contains, and when the canvas awning is withdrawn, as was intended to be done this winter, they could of themselves give quite a tropical air to their present habitat. But although the general effect is still of course somewhat meagre, there are particular points of interest that even now astonish and delight the beholder as he wends his way round the house. An aquarium of which the banks are formed of a picturesque species of limestone rock, known in Derbyshire by the name of tufa, is a gem in its way, and seems to answer admirably. In a cooler quarter (for here are various climates), a grove of Orange-trees is vastly luxuriant and effective. But nothing took my fancy more than an avenue of Bananas, which crosses the centre of the house, and is already most imposing; indeed all the Scitamineæ are growing separate, which soon promises to banish all semblance of bleakness and barrenness from the Elysian fields. No 'aching void' can long exist amid such tropical vigour of vegetation. A compact clump of Musa Cavendishiana occupies a corner of the house, and is a charming object, with the fruit, flowers, &c., in every stage of maturity and development.

I have before alluded to a gallery running round the house. This is reached by a flight of stone steps carried up through a pile of artificial rockwork, over which various Ferns, Lichens, Araceæ, and other Epiphytes are profusely scattered: this strikes me as an excellent idea.

Into the world of boilers and pipes, fire and coals, which exists underneath the fair flowering world we have been describing I have no desire to descend, especially as the miles of iron piping have already been accurately measured for the edification and astonishment of the public; suffice it to say that the arrangement for supplying heat and air, and water, appeared to be admirable and to answer perfectly.

That no disappointment may be experienced by an ordinary visitor, it may be well to inform him that after entering the conservatory at the north entrance and enjoying a *coup d'œil* of the novel scene within, his progress into the interior will be obstructed by certain rails beyond which he will not be permitted to pass. This arrangement, though deemed arbitrary by the unreflecting, is obviously indispensable, unless the comfort of the noble proprietor and his friends is to be sacrificed, and the operations of the gardeners to be impeded in order to gratify *ignorant* curiosity. I lay stress upon the word 'ignorant,' for to a person of any standing in the world of science or horticulture everything is most freely and liberally shown.

(To be continued.)

NOTES UPON SOME OF THE NEW PELARGONIUMS.

(Continued from p. 37.)

12.—**Erectum**; and 13, **Comte de Paris**. These are two lovely flowers similar in colour and general habit; of their comparative merits it is difficult to decide, as there is but slight difference between them, but still there is sufficient to make it desirable to grow both, and they will deserve a place in every collection. Our remarks were made from seeing two fine specimens beside each other. The flowers are of a beautiful clear orange crimson, the ground-colour being nearly the same in all the petals. In general appearance, Comte de Paris appears the more showy, from the flowers being more expanded; which advantage is compensated for by the general form of the flower in Erectum being slightly better, and the spot more defined. The most perceptible difference to a casual observer consists in the foliage of erectum being smooth, and of a deep bright green, which shows the flowers off to the greatest advantage. They both throw up a fine head of bloom, and are two of the best Pelargoniums we know, admirably adapted either to ornament the conservatory, or for the purposes of exhibition, the rich colour of the flowers forming an agreeable variety with the white and rose-coloured sorts, which are more common.

14.—**Cyrus** has delicate pink under petals, with a fine spot in the upper part of the flower, gradually shading to the edge. The upper petals are a little too pointed in their form, but we consider it superior to Garth's Victory, which it resembles. The habit is good; it blooms freely, and the trusses are large. It is well adapted for shows.

15.—**Vulcan.** Ground-colour purplish rose, with a fine spot; the form is good, and the colour renders it a desirable variety for a collection.

16.—**Modesty.** This is compact in habit, and every one who sees it will wish the blossoms had been larger. The trusses are too small, as well as the individual flowers, to make it available for the purposes of exhibition. The ground-colour, which is a delicate pink, is alike in all the petals; the centre is white, with a good dark spot in the upper petals.

17.—**Tournament.** This, from its colour, forms a distinct variety; the lower petals are bright rose with a tint of purple, the upper petals are of a deeper hue with a good spot: the form of the flower, however, is not first-rate.

18.—**Albion** has a tinge of purple in the pink of the under petals, the centre white, and a good dark spot in the upper petals, changing to deep rose. It is a finely-formed flower, the under petals being round, broad, and even on the edges.

19.—**The Nymph** was sent out last season, and was considered to possess properties of a superior order. The near approach to roundness in the form of the flower, with its fine broad stiff petals, was a great improvement in these qualities. The ground-colour being a bright rose, the under petals terminating in white, with a fine dark spot in the upper part of the flower, gives it a refined character: we doubt its being a free bloomer, and there is a slight inclination to twisting in the petals; this quality in one specimen we saw was nearly obliterated, probably from having grown very near the glass. It is considered to be one of the best flowers of its class.

20.—**Evadne** is a delicate representation of the Nymph, being neither so deep nor so bright in colour, with the advantage of blooming more freely.

21.—**Mabel** is another flower of this class, being a faint copy of the Nymph; it has a fine dark spot in the upper petals, surrounded by a dash of crimson, and blooms freely.

22.—**Gaines' Rising Sun** was a flower that attracted a good deal of notice last season at the different exhibitions near town; it is characterised by great brilliancy of colour; it flowers freely, and displays its numerous trusses of bloom, amid foliage of a deep green, which contributes, by a contrast of colour, to heighten the brightness of the flowers. The colour is a rosy vermilion, and it has a feathery spot on the upper petals, which wants intensity. It is a distinct and desirable variety.

23.—**Prince Albert (Gaines').** The general appearance of this flower is similar to Joan of Arc, with the advantage of being much superior in form; it is a showy variety, and blooms freely.

SCRAPS FROM THE LIFE OF A GARDENER.

(Continued from page 21.)

NO. II.—MY FIRST PLACE.

MY master put on a rough coat and a well-worn hat, and left his comfortable room to conduct me to the place where the foreman and another gardener slept. We entered the garden by a little wicket, and walked along several winding walks, till at last a light was discernible. I do not know what the thoughts of my master were at the moment, but he sighed deeply several times. On other occasions and with other men I should have felt for his grievance, and inquired into the cause of his sorrow; but there was such a distance in his manner, and such a coldness in his speech, that it prevented me from feeling any sympathy. By this time we were near the garden-house, and, indeed, it was different from those fanciful ones that I had drawn in my mind; I had pictured to myself a little Gothic cottage with abundance of monthly Roses and Honeysuckles growing round it, and with a pretty garden outside; but alas! how different was the one before me! I thought I saw the light shine through the chinks of the walls, and as we turned the walk it appeared a long, low shed, not built with bricks, nor painted, nor in the warmest situation, for it was at the back of a dark high wall which shut out the sun from the south, rendering it exposed to the keen north wind and the driving shower. We halted for a moment at the corner, and I had time to make these observations before my master spoke. He called "James" in a sharp, quick voice; there was a short bustle, and then out came a man. "Here is this lad," said my master; "can he remain with you tonight?" "Yes, sir, we'll try," said James, "although there is little room for any one but ourselves." "He must stop here to-night; to-morrow I will find another place for him." This he said as he was walking away; and he was so far off when he finished the sentence, that I could scarcely hear the last word. James uttered a discontented growl, and, without saying more, turned into the shed. The feeling that crept across my mind at this time was anything but pleasant, and from the unkind manner of my future master, and the surly voice of the foreman, I fancied I was among savages rather than men. I entered the shed, which was divided into two departments; in one roared a fire which heated a conservatory at the back, and the other was the bed-room, the sitting-room, and the kitchen! Yes, reader, they were all in one place, about ten feet long by eight square: the foot of the bed reached to the fireplace, opposite which there was a deal table; the other articles were a chair, a box, a candlestick, and a frying-pan. "Man wants but little here below, nor wants that little long!" truly this is correct. The shed, or hovel as I may call it, was made of boards nailed slightly together; they were rotten in many places, and some were removed all together; the rats and mice had made burrows through and through, and when the rain fell in torrents, or the winter blast blew, there were these two beings obliged to sleep in a dismal shed. The windows were pasted with paper, and several places in the boards stuffed with moss to keep the wind from disturbing the light of the candle; for although misery seemed around him, and his voice was hoarse with cold, still he loved and admired every blossom that opened. Upon the table were several publications connected with his business, and some blotting-paper. When we sat down, he eyed me attentively for a few minutes, and I dared not look up, for I felt my heart swell, and a tear fell upon my hand. He started from his seat and caught my hand in his own, which was hard; but it was made so by labouring for an honest subsistence, and I reverenced it on that account. I looked up at him, and in despite of the hard buffets and the sharp struggles, and the scars that fortune had marked him with, I still could see that the milk of human kindness was there, and I felt that a kind heart beat within his manly chest. "Young man," he said, "you must not fret. I know 'tis hard to leave home and friends; but we must part sooner or later. Look over the wide field of nature, and you will not find two things that always remain in one state. Now you'll feel grieved for your home; but in time you'll forget it, and those who love you at home will forget you—for life is ever changing, like clouds passing over the face of the sun." I said, "Yes, sir," and dried my tears, inwardly satisfied that I had found one friend; for when one is distant from home, and young in the world, and with a heart tender and uninured to the buffets of life, any kind word sinks deeply into the mind, and makes the heart yearn with fondness towards the adviser. So was it with me; for I recollect his words as well as if they were spoken yesterday. As he spoke so kindly, I ventured to ask him a few questions. "What a miserable hut you are doomed to live in!" I said; "do you reside here summer and winter?" "Oh, yes; and we are thankful for such a place, for it is not so bad as a prison," he smilingly said: "and as for a little air, I believe it is a very good thing." "It is a wonder you do not die with cold here." "Oh, there is little fear of that," he said: "if we nursed ourselves up and made ourselves tender, then perhaps we might; but we do not do so!" "'Tis a wonder Lord George Hallerton allows such a place to stand, particularly in his garden," I said. "Perhaps he never noticed it; and if he did, perhaps he don't know what it is used for," said James. "We must not repine nor be discontented, for this is better than none, you will allow." "Well," I said, "if you can be contented in it, so be it." "Yes, young man, contentment is a noble blessing. What recks it though the king have his palace, his retinue, and his servants? If he has not contentment, he will not be happy; and I am one of those men who could be happy anywhere, always believing that Providence designed me to be there. I was not happy when I first came here; but I was young and proud then, like many more; and as long as I live, if they only let me have my books and my room here, I will die happy. I have lived here so long, that the ways of the place have grown on me, and I feel as if I love every spot about the neighbourhood. Every tree is as familiar to me as an old friend; and every breath of wind that whistles through the chinks and cracks of our old Abothy* brings back the remembrance of occurrences in days gone by. I could not leave it. The very gravel and the smallest bit of moss about here I admire and respect, because they exist with me. My dreams by night, and my thoughts by day, are about this old place, and the many friends that I have around here and in this neighbourhood. It would be like death for me to leave it." "And how long have you been here, sir?" I said. "Twenty-nine years," was his reply. "I came here when I was about twenty-two, and I have been here ever since. I liked the appearance of the old building when I saw it, and vowed to stick to it; and so have I done." "And were you young when you left your home?" "I'll tell you, young man, as soon as I light my pipe," he said. He looked at his watch, and said, "My companion will not be home yet. I'll give you an outline of my life, to pass the time until he comes." *W.P.*

(To be continued.)

ON THE CULTURE AND IMPROVED VARIETIES OF THE GOOSEBERRY.

Two or three notices have already appeared in the *Chronicle* on the culture and improved varieties of the Gooseberry, and anything further on the subject may possibly be considered uncalled for. But as many individuals seem yet to be prejudiced against what are called the Lancashire varieties, I am desirous of saying a word or two in favour of some of them. The remarks of several works on Gardening which still continue to be sold have a tendency to foster these prejudices, by saying that the large varieties are thick-skinned, and possess so many other bad properties that size is considered to be their only or principal recommendation.

Cobbett says that big Gooseberries are nearly all skin, and the pulp is of a very mean flavour. Size, I believe, has been the only criterion of merit at the shows of those to whom we are indebted for these large varieties; and if we only consider that there is a much greater probability of obtaining new varieties of fruit from seed of large size only, than of large size united with excellence of quality, we shall be led to conclude that many varieties of Gooseberries must be cultivated, which in point of flavour are worthless, and to which the above objections would apply. To show how exclusively the efforts of the genuine Gooseberry-growers are directed to mere size, I may mention a ludicrous circumstance which once occurred to Mr. Knight. When on a visit to a connexion in Cheshire, he went to the garden of a celebrated improver of Gooseberries, or, more properly, to a grower of Gooseberries of enormous size. He was much pleased with the fruit, which was very large and of great beauty, and being engaged in attempts to improve other fruits, Mr. Knight and his new acquaintance seemed much to please each other; when the former suddenly sunk to nothing in his esteem by unfortunately asking him whether his Gooseberries were good to eat. He repeated the word "eat" with nearly as much surprise as a florist would have repeated it if he had asked him whether one of his Tulips or Carnations was good to eat. Size, however, as Mr. Knight justly observes, with other points is desirable; and if a union of size, quality, and productiveness be taken into consideration, I am satisfied that many of the Lancashire varieties are unrivalled. The variety which is considered to be the most profitable, and which is most extensively cultivated by market-gardeners in Lancashire, is the Crown Bob; it is a most abundant bearer, and ought, in my opinion, to supersede the variety called Aston's seedling, or the Red Warrington of some. It will produce a greater crop, it is of better quality, and superior for all culinary purposes. The Lion must be well known, owing to the prodigious size to which it has been frequently grown. It is a good bearer and one of the best for preserving, but it is an old variety, and I think there are some proofs that the vigour of the tree is declining. The Rockwood, Gunner, and Teaser are the three best yellow varieties I know; they all bear well, and are of good quality; the first is a very old sort, the last is a comparatively new one and very beautiful. The Fleur de Lis, a comparatively new white variety, is of first-rate quality, and valuable on account of its very early ripening. The Peacock, one of the newer sorts, is the best large green Gooseberry I know, but it does not bear well. There is no Gooseberry, however small, I believe, which has a thinner skin than the one called Wellington's Glory; it is so clear and transparent when ripe that the whole of the seeds may be counted with ease; it is, moreover, a tolerable bearer, and of excellent quality. The White Eagle is a good bearer, and if allowed to become quite ripe it is one of the best. When well grown, it is, I think, the most beautiful Gooseberry we have; it is also one of the latest ripe. The best-flavoured Gooseberry preserves I ever tasted were made exclusively of this variety. I caused them to be preserved separately two years, supposing the quality the first year might be owing to some extra good management or good luck in the culinary process, but on both occasions their superiority over others was evident. It may not be generally known that some of the best of the large varieties, such as I have mentioned above, make much richer, more jelly-like, and better flavoured preserves than the Aston seedling, and other smaller sorts generally grown for that purpose, but such is undoubtedly the fact. This I have mentioned to several of my friends, who have tried them separately, and all have been satisfied of their value in that respect. Many cottagers even in Lancashire have yet to learn this. I have known individuals who have had two or three trees of the improved varieties, and who seemed to grow them more as curiosities than aught else. But they could not do otherwise than see that the trees were more productive, and that the fruit attained a marketable size earlier in spring than the smaller sorts, and thus from the fact of their reserving the principal part of the crop to be eaten when ripe, we might suppose they were of opinion that they were of better quality also; yet when fresh trees had to be obtained they seemed never to have considered which of the varieties they grew would afford the greatest amount of the most valuable produce, but have purchased more trees of the old sorts, and when asked why they did so in preference to the others, the answer has been to this effect—the Gooseberries we wanted were for preserving, these are the sorts always grown for that purpose—the others are only for eating, surely you would never think of preserving them.

---

* The usual name for a gardener's shed.

In addition to the above, I am informed by a respectable market-gardener in Lancashire that the following are desirable new varieties, viz:—Ostrich, Wonderful, Companion, and London. Although I recommend a more extensive cultivation of some of the best of the large kinds, I should be sorry to see those old favourites the red and yellow Champagne eradicated; two or three trees of them ought to be in every collection, and there is another small variety which I think even surpasses them in excellence, and that is the Pitmaston Green Gage, raised by Mr. Williams: it is truly delicious.—*John Townley.*

(*To be continued.*)

THE AMATEUR'S GARDEN.—No. V.

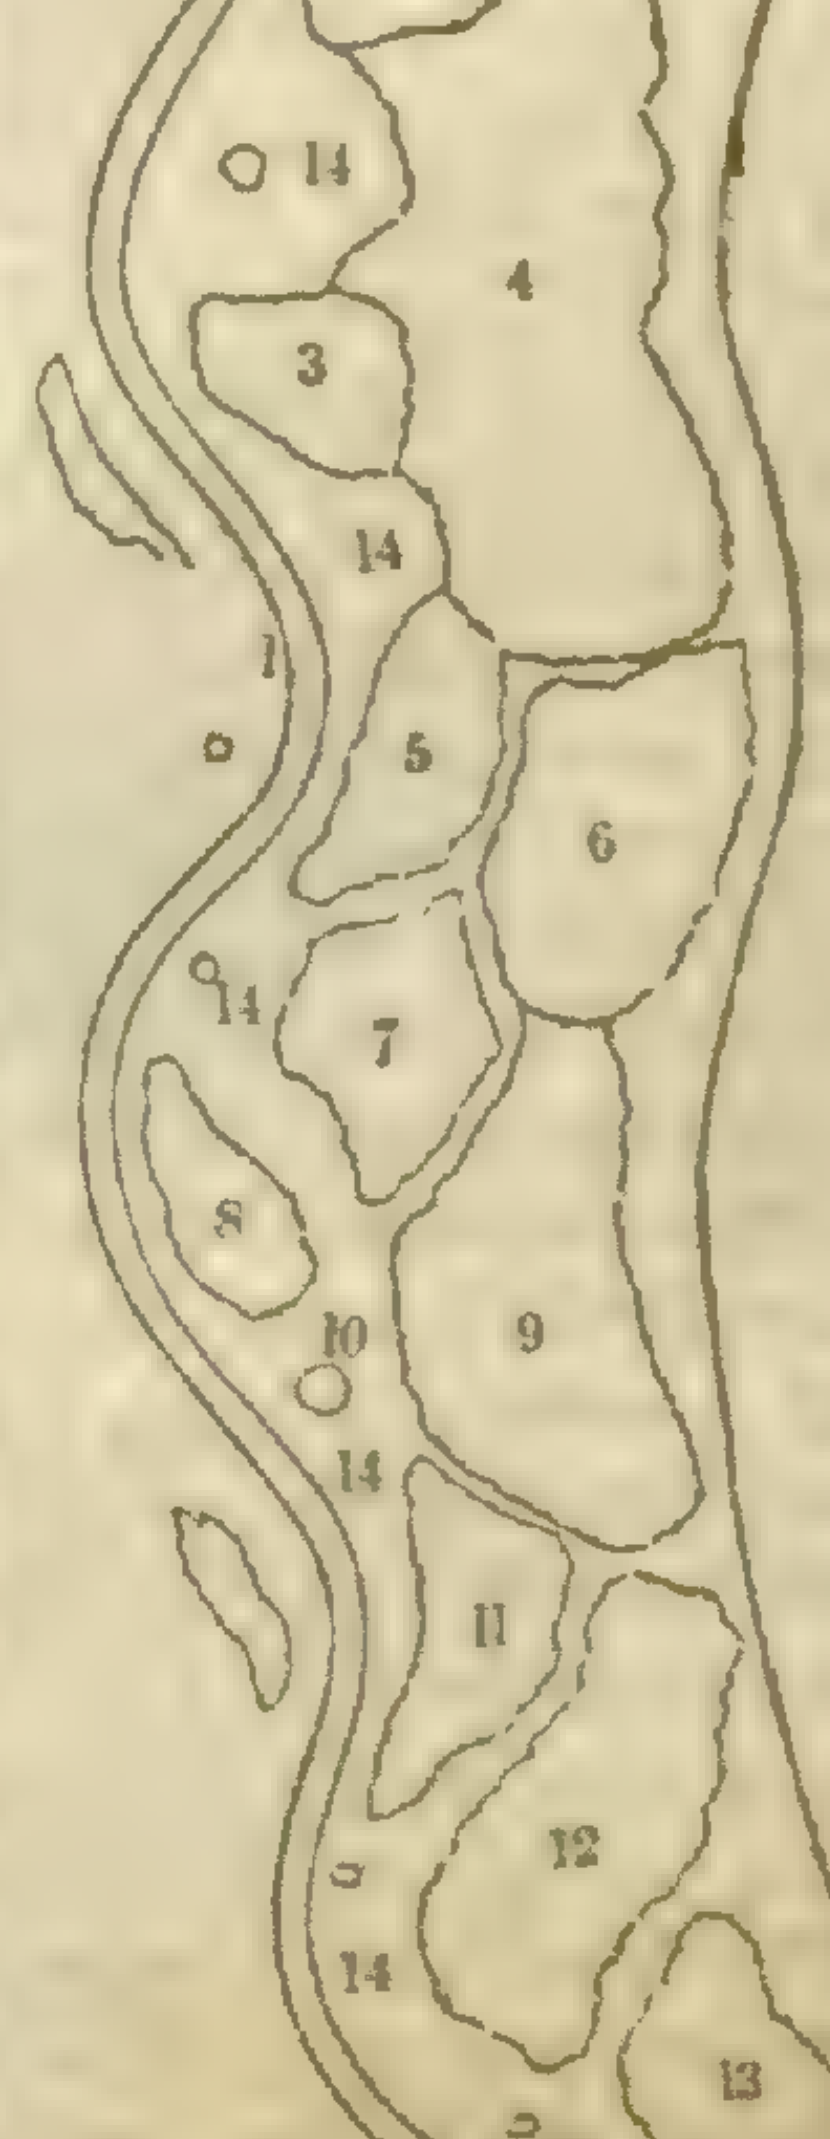
THE structure of the leaves of plants is extremely beautiful, and the offices which they perform are very important. They are covered over with a thin skin, which is full of small pores called stomates, by which plants breathe and perspire. During the winter, greenhouse plants, and more particularly such as are grown in rooms, get covered with small particles of dust, by which these pores are filled up, and prevented from performing their proper functions. At this season of the year, therefore, a fine mild morning may be chosen when the plants are rather dry, and the whole should be well syringed with pure rain-water; afterwards as much ventilation as possible should be given in order to dry the leaves before the evening. Room-plants may be taken out on the lawn for this purpose, and left there until the leaves are dry. The syringing will be particularly beneficial to those having large broad leaves, such as Pelargoniums and Camellias, and the amateur will soon be convinced of the utility of the plan by the health and freshness of his plants. The green-fly, which is so common on Rose-bushes and Peach-trees during summer, will soon begin to appear on the young shoots of tender plants, particularly on such things as Verbenas and Petunias, intended for planting out in the flower-beds. Of all the gardener's enemies there are none more completely in his power, for although they are as numerous as the Chinese, yet they are quite as easily conquered. A little tobacco-water to syringe them with, or what is better, tobacco-smoke, very soon destroys the whole of them. There is a kind of paper sold in all the tobacco-warehouses, which has been used for packing with, that answers the purpose extremely well; but common shag or any other kind will do; or the amateur may even grow a few plants in his own garden which he can cure and use for this purpose. A calm evening being chosen when the leaves are dry, the house should be completely filled with smoke, and the same operation should be repeated the next night, which will generally be sufficient. A common garden-pot, having a hole in its side, may be used, but there are fumigating bellows sold for the purpose. If the former is used, all that is necessary is to put some fire in the bottom, and fill it up with alternate layers of tobacco and damp moss, and then blow gently with a pair of common bellows at the hole in the side of the pot, taking care not to produce flame. The plan described by Mr. Mills in a former Number is also very good, particularly for small pits or frames. Room-plants can be taken into a small close shed, and treated in the same manner; or if only one or two are infested, a person accustomed to smoke can easily destroy them with a common pipe.

If the weather is tempting enough for the amateur to engage in out-door operations, the pruning of fruit-trees and bushes may now be done, any whole unhealthy evergreens dug up, and soils got ready for potting.—*R. F.*

HOME CORRESPONDENCE.

The Protection of Peaches and Nectarines.—It was well observed in p. 795 (1841), that the site for the kitchen-garden was formerly often chosen in a valley in preference to higher ground, and I am induced to make these remarks because the conclusions to be inferred from those observations might have a tendency to lead gentlemen who have gardens so situated, to believe that plenty of fruit may be obtained by root-pruning and bringing the roots of the trees near the surface, and by well draining the borders. I have had the management of a garden of this description for upwards of 20 years, where there is nearly one mile of wall. It consists of eight acres, situated in a valley; and when I first went, in 1819, I thought it an excellent situation, although the appearance of the Peaches and Nectarines was anything but cheering; and I concluded that nothing was wanting but new trees and well-prepared borders to ensure future success. In the autumn of that year I began by removing all the old soil in which the decayed trees were growing, to the depth of three feet, and formed a hard bottom with one foot of brick rubbish, and filled up the remaining two feet with the best turf loam. The young trees rooted finely, and made good wood for five or six years: but after that, unless well protected from spring frosts, they began to show symptoms of decay. In such situations I am convinced the fault is not at the roots, but it is the humid atmosphere in the spring months that causes the mischief. I have often seen a thick fog cover the valley and garden, while the higher ground was quite clear. If precautions were not taken to cover the Peach and Nectarine trees in the spring month, disappointments were sure to follow, unless the seasons were very favourable. It is well known that frosts take quicker effect in valleys than on higher ground; I have often had French Beans and Dahlias killed by frosts in the months of May and October, while in the flower-garden the latter have bloomed till November, and not half a mile distant. I have invariably found, on removing decayed trees, that the roots were not at all affected, but in good order. The same kind of turf and loam was used in making the borders as was employed for the trees in the Peach-houses, in which they grew and bore excellent crops of fruit every year. Those trees have been planted 22 years, and had, when I left them in 1839, the appearance of young and healthy trees. The humidity of the atmosphere in the months of April and May, and the tendency to freeze in such situations, is the real cause of premature decay in Peaches and Nectarines. It appears, therefore, that not only well-prepared and well-drained borders and good management are requisite, but that protection from spring frosts is also necessary. The covering with mats at night, or bunting (on an extensive scale and where only a limited number of hands are kept), and removing them in the day-time when favourable weather permits, requires additional labour, which ought to be allowed by every gentleman who wishes to see his trees healthy. One of the best modes of protection with which I am acquainted is practised here every year, and consists in covering the trees with mats. Stakes are driven into the ground three feet from the wall at the bottom, and about six feet apart; they project one foot above the coping, to which they are fastened, and when the mats are rolled up in the morning, they are secured to the ends of the stakes, and lie on the top of the wall. It requires two men to let them down at night, and the same to roll them up in the morning; but they are an effectual preventive against frost. When the trees are in bloom, it is also necessary to continue covering them, till after the fruit is swelling, as the young shoots are easily injured, and on their preservation the main health of the tree depends. I have been particular on this subject, because it is one that has not had that attention paid to it which it deserves. It is no uncommon complaint to hear of the premature decay of Peach and Nectarine trees in the open air; whereas if covering at nights in the spring had been practised, the trees might have continued healthy and borne good crops.—*J. Brown, Gardener to Lord Southampton, Whittlebury Lodge.*

Shrubberies.—I agree with the article on the shrubbery in p. 763 (1841), that the leaves of the trees, after they have become useless to the branches, should be returned to the roots; but I differ from it in regard to the manner of returning them. I would have convenient recesses formed with groups of evergreens behind the banks or borders of the shrubberies; and if they are backed with forest-trees, eligible spots will be found for this purpose. I would never allow the leaves to accumulate in great quantities in the autumn, but would have them raked from time to time from the borders, walks, and lawns, and laid up in the recesses along with the prunings of the shrubs, &c. The thick branches of the latter I would burn, and mix up the ashes with the leaves and spray, adding a quantity of hot lime, and have the mass turned over two or three times before using. Once in two or three years I would give the shrubbery borders a good top-dressing with the decomposed leaves from the recesses; and if a quantity of road-scrapings or any other stiff compost could be added, it would be better. I do not like the practice of digging among shrubs, excepting a few years after planting. When digging in leaves, it is often requisite to make large holes to get them buried, and whenever the leaves rot the ground falls in, leaving an uneven surface; and besides, the roots of the shrubs are apt to be injured. The nearer the surface the roots of any plant can be kept, the better; and the leaf-mould when laid on the surface without being dug in will have a tendency to draw the roots to the surface, and to increase their number at the same time. The top-dressing should be put on in the beginning of winter, and it will both protect the roots from frost and give the mould time to consolidate before the dry weather sets in. If the borders are hoed and raked two or three times during summer, it will be sufficient to keep them clear of weeds; but instead of keeping the borders hoed and raked, I think a better method, and one more pleasing to the eye, would be to have the shrubs well thinned out a few years after planting, and the borders or banks sown with grass, which must afterwards be kept short and clean by mowing and sweeping. The top-dressing could be laid on, nevertheless, but it would require to be better decomposed and riddled, and perhaps put on thinner and more frequently. When the banks or borders of a shrubbery are of considerable breadth and of little elevation above the walk, it often happens, although the shrubs are regularly thinned out, and standing in quincunx order, that some of the fine specimens in the rear become worse than a jewel in a casket, on account of the shrub or shrubs in front overtopping them. The jewel in the casket can be exposed to view at pleasure, but the fine specimen in the rear of the shrubbery can be exhibited from the walk, only at the expense of transplanting to a more exposed situation, or that of heading down those in front of it. To remedy this evil, I would have the shrubs planted in wavy groups along the banks or borders, and arranged in tribes so far as practicable, each tribe or genus to form a group of itself; or if the genus only contains two or three species fit for the shrubbery, I would fill up the group with two or three genera. Herbaceous plants being in my idea unfit for the shrubbery, I would never have them introduced; but a few patches of any bulbous plant, such as Snowdrops, Crocuses, and Narcissus pumilus and minor, may be planted with good effect among the grass in the open spaces. The annexed figure represents a border or shrubbery bank from 20 to 25 yards wide, with a winding walk, 1, in front; 2 may be a group of Phillyreas, the dwarfest being next the walk, and the tallest behind the rest; 3, a group containing Ligustrum lúcidum, L. vulgare, and their varieties; 4, a group of Ilex aquifólium; 5, Syringa vulgaris, chinensis, and pérsica, with their varieties; 6, Catalpa syringifólia, Ornus europæus, O. rotundifólia, Elagnus angustifólia, E. argéntea, and Cephalanthus occidentalis; 7, different sorts of Rhamnus, Euónymus, Lonicera, and Caprifólium; 8, a detached clump of hardy Azaleas; 9, Viburnum tinus, V. lúcidum, V. opulus, and their varieties; 10, a detached plant of Ribes sanguíneum; 11, different sorts of hardy Heaths; 12, Laurus nóbilis, L. undulata, L. salicifólia, with the different sorts of Kálmias in front; 13, Daphnes, Rhododendrons, and Ledums. The hardy species and varieties of Prunus, Pyrus, Amygdalus, Cratægus, Cydónia, and Spiræa, will form a fine group with a detached clump of Roses between them and the walk. The different sorts of Juníperus, Taxus, and Ephedra, will form another natural group. Nos. 14 are blank spaces in grass, with occasional ornamental shrubs standing singly, and occasional patches of the bulbs formerly mentioned. If the other side of the



walk be planted with shrubs, they may be arranged in like manner with groups of other species and varieties; but if it is only a narrow strip of lawn between the walk and the park, there may be a few tree Roses planted singly, ornamental shrubs, or small patches of dwarf Roses, Heaths, dwarf Rhododendrons, and Scarlet Pelargoniums. When plants in a shrubbery are arranged in this manner, there should be several plants of each species or variety placed together; the number to be proportioned according to the extent of the shrubbery: and some Bays, as nurses, interspersed throughout the whole. These may be headed down and taken out at the final thinning, and planted as underwood among the forest-trees behind the shrubbery; a considerable breadth of which, with such underwood, will benefit the shrubbery by sheltering it. A shrubbery of half a mile or a mile in length, comprising all or most of the hardy ornamental shrubs introduced into Britain, and planted in wavy groups, would form a scene at once striking and amusing, and which would be greatly heightened by the extent of surface exposed to the eye by the undulations; and by having the shrubs grouped in tribes, new objects would be seen at every step.—*J. D., B. D. G.*

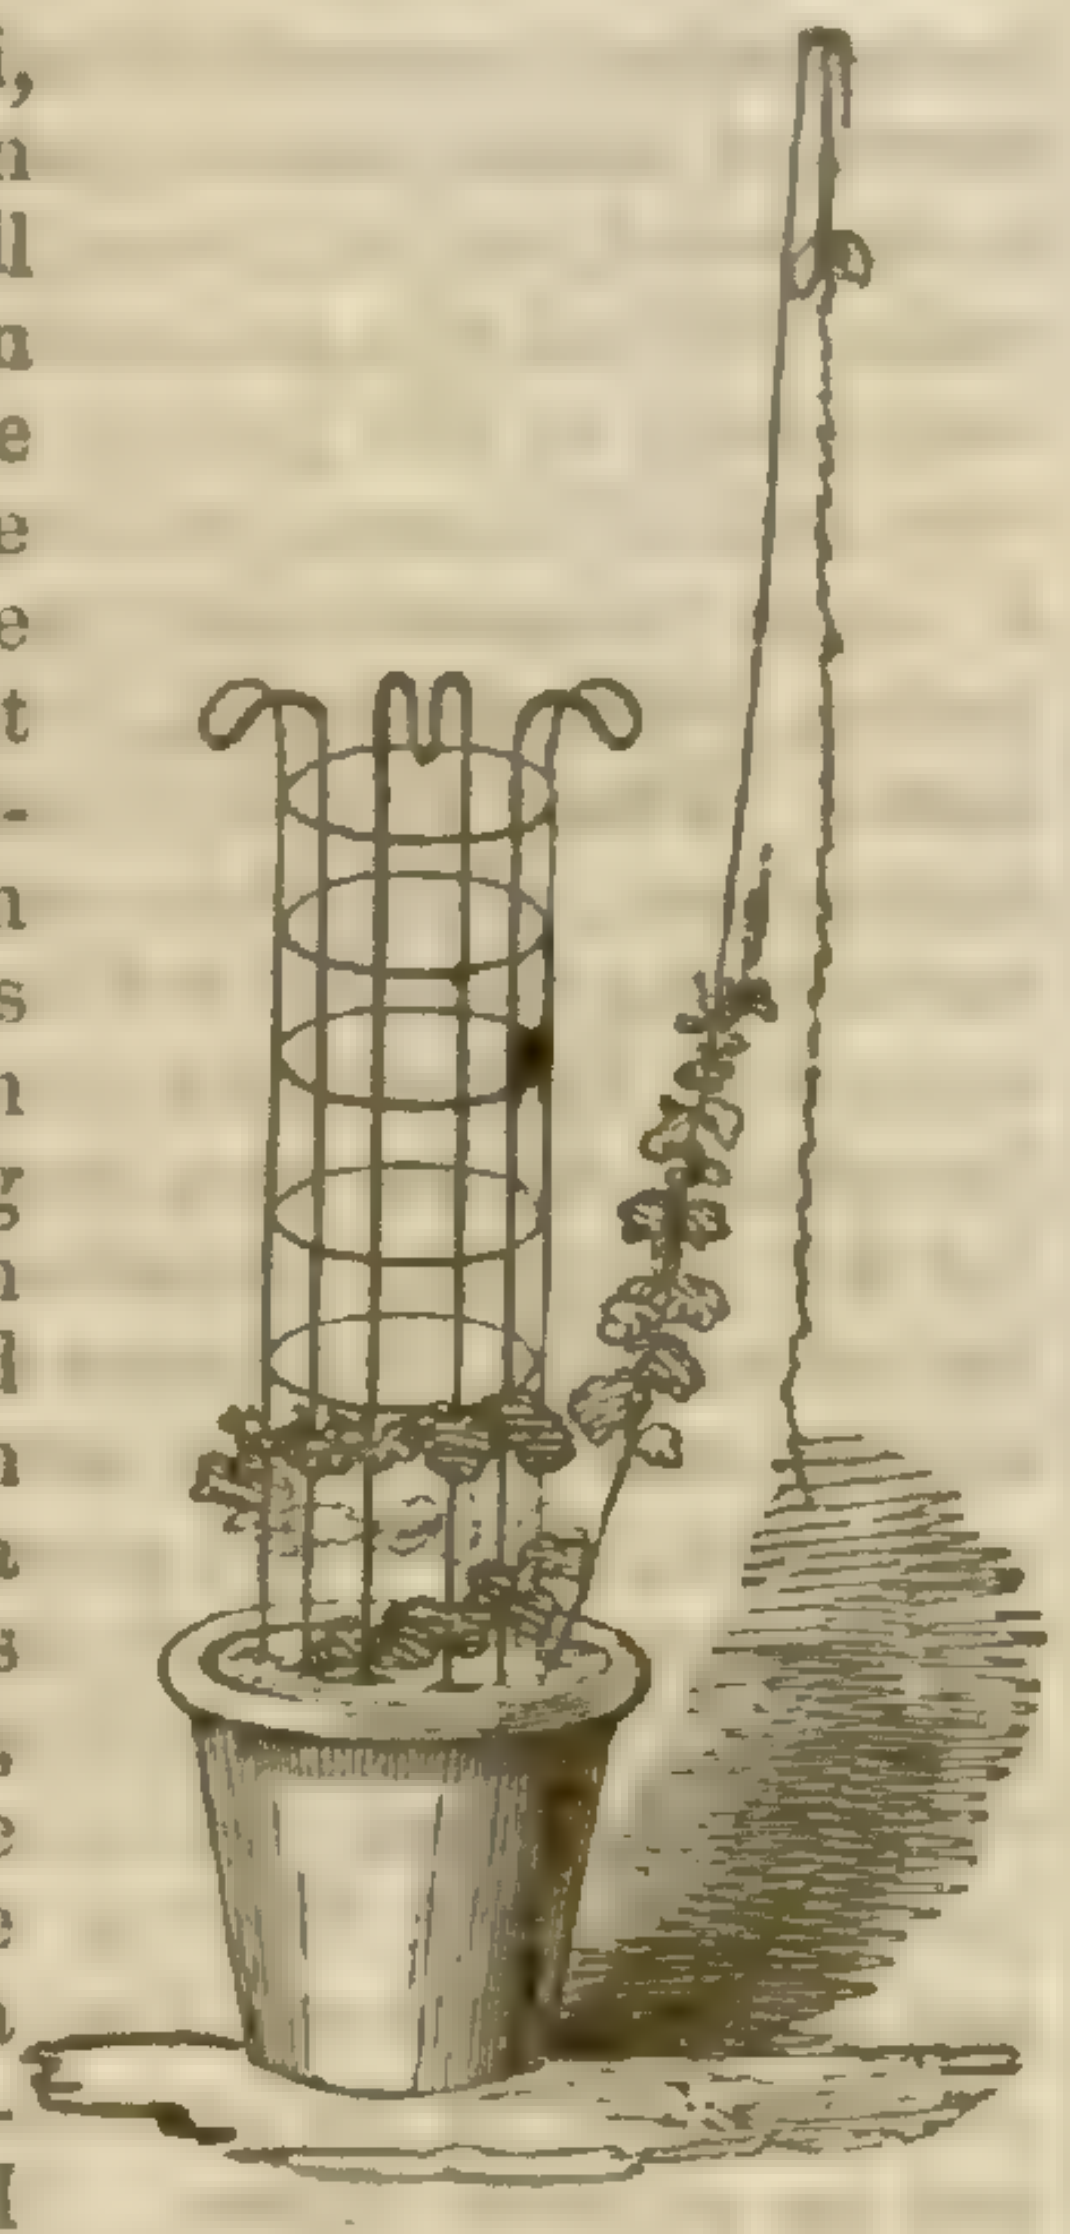
Prizes for Seedling Florists' Flowers.—*W. C.*, of Cork, recommends that under the direction of the Floricultural Society, members and others should subscribe a sum amounting to the value of the seedling, including the stock to which a prize was awarded, and that the raiser, who gained the prize, should deliver the entire stock to the Society. The stock should then be raffled or drawn for by the subscribers, in the same way as is done with pictures by the Art Unions. *W. C.* believes that this method would insure a prize to the best flower, as the decision would be made by those who would have a chance of winning the stock. Suppose 100*l.* to have been subscribed for Pelargoniums, a twelvemonth previously to showing, what a stimulus it would give to the growers! The amount might be increased by each competitor paying entrance money, and this might produce enough for a prize for the second-best seedling.

Viviparous Orange.—On opening an Orange which had hung on a tree in a vinery for the last eighteen months, several of the seeds were found to have germinated. The radicle of one had grown about one inch and a half, and taken firm hold of the spongy tissue lining the rind; whilst its plumule was two inches long, of a beautiful green colour. The rind of the Orange was quite perfect, and to the naked eye no crevice was perceptible through which light could penetrate. The Orange was thirteen inches in circumference. Whence its green colour, and why should the plumule be green and the radicle of its usual yellowish white colour, both being in the same circumstances with regard to light?—*William Barron, Holker Hall Gardens.*

To Raise an Early Crop of Peas.—The following plan I adopt for raising early Peas to insure a good crop to precede that sown in November. In the last week of January I make a hotbed about two feet high of leaves and cow-dung, on which I place a frame, and when the heat has declined to 50° or 55°, I cover the bed with an inch of light mould; I then cut some turf in strips of three inches in width, the length depending on the width of the frame; I prefer two lengths, as being more convenient to move the Peas with when grown. I lay the pieces of turf in the frame, grass downwards, close together; I then make in the centre of each piece of turf, by pressing it with the edge of a board, a drill, in which I sow the Peas, and afterwards cover them over with three inches of earth; I then place the lights on, leaving them open a quarter of an inch to allow the damp to pass off. The Peas soon come up, and then I take the lights entirely off in the daytime, unless very cold, and shut them down at night. I keep them close in the beginning of March, and have Peas healthier and finer than those sown in the hothouse in pots; they also produce a greater crop, and are hardier. When the Peas are to be planted in the border, I lift the box entirely off, and take the strips of turf, in which the Peas will be well rooted, and place them on a hand-barrow, and take them to the border for planting; which I do in a drill cut so deep that they shall be about an inch lower than they were in the box. It may be necessary to protect them from frost and cold winds at first, and this may be done by putting some short sticks along the rows and laying some long litter or cuttings of evergreens over them.—*J. Jones, Gardener, C. Baldwin, Esq.'s, Grove Hill, Camberwell.*

Culture of Figs under Glass.—Your correspondent *Ficus* is desirous of profiting by the experience of others in the cultivation of the Fig. I have tried them by four modes—one against the back wall of a vinery, planted in a prepared border, with Vines trained to the rafters; they grew vigorously, but scarcely ripened a fig; I tried to confine the roots, but had no better success; on the back wall of a pinery, similarly treated, they succeeded not much better. But in large pots, placed up the front flue of the pinery, having only glass above, and at the end of a greenhouse, in a raised border against the fire-end of the flue, they produced abundance of fruit and of the most luscious description; they entirely lost their nature of being deciduous, and generally had fruit in three stages of growth upon them. I ceased to grow them, from the few persons I could find who liked Figs; the kind was a small white Fig; all others cast their fruit except just in the summer, the above kind never.—*Flora.*

Climbing Plants.—The way I train these plants has a good effect with little trouble; their rambling habits prevent many persons from growing them. I have a wire trellis, about five feet high, firmly fixed in the pot with a string close to the side of the plant, the other end fastened to the top of the house; I first train the plant up the string, and as soon as it has grown to the top, begin to coil it altogether round the trellis, and so go on till the flower-buds show themselves; as soon as this is the case, the plant is arranged so as to cover the trellis, and the additional growth is easily kept in a neat state. They are most ornamental—the sketch may, perhaps, make me more intelligible.



Ipomœa insignis and Sellowii, after flowering, I cut down and keep in a warm cellar till wanted in the spring; this plan succeeded admirably with me last year. I have a few of the Orchidaceæ (would that the great price did not prevent me from increasing the number!)—when I repotted them last, with some I used pieces of charcoal instead of broken pots or crocks for draining them, and am quite certain they are much stronger, and of a darker, richer green than those not so treated. Sollya heterophylla and some others I have planted in large pots, which, in the summer, are sunk in the garden; in the winter, in the border of a greenhouse; the roots protrude through the hole, and at every removal are considerably shortened. I do not find the plants at all injured by this treatment, and my specimen is now many feet high, covered with its pretty blue bells. I occasionally give fresh soil to the top of the pot with liquid manure.—*X. H. X., Leicester.*

The Orange.—Can your correspondent *C. A. F. A., E. H.*, in p. 5, tell me by what other name the Citrus Aurantíum, called "Pomme d'Adam," is recognised? I have an Orange from Italy under this name, as well as one under the name Bigaradier, intended, no doubt, for the C. Bigaradia, or Bitter Orange. This last has remained with me entirely leafless until now, though certainly alive; verifying, so far, a curious article on the torpidity of the Orange in your former pages.—*J. Murray.*

Preservation of Seeds.—To preserve seeds intact from moisture, or being affected by surrounding damp, and by which they are so soon decomposed and destroyed, seems a desideratum. Now, the seed of the Lycopodium clavatum, called "Lycopodium powder," will effect the purpose, if the seeds be rolled in it, or it be rubbed upon them. Let the Lycopodium be applied to the hand, or dusted over any substance, and either may be immersed in water without being wet. In the case of seeds sent abroad, or imported from a tropical or other clime, though they must be preserved from damp, they should also be excluded from atmospheric influence, by being hermetically sealed, and, at the same time, insulated in reference to the mutations of electricity and temperature, which last may be easily effected by the judicious application of nonconducting materials.—*J. Murray.*—[We must beg to observe that these opinions are very different from our own. See *Gardeners' Chronicle*, pp. 715, 731, (1841.)]

Railroad Embankments.—The recent slip of the embankment on the Great Western Railway might have been prevented by studding the embankment thickly over with cuttings of the Balsam Poplar. The penetrating and ramifying roots would have formed a compact and firm mass—in fact, a complete "saule-en-herbe;" rains would have had no impression on the mass. The impracticability of any successful attempt at forming a canal across the Isthmus of Suez, from the loose and moving sand, must be obvious, as well as in the case of thus connecting the Nile and the Red Sea. I think it was Sir Sydney Smith who proposed to plant there lines of Acacias, by the matted roots of which the embankments of the canal would remain compact, and not crumble down to fill up the bed of the canal. This interesting suggestion, if acted on, would render canals and even railroads practicable in the Desert itself.—*J. Murray.*

An old Welchwoman's Cure for a Scald.—Take thin green turf, sufficient to cover the place scalded; lay the green part on, without removing any of the cloths; there let it remain for two hours, and the scald will be cured. I have proved this in my own family and on others several times, even on those scalded with boiling water out of the furnace.—*R. Arnott.*

Thunbergia aurantiaca.—Thunbergia aurantiaca appears to be much hardier than Leucantha or alata, as it continues to flower much later; and even at this time, in a cool greenhouse, after it is cut down the lateral shoots continue growing.—*G. G. Watson.*

Gesnera Elongata.—In p. 21, there is a paragraph by C. D., who says that Gesnera elongata succeeds better with greenhouse treatment than with that of a stove. I differ a little from him, as I consider 55°, which he says the plants in bloom are in at the present time, quite sufficient for the stove plants during autumn and winter. Gesnera elongata will stand out of doors during the summer months, but it will make little progress in growth; and if it is brought into the greenhouse early in the autumn, when the temperature varies from 50° to 55°, it will soon become a pretty object. I think this the most desirable of the Gesneras, for its shrubby habit, and for the length of time it flowers, and that happening at a season when little else is seen. I have hardened off young plants, to prepare them for the open air during summer, as well as for the greenhouse; but none of them have succeeded so well as those that were regularly kept in the stove, where the temperature in winter ranges from 50° to 55°. I have now in the stove a plant growing in a tub; it is four feet high, and about five and a half in diameter, and loaded with clusters of bright scarlet blooms. It commenced flowering in September, and has every appearance of lasting much longer. This plant has always received stove treatment, and it is two years and a half old. After flowering, it is cut back pretty close. A neighbour of mine, a short time since, told me he grew and flowered Euphórbia splendens, Brónnii, and Jacquiniflora, in a greenhouse. I did not see the plants, but I was inclined to doubt the fact; and I afterwards learned that his greenhouse was used during autumn and winter for forcing flowers, and he grew a few other stove-plants with tolerable success.—*S. Barnes, Gardener to J. B. Hankey, Esq. Fetcham Park, Surrey.*

Nitrate of Soda.—About the middle of April advantage was taken of the wet weather, and nitrate of soda was applied at the rate of one cwt. per acre on a grass field intended for hay the ensuing summer. The effect of this application was an abundant crop of grass, and still further to test the nutritious quality of the nitrate another experiment was tried in the beginning of July. The two bags which contained the nitrate of soda had a quantity crystallised on their insides, they were put into a cask containing about 20 gallons of water and washed clean. The solution was applied on several parts of the field, and in a fortnight or three weeks those parts were easily distinguishable, from the grass being of a dark green colour, and nearly as long again as in the other part of the field, where it had become rather yellow than otherwise. I think from this farmers would do well to give nitrate of soda a fair trial, on grass-land particularly.—*G. G. Watson.*

Genus Citrus.—I assure "C. A. F. A., E. H." in p. 5, that the only fault I find with him is that he has not told us his 'whereabout;' as, decidedly, if he would oblige your readers, or me privately, with his address, I should (*Deo volente*) make a pilgrimage to his Orangery when the cuckoo and swallow bring back to us the smiles of summer, and so become the happy witness of his successful culture of the genus Citrus. The names in error which he cites were put down simply from the nomenclature given me by Signore Mottaro, from whose nursery at Nervi I selected all the plants enumerated, and by which names alone orders can be successfully given by parties who write for plants. As for "C. A. F. A., E. H.'s" remark that the Citrus bigarádia myrtifólia is not adapted to terraces, I must still differ from his opinion, having witnessed so much successful application of that sort to such a purpose in Italy. And again also, when he says, that "the genus Citrus is greatly injured by the perverse habit of putting it out of doors during summer," I think with submission I can put a decided negative by proof on that matter, by quoting the splendid plants of a worthy Baronet's, near Cobham in Surrey, whose Orange-trees always dignify and adorn the mowed lawn by their noble, healthy, and inviting appearance all summer long—(Sir R. Frederick.) The difference arises from the different mode of wintering the tree. If wintered, as in France and Italy, in opaque, dry, and well-aired houses, and kept from excitement all winter by not having a particle of fire given them, they will rejoice in after liberty in the open air, and thrive. If wintered in well-glazed light-houses and secured from frost by fire, the tree ought never to breathe air but through the sashes. I would that "C. A. F. A., E. H." would try this treatment on a few trees, and I have no doubt that he would conclude opinions by an "ergo cadunt quæstio et argumentum" on my side of the business.—*W. Mason, Necton Hall.*

Lost Cherry.—Hitt, in his work on fruit-trees, mentions a Cherry that he found near Sleaford, in Lincolnshire, called the Baramdam, as growing wild and producing good fruit, but a dwarf tree, and bearing well on moist spongy soil; and he found it a good stock for the Duke Cherry, which, when grafted thereon, was freer from blight than those grafted on the Wild Cherry.—*Totty.* [Endeavours to find this Cherry in latter times have been unsuccessful. What *Totty* adds we shall address to our readers:—"Is anything known of this variety? It seems valuable, both as a fruit-tree bearing where other Cherries do not, and as a dwarfing stock."]

Assam Tea.—"Palmam, qui meruit, ferat."—Certain subjects connected with the Tea-plant of Assam having been lately much agitated here, and the decision of the last meeting of the Agricultural Society of India being in some measure opposed to that which had so triumphantly been carried at a previous meeting in favour of Capt. Charlton, I am induced to address you, as the editor of a widely-circulated journal, and as one "having authority," in the hopes that the English public may generally become acquainted with the true state of the case. It having been found that the Tea cultivation in Assam promises a good deal of success, the merits of the person who first established "beyond doubt" that it existed in Assam, and who, consequently, was the pure "fons et origo" of the extensive cultivation now carried on in that province, have become proportionately increased; so that though in the infancy of the experiment there was only one candidate, Captain (then Lieut.) Charlton, in the supposed present state of maturity of the scheme there have been no less than three, and there are now two. You will have been aware of the fact, that although Dr. Wallich has attributed the merits to three different persons, at three different times, yet the unanimous voice of society at large, and a large majority of his own Society, "the Agricultural of India," has decided, that to Captain Charlton is due the entire merit of having determined, and given the means of determination to others, that the Tea-plant of China exists in Assam; and for this the Agricultural Society has granted, by a large majority, a gold medal to Captain Charlton. But though it was impossible to overthrow, means have been taken to weaken the claims of Captain Charlton. Although he has been established as the first establisher of the fact, he may have had a coadjutor. Upon this point the whole ingenuity of Dr. Wallich's party, the whole weight of the president, the entire activity of the secretary have been concentrated, and they have fixed upon a coadjutor, and they have given him a medal by a majority of one. In Dr. Wallich's announcement of the glorious discovery that the Tea-plant was indigenous to Assam, he attributes the merit to Captain Jenkins and Lieut. Charlton; and the coadjutor to whom they have awarded the medal is Capt. Jenkins. But it is to be remembered that the annexation of Captain Jenkins's name to that of Lieut. Charlton, in the letter of the Tea-committee to Government, Dec. 1834, was a mere matter of form, due to his high place as Commissioner of the Province. And if we examine the relative situations of these two officers, the last grant of the Society will be found to be indiscriminate—to be merely the grant of a party; for Capt. Jenkins, as Commissioner, presides over the prosperity of the province; he is bound to develop its resources with the utmost zeal and perseverance, and to the best of his ability and judgment. He does so; but, nevertheless, without detraction, it may be said, that it is a matter of duty. When Lieut. Charlton settled the point, when he persuaded even Dr. Wallich, he was second in command of the Assam Light Infantry Battalion; it did not enter into his duty to pay attention to, or to go to any expense in developing the resources of the country; he received no instructions, oral or written, to do so; and yet he did so, because he would not limit his sphere of usefulness within the narrow circle of official duty; because he has a natural turn for such inquiries; and because he was determined to prove the truth of his information in 1831, that the Tea-plant did exist in Assam; and that the plants he sent to Dr. John Tytler of Calcutta, in February 1832, were genuine Tea-plants. In January 1835, the Tea-committee write thus to Government:—"We have at length obtained the fruit of the Sudddya plant from Lieutenant Charlton, and we are now enabled to state, with certainty, that not only is it a genuine Tea, but that no doubt can be entertained of its being the identical Tea of China," &c. They received these doubt-removing seeds through Capt. Jenkins, the official organ of communication. Lieutenant Charlton achieved the victory—Captain Jenkins bore the despatches. I confidently anticipate, that, by all right-thinking persons, the setting up of a coadjutor will not be considered as in any way subtracting from the indivisible rights of Capt. Charlton; and, for the satisfaction of all the rest, I hope, as a friend and admirer of Captain Jenkins, that he will decline the award, which a majority of one so evidently shows to be a matter of party. It may be repeated, that to Captain Charlton belongs the merit of having solved a doubtful point of great importance; and that by so doing, he called into existence, in Assam, a novel and most important branch of cultivation. And it may be added, with equal truth, that he was the first who made a nursery of Assam Tea-plants, and that he was the first who manufactured drinkable tea from Assam Tea-plants. In every sense the merit appears to be his, and I am sure that, in a question of national importance, the generous public of England will not allow it to be weakened by addition; because Captain Charlton was severely wounded in the execution of his military duty, and was, consequently, obliged to quit Assam when his services to the deputation might have been most valuable. For it was during his long absence that those statements were made, which, it was feared by Captain Charlton's friends, would succeed in depriving him of all merit, and which has, perhaps, partly succeeded in detracting from it.—*William Griffith*, *Serampore*, *Nov.* 13, 1841.

Grafting Wax.—A good composition for grafting wax, as described by David Powell, Esq., in the Transactions of the Horticultural Society, consists of four proportions by weight of pitch, four of resin, two of bees' wax, one of hogs' lard, and one of turpentine, melted and well mixed. When this, or some similar composition, is spread on brown paper, it forms grafting paper, as it is sometimes termed. Being cut into slips, it can be easily applied by the amateur; but practical gardeners and nurserymen generally prefer using grafting clay—and they are right, unless it can be proved that shoots thrive best when encased with adhesive substances totally preventing transpiration. Earthy substances may be applied to the bark of trees for a considerable time, without bad effects being manifested on the removal of such substances; but when closely sealed up, the bark is apt to canker on exposure to air and moisture.—*R. T.*

PROCEEDINGS OF SOCIETIES.

AGRICULTURAL SOCIETY.

Jan. 19.—T. R. Barker, Esq., in the chair. Thirteen gentlemen were elected. Major Moor, F.R.S., of Bealings, near Woodbridge, called the attention of the Council to the desirableness of some cheap and efficient mode being made known for the conversion of Barley, and other meal of cheap grain, into a substitute for the present expensive oil-cake for cattle; Mr. R. W. Baker, of Cottesmore, communicated the results of his experiments on the growth of Turnips, tried on the model plan, proposed by the Society; Mr. Walker, of Newbury, transmitted his remarks on economy in manures; and Mr. C. H. Newman, of Court Farm, near Hayes, communicated a paper on the results obtained by him in the adoption of the system of sub-soil drainage he employed to so great an extent and with so much advantage on his farm; all of which communications were referred to the Journal Committee. Mr. E. David, of Raydyr Court, Glamorgan, informed the Society of the establishment of a Farmers' Club at Cardiff; and Mr. Sheppard, of the Commercial-road, Lambeth, presented a sample of new red spring Wheat from Spain, the merits of which Mr. Gibbs undertook, at the request of the Council, to test by proper cultivation.

FLORICULTURAL SOCIETY.

In our last report, p. 55, we accidentally omitted to state that the Secretary read the following rule, which had been proposed at the general Meeting on Jan. 13th. "That no seedling sent for the opinion of the Society be received, unless accompanied by the grower's name and residence, the year when raised, and the name intended to be given to the flower, in order that its identity may be preserved, and a complete record made in the books of the Society." It was unanimously adopted.

MISCELLANEOUS.

On Making Cider.—The following paper, on making Cider, written by Mr. Pritchard, for the Ross Farmers' Club, has appeared in the *Hereford Journal.* "The production of good cider must depend upon the description of fruit of which it is made, the season and state of the Apples when they are crushed, and the management of the juice whilst it is fermenting. It will therefore be proper to consider the subject under these three heads separately:—*The kind of Apple which makes the best Cider*: The acid which gives the peculiar quick and sharp feeling upon the palate in good cider having been first noticed in the Apple, although it exists in many other fruits, has been termed the malic acid. It may not be too much to say, that it is the due combination of this acid with saccharine matter; namely, the sugar of the Apple properly fermented, which are the objects to be aimed at in the manufacture of cider. On the selection of the fruit will depend the proportion of malic acid contained in the liquor. The Crab has a much greater quantity of this acid than the cultivated fruit; and generally speaking, in proportion as we obtain sweetness by culture, we deprive the Apple of its malic acid. Hence it follows that some delicious table fruits will not make good cider; this rule, however, is not invariable, as the Golden Pippin, and some other fine Apples, appear to contain the proper admixture of acid and sweetness which is desirable in the liquor. Mr. Knight recommends that the different sorts of fruit be kept separate, and considers that only those Apples which are yellow or mixed with red make good cider; and that the fruit of which the flesh or rind is green, are very inferior. He recommends that the Apples should be perfectly ripe, even mellow, but never decayed, before they are crushed. There was a curious manuscript written by Dr. John Beale, a Fellow of the Royal Society, in 1657, upon the subject, from which the following are extracts: 'Crabs and wild Pears, such as grow in the wildest and barren clifts, and on hills, make the richest, strongest, the most pleasant, and lasting wines that England yet yields or is ever likely to yield. I have so well proved it already by so many hundred experiments in Herefordshire, that wise men tell me that these parts of England are some hundred thousand pounds sterling the better for the knowledge of it.' He mentions of these kinds of austere fruit the Bromsbury Crab, the Barland Pear; and intimates, 'that though the discovery of them was then but lately made, yet they had gotten a great reputation.' He adds, 'the soft Crab and white or red Horse Pear excel them and all others known or spoken of in other countries.' Of the red Horse Pear of Felton or Longland, he says, 'that it has a pleasant masculine rigour, especially in dry grounds, and has a peculiar property to overcome all blasts.' Of the quality of the fruit he observes, 'such is the effect which the austerity has on the mouth on tasting the liquor, that the rustics declare it is as if the roof were filed away; and that neither man nor beast care to touch one of these Pears, though ever so ripe.' Of the Pear called Imny-winter Pear, which grows about Rosse, in that county, he observes, 'that it is of no use but for cider; that if a thief steal it, he would incur a speedy vengeance, it being a furious purger; but being joined with well-chosen Crabs, and reserved to a due maturity, becomes richer than good French wine; but if drank before the time, it stupifies the roof of the mouth, assaults the brain, and purges more violently than a Galenist.' Of the quality of the liquor, he says, 'according as it is managed, it proves strong Rhenish, Barrack—yea, pleasant Canary, sugared of itself, or as rough as the fiercest Greek wine—opening or binding, holding one, two three, or more years, so that no mortal can yet say at what age it is past the best. This we can say, that we have kept it until it burns as quickly as sack, draws the flame like naphtha, and fires the stomach like aqua vitæ.' Thus there appears a great difference between the opinions of the two men, who probably paid more attention to the subject than any other; and the question naturally arises, is the cider and perry of the county as good, or better than they used to be, after greater attention having been paid to the orchards? I am decidedly of opinion that they are inferior; and it was this impression which caused me to venture to call your attention to the subject. If such be the case, it is a great object to ascertain what has caused the deterioration in the liquor. I believe that it is for want of a due proportion of the peculiar acid which is found in the greatest quantity in the wild fruit, and beg to suggest whether it would not be worth while to try back, and mix a certain quantity of Crabs with the fruit before it is crushed. We have many of us tasted and all heard of the Stire and Hagloe Crab cider, both of which were so celebrated for their rich quality; and these fruits differed little from wild Apples. It is known that the juice of Crabs, if kept long enough, will make excellent vinegar: every housewife knows, that however sour the liquor may be at first, it will not answer for pickling; but that if kept a sufficient time, there is no better for the purpose. It cannot be supposed that one acid is changed into another without passing through an intermediate stage, and this must be the malic acid having been converted into sugar, which it appears in the ripening of fruit it has a natural tendency to do. The object in making cider of such fruit is to prevent the sugar when formed passing on to the acetous fermentation. A singular circumstance occurred at Baysham: a hogshead was filled with crab-juice, intending to keep it till it became vinegar; but the cask was tapped by mistake, and supposed to be cider until it was all drunk, which in fact it was. Crab-juice ferments much more slowly than the juice of the Apple, probably owing to there not being enough sugar already formed in the liquor; but I am of opinion that if some of the heading from a cask of cider in a state of fermentation were added to the Crab juice, it would ferment as readily and clear itself as soon as the juice of the Apple. Owing to the slowness of its fermentation, it takes a great deal of time to convert the juice of Crabs into vinegar: but it is found that if, after crushing them, the juice is put into a cask for some days till it heats considerably, and that if the liquor afterwards be ground with this must and pressed again, it will pass into vinegar immediately. I therefore strongly recommend a mixture of the most austere and hardiest Apples which can be procured with the soft and mellow fruit before it is crushed. *The best time of the year for making Cider*: It has been before observed, that Mr. Knight recommends the fruit to be perfectly ripe, even mellow, before it is crushed; and this can only happen late in the autumn. As it is known to be more difficult to manage the fermentation of the liquor in warm weather, it is usual to defer making cider till November and December; if, however, the liquor can be put into a cold cellar after the first fermentation is over, I am of opinion that it might be commenced earlier. The juice of unripe fruit ferments more quickly than of that which is ripe, and contains more malic acid. Where there is the convenience of a good underground cellar, the difference of temperature between that and the outward air is greater in moderately warm weather than in November; so that, if the liquor were fermented under sheds, as Mr. Knight recommends (and his instructions as to the management of the cider whilst fermenting are excellent), and as soon as fine removed into the cold cellar, the change of temperature would be greater at the end of September than in November, and this would probably tend greatly to prevent the liquor fermenting again. If the new cider cannot be removed from the warmth of the atmosphere, there can be no question that it is better to defer the making till the weather becomes cool. *Fermentation of the Juice*: The researches of scientific men, although very elaborate, have done very little in throwing light upon the nature of fermentation; it appears to partake in a measure of the vital principle, of the phenomena attending which we know nothing. Many curious and interesting facts have been discovered during the investigation, but none of which appear likely to be of much use in the making of cider. There are three kinds of fermentation—or rather, there are some products which pass regularly through three stages of fermentation, viz. the vinous, the acetous, and the putrescent. Other substances pass at once to one or other of the latter stages; gum and water turning to vinegar without forming any spirit, and meat at once putrifying. It is not desirable that the vinous fermentation should be complete in the manufacture of cider, in which case all the sugar of the Apple would be converted into spirit; this never does happen without a portion of vinegar being also formed, the acetous fermentation going on jointly with the vinous; as when cider frets a great deal, it may be very strong, but is comparatively of little value, having lost all its richness and become sour. The vinous fermentation stops naturally before it has run its course, and it is the object of the maker to avail himself of this property in the liquor, and to endeavour to prevent any secondary fermentation taking place; the number of schemes which have been suggested to prevent which, showing that it is the most important point to be attended to in the manufacture of good cider. I am of opinion that the 100-gallon cask is much better than larger, and that the liquor is not only more easily managed, but more likely to be good; it may be that cider in large casks becomes stronger, but not so frequently rich, as in single hogsheads. Although it may not be apparent, fermentation commences as soon as the juice is expressed from the fruit; and the sooner the cask is filled and allowed to remain quiet, the more regular and certain will be the process. What should we think of a brewer who, whilst his beer was working, brewed another quantity, and added the raw wort to the first? Yet this is constantly done in filling a large cask with cider; or even worse, for the Apple-juice is added cold, whereas the wort might be mixed with the beer whilst warm. It would be greatly better to keep the liquor in open tubs till enough be obtained to fill the cask, and then put it together at once. If I may be allowed to suggest an experiment, there is one use to which I should be very glad to see a large cask applied; that is, to fill it partly with *fresh* must, and the remainder with boiling water; the probable result would be a very pleasant and useful liquor. Temperature has much to do with fermentation; and it would be of advantage to have two cellars, one much colder than the other. If the liquor, upon pitching fine, were racked into a clean cask, and put into a cold cellar, there would be much less risk of its fermenting again. I should recommend no other liquor to be added to it; but in order to prevent ullage, that it should be racked into a smaller cask: the less air admitted the better: and if the cask be sound and iron-bound, it may be better to close it altogether at this time. The application of cold will check fermentation immediately. I have seen liquor in a state of froth boiling out of a large jar suddenly reduced to a state of quiescence by pumping upon the side of the jar. This fact induced me to cause an experiment to be tried at Gayton during a very bad season for cider-making, the weather being very warm: a cask of juice was rolled from the mill into a brook of cold water, and sunk by stones attached to it; it remained in that position till nearly Christmas, and was so much better than any other made there that year, that Mr. Newman obtained double the price for that hogshead he did for any of the rest. Perfect stillness is very desirable, as motion is found to excite the acetous fermentation. A bottle of wine attached to the sail of a windmill in motion was, after three days, converted into vinegar, although closely corked. When a second fermentation does take place in cider, there is very little hope of its being rich and good. In such case I should recommend its being drawn out into tubs, exposed to the cold as much as possible; and after being thus flattened, put back into the cask, at the same time well stirring up the whites of fifteen or twenty eggs previously mixed up with a portion of the liquor; if this succeeds in fining it, which probably it will, it may then be racked into a clean cask, and closed as much as possible from the air. It is probable that a great deal of mischief is caused by some principle of fermentation remaining in the cask; this might be prevented by well scalding before the casks are filled; or what I think would be better, by washing out the casks with clear lime-water: one large piece of lime put into a hogshead of water, and allowed to settle, would answer the purpose. Some brimstone matches burned in the cask would have a great tendency to prevent fermentation. I shall not say much upon the mode of crushing the Apples and pressing out the juice, having had so little practical experience; but I have always thought that if the fruit were crushed between wooden rollers, and allowed to drain before being put under the stone, the process would be much expedited, as the Apples sometimes roll before the stone a long time before they are broken. In Ireland they use a press formed by a lever, which might be made at less expense than with a screw, and be more quickly worked. It is impossible the pressure can be too light at first, and it should be increased gradually as the liquor runs from the must. Two sets of bags, allowing one to drain for some time without pressure, would be an undoubted advantage."

GARDEN MEMORANDA.

Chandler's Nursery, Vauxhall.—In a short time the Camellias here will make a fine display: already, in addition to the old double white and the variegated, are noticed Donckelaeri in full flower. Althæiflora and Gilésii were also just opening; the latter is somewhat like the former, except that it is darker in colour, and frequently marked with white. A single flower of tricolor had just expanded; it is a rather small semi-double variety, having a white ground suffused with light pink, on which are patches of deep rose. Near it stood Epsomensis, a dark red, remarkable for its round firm petal, in which the veining is very distinct. Among other plants now in flower, were some seedling Epacrises, one of which, called impressa alba, seemed to be different from the others; it produces long spikes of good sized flowers, which at first are quite white, but when dying off change to a delicate pink. There is now in flower a seedling Rhododendron; it is dwarf and compact in habit, and the flowers are rose, changing to white at the bottom, and beautifully spotted with brown in the throat. It is quite hardy, and has flowered without being at all forced.—*Jan.* 26

Review.

The Book of the Farm. By Henry Stephens. Part I. Blackwood. 1842.

If it is possible to judge of a work by the first number, we should say that this promises to be really a useful book for young farmers. The author, Mr. Stephens, has had great experience in agricultural literature, and is, therefore, well able to judge what it is that farmers are likely to want. The work is handsomely printed, and is illustrated by excellent engravings.

When we first saw an extract from it in one of the daily papers, we were apprehensive that we should find the author attacking the modern attempts to apply science, particularly chemical science, to practical purposes; but we are glad to see, upon reading the work, itself that no such intention is apparent. On the contrary, we find him steadily and soberly advocating the application of science to agriculture, and it is only by separating particular passages from their context that a contrary design can be ascribed to him. We should say that the moderate manner in which the subject is treated is quite as likely to stimulate farmers to acquire some knowledge of science, as florid declamation, which, if it excites in the first instance, only produces an unfavourable reaction by the disappointment that must attend exaggerated expectations. But while we state this in justice to the author for the purpose of removing a prejudice to his disadvantage which we find has been created by such garbled extracts as have been alluded to, we must also in justice to chemists add, that while the importance of chemistry is fully admitted, yet the advance actually made in the practical application of that science, since the time of Davy, has not been sufficiently appreciated.

The following is the plan of the work as given by the author himself:

"The Book of the Farm is intended as a guide to those who wish to learn husbandry with the purpose of becoming *practical* farmers. Its author is of opinion, that a work having that decided object in view is yet wanting in the agricultural literature of this country; and to supply this desideratum is his aim, all his inferences having been drawn from *practical* experience. The better to accomplish this, he has divided it into three portions. In the *first*, the pupil is shown the difficulties which he has to encounter in acquiring a competent knowledge of farming as a profession, and the most easy and effectual methods of overcoming these. The *second* portion details the various kinds of farming practised in this country, and points out that which the author reckons the best for adoption under given circumstances. The operations of the recommended system are given from the beginning to the end of the agricultural year, together with instructions for the culture of the plants, and the treatment of the various animals usually found on a farm. Instructions are given for the proper practical management of the various crops, and the live stock on a farm; and reasons are stated, explanations offered, and theories suggested, in order to show that the particular recommendations given are better than any other that can be followed. Practice and theory are thus presented together; but the suggestions and narratives regarding each are studiously kept separate. The *third* and concluding portion accompanies the young farmer into the world, where it acquaints him how to look about for a proper farm for himself. The qualifications of a good one are next pointed out, and the amount of capital required to furnish and conduct it. The author having thus seen his pupil fairly established in agricultural life, takes his leave, and bids him 'good speed.' To avoid prolixity of description, numerous engravings and woodcuts of implements, and of particular practices of husbandry, have been introduced; and portraits of animals of acknowledged celebrity have been given, as without reference to figures the distinguishing points of animals cannot be satisfactorily described. The portraits of the animals, selected by the author from unexceptionable specimens of stock of their respective kinds, were painted in oil, from the life, by Mr. John Sheriff, and engravings from them executed by Mr. Thomas Landseer. The drawings of the implements of husbandry have been made by Mr. G. Slight, and the detailed descriptions of these have been furnished by Mr. J. Slight, whose knowledge of the principles and practice of the science of mechanics is now well appreciated by the agricultural interest of Scotland. In order to render the work still more acceptable by the application of the principles of chemistry and vegetable physiology, explanations of the phenomena developed in the operations of husbandry have been afforded by Dr. Madden.

CALENDAR OF OPERATIONS *for the ensuing Week.*

The breaking up of the frost will necessarily cause many out-door operations to be suspended until the ground becomes in some degree dried; consequently a good opportunity will be afforded for thoroughly cleaning the interior of [illegible] houses, or any others which may require it, as well as the [illegible], &c. connected with them. All flues should be cleared of soot, flaws carefully stopped, and the exterior well white-washed with quick-lime and sulphur. See also that tools of every kind are in proper repair, and let every preparation be made against the approaching busy season.

KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—Any plants that are swelling off their fruit would be assisted by a little manure-water; these, being kept warmer than the general stock, will require water more often, and also occasional sprinklings over their tops, in case there is no specific contrivance for filling the house with steam. If the renewed bed [illegible] maintains a steady heat not higher than 95°, the atmospheric temperature might be kept up to 70° at night. The object of this additional heat being to induce the plants to throw up their flower-stems, no more water should be given than is absolutely necessary for the support of the plants; for if moisture is supplied in proportion to the increased warmth, a new growth will be the result, and cause the [illegible] of fruit.

Vinery.—When the Vines in the early house are in blossom, they must be carefully [illegible]. If the sun should shine brightly after his long absence, the leaves will be [illegible], which, in preference to admitting a stream of cold air, it will be better to spread some temporary shading, such as a [illegible], over the glass. At this early period artificial impregnation should be resorted to. A good method of effecting this is to shake the [illegible] pollen from some free setting variety on to a sheet of paper; then, with a fine camel's-hair brush, apply it gently to the stigmas of those sorts which generally set badly, such as the Muscat of Alexandria, White Sweetwater, and Black Damascus. By going over the Vines daily, well formed bunches will be obtained, which will amply repay the little additional trouble.

Peach-house.—Upon the first appearance of aphis, let the house be well fumigated with tobacco in the evening, and next morning give the trees a good washing with the engine. Do not syringe just before smoking, as is sometimes done. As soon as the fruit is fairly set, the night temperature might be increased two or three degrees, giving air as early in the day as the weather will permit.

Cherry-house.—Where a regular succession of fruit is required, and the trees in the first house are now coming into bloom, fire heat should be applied to a second house. A particular case might occur when it would be desirable to hasten the blossoming of trees in a succession house; under such circumstances, an artificial temperature from five to ten degrees higher than that formerly recommended at a similar stage of advancement might be maintained for a time, provided the [illegible] is progressive; but it should be gradually lowered again [illegible] before the flowers open.

Figs.—Frequently syringe the leaves of those that are advancing in growth; and if the plants have not been re-potted since autumn, liquid manure should be given now and then.

Cucumbers and Melons.—Pot off seedling plants when they show one rough leaf. Let the soil be previously warmed, and light in texture, to encourage the plants to root freely. One plant in a pot is better than a greater number. By way of preventing the escape of heat from the beds or linings, it is an excellent plan to fix a thick layer of straw, in the way of thatch, against their sides.

Asparagus.—If the beds are built upon a stratum of brushwood, each will serve to force two crops, as heat may be thrown under them by linings.

Cauliflowers.—The autumn-sown stock has most likely been diminished by the ravages of slugs and bad weather; therefore a slight hotbed should now be constructed, covered with three or four inches of old Melon-soil, and sown immediately.

Onions.—Those who desire large bulbs ought now to sow the White Spanish, Brown Spanish, or the Tripoli, either in boxes or on a slight hotbed. The Tripoli is a very large mild Onion, but will not keep long.

Peas might still be sown in heat for transplanting. Where boxes are not to be got, common draining tiles will be found useful substitutes. Each should have a [illegible] straight straw laid along the bottom, both ends stopped with lumps of turf, then filled with soil, and the Peas sown in a row along the middle. In transplanting, the whole mass might be drawn out unbroken by taking hold of the projecting straws at one end.

Out-door Department.

If the continuance of the present thaw makes digging practicable, it ought not to be attempted while the ground continues saturated with wet. If not already done, immediately uncover Celery, Endive, and all other protected vegetables, or the moisture retained by the covering will in a short time effect the mischief it was designed to prevent.

Orchard.—Persevere at all favourable times in pruning and nailing of all kinds. See to stored Apples and Pears, which, owing to the excessive wetness of the last summer, do not generally keep well.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Select a few tall Cacti which have prominent flower-buds, water them, and place them at the coolest end of the house; these will blossom early. Orchidaceous plants must still be watered with great caution, as [illegible], such as [illegible] for example, are very apt to suffer from it during this dull weather. The temperature of the cool Orchidaceous house, where the species from Mexico and Guatemala are kept, ought not to exceed 55° with fire-heat.

Greenhouse.—Give air very freely now in fine, calm days, but do not expose the plants too suddenly to cold wind after their long confinement. Soft-wooded plants which are intended to be grown in pots should be shifted before they suffer from want of food. Some Camellias and Chinese Azaleas might be removed to the [illegible] or to a forcing-house, if it is wished to accelerate their flowering.

Pits and Frames.—Propagate with all diligence plants of all kinds for bedding out. Embrace every opportunity of drying the plants in these structures; during their long confinement they will most likely have suffered from damp.

Out-door Department.

As in other departments, digging had better be put off till the ground is [illegible]. In fine weather, [illegible], including Roses, may be planted; but if it is desirable to retard the flowering of any Rose trees, such should not be pruned till the buds have begun to push, and then be cut back to a dormant bud. New walks might also be formed.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Seeds of all kinds should be made ready to be sown as soon as the ground is in a fit state to receive them. Make preparations for layering, and to number [illegible].

Forest and Coppice Woods.—The late frost has presented a good opportunity to observe and mark [illegible] of the plantations that require [illegible] be set about. Continue to thin young plantations, and to fell coppice and timber trees. Proceed with planting whenever the ground is sufficiently dry.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending Jan. 27, 1842, as observed at the Horticultural Garden, Chiswick.

REPORT ON COVENT GARDEN MARKET,

For the Week ending January 29, 1842.

During the present week the supply of many articles has been short, and consequently the prices have advanced. This remark, however, applies more particularly to vegetables, as among fruits little difference exists. *Fruit.*—Pears of good quality are abundant. A few hothouse Grapes are still offered; foreign continue excellent. Apples are abundant, and among them are many samples of American New Town Pippins. Among Pears a few Passe Colmars are offered. Chestnuts continue scarce, and command rather a high price. Filberts are tolerably plentiful, and pretty good. *Vegetables.*—Savoys and common Cabbages are plentiful, but the supply of the better kinds is rather short. [illegible] of all sorts is scarce. Forced French Beans are [illegible]. Asparagus and Seakale are by no means so plentiful as they were last week, and have, therefore, considerably advanced in price. Lettuces, Endive, and other kinds of salading are scarce. Rhubarb is abundant and excellent. Mushrooms are by no means plentiful. *Flowers.*—Among the cut flowers this week, were many beautiful Camellias, forced Azaleas, Hyacinths, Lilies of the Valley, and Amaryllis aulica.

COVENT GARDEN, Jan. 29, 1842.—FRUITS.—

Notices to Correspondents.

Newsmen [illegible] the "Gardener's Calendar" having been sent to our publisher, with directions to charge the amount to the accommodation of the respective writers, we must again state that we do not forward copies of the Paper direct from the office, but, according to the general usage of the London trade, hand over all orders to News

Agents, and have no means, therefore, of knowing by whom particular subscribers are supplied. But the Publisher will undertake that copies of *the Calendar* shall be sent to all who may transmit to him money, or a post-office order.

J. A., Limerick.—The Arnott stove will do. The plant is Heliánthemum algarvense. Cow-dung and water will prove the best kind of liquid manure for the Tree Heath, &c.

Cyngr can obtain seed of the Scotch Fir of any great seedsman.

A Correspondent asks for information respecting the planting, formation, and treatment of OSIER-BEDS. Will any one favour us with his experience on this subject?

The Publisher is still willing to give 1*s*. each for Nos. 9 and 44.

B. B.—It is difficult to prevent, and still more so to cure, canker in Apple-trees. Many of those varieties introduced from America are peculiarly subject to it, as are also some from the Continent of Europe; and although it is true that among the vast number that have originated in this country many are also affected, yet the proportion is not so great as in the case of foreign varieties. Insects may increase the evil, but they do not seem to be the primary cause, as may be inferred from the following considerations:—Insects that would inhabit, and prey upon the old bark, could not find anything like similar means of existence in the young bud. If such bud is, however, taken and worked on a clean stock, no signs of canker are exhibited for several years, or a longer period than insects could lie dormant, supposing they had existed in the bud at the time of its separation from the tree; but after an indefinite number of years, according to circumstances, canker does break out, characteristic of the variety, among hundreds of others that remain healthy under the same circumstances of soil and climate. The variety disposed to canker has, moreover, its period of sanity influenced by the nature of the soil and climate. An old Colmar Pear-tree will long remain healthy against a wall; but the same variety soon cankers as a standard. It is reasonable to conclude from the above that the causes of canker in fruit-trees are attributable to peculiarities in the constitution of the variety which render it susceptible to inimical qualities in the soil and climate. As it is your choice sorts from Holland that are chiefly affected, you must ascribe their being so to the nature of the variety, and the most effective remedy will be to graft the trees with other sorts; but as you much esteem the Apple, if you remove the trees and plant them almost on the surface of the soil, they will continue to bear well for a good many years, and in the mean time you can cultivate young trees to replace the old as these last decay. Do not prune late in spring.

A Friend in the Bahamas inquires whether any reasons can be given why Jonquils, Hyacinths, Tulips, Guernsey Lilies, and many other bulbous plants, some of which even require heat in England, will not blossom there, though producing leaves and roots in abundance. He has tried them in every way, in sand, in rich and poor soil, in water, in the sun, in shade, in and out of doors, but without success. He also asks why Cauliflowers and Broccoli will not flower there, although growing generally well and often vigorously, and whether any remedy founded on general principles can be suggested. We fear not. The cause in both cases is the heat of the climate, which is too great for the Cauliflower and Broccoli under any circumstances, and for the bulbs if they are exposed to it all the year round. In both instances the plants are so much stimulated as to produce nothing but foliage at the expense of their flowers. The only course to take would be to gradually dry the bulbs as soon as their growth is complete, and when their leaves have begun to wither, to pull them up and lay them in the sun till they are quite dry, in which state they must be kept for five or six months. Possibly the same process might throw the Cauliflower into flower; but in that case a stoppage of growth for a month would be as long as would be advisable.

C. N.—To have Russian Violets in flower during winter, you must treat them in the following manner:—As soon as they have done flowering, about March, sift a little rich light soil over them, and encourage their growth as much as possible, as the principal thing is to obtain as early as possible strong-rooted runners from the old plants, which, if properly managed, will be about the end of May. Transplant the young runners into a nursery-bed, in a rather shaded but not confined situation. The soil should be composed of fresh sandy loam and peat, with a small portion of leaf-mould, but by no means made rich with dung, as that causes the plants to grow too vigorously. About the beginning of August prepare a place for their final reception; an old Cucumber or Melon bed will do well, taking away the soil from the frame and filling the place with a mixture of good loam and sandy peat, adding about one quarter of well-rotted cow-dung to it; well water the whole, and let it remain for a few days to settle. After this remove the young plants from the nursery-bed with good balls, and plant them in rows about six or nine inches apart, each way, and afterwards place the lights on (for a few days) until the plants recover the shift. They will afterwards require no further trouble except watering and keeping free from slugs and weeds, which must be attended to. When the weather becomes cold in the autumn, the lights must be put on during the night, and in rough wet weather; and finally, the Violets must be well protected from frost during winter by covering them with either mats, fern, or straw, giving little water and plenty of air at all times, when the weather will permit, to prevent their damping off. Treated in this way, they will then flower freely from December to February. They may also be potted and cultivated in the same manner, and when in flower may be planted in the greenhouse; but they will not bloom during the winter if exposed to the inclemency of the weather, or if in a damp situation.

Salopian.—The best way to treat the more delicate varieties of China and Bourbon Roses after a long journey, is immediately to pot them in rather a dry soil, composed of an equal mixture of loam and peat, shortening the tops at the same time, and then placing them in a moderate hotbed, which must be kept close for a few days; they will then, if not too far gone, begin to grow in a short time, when they may have some water and be hardened by admitting air. It will not do to place their roots in water for a week; it is their receiving too much moisture, and that too suddenly, after being so long dried up by the journey, and particularly in the autumn, when the plants are in a soft state, when taken up, that injures them. The best way to graft the smaller kinds of Roses is by rind-grafting; that is, after taking off the heads of the stock (which should be young), make a slit in the bark on one side, and then with the knife remove the bark a little on each side to admit the graft, which will then be between the rind and the wood, tying as usual in grafting pretty tight, and put a little grafting-wax over the whole. The strong shoots of Roses are not proper for grafts; the weaker ones should be used; the grafts should not be more than two or three inches long. It will do to take up small suckers, and graft them as you propose; but they must be put into a close pit with a little artificial heat for a week or two. Your making a hotbed over an open fire as described in the "Gard. Mag." is not practical as there described. You had better have a small chamber underneath pierced with holes at the top, and heated by a small flue or hot-water apparatus.

D. D. writes that he has the management of two gardens where Sea-kale and Rhubarb are grown. One garden is a rich sandy loam of great depth; the beds of Kale, &c., are planted 12 feet from a wall having a S. and S.W. aspect, but partially shaded at this time of year by a belt of Firs in front, 20 yards' distance from the beds. The second is a heavy retentive clay; the beds are similarly planted, but have no wall at back nor trees in front. The Kale in both instances has been treated alike; but in the first garden it was commenced forcing on the 17th Nov., and he has gathered a small quantity, but weak and small; while in the second garden (the heavy clay, &c.) he did not commence forcing till the 21st Dec., and has gathered a quantity of excellent Kale and Rhubarb on the 13th Jan. The plants, he says, are in both cases very strong. The Rhubarb is Elford and Tobolsk. —[The following causes may make the difference described by *D. D.*:—1st, That forcing the first so early is against its producing strong shoots and leaves, having so short a period of time to rest; for although Sea-kale and Rhubarb are early excited by forcing, it must be recollected that the shoots and leaves are all removed, and the plants robbed of a great part of their vitality, and all the fresh supply for the next season must come from a debilitated system. 2d: Forcing so early in the open ground (17th Nov.) must destroy any plants, let them and the soil be ever so good; and if done, it is better to destroy the plants after forcing, and procure a succession for another year, for nothing is more injurious to plants than continual excitement. 3d: Sea-kale and Rhubarb like a strong and rather moist soil, particularly the former, and consequently your sandy soil may become too dry in summer when the plants have to make their growth, for it must be remembered that forced plants have to gain fresh matter from weakly shoots and leaves. 4th: The difference in the time of exciting the first and second crops (21st Dec.) and the latter being in a heavy retentive clay, will grow much slower at first than those in the sandy soil, and consequently will not be exhausted so soon, and also the plants will have sufficient time before forcing to mature their buds and ripen; for to commence forcing a plant before it has become torpid is destructive to its health; but there may be other reasons, such as whether the forcing was commenced gently or suddenly, the degree of heat applied, whether the plants were sufficiently established, and the soil properly prepared before planting.]

Philo-Chronicle.—Asclépias tuberosa requires to be grown in a light, sandy soil, and in a situation that is well drained and partially shaded; for in its wild state it is found either in stony fields or in dry woods. It is perfectly hardy, but always suffers from wet in autumn and winter, when it should be well protected with a handglass and kept quite dry. When it has done flowering, the tops should be partly cut off, which will cause the roots to form fresh buds. If grown in pots, the plants should be allowed to get dry during the winter; or they may be taken out of the pots, and kept in dry sand.

D. J.—Your Apples are—Nos. 2, 4, 25, King of the Pippins; 7, Orange Pippin; 8, Hollandbury; 12, Winter Queening; 13, Old English Codlin; 14, 23, Pompion; 16, Nonesuch; 17, Wormsley Pippin; 18, Northern Greening; 19, Lewis's Incomparable; 20, Gravenstein; 21, Api Gros; 24, Marmalade Pippin. The Pears are not known, nor do they appear to be worth growing.

C. A.—Your Apples are—No. 1, Dutch Mignonne; 3, Lamb Abbey Pearmain; 4, Winter Queening; 5, Winter Nonesuch; 7, Baxter's Pearmain; 8, Reinette Grise; 12, Bersdorffer; 13, Bringewood; 15, Rhode Island Greening; 16, Red Winter Colville; 18, Court of Wick; 19, London Pippin.

D. Alneto.—Rosa clinophylla, one of the reputed parents of R. Hárdii, is a single-flowered species, of no beauty, allied to the Macartney, and now difficult to find. The nurserymen do not grow it, because it is unsaleable. The best book is Rivers' Rose Amateurs' Guide.

J. C. L.—Your plant is a Catasetum; and if its flowers are always as small, with the same short labellum, it is new. It is allied to C. cristatum.

A Subscriber.—Nitrate of soda should be applied to the roots only. When we gave the rate of 2 cwt. per acre, we did not suppose our correspondents would call upon us to calculate for them the quantity per square yard. Nothing can be done for the Hyacinths. We consider Mr. Shearer right. Sow Nemophila insignis seed as soon as ripe.

P. A.—Cucumbers will not come to perfection unless they are carefully set, as it is called. To let the air blow among the plants is not enough.

H. D.—Gladiolus signifies 'small sword,' and has its name in allusion to the form of its leaves. Gladius, a sword, gives Gladiōlus for its diminutive, not Gladiōlus. The Pelargonium list is going on.

G. Fry, if he is wise, will not attempt experiments of a doubtful issue as to the right of property in plants. There is no analogy between a pruning-knife and a thermometer and a living plant. The former require neither soil nor air, nor attendance; the latter, all these. We do not regard the question of right of property in plants open to further discussion, except some quite new light is to be thrown upon it, which is not likely. Our columns are so filled with matters of practical value, that we have no room for dull speculations about what we regard as a settled question.

Cabbage wishes to know on what extent of Vineries Mr. John Duncan practised his successful experiment with root-pruning?

B. T.—The Pear with the musky flavour, which some prefer and many dislike, is the Bezi de Montigny.

G. W.—Your Pear is the Winter Orange, only fit for stewing; the Apple appears to be Parry's Pearmain. In order to induce the old Magnólia to flower, its roots had better be pruned.

Examiner.—Take the nursery first.

F. L.—It is very difficult to advise without seeing the land, and knowing what kind of soil it is. If it is so high above the Ouse as to be dry, it would be better to inoculate it with good pasture turf, provided it can carry it; but if it is subject to marine inundations, it would probably be most useful to inoculate it with salt-marsh.

Johannes.—Fuchsia cordifolia is in the hands of the principal nurserymen, and may be had through the Fellows of the Horticultural Society. Cinerarias would receive a prize at the Horticultural Society's meetings, if good enough; the others not.

W. D.—Your letter has been unanswered until we could give you a plan of a Melon-pit. This is now in the engraver's hands, and we hope to publish it next week, or at latest the week after.

A Young Gardener.—We do not remember your letter. Take Ayres's "Treatise on the Cucumber" for your guide; Lindley's "Guide to the Orchard" for fruit; and for Kitchen-garden work, Rogers' "Vegetable Cultivator." You must look over the Answers to Correspondents of last year for the list you want. Many such are to be found, and we have not room for another just now.

R. P.—We are sorry we cannot oblige you. The plants, &c., in the garden of the Horticultural Society are for the Fellows of the Society, and can be only had through their good offices.

A Subscriber, who cannot procure a plant of the Verdelho Grape from the London nurserymen, had better obtain cuttings through application to a Fellow of the Horticultural Society.

Pauper says—"A. possesses duplicates of rare plants; B. likewise possesses duplicates of rare plants: A. wishes for B.'s duplicates; B. wishes for A.'s duplicates. Both would be very glad to exchange; they are strangers to each other; consequently neither knows the wants of the other, or their ability to accommodate: neither are rich enough to purchase. Can you suggest any mode to assist in this matter?—[The ready, and, indeed, only way is to communicate by means of advertisements.]

C. B. t.—The Roses which are sold by the hawkers in the streets are forced for the purpose in close pits, and, consequently, soon suffer when afterwards exposed to a colder and drier atmosphere. The only remedy is to keep them in as close a situation as possible until the flowers are past their beauty, which is not very long, and then partially cut them back, and place them in a cold frame or pit, giving them plenty of air in fine weather, and but a moderate supply of water at first. They will then, if China, hybrid China, and Tea-scented, soon recover and flower freely again. This is the treatment which the growers themselves resort to, if they cannot dispose of the plants when in flower. If, when purchased, they are kept in a rather warm and close place, they will keep on flowering for some time without suffering much injury. It is the sudden change that injures them. They do not want shifting.

If *G. G.* will turn to the Index of our volume for 1841, he will find several references to methods for destroying Woodlice.

A Constant Reader.—The following six climbers are suitable for a conservatory:—Hardenbérgia macrophylla, Bignónia Tweediana, Ipomœa Leárii, Tacsónia pinnatistípula, Mimosa marginata, and Passiflora cæruleo-racemosa.

J. M., Huperton.—Your letter is an advertisement.

Two Young Gardeners may select the following plants to grow in the parlour-frame described in the *Chronicle* for Dec. 4:—Lycopódium denticulatum, to cover the under part; Venus's Fly-trap, to be planted near the front; the Fairy Rose; Dóodia caudata; Gymnogramma chrysophylla; Fúchsia macrophylla, and Echevéria secunda. Several species of Mammillária and Mesembryánthemum tigrinum may be hung from the top. The Pitcher-plant, when young, has also a pretty appearance when planted among the Moss.

W. D., Sussex.—You have no doubt given your Canna too much water at a season when it required rest. Your insect is the green-fly or aphis; and methods of destroying it are given at pp. 153, 297, and many other pages in our volume for 1841.

W. Turner.—Newman's book on Ferns costs 10*s*. 6*d*.

M.—We do not think you will succeed very well in growing Lilium lancifolium in a window. The soil which suits it best is peat and sand, and in potting observe that the drainage is perfect. For other particulars we recommend you to peruse Mr. Groom's article at p. 68 (1841).

Mary.—We were quite in earnest in advising you to burn your soil if it is very stiff. It must be done in the dry weather of spring. The method is to pare it, and to let the turf pared off become quite dry; then to collect it in heaps, and set fire to it, either by means of the Grass and other vegetable matters belonging to it, or with furze or any coarse herbage; the heaps will consume with a smothering heat. When burnt, the ashes must be spread quickly, and slightly turned in with the spade. Neither this, however, nor lime-rubbish, nor any other application will be of service unless the land is drained well; to effect which, the best mode will be to form bush-drains, all sloping towards a ditch as much lower than themselves as possible. Any farmer or gardener will tell you how to make them. We have already explained the manner at p. 800 (1841).

A Cornish Cottager.—Dwarf Apple-trees intended to be brought into a bearing state as early as possible may be planted at the distance of 10 feet each way, whether for training in a conical form, or concave, like a goblet; by either mode good produce can be obtained. The open dwarfs are, however, more liable to be injured by frost in spring, and therefore there will be propriety in training portions according to both modes. You had better procure Rivers' "Treatise on Root-pruning," which only costs 1*s*. The Hawthornden and Alfriston are good kitchen Apples, coming early into bearing and suitable for dwarf training; as are also the following dessert Apples:—Court-pendu Plat, Scarlet Nonpareil, Braddick's Nonpareil, King of the Pippins, and Ribston Pippin. Hacon's Incomparable Pear will succeed on a south wall, but it does not require one. The Passans du Portugal bears early.

Rosalinda.—1st: Roses if properly pruned and manured will grow for many years in the same place, provided the soil and situation are suitable, but much also depends on the kinds, as well as whether they are worked on stocks or on their own bottoms; and if worked, on what kinds of stock; also if they are of the more tender sorts which may be injured by the severity of the winter. 2d: Roses certainly will do much better if removed to a fresh soil about every five or six years, and have their roots partially pruned, and the old plants reduced in size when on their own bottoms, particularly the Scotch and garden Roses. 3d: When the natural soil is stiff, mix a good quantity of fine sand with it; if poor, well-rotted dung also. 4th: In root-grafting, any portion of the root will do, provided it is large enough; but the grafted part must be buried below the surface of the soil in the pot, which must then be placed in a hotbed or close warm pit, to cause immediate union, otherwise both are apt to perish. 5th: The best time to prune Portugal and common Laurels is from April to June; but they may be pruned at almost any time if it is judiciously done.

Rusticus.—Whether it is really of service to add acids to bone-dust, we do not know; it certainly cannot be done if the dust is to be drilled. We doubt the advantage of doing so under any circumstances. The plant is Bérberis aquifólium. The other question will be answered next week.

We have unpacked with admiration the beautifully-saved seeds of some of our finest border-flowers, which *Mr. Sheepshanks* has been so kind as to send us. We doubt whether samples so perfect, and so free from all impurity, were ever saved by any other grower. He has our best thanks.

If *Mr. Mack* will look again at the article on Pelargoniums, he will see that we have not stated the Queen of the Fairies to be superior to any Pelargonium known. If he will wait till the whole of the paper is printed, he will find the remainder of his criticism equally groundless.

J. L. S.—The plan which you have sent to us for heating your small frame would, perhaps, answer your purpose, but we think it liable to some objections. You would not be able to clean your flues without taking down some part of your walls; and the under flue is too far from the beds. We think a better plan would be to carry the flue from the back to the front, along the front, and then up to the back again on the other side, keeping it about a foot lower at the fire-place than where it enters the chimney. You can then pack the bottom, sides, and top of the flues with brick-bats, as shown in your plan, and likewise cover some parts with evaporating tanks. Hot-water pipes would be by far the cleanest and best, but for a small frame like this they would be more expensive. It is the object of the articles under the head of "The Amateurs' Garden," to teach the amateur how, as well as when, to perform gardening operations; so that your suggestions concerning fermenting material, &c., will meet with attention.

W. H. G., Clapham.—The small quantity of sulphur which necessarily falls upon the soil in the pot will not injure the roots of your Heaths, but it is always better and cleaner to remove as much of it as possible from the surface before watering. For lists of greenhouse plants we beg to refer you to pp. 89, 649, 151 (1841); for stove, to the Answers to Correspondents in our last Number.

A Subscriber.—The trough in Mr. Green's Cucumber-pit, described at p. 36 (1841), is an open one.

Hibernia may sow the Fuchsia seeds in about a month, in pots filled with any light earth, and place them on a shelf near the glass in the greenhouse, or in a moderate hotbed frame. Fuchsias growing in boxes, which cannot be readily shifted, may have the surface-soil removed, and fresh added. Kennedyas may be propagated either by cuttings or seeds; a mixture of loam, peat, and sand is a good compost for them. Speechley's "Treatise on the Vine" is one of the best.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE christening of the Prince of Wales, and the State ceremonies which have attended the solemnity, will naturally be regarded in every part of the kingdom as the most interesting intelligence of the week. Our Home News contains all those details which are likely to prove acceptable to our readers, and it is therefore unnecessary in this place to do more than advert to the peculiar circumstances under which the event has taken place. The performance of the ceremony—not as heretofore in a private apartment of the palace—but in an edifice consecrated to Divine worship, and the appearance of the King of Prussia as one of the sponsors, at a time when the establishment of the Protestant Bishopric at Jerusalem promises to perpetuate an alliance between the two nations on religious grounds, may perhaps be considered as among the most gratifying of these circumstances. Its occurrence also at a moment when the world is enjoying almost universal peace, and the adoption of the name of Albert Edward, in which the recollections of his father's virtues will be associated with those of the greatest Sovereigns of England, can hardly be regarded as less propitious. These considerations appear to combine in giving an auspicious character to the solemnity, and in increasing the confidence of the nation, that when at some future, and, as we hope, most distant day, the young heir of Great Britain shall be called to the throne of his ancestors, he may give additional glory to his name, and prove the defender of the constitutional liberties and religion of this united Empire.—The reception of the King of Prussia in this country has been in every way worthy of the occasion. His Majesty's progress has been marked by cordial demonstrations of popular respect, and during his visits to our national institutions, the people have lost no opportunity to do him honour. The preparations for the opening of Parliament on Thursday next are now completed: it is officially announced that the Queen will open the session in person, and that the King of Prussia will be present.

Our news from France relates chiefly to the proceedings in the Chambers during the debates on the Address, which have been carried on with considerable warmth. The affairs of the East, and the convention which restored France to the European compact, were the first subjects of discussion; but the paragraphs relating to them, although opposed by M. Thiers, were carried without a division. The convention relative to the right of search, for the more effectual suppression of the slave-trade, has been more successfully opposed; the Chambers were all but unanimous in regarding the right of search as compromising the independence of the national flag; and consequently an amendment has been carried, which may possibly prevent the ratification of the treaty. The dispute with Spain has since been the subject of discussion; the amendment of the opposition was rejected by a large majority, and during the debate M. Guizot emphatically declared that the demand of the Ambassador at Madrid was entirely supported by the Great Powers, and by the whole diplomatic body; and that the French Government, so far from abetting the movement of Queen Christina, actually apprised the Regent of the intended insurrection.—From Spain we learn that public attention is directed to the approaching debate on the Address in reply to the Speech of the Regent, and it is generally believed that the Address of both Chambers will pass without much opposition. —Advices from Turkey announce the suspension of the threatened hostilities against Greece, in order to give time to the Government of King Otho to make the required reparation; and hopes are entertained that the English and French Ambassadors will succeed in effecting a speedy adjustment of these differences.—The news received during the week from the United States, relates chiefly to the deficiency in the Treasury, and to the new fiscal scheme of the Government, which is expected to meet with severe opposition. Sir Charles Bagot, the new Governor-General of Canada, arrived at New York on the 29th ult., and intended to remain there for a few days previously to his departure for Montreal.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal are in the enjoyment of excellent health, and continue at Windsor. On Saturday evening the King of Prussia arrived at the Castle, attended by Prince Albert, who had proceeded to Greenwich to receive his Majesty on his arrival from the Continent. On Sunday the Duke Ferdinand of Saxe Cobourg, accompanied by the Princes Augustus and Leopold of Saxe Cobourg, arrived at the Castle, having landed at Woolwich from the Continent, to be present at the Christening of the Prince of Wales. The proceedings at Court consequent on the arrival of the King of Prussia and the other illustrious visitors, and the ceremony of the Christening of the Prince of Wales, will be found in detail below. On Thursday the King honoured Sir Robert Peel with his company at luncheon, and visited the National Gallery and Whitehall. The King of Prussia will leave Windsor Castle for London on Monday, with the intention of passing the remainder of his sojourn in this country in town, apartments having been prepared for his Majesty's reception in Buckingham Palace. The Queen and Court are expected to arrive in town on Wednesday; and on Thursday it is announced that her Majesty will open Parliament in person, when the King of Prussia will also be present at the ceremony. To-morrow, Sunday, it is expected that the King of Prussia will attend divine service at St. Paul's.—The Countess of Dalhousie has been appointed one of the ladies of the Bedchamber in ordinary to her Majesty, in the room of the Countess of Sandwich, resigned.

The Queen Dowager.—The accounts published during the week of the health of her Majesty the Queen Dowager state that her Majesty has suffered no inconvenience from her journey to town, and that her restoration to a confirmed state of health is proceeding favourably. On Monday her Majesty received a visit from the King of Prussia, who came to town for this purpose from Windsor, and stayed some time at Marlborough House, where his Majesty partook of a *déjeûné*.

Christening of the Prince of Wales.—The Christening of the Prince of Wales, the anticipation of which has so long occupied the attention of the public, took place on Tuesday, in St. George's Chapel, Windsor, under every circumstance that could give interest and brilliancy to the ceremony. The day, at its early part, was wet and unpropitious; but shortly before noon the weather cleared up, the sun shone out brightly, and the remainder of the day continued fine, affording to the assembled multitudes an opportunity of witnessing the spectacle under most favourable circumstances. The public were only admitted to the interior of the Castle by means of tickets; and as these were limited in number, there was neither pressure nor anything like disturbance during any part of the proceedings. The Eton boys were also admitted, and the Round Tower was appropriated to them. A battalion of the Grenadiers from London were drawn up in the Grand Quadrangle, and the 72d Reg. of Highlanders in the Lower Ward opposite the Chapel; and their bands playing military airs throughout the day added much to the festivity of the scene. A battery of flying artillery was stationed in the Long Walk of the Park, and was discharged at different parts of the ceremony, while a body of Horse Guards patrolled the roads in the vicinity of the Castle. The distinguished visitors honoured with invitations to the Christening began to assemble in the Waterloo Gallery at eleven o'clock, being set down at the portico leading to the grand staircase, which, as well as the entrance-hall, was lined by the Yeomen of the Guard in their Coronation costume. At half-past eleven the Foreign Ministers, ladies, Knights of the Garter, Cabinet Ministers, and other visitors, left the Castle in Royal carriages for Wolsey's Hall, followed by the Archbishops of Canterbury and York, and the Bishops of London, Winchester, Oxford, and Norwich. Shortly after, the King of Prussia, the Queen, and Prince Albert, with the Prince of Wales, left the Castle for the Chapel, accompanied by the Duke of Sussex and Prince George of Cambridge. The procession advanced to the Chapel in the order of the programme that had been previously arranged. Due military honours were paid to the Foreign Ambassadors, but no cheering was given until the carriage containing the Infant Prince came in sight. The Duchess of Buccleuch, to whose care the charge was intrusted, held him in such a manner as enabled the assembled company to obtain an excellent view of the young Prince, which caused the cheering to be redoubled. The *cortége* moved on, and shortly afterwards another of the state carriages came in view, in which sat the King of Prussia, who was loudly cheered. The military presented arms, and the colours were lowered to him as he passed towards the Chapel. When her Majesty and Prince Albert approached, their presence was welcomed by loud and long-continued cheering on the part of the spectators, and by the usual military honours on the part of the assembled soldiery. The interior of St. George's Chapel had been fitted up with great splendour for the occasion. The banners of the Knights Companions of the Garter, suspended above the sword, scarf, and arms of each, also served to heighten the gaiety of the scene; and when the knights themselves took their stalls, habited in the full costume of the order, and the Ministers of State and the Ambassadors had taken their seats—when the King of Prussia and his suite, and the Queen, Prince Albert, and their attendants appeared on the platform, the whole presented a magnificent and animating spectacle. Among the few ladies who were present, were the Duchess of Sutherland, the Duchess of Hamilton, the Duchess of Buccleuch, and Mrs. Harcourt, of St. Leonard's-hill. Such accommodation as the space would afford was also provided in the shape of galleries for the public, who were only admitted by tickets, which were very limited in number. After leaving Wolsey's Hall, and on entering the passage leading to the aisles, the Royal *cortége* separated; the Queen with Prince Albert and their attendants filing off and entering the choir by the north door to the right; while the King of Prussia and his suite turning to the left, approached the platform by a corresponding aperture on the left in the south aisle. His Majesty, who was dressed in a field-marshal's uniform, entered first and took his seat nearest the font. The Duchess of Kent, who was led by the King of Prussia, took her seat on his Majesty's right hand; next came the Duchess of Cambridge, the Duke of Cambridge, and the Princess Augusta of Cambridge. The Queen, in a few seconds after, made her appearance, conducted by Prince Albert in the costume of the Order of the Garter, and preceded by the Lord Chamberlain and Master of the Household. The whole company then immediately rose and remainded standing, while the band played the march from *Joseph*. Her Majesty was dressed in the robes of Sovereign of the Order of the Garter, and wore a circlet, earrings, and necklace of diamonds. Her Majesty was supported on the left, beyond Prince Albert, by the Duke of Sussex, Prince George of Cambridge, and the Princes Ferdinand and Leopold of Saxe Cobourg. The Duke of Wellington stood behind her Majesty's chair supporting the sword of State, and upon more than one occasion during the ceremony was observed, notwithstanding the considerable weight he supported, adjusting, with obvious pleasure, the train of her Majesty's robe, which, placed over the back of the chair, was liable to become entangled when the Queen had risen from her devotions. The other distinguished visitors were each stationed in their appointed stalls. The "March" having been concluded, the Archbishop of Canterbury, standing behind the font, and supported by the Archbishop of York and the Bishops of Norwich and London, commenced reading the usual baptismal service. The sponsors, as has already been announced, were the King of Prussia and the Duke of Cambridge, the Duchess of Cambridge as proxy for the Princess of Saxe Coburg, and the Princess Augusta of Cambridge as proxy for the Princess Sophia; and when the Infant Prince was brought in and given into the hands of the Archbishop, the King of Prussia gave the usual responses, and named him ALBERT EDWARD, by which names he was accordingly christened by his Grace. The Infant Prince, who remained perfectly quiet during the whole of the ceremony, was then delivered by the Archbishop into the hands of the lady who had brought his Royal Highness to the font, and who carried him to the door of the Chapter-room, where his nurse was in waiting to receive him. At the conclusion of the service, the Hallelujah Chorus was chaunted by the full choir with great effect; after which, the Royal procession departed in the same order in which they had entered the chapel; and thus concluded this important national solemnity, which will be hailed by all classes throughout the country with the satisfaction which so interesting an event, consummated under every auspicious circumstance, is calculated to convey.

The Chapter of the Garter.—On the return of the Queen and Prince Albert, the King of Prussia, and the remainder of the procession, a Chapter of the Order of the Garter was held in the Throne-room, and nearly all the visitors assembled in the Waterloo Gallery. Her Majesty being seated on a chair of state, and the Knights and officers having being introduced and taken their places, the Sovereign's pleasure that a lineal descendant of King George I. should be elected into the Order, in pursuance of a statute to that effect, was notified by the Bishop of Oxford. The election was then proceeded with, and his Majesty the King of Prussia was declared elected a Knight of the Order of the Garter. The King was then introduced, and the Garter was buckled on his left leg, and her Majesty, assisted by Prince Albert and the Duke of Sussex, afterwards passed the Ribbon and George over his left shoulder. Her Majesty then gave the accolade to the King, who received the congratulations of the Knights Companions present. After this ceremony had been concluded, a *déjeûné* was served to the visitors in the Queen's presence chamber, the Queen's audience chamber, and the Vandyke gallery.

The Banquet.—In the evening, a state banquet was given in St. George's Hall, which presented a magnificent appearance. At each end beaufets had been erected, covered with crimson, and encased in light Gothic screens. On these beaufets, the finest gold shields, salvers, vases, tankards, and cups, of the Royal collection, were displayed among candelabra and sconces of silver-gilt, filled with wax lights. The table for the banquet, which was laid between, had a succession of gold candelabras and epergnes, reaching from one extremity to the other, together with a great variety of vases and other ornaments of gold plate. Covers were laid for 140 persons, and the tables, it is stated, groaned under the weight of the gilt silver plates deposited upon them. For each guest a servant in the Royal State livery was in waiting, and the Hall presented a scene full of animation and splendour. The dinner, which commenced at half-past seven, was sumptuous, and the dessert contained every delicacy both in and out of season. Several pieces of exquisitely prepared confectionary were served up, and from the profusion of flowers with which they were decorated, it seemed as if a garden had suddenly sprung up among the other illusions of the scene. After dinner a succession of toasts was given, commencing with the Prince of Wales; which was followed by that of the King of Prussia. Her Majesty's health was then drunk, and was succeeded by that of Prince Albert. The toasts were all drunk in silence, followed by appropriate tunes from the bands which were in attendance. Her Majesty, accompanied by the ladies, left the table about ten. The rest of the Royal guests remained a short time, when the King of Prussia, the Princes, Ambassadors, and other guests, joined her Majesty, and this terminated the banquet, which, altogether, as respects the rank of those who attended it, the splendour of their dresses, the magnificence of the tables and the apartments, has, it is said, never before been equalled. The doors of the Waterloo Gallery were then thrown open for the reception of the company, and a grand musical performance took place, which concluded the festivities of the evening. During the concert, her Majesty took a glass of punch from a colossal punch-bowl, prepared for the occasion, and drank to the health of the Prince of Wales, an example which was immediately followed by all present. A christening cake, of very large dimensions, was also displayed among the other refreshments in the saloon, and elicited general admiration. At half-past eleven the Queen took her leave of her guests, to whom she made repeated obeisances, and, placing her arm in that of the King of Prussia, retired from the apartment, which was speedily afterwards vacated by the visitors.

Opening of Parliament.—Lord Willoughby d'Eresby, the Lord High Chamberlain, has received the usual official notice of the intention of her Majesty to open the ensuing session of Parliament, on Thursday next, in person, and Mr. Pulman, the deputy black-rod, is daily engaged at the House of Lords in directing the necessary preparations, as the ceremony is expected to derive unusual splendour from the circumstance of the visit of the King of Pruisia, who will be present. The state chair for his Majesty will be placed on the right of the Queen; and on the left of these, seats will be provided for the Duchess of Kent, Gloucester, and Cambridge, and the Princess Augusta of Cambridge. The King of Prussia will go in separate state to the House, and will be received with the usual honours paid to crowned heads.

Parliamentary Movements.—A Cornwall paper informs us that it has been authorised to announce that circumstances have occurred which oblige Mr. Basset to decline contesting the western division of that county. Sir Howard Douglas and the Rt. Hon. J. C. Herries have come forward on the Conservative interest for the representation of Liverpool, vacant by the elevation of Mr. Creswell to the bench; no Liberal candidate has yet been announced. The Hon. Col. Abercromby has resigned the representation of the united counties of Clackmannan and Kinross, on account of ill-health, and Gen. Morison has started in the Liberal interest. The election for the city of Dublin commenced on Tuesday, and at the close of the poll on Thursday the numbers were, for Mr. Gregory, 2149; for Lord Morpeth, 1840; the election is not yet concluded.

Church Preferment.—Dr. Gilbert, principal of Brasenose College, Oxford, and late Vice-Chancellor of the University, has been selected to fill the vacant see of Chichester.

Foreign.

FRANCE.—*The Chambers.*—The journals are occupied exclusively with reports of the speeches delivered in the Chamber of Deputies during the debates on the Address, which continue to be carried on with considerable warmth. After a long discussion, the first paragraph of the Address, which related to the affairs of the East, passed without a division. The most remarkable speeches delivered in this part of the debate were those by M. Thiers and M. Guizot. The latter, in a very long speech, vindicated the course pursued by Government, and laboured to show that he had exerted himself for the Pacha, and obtained more favourable conditions than he would otherwise have been allowed. In the latter part of his speech M. Guizot alluded to the Convention of the Straits, and to the return of France to the European Concert. "This *Concert*," said M. Guizot, "is no Holy Alliance, no coalition, no abdication of policy or independence on any side. It is merely an understanding that previously to having recourse to any war on any political question, the Powers will always endeavour to come to a common and amicable understanding." He then declared that there were but three systems of policy possible: the policy of close alliance with one or two powers, the policy of isolation, and the policy of close alliance with none, but of good intelligence with all. The time for the first, he said, had passed, and was no longer possible; the second was imprudent, as it bound the four Powers against France, and therefore the last was the only prudent course left for him, and this he had adopted. M. Guizot, at the close of his speech, read an extract from a letter of Lord Aberdeen, in which that minister states, with respect to the French colony in Algiers, that his views on the subject had changed since he was foreign minister in 1830; and that regarding the position of France in Africa as a fact accomplished, he had no longer any objections to raise against it. M. Thiers replied to this speech at great length, and hinted that had he been left in office he would have kept at least half Syria, and accused M. Guizot of ceding everything and gaining nothing. He went on to give a long statement of his political views and condemned the policy of the present Cabinet; during which he stated several times that the European Powers do not and did not meditate any war or invasion against France; but that the object of those powers was to lessen and annul her influence. He condemned the Turks as "*effete*, worthless, and impossible to regenerate; and the most worthless in his eyes were the Turks who attempted to reform or ameliorate the institutions or organisation of their country." As a contrast to this, M. Thiers passed a high eulogium upon Russia, and a panegyric upon her ambition. "I respect," said he, "Russian ambition; it is the ambition of a great nation. The ambition of nations is the measure of their greatness. A nation without ambition has lost its vital principle." The first three paragraphs of the Address having been carried without any amendment, some observations were made by one of the deputies respecting the alleged disarmament of the fleet, when Admiral Duperé, Minister of Marine, declared that certain circumstances had obliged Government to concentrate the naval forces of France in the Mediterranean, and that other circumstances, well known to the Chamber, had since rendered it necessary to divide those forces, and to transfer a portion of them to the ocean; but that there was no intention on its part to disarm the fleet. M. Guizot, in his turn, protested that Government had pledged itself to no foreign Cabinet to reduce the naval establishment. On Saturday an amendment to the fourth paragraph was moved by M. Billault, a partisan of M. Thiers; the object of which was to pledge Government not to ratify the Convention signed with the Powers relative to the right of search for the more effectual abolition of the slave-trade. The amendment was supported by MM. Dupin, Thiers, and Berryer, and opposed by M. Guizot and the Minister of Public Instruction. The debate on this amendment was animated and excited considerable interest, since, if carried, the Cabinet could not ratify the Convention, and it was thought would consequently give in its resignation. On Monday, however, a counter-amendment was moved by M. Lacrosse, of the Dufaur-Passy, or middle-party, which was as follows:—"We have the *hope*, that if your Government adheres to fresh arrangements relative to the slave-trade, it will be able to manage, efficiently with the suppression of this infamous traffic, to preserve upon every attack the legitimate interests of our maritime commerce, and the independence of our flag." —We have since received accounts of the termination of the debate on this paragraph, which concluded by the adoption of a counter-amendment, proposed by M. Jacques Lefebvre, who is of the right or Conservative side of the Chamber, but which did not apparently differ much from that of M. Billault, inasmuch as it was still a kind of pledge for the Deputies to refuse their sanction to the treaty. Its precise words are as follows:—"We have also the confidence that in granting its assistance to the suppression of a criminal traffic, your Government well know how to prevent all attempts against the interests of our trade and the independence of our flag." The adoption of this amendment, which was carried unanimously with the exception of the votes of the five Ministers who are deputies, appears to be regarded, in consequence of the tone of the debate, as a serious check to M. Guizot's policy. MM. Billault and Lacrosse withdrew their amendments, declaring that they adopted M. Lefebvre's because they considered it as a censure passed upon the treaty of 1841, and a wish that this treaty should not be ratified. M. Lefebvre and his friends declared that their object in proposing their amendment was to oppose, as far as the prerogative of the Chamber could do so, any extension of the treaties of 1831 and 1833. M. Dupin, a member of the committee which prepared the address, was even more explicit. He declared that the object of his vote was to hasten the period when those treaties should no longer have any effect. The Ministry, on their part, did not conceal the fact that they attached the utmost importance to the rejection of any amendment tending to disapprove of the treaty of 1841; and M. Guizot, it is said, with a view to alarm the Centres, explained to them, that if they declared an opinion contrary to the negotiations concluded by his Cabinet, they would place the Government in a false position. The papers state that, by this amendment, the Chamber has formally and positively separated from the English policy, and given Government an opportunity of concluding an alliance with the minor maritime Powers at some future period.—The Chamber then proceeded to the consideration of that paragraph in the speech which refers to the foreign relations of the country, on which M. Gustave de Beaumont proposed the following amendment:—"The Chamber hopes that the differences which have unfortunately arisen between the Governments of France and Spain will not seriously disturb the friendly relations existing between the two countries; and that, mindful of the great interests which unite them, and of the common principle of their institutions, they will speedily terminate a difference without any well-founded and national cause." M. G. de Beaumont having spoken at length in support of his amendment, M. Guizot rose and defended the course that had been adopted by the Ministry. Government, he said, could not expect that the presentation of M. Salvandy's credentials would have led to any unpleasant consequences. The claims of the Ambassador were conformable to the practice observed in every monarchy, to the public law of Europe, and to all the precedents. In Greece and the Brazils, during the minority of the Sovereigns, the same pretensions had been raised by the Regents, and all the Powers had declared against them. The presentation by an ambassador of his credentials to the real Sovereign was a European right, and the moment the affair became known, the Governments, both absolute and constitutional, and Great Britain amongst the rest, supported the demand of France. Government could not have foreseen the objection arising out of the 59th article of the Constitution of 1837, which was no law for foreign nations; and Spain, by her conduct, had not comprehended her own interests, the intentions of the French Government, and the advantages which she would have derived from a closer intimacy with France. M. Guizot, in conclusion, said that M. de Beaumont had not calculated the consequences of his amendment, and that it could not be the intention of a French Chamber to impede, by its adoption, important negotiations impending between France and a foreign country. M. Odillon Barrot rose next, and addressed the House at considerable length; after which the Chamber divided, and rejected the amendment by a large majority. M. de Salvandy was at his seat, and Queen Christina was placed in the Ambassador's tribune.

The Capital.—The "Journal des Débats" informs us that the King of Prussia will not visit Paris, as rumoured, but will return to Berlin without passing through France. The Prince de Joinville returned to the capital on Friday, from his voyage to the United States, and has since been made rear-admiral. His Royal Highness was in perfect health. —The report of the commissioners at Paris, appointed to inquire into the project for erecting a monument to the memory of the late Emperor Napoleon, states that it should be "a sarcophagus of granite or porphyry, of a noble and rigid style of sculpture, and erected on an imperishable basis;" and that besides the tomb and crypt to be erected in the Invalides, there should also be an equestrian statue of the Emperor on some spot near the hospital, on the outside. The reasons for this plan are thus expressed:—"Inside the Church, the tomb—outside, the statue! Nothingness in the sight of God! Glory in the sight of men!"

The Press.—Sixty journals of departments have given in their adhesion to the "declaration" published a short time since by the Paris Opposition papers in regard to the conviction of M. Dupoty. The responsible editor and printer of the "Journal du Bourbonnais," a legitimist journal of Moulins, were, a few days ago, brought before the Court of Assizes of the Allier for a libel against the King, published on the 8th inst., in a critique on an exhibition of paintings, in which was a portrait of his Majesty in full length, presented by him to the town of Moulins. The editor was found guilty by the jury, and sentenced to six months' imprisonment, and a fine of 4000f. The printer was acquitted. The "Mode" was seized on Saturday by the police for an article reflecting on Government.

SPAIN.—Our accounts from Madrid are to the 15th instant, but there is nothing of interest in the political news, as public attention was directed to the approaching debate on the Address, which was to come on on the 17th inst. It appeared to be the general opinion that the Address would pass. The reply of the Chamber of Deputies to the speech of the Regent has appeared in the shape of a rough draught from the hands of the committee appointed for the purpose, and of which Señors Olozaga and Cortina are, it is stated, virtually the chiefs. It is said to be more critical than that of the Senate, more particularly in reference to the want of precautions to prevent the outbreak of the 7th Oct., and to the "illegal" treatment of the Barcelonese in proclaiming the state of siege in that city, but on the whole preserves the character of a dignified State paper, and does not attempt to criticise the foreign policy of the Cabinet. In this respect, both it and the reply of the Senate are regarded as tacitly approving and confirming all that Government has done in reference to M. Salvandy. The subject of the late differences with this Ambassador continues to be still the principal topic of public discussion; and in spite of the decisive vote of the Cortes upon the matter, some of the journals now state that the Cabinet failed to comprehend the affair in its proper light, and interpreted the letter but not the spirit of the article of the constitution which had formed the basis of the vote of the Cortes. The opinion in the diplomatic circles, it is said, was in favour of the views of the French Cabinet; and, it is added, that the last despatches received from the several Governments were all to that effect. It also appears, that since the departure of M. de Salvandy, the Duke of Gluckburg, Chargé d'Affaires of the French Embassy, and not Chargé d'Affaires of France, has had some difficulty in coming to an understanding with M. Gonzales, foreign Minister, and Government, with respect to the difference between these two titles and their respective duties. In the Senate, on the 13th inst., a motion was made by one of the members for the production of the documents connected with the case of M. Salvandy; but on the declaration of Señor Gonzales that it would be inconvenient to lay them before the public until the negotiations now pending were terminated, the proposition was withdrawn. It was rumoured that all the French employés still remaining in Madrid would immediately be withdrawn, and the natives of France resident in the capital be placed under the care of the Chargé d'Affaires of Belgium. The journals state that all parties are agreed upon the advantages held out in the Royal speech, of pursuing the path of practical improvement; and the Senate declares "the pleasure with which it beholds Government, in spite of the wants and difficulties by which it is surrounded, dedicating its attention to the improvement of all those branches which advance the happiness of society, means of communication which are so much wanted; agricultural, manufacturing, and mining pursuits, susceptible of so many degrees of increase and improvement; the organisation of the army, the increase of the navy, the civil administration, legislation, public instruction, the revenue, public credit, &c. Various slight suggestions are offered in the Address of the Senate, in respect to some of these important items; but the conclusion is said to be highly complimentary to Government, and expresses great confidence and respect for the character of the Regent.—On the 15th, the Minister of War informed the Senate that the Duke de Castro Terreno, implicated in the outbreak of October, had, in virtue of a decree of the Regent, been permitted to reside in Madrid on parole. Count Requena, lately sentenced to transportation for the part which he had taken in the same revolt, was embarked at Cadiz for Porto Rico on the 7th inst. It is supposed that no less than 680 officers have been placed on half-pay in consequence of the late Christino events. Recent accounts from the Havannah describe the prosperity of that island as gradually increasing, and state that the exports of copper ore alone, during one week of November, were 755 tons weight. A guerilla of 14 men have made their appearance at Santa Cruz de la Zavra, in the province of La Mancha, under the command of one Marrajo.

PORTUGAL.—We have received intelligence from Lisbon to the 17th inst., brought by the *Tagus* steamer. Monsignor Capuccini, the Papal nuncio, arrived in that capital on the 17th inst., and was expected to be presented to the Queen the following day. The journals are still occupied with discussing the merits of the new finance operations. Some excitement appears to prevail among the Chartists at Oporto, who have been celebrating their municipal triumph with much warmth; and it seems that the ardour with which Don Pedro's hymn had been sung there had induced the opposite party to suppose that a revolution, in a Chartist sense, was about to take place; an impression which seems to have been increased by the information that the Minister of Justice was about to proceed there. The visit of the latter, however, who left Lisbon on the 17th for Oporto by steamer, was believed, in the capital, to be only on private matters; and no fears, it is said, are entertained that this attempt to disturb the present state of things will be encouraged or tolerated by Government. A royal order, conceding to the petition of the merchants the privilege of getting the fifteen per cent. reduction of duties on goods imported in Portuguese shipping, up to the period assigned by the new law abolishing the differential duties, although not despatched for consumption till afterwards, had been officially published. Hopes were entertained that the treaty with England would soon be completed, and that it would be accompanied, or soon followed, by propositions for an extensive and reciprocal reduction of duties.

GERMANY.—We have German papers and letters to a recent date, but their contents are uninteresting. They mention that important reductions are about to take place in the Austrian as well as the Russian armies, and that 200,000 men, disbanded from the Austrian army, are to be employed as workmen on the great railways. Count Medem has been appointed Russian Envoy Extraordinary and Minister Plenipotentiary to the Court of Vienna, where he is expected to arrive about the beginning of next month. Private letters from Vienna, dated the 16th inst., mention that some alarmists had appeared at the Bourse of that city, and had succeeded in putting a stop to all business, by asserting that the Greek Government had assembled a corps of 30,000 men on the frontiers of Thessaly, and that hostilities had even commenced. These reports had, it seems, so completely paralysed the great capitalists that they are said to have demanded the interference of Government to put an end to this period of anxiety. The journals state that all the parties concerned in the late duel of Prince F. Lichnowsky with M. de Montenegro, noticed in our last, have left Vienna, in order to avoid the action of the law against duellists. The Prince, it is added, is much better, and can go out of doors.—Intelligence from Berlin of the 17th inst. informs us that his Majesty on the 16th inst., before leaving that capital for England, had published an order, giving the supreme direction of political affairs during his absence to H. R. H. the Prince of Prussia. Private letters state that on the 13th inst. Baron de Meyendorff, the Russian minister at Berlin, gave a grand ball, at which Comte Bresson, the French Ambassador, was present; and that on the following day the latter diplomatist gave a grand dinner, Baron de Meyendorff being one of the guests. It is inferred from this that the temporary misunderstanding between the Cabinets of St. Petersburgh and Paris has been arranged. The states of Rhenish Prussia have petitioned his Majesty to protect the nightingales of the country; and the Police Minister has accordingly issued an edict, prohibiting to rob a nightingale's nest, or keep one in a cage, under a penalty of five dollars.—A sharp shock of earthquake was felt at Biberich on the Rhine, on the night of the 13th inst. The oscillations are said to have lasted several seconds.—The *Suabian Mercury* of the 20th inst. states that at the opening of the session of the Chamber of Deputies at Carlsruhe, on the 18th inst, one of the members brought forward a motion relative to the liberty of the press.

BELGIUM.—Intelligence received from Brussels, dated 21st inst., informs us that the principal persons accused of taking part in the late Belgian conspiracy, namely, Major-Gen. Van der Meeren, ex-Gen. Van der Smissen, Jean Pierre Parys, and six others, have been found guilty by the Court of Appeal in that city, in confirmation of the previous judgment of the Court of Assizes of Brabant. The rest of the prisoners have been acquitted. It is stated that an individual has been arrested at Thionville, the bearer of a voluminous correspondence said to relate to this conspiracy. Brussels papers of the 21st inst. give the following account of the King of Prussia on his route through Belgium to England:—It seems that on the 19th the King of the Belgians set out for Ostend to have an interview with the King of Prussia, who slept that night at Aix-la-Chapelle, whence he set out the next day for Liege. His Majesty's suite consisted of fourteen carriages and twenty servants. The King of Prussia, on his arrival at Malines, was met at the railway station by M. de Brouckere, Governor of the province of Antwerp, with whom he had some conversation. M. de Brouckere having said that the city of Antwerp would be glad to have the honour of seeing his Majesty on his return from London, the King replied—"I thank you, Sir, but that will not be possible, for if I do not return to Prussia by way of Holland, I wish to leave Ostend very early, in order to arrive the same evening before dark at Aix-la-Chapelle, where I have not been able to stop this time." The King did not arrive at Ostend till half-past four on Wednesday afternoon, and this delay is said to have been caused by the long speeches addressed to his Majesty at Ghent and Bruges, by the Governors of East and West Flanders.

HOLLAND.—Intelligence received from the Hague informs us that their majesties the King and Queen received on the 21st inst. the congratulations of the Court and the principal public functionaries in that city on the occasion of the official announcement of the approaching marriage of their daughter, the Princess Sophia of the Netherlands, with the Hereditary Grand Duke of Saxe Weimar Eysenach.

HANOVER.—Letters from Hanover to the 14th inst. inform us, that the Crown Prince had been indisposed for some days, and is visited every day by the King. Though the mourning for the Queen expired on the 31st ult., neither the King nor the Crown Prince has, it seems, yet visited the theatre, or any other place of public amusement. The Second Chamber of Hanover rejected, on the 13th inst., a proposition having for its object to permit the marriage of Jews with Christians, on condition that the children should be brought up in the Christian religion—or, at least, to declare valid marriages contracted between Jews and Christians in foreign countries, without any intention on their part of evading the Hanoverian laws.

SWITZERLAND.—The Swiss journals of the 18th inst. state under date Locarno 13th, that the Grand Council of Ticino decreed, on the 11th, that the foreign monks who had lately settled in the canton should demand an authorisation to that effect from Government.

ITALY.—According to letters from Naples of the 5th inst., the duty on sugar exported from that kingdom has been fixed, since the 1st inst., at eight tari per cantaro. The Prince of Capua, it is said, has demanded the mediation of Lord Aberdeen to reconcile him with his brother, the King of Naples; and some reports have appeared in the journals stating that Queen Christina and Queen Victoria have frequently relieved his Royal Highness with pecuniary assistance. This latter statement, however, has been contradicted on the authority of the prince, who declares that he has never received any assistance of the kind, or even the allowance from his brother to which he is lawfully entitled. The journals inform us that detachments of Austrian staff-officers are now stationed in the Pontifical and Neapolitan States, to make accurate surveys of them for the large maps which are to be constructed for the Austrian government.—The journals state that a company has been formed at Lucca, for the purpose of constructing a railroad from that city to Pisa. As the ground is favourable, if the Tuscan Government sanction the undertaking it is thought that it will be completed in the course of the ensuing summer, and as the railroad from Pisa to Leghorn will be finished at that period, the journey from Lucca to Leghorn will consequently be made in a few hours.

RUSSIA.—Accounts from St. Petersburg to the 8th inst. positively affirm that the army will be considerably reduced immediately after the new year. They add that some steps preliminary to the measure have already been taken; that the places of commandants in several fortresses have been abolished; and that the battalions of the reserve in the regiments of infantry are to be broken up. These accounts also state that at length confirmed winter weather had set in, and that there was sufficient depth of snow for good sledge roads. The cold was already 27 degrees below freezing point by Fahrenheit.

TURKEY.—We have received, by way of Vienna, letters from Constantinople to the 29th ult. They state that since the Porte sent its late threatening message, announcing that the Sultan was determined to take satisfaction of the Greek government, the Divan had again resolved to wait the result of an application made by the Greek Ambassador to his government in the beginning of the present month, requiring further instructions. It appears to be the general opinion, from the firm and decided character of Izzet Mehemet, that he will, if the great Powers do not interfere, compel the Greek government by force of arms to comply with his wishes. Hopes, however, were entertained, that Sir S. Canning would, on his arrival, unite with Baron de Bourqueney, the French ambassador, in bringing about a speedy adjustment of these differences. Reports were in circulation in the capital of intended sacrifices of salary on the part of the Grand Vizier and Tahir Pacha. The income of the first is 10,000*l.* a-year, which, it is said, will be reduced to 7500*l.*; and that of the latter, 7500*l.*, which, it is understood, will, by his own consent, be diminished to 5000*l.* It seems, however, that there had been no official communication yet made on the subject to the Porte. It is stated that Baron de Bourqueney has had a long conference with Izzet Mehemet Pacha relative to the establishment of the new Protestant bishop at Jerusalem. The ambassador is said to have complained that the King of France had not been consulted on the subject; from which it is inferred that the proposed establishment inspires the French Government with distrust. The Grand Vizier is reported to have replied in the most flattering terms to M. de Bourqueney. Schekib Effendi, late ambassador to the Court of St. James, had been appointed Councillor of State, and Osman Bey had been promoted to the rank of Iftissar Nasiri. The sanatory state of the capital was satisfactory as to the plague, but the small-pox prevailed to a serious extent, and had proved particularly fatal. The Austrian Admiral Bandeira, commanding the Austrian squadron in the Levant, paid his farewell visit to the Grand Vizier on the 27th ult., and sailed for Smyrna on the following day.—According to intelligence received from Bosnia a considerable body of cavalry had been sent for from Constantinople. The administration of the finances had been restored to the Pacha of Bosnia. In the Herzegowina the Christian population, it is said, had been driven from their habitations, and were wandering in the woods, while anarchy, it is added, universally prevailed.

EGYPT.—Private correspondence from Alexandria, dated the 6th inst., announces the arrival of the French Consul, Baron de Billing, in that city on the 4th inst., accompanied by M. Latour Maubourg, *attaché* to the Consulate. Accounts had been received at Alexandria from Sennaar, stating that Ahmet Pacha was about to make war upon the tribe of Bishari, who had been employed in the *gazowa*, or hunting negroes, for the purpose of reducing them to slavery, and had been in consequence exempt from the payment of tribute to Government. Ahmet Pacha, however, wishing to compel them to pay the capitation tax, they had revolted, and the Pacha demanded reinforcements, in consequence of which demand a body of Albanians had been despatched from Cairo for Abyssinia. The term for which the *appalte*, or exclusive right to deal in wine and spirituous liquors, was leased having expired, Government had taken this branch of commerce into its own hands. Europeans, it is said, are to have the privilege of receiving wine and spirituous liquors for their private use duty free, but are forbidden to trade in them. Monsignor Perpetuo di Solero was preparing to leave Alexandria for Jerusalem, in order to be there on the arrival of the Protestant bishop. It is said that the Porte had not yet granted any firman for the English prelate.

UNITED STATES.—The packet-ship *Cambridge* arrived at Liverpool on Saturday, bringing papers of three days' later date than those brought by the *Columbia* last week. They do not, however, contain any intelligence of importance. The Treasury of the United States was bankrupt, owing, it is stated, to the failure of the loan, to which the capitalists would not subscribe to the full amount. The members of Congress, it is added, "could not get their wages, the judges of the courts their salaries, nor the functionaries their pay." The deficiency in the Treasury was estimated at more than 600,000 dollars. The Senate had had the new fiscal scheme of the Executive under consideration. It would, it was expected, encounter a determined opposition, which it was thought would prove fatal to the measure. The House of Representatives was still debating on the new tariff. Sir C. Bagot, the new Governor-General of Canada, landed on the 29th ult., and was still at New York. He was expected in a day or two to leave for Montreal or Kingston. Lord Morpeth was about to quit New York for the south. A large meeting had been held on the 30th ult., in the County Court-house, Philadelphia, on the subject of taxation and repudiation. Some opposition was made to the proceedings, but the repudiators seem to have prevailed. Resolutions and a declaration were agreed to, the latter distinctly denying that the State was under any obligation to pay debts which had been illegally and unconstitutionally contracted. Two new schooners, built and armed at New York for the Mexican Government, had been seized in that port by the Collector. The opening of a new railroad from Boston to Albany had taken place on the 28th ult., which is said to be the most perfect of the railroads of the United States. The inhabitants of New York seem to fear it may draw a large portion of their western customers to their rival, Boston; and a new line direct from New York to Albany is talked of.

BUENOS AYRES.—In the Buenos Ayres papers received on Thursday, which come down to the 18th of November, the death of Lavalle is confirmed; with the dispersion of his troops and the slaughter of many of his leading men. The announcement had been made through the usual official channel, the *Gazette*, but, what is somewhat singular, the manner in which the great leader of the Unitarians came to his end is not given; all is left to conjecture on that head, but that he is dead there is no reason to doubt. Respecting the fate of La Madrid nothing certain was known. Two Indians, who had lately come over the Cordilleras, stated that before their departure from Chili, a body of about twenty men had reached the first post-house in great distress, and that on their passage across they discovered nearly 100 dead, upon some of whom they found considerable sums in gold. From Corrientes, the quarter to which is now directed the attention of the Argentine forces as the stronghold of the Unitarians, the last accounts stated that Generals Pas and Ferri had retreated across the river, upon the north bank of which General Echague had encamped. In the Banda Oriental, the Rivera Government, as one means of preserving the integrity of the state, had ordered a general enrolment of slaves. Rosas' company at Santos Luguires was about to break up, in consequence of the frequent desertions of his troops to Don Frutos. The attempt of the Montevidean Government to open the navigation of the Uruguay is said to have failed. The British brig *Nautilus* had made the experiment, but was sent back by the commandant of the island of St. Martin Garcia. As the natural result of the receipt of the intelligence of the death of Lavalle, there had been the most joyous festivities at Buenos Ayres; and Rosas, who is described as the "enlightened genius, the illustrious restorer of the laws," had had laid at his feet the most flattering addresses on the success attending the operations of the troops in the interior.

CITY.

Money Market, Friday.—Consols for money left off at 89⅛, ¼; ditto Account, 89⅜, ½; Three per Cents. Reduced, 89⅝, ¾; Three-and-a-Half per Cents. Reduced, 99⅝, ¾; New Three-and-a-Half per Cents., 98¾, ⅞; Long Annuities (expiring Jan. 5, 1860), 12⅝; India Stock, 248⅛; Bank Stock, 168½.

Metropolis and its Vicinity.

Arrival of the King of Prussia.—On Saturday the King of Prussia landed at Greenwich Hospital, on his arrival in this country, to be present as one of the sponsors at the christening of the Prince of Wales. From an early hour the town was a scene of great bustle and excitement, and thousands of persons, who had been disappointed by the non-arrival of his Majesty on the previous day as expected, assembled in the quadrangle and neighbourhood, and every available spot where a view could be had of the ceremonial of the disembarkation. The River also presented a gay and animated appearance. About half-past one Prince Albert arrived from Windsor, and was received by the governor, Sir R. Stopford, the Duke of Wellington, and several other members of the Cabinet. There were also assembled at the governor's house a number of other distinguished individuals, among whom were the Princess Sophia Matilda and the members of the Prussian embassy. About two, one of the steamers arrived, bringing the retinue and luggage of the King; and shortly after, the steamer having his Majesty on board hove in sight, bearing the Prussian flag at the main, and at a quarter past two dropped anchor opposite the stairs. Great excitement now prevailed among the assembled multitude; and notwithstanding the extreme inclemency of the weather, a heavy fall of snow and sleet continuing the whole afternoon, even ladies persisted in braving it, in order to have a view of his Majesty on landing. Prince Albert, it is said, also evinced great anxiety to leave the governor's house, even before it became necessary; and on Sir R. Stopford's representing that his Royal Highness would risk taking cold, he observed, "I do not care for the weather; I shall not catch cold; it is a beautiful sight." The Admiralty barge, under the command of Sir G. Cockburn, now put off in order to receive his Majesty; and Prince Albert, followed by the Governor, the Duke of Wellington, and the other distinguished persons present, descended to the stairs and received the King on his landing; the moment of which was the signal for a salute of 21 guns from the Royal Artillery, while a salvo was discharged from the steamer. The King and Prince Albert having warmly greeted each other, his Royal Highness introduced the Duke of Wellington, Lord Aberdeen, and Sir R. Stopford; after which the Royal party proceeded to the governor's house, his Majesty on his way being enthusiastically cheered both by the numerous company assembled, and by the whole body of pensioners and boys of the hospital schools, who had been drawn up in order along the quadrangle. A guard of honour composed of the Royal Marines, on his Majesty reaching the gateway, presented arms, the colours were lowered, and the band struck up the national anthem. Notwithstanding the unpropitious state of the weather, the whole scene was enlivening and brilliant, and the reception of the King most hearty. His Majesty, who acknowledged by repeatedly bowing the cheers of the company, appeared gratified at his cordial reception. In person he is described as being about 5 feet 8 inches in height; and his figure is somewhat full, but well made. He is of fair complexion with blue eyes; the form of his face being round, and the expression good-humoured and benevolent. He was dressed in plain clothes, and wore a large cloak. Having remained about a quarter of an hour in the governor's house, where a *déjeûné* had been prepared, his Majesty and Prince Albert entered their carriage, and accompanied by a guard of honour, composed of the Life Guards, and followed by four other carriages containing the royal suite, started for Windsor, amid the loud and long-continued cheering of the multitudes, who had assembled along the streets to greet his Majesty as he passed. The Royal *cortége* proceeded by Wandsworth, Kingston, Hammersmith, and Staines, at each of which places, and along the whole line of road, great anxiety was evinced by numbers of persons who had assembled to gain a view of his Majesty, who was enthusiastically cheered by them, and who repeatedly bowed in acknowledgment, seeming much pleased with the interest and warm feeling universally manifested towards him.

Visit of the King to the Metropolis. — On Monday the King of Prussia left Windsor, and arrived in town by a special train by the Great Western Railway. On arriving at Paddington, his Majesty and suite proceeded in three of the Queen Dowager's carriages to Westminster Abbey; and having spent some time in viewing that edifice, proceeded to the House of Peers, and after inspecting both Houses of Parliament, entered Westminster Hall, and from thence proceeded to Buckingham Palace. The King appeared to be much pleased with the different objects of interest submitted to his notice; more particularly with the interior of the Abbey, and the paraphernalia connected with the coronation, which, it is said, his Majesty expressed a particular wish to inspect. His Majesty also expressed admiration at the grand scale on which the new Houses of Parliament are preparing, and with the spacious interior of Westminster Hall. After leaving Buckingham Palace, his Majesty and suite paid a visit to the Queen Dowager at Marlborough-house, where a *déjeûné* was served to the illustrious party. Before leaving town, his Majesty also visited the Senior United Service Club in Pall-mall, in consequence of a resolution of the Committee of that club soliciting his Majesty to become a permanent honorary member of the club. In place of a written answer, his Majesty personally replied by his royal presence, unexpected, it is said, by the Committee and members. His Majesty was received by the Committee of Management and about 150 members of the club. It appears that his Majesty's father, the late King, was an honorary member, and that the Kings of France, the Netherlands, Hanover, and Belgium are the other sovereigns who are members of this club. His Majesty's route on his return was through Pall-mall, Waterloo-place, Regent-street, Portland-place, and the New-road, to the railway terminus at Paddington, which his Majesty again quitted by a special train at half-past four, on his return to Windsor Castle. — A Court of Common Council was held on Monday, for the purpose of adopting measures to show the respect entertained by the Corporation of London for his Majesty the King of Prussia. A long discussion took place as to the propriety of giving a banquet to his Majesty at the Guildhall; but the proposal was finally overruled, and it was resolved that a suitable address, ornamentally written and emblazoned, should be presented to his Majesty instead. On Thursday, by the King's appointment, the Lord Mayor and civic authorities waited on his Majesty with the address at Buckingham Palace, and were very graciously received. The Address proceeded to state that the corporation of London, feeling greatly interested in every event which affected the domestic happiness of the Queen and her Royal Consort, hailed with great pleasure and satisfaction his Majesty's presence as one of the sponsors to a Prince who, they trusted, would in the fulness of time ascend the throne of these realms, the protector of the religion and liberties of the nation. It concluded by expressing the earnest wishes of the Corporation that his Majesty's presence in this country might tend to increase and perpetuate a friendship and alliance so essential to the Protestant interest, and eminently calculated to promote the liberties, the happiness, and welfare of the British and Prussian nations. His Majesty in reply thanked them warmly for the interest they took in his arrival in this country. He had seized, he said, with particular pleasure the opportunity which the kind invitation of the Queen had afforded him of showing the high regard and sincere friendship he felt for their justly-beloved Sovereign, and of being one of the sponsors to the Royal Infant, whom he prayed God would bless. It would be to him a source of high gratification to find that his visit to this country would contribute to increase the friendly relations existing between the two countries—relations so important for the maintenance and development of all the blessings of peace, and for the furthering of the civilisation which is founded on Christian piety and virtue. He was glad to have had this opportunity of expressing these his feelings to the Lord Mayor, Aldermen, and Commons of the City of London. The Aldermen and officers of the Corporation having been presented to his Majesty, the deputation retired. The King, after holding a Court for the reception of the foreign diplomatic body, and having partaken of a *déjeûné*, left town for Hampton Court Palace to view "the Cartoons."

Rejoicings in the Metropolis.—Tuesday being the day appointed for the christening of the Prince of Wales, the heads of the leading mercantile establishments in the City made known their intention to abstain from business on that day; and the Lord Mayor directed the Guildhall and other City offices to be shut, and recommended that the day should be made a general holiday, to give an opportunity to all classes for celebrating the event in a manner suitable to the occasion. In consequence of these arrangements little business was transacted in any part of London on Tuesday, which was made a day of general rejoicing; most of the public companies giving dinners, and the numerous poor in the Metropolis being supplied with food and other means of enjoying themselves. In the evening there was a general illumination, more particularly west of Temple-bar; the different club-houses in the neighbourhood of Pall-mall presenting several brilliant devices. Great crowds of persons thronged the streets as usual on these occasions, to witness the display, but no accidents or disturbance of the peace occurred.

The Weather. — The weather still continues variable and unsettled. On Sunday and Monday the frost was very severe, and during Monday night there was a slight fall of snow. A general thaw, however, took place the following day, the result of which was that the streets of the Metropolis were greatly obstructed with half-thawed snow and dirt. On Wednesday there was a severe storm of wind that lasted 24 hours, and seems to have extended all over the country, and occasioned much damage to the shipping; the temperature, however, became much milder, and continued so until yesterday, when the wind shifting, it again became cold, and the frost returned. In the Parks the ice since Tuesday has been in a sloppy and dangerous condition, and few skaters have been bold enough to venture on it since that time. There have been a few immersions, but no accident of a serious nature occurred.

The Tower.—An official return has just been made to the Board of Ordnance of the exact amount of military and naval stores destroyed in the great armoury during the late fire. From this it appears that, at the period of the fire, the number of arms in the armoury was considerably below the average amount, which is 600,000 stand. The number of percussion muskets destroyed was 11,000, with bayonets 26,000. Flint locks 22,000, percussion locks 7,000; 12,158 pistols, 75 double-barrelled pistols with moveable butts, 1,378 swords, 2,271 sword-blades, 2,026 plug bayonets, 192 spears, 95 pikes, 210 musquetoons, 709 carbines, 3 wall-pieces, 279 cuirasses, 276 helmets, and 52 drums. Amongst the relics destroyed was a military trophy, only erected, under the direction of Mr. Stacey, the keeper of the stores in the armoury, two days prior to the fire—consisting of Chinese arms, &c., taken by the British troops at the capture of Chusan. Several of the large pieces of ordnance still remain in the ruins; and in the south-west portion some have become so amalgamated with the other metal, by the fire, as to form a mass of such magnitude as to render its removal next to an impossibility. The west-end wall of the armoury is razed to the ground. The Board of Ordnance have determined on preserving to the public most of the large cannon and other trophies which are in any way whole, and orders have been issued that those which are injured or broken shall be sent to Woolwich, where models will be taken, and the same metal recast into their original form. The loss sustained by the fire is now estimated to be a quarter of a million of money. The Crown jewels have not yet left the custody of Messrs. Rundle and Bridge, nor will they, it is understood, be removed until some decision is come to by Parliament as to whether the remains of the armoury shall be pulled down, or a new erection take place.

Public Meetings. — On Wednesday the half-yearly meeting of the proprietors of the United Mexican Mining Association took place, Sir J. Easthope in the chair. The first part of the Report alluded to the Mine Rayas, on which the amount of outlay was 169,970 dollars, and the amount of returns 164,460 dollars, leaving a loss of 5,510 dollars to the 30th June, 1841. The amount spent on the mine in the three subsequent months was 105,884 dollars, and the returns 94,378 dollars, leaving a loss of 11,506 dollars. The value of ore then in hand was 29,777 dollars. No improvement in the mine was expected till it was thoroughly investigated, which would be when the new contracts are obtained. Since the last meeting, Mr. Shoolbred had remitted 2,920*l.* 18*s.* 4*d.*, in dollars; and on the 16th Oct., his assets were 23,865 dollars, and a claim on Government for 9,054 dollars. The finances in London to the 31st Dec. were—assets, 10,118*l.* 11*s.* 5*d.*, from which deduct liabilities, 2,032*l.* 10*s.*, there remained a balance of 8,806*l.* 1*s.* 5*d.* at the bankers'. After some conversation, the report was unanimously adopted. — On Tuesday a special general meeting was held of the proprietors of the Union Bank of Australia, J. B. Smith, Esq., in the chair. It appeared from the Report that the accounts received from New South Wales and Van Diemen's Land since June were highly satisfactory. The amount of undivided profits to that date was 46,220*l.* 8*s.* 6*d.*, to which add the profit of the last half-year, less the expenses of the branches, and in London, amounting to 33,564*l.* 16*s.* 7*d.*, which left a balance, after further deductions, of 54,785*l.* 5*s.* 1*d.* of undivided profit. The result of the foregoing statement enabled the Directors to declare a dividend of 25*s.* per share on the original shares, and in the second series 10*s.* per share, which was after the rate of 10 per cent. per annum. The reserve fund balance to the end of Dec. was 15,198*l.* 6*s.* 6*d.* The report was adopted unanimously. A discussion took place between the Directors and several of the Proprietors, during which the chairman said it was their intention to apply for an Act of Incorporation.—On Saturday a meeting of the Spitalfields weavers was held, when it appeared from the statements made that great distress still exists amongst that class of operatives, and that it will be necessary to call for additional subscriptions to aid in supporting them.

Losses at Sea.—On Saturday accounts were received at Lloyd's of the wreck of the ship *Sophia*, of this port, which happened on the night of the 2d Oct., attended with a serious loss of life. She was on her voyage from New Zealand to Kiapara, having on board a rich cargo; when it seems she encountered a heavy gale of wind off the Bay of Islands. The master, Capt. Harrison, and ten seamen saved themselves by clinging to the rigging and portions of the wreck; but the remainder, consisting of 28 seamen and passengers, and two women, were all drowned. On Saturday other accounts were received respecting the loss of three other ships, the schooner *Montagnaise*, of Belfast, which will be found noticed under our Irish intelligence; the *Glengarry*, from St. Thomas's, and a brig unknown. The *Glengarry* was wrecked on the 13th Dec., on the Turk Islands, and the unknown brig is supposed to have gone down off the Gravelines Lights, with the whole of the crew. The wreck was discovered by the crew of H.M. steamer *Widgeon*, who endeavoured to trace out her name, but were unable.

Metropolitan Post.—The following is a statement of the letters which have passed through the General and district Metropolitan posts during the four weeks ending the 22d inst., as compared with the corresponding periods in 1841-1839: Through the General post—four weeks ending Jan. 22, 1842, 5,266,339; corresponding period of 1841, 4,663,353; do., as nearly as can be given, of 1839, 1,543,375. Increase since 1840 on the four weeks' letters, 602,986; do., since 1839, 3,722,964. Through the District post, four weeks ending Jan. 22, 1842, 1,890,898; corresponding period of 1841, 1,789,184; do., as nearly as can be given, of 1839, 1,067,358. Increase since 1841 on the four weeks' letters, 101,714; do., since 1839, 823,540.

Mortality of the Metropolis.—The following is the number of deaths in the Metropolis, from all causes, registered in the week ending Saturday, the 15th inst.:—males, 522; females, 520; total, 1,042. Weekly average, 1838-9-40-1—males, 467; females, 445; total, 912.

Fires. — On Sunday a fire broke out at the King's Arms public-house, Rotherhithe. It was first discovered under the flooring over the spirit-room, and the flames were not subdued before considerable damage was done to the building and stock. During the fire Mr. Morley was robbed of a quantity of silver plate.—On Saturday evening a serious fire broke out on the premises of Mr. Sowerby, hairdresser, High-street, Southwark, and was not extinguished before much damage was done to the stock and furniture.—On the same evening another fire was discovered in the house of Mr. Macartie, baker, Great Windmill-street, Haymarket. It is supposed to have been caused by some clothes catching fire from a candle, and was soon got under.—On Monday a fire was discovered in the Holborn Union Workhouse. It originated from a wooden beam that crossed the flue of the kitchen fire, and on the arrival of the engines it was got under without difficulty, and before any damage was done.

Robbery.—A burglary of a daring description was committed during Saturday night in the house of Mr. Chandler, Ship Tavern, Milbank. The thieves appear to have effected their entrance into the house by wrenching up the cellar-flap in the street, and dropping into the vault; they had then broken the cellar-door open and ascended the kitchen stairs to the bar, when they forced down the shutters and broke open sixteen drawers, a desk, and the whole of the cupboards. A large box belonging to a benefit society held at the house, and having three locks on it, was broken to pieces, and the whole amount of its contents taken. Although great damage has been done to the premises, the amount of property stolen was not considerable, being only a small quantity of plate, and a few articles of wearing apparel. The thieves have not been traced.

Kensington.—A meeting has been held in this parish pursuant to public notice, "further to consider the best means to be adopted to obtain a dissolution of the Kensington Union, &c." Archdeacon Pott in the chair. In reply to a question from Mr. Davies, the vestry-clerk stated that no answer had been received from the board of guardians of the union to the official copy of the resolution passed at a previous vestry, urging on the consideration of the board the necessity of the separation of the parish of St. Mary Abbotts from the Union. Several gentlemen having expressed their disapprobation at this mark of disrespect on the part of the board to the parish, it was proposed that a petition on the subject should be drawn up, to be ready for presentation to Parliament, as soon as the Speaker took the chair. Mr. Hutchins, who proposed this resolution, thought, under all the circumstances, that this course would be best, as Kensington was not a parish that would be lightly looked upon by either the Poor-law Commissioners or the Parliament. Mr. Percival said he attended as the representative of a large body of the rate-payers, who had formed themselves into an association called "The Rate-payers' Association," for the purpose of aiding the parochial authorities in obtaining a dissolution of the union, to suggest to the vestry the propriety of not adjourning beyond a fortnight, and in the mean time of appointing a committee to draw up the reasons why a dissolution of the union had become of such vital importance to the parish. A discussion of some hours' duration ensued, during which it was resolved, "That the trustees of the national school be requested to allow the use of that room for the general meetings of the Rate-payers' Association; that the thanks of the vestry be given to the guardians for Kensington, for their opposition at the board to a continuance of the union;" and a committee was appointed to draw up the petition to Parliament.

Provincial News.

WE have received from a number of provincial towns and villages reports of the rejoicings which took place on Tuesday, the day of the Christening of H.R.H. the Prince of Wales. These have been of the ordinary character usual on similar occasions, viz. public meetings, dinners, balls, and illuminations, and need not be repeated. In Lancaster, and in most of the large towns and manufacturing districts, charitable contributions were collected for the relief of the distressed poor; and a plentiful supply of food, and the other necessaries of life, were distributed to the lower classes, who were thus afforded the means of enjoying themselves, and of celebrating the day in a manner suitable to the happy occasion.

Derby.—A serious fire has occurred on the premises of Mr. Carrington, of Croxden Abbey. The alarm, it seems, was first given by a watch-dog, but before the inmates were roused, or assistance could be procured, the flames had gained so serious a height that the whole of a large barn, with a quantity of fodder, and some barley, together with an adjoining cattle-shed, were entirely consumed. In the cattle-shed 24 cows perished, and others were much injured. By the exertions of the neighbours, the remainder of the buildings, and several large stacks of hay, though frequently in great peril, were fortunately saved. It is said that there is no doubt that the origin of the fire was entirely accidental.—A fire, supposed to be the work of an incendiary, broke out a few days since on the premises of Mr. Meakin, of Borrowash, at an early hour in the evening. It appears that Mr. Meakin was at the time in his stack-yard, when he perceived a fire in the barn, but which had gained such a height as to defy all efforts to extinguish it. The barn, it seems, is within a few yards of the turnpike-road, and it is thought that whoever had been guilty of the act came from thence, as footmarks were visible in the snow from the highway to the building. The barn contained a quantity of wheat, barley, and a variety of farming implements, all of which were entirely consumed.

Durham.—A meeting of delegates from numerous parishes in this county has been recently held, when it was unanimously resolved to petition Parliament, immediately on its re-assembling, against the rural police system. A similar demonstration of public feeling against the continuance of this force has lately been exhibited in several other counties, particularly in Gloucestershire and Wiltshire.

Howden.—A few days since a fire was discovered in a flax house, upon the premises of Mr. Singleton, farmer in this town, which in a short time completely destroyed the building, together with its contents; a large stack of beans was also considerably damaged. It is supposed that the fire was occasioned by some of the men employed in dressing the flax going into the place to smoke a pipe of tobacco.

Liverpool.—The town-council having declined to purchase land for the purpose of forming a park for the use and recreation of the public, Mr. R. V. Yates has purchased from the Earl of Sefton a spot of ground of the extent of 43 acres, two-thirds of which are to be laid out for a park for the use of the public, and the remaining third to be appropriated to sites for villas. Lord Sefton, it is said, receives 1100*l.* per acre; so that the purchase-money for the whole will exceed 47,000*l.* The land abuts, on the south, to Ullet-lane, which runs from the Park Chapel past the end of the Aigburth-road, and on the east, to Lodge-lane, which joins Ullet-lane. There is no doubt that the comfort and recreation of the inhabitants of this large city will be greatly promoted by the formation of a public park in the immediate vicinity of the town.—On Tuesday a numerous meeting of ship-masters, captains, and mates of vessels engaged in the merchant-service, was held in this city, Mr. W. Potter in the chair, for the purpose of taking into consideration the propriety of memorialising the Government to appoint boards of examination for captains and mates of vessels previous to their being inducted into those responsible situations. The meeting was addressed by several speakers, who endeavoured to show the necessity of such examinations, and stated that under the present irregular system of appointing ignorant persons to the command of ships at sea a serious loss both of life and property had occurred, which might have been avoided if the commanders of the vessels had been skilful navigators. Several resolutions were passed, and the following memorial to the Earl of Ripon, as President of the Board of Trade, was finally adopted:—"The memorialists begged to call the attention of the Board of Trade to the lamentable loss of life and property annually occurring by shipwreck, and to the indisputable fact that many of such disasters at sea were attributable to the incompetency of those placed in charge of merchant-vessels; and the object of the memorialists was to submit to the Board of Trade the necessity of requiring that all masters and mates should have passed an examination, and been found duly qualified, before it is permitted that life and property be placed in their charge. The memorialists believed that if Boards existed in the chief ports of the United Kingdom, by whom such examinations might be made and diplomas granted, the evil referred to would be removed, and the standing and character of the merchant-service raised, and a deplorable amount of loss prevented. The memorialists further suggested that such board should have power to investigate all cases of shipwreck, and to grant or withhold renewed certificates according to the circumstances of the case. Similar regulations to those desired existed in France, Denmark, Holland, and other countries of Europe, and the attention of the hon. board is also called to the fact that in this country, in other professions, such examinations were deemed absolutely requisite, whilst in the merchant-service, an arduous and responsible one, they had hitherto been entirely neglected. The memorialists did not deem it necessary to advert to the constitution and working of such boards of examination, but if desired were ready to place such plans and information as they possessed at the disposal of the Board of Trade." During the meeting numerous instances were given where ships had been lost, and lives sacrificed, through the ignorance of captains.

Newcastle.—A public meeting of the ship-owners of the ports of Newcastle, Sunderland, and Stockton, has been held in this town, at which a resolution was moved, affirming the existence of differences of opinion among ship-owners, and desiring an inquiry by Parliament into the distress of the shipping interest, and its causes. This was met by an amendment, declaring the cause of the distress to be the alteration made in the Navigation Laws by the Reciprocity Act, and calling for an inquiry into the operation of that abandonment of the previous policy of England. The majority decided in favour of the amendment.

Norwich.—A few days since a serious accident occurred to the Magnet coach, running between this city and London. It seems that there being a thick fog, the coachman had been driving gently, and perceiving a waggon approach when near Bournbridge, he pulled up as near the proper side of the road as possible; the waggoner, however, is supposed to have been asleep, and his horses proceeding unchecked, the wheels of the waggon caught those of the coach, and overturned it. The coachman and the guard were severely injured, and one of the coach-horses so much hurt that it has since been killed; the passengers, however, escaped with only slight bruises.

Nottingham.—A local paper, the *Mercury*, informs us that a deputation from this town and Leicester has waited on Sir R. Peel at the Home-office, on the subject of the Corn-laws. The deputation were courteously received by the Premier, who, at the close of their statements, expressed a desire to be furnished with information and suggestions. The deputation then gave it as their opinion that the "sliding scale," under almost any modification, would be unfair towards distant countries, and more especially injurious to the trade with the United States; and, therefore, urged upon the attention of the Rt. Hon. Baronet the adoption of a moderate fixed duty, whereby, they said, the importation of grain from America might be rendered a safe operation for the merchant. They proceeded to show that if such fixed duty were adopted, this country would furnish the Americans with the means of paying for an increased amount of British goods, and thus accomplish two important objects—obtain a supply of food for our operatives, and the employment of their labour in purchasing it. Sir R. Peel, after cautioning the members of the deputation against drawing any other inference from such questions as he might put, than that he was desirous of obtaining every possible information on the subject, asked them whether an improved mode of taking the averages, and such a modification of the sliding scale as would lessen materially the extent and suddenness of the fluctuations, would not meet the case? The deputation, in reply, said that it was the almost unanimous conviction of those engaged in commerce, that a fluctuating duty was essentially mischievous; but at the same time suggested that if Government were determined to adhere to a fluctuating duty, its effects might to some extent be counteracted, if time were allowed to exporters from distant countries to bring their corn into the British market without being subjected to any higher rate of duty than that charged on the earlier importations from the Continent of Europe. Sir Robert observed that such an arrangement might be a contravention of existing treaties with Continental Powers, with whom—as, for instance, with Denmark—it had been stipulated "that no other duty should be charged on their grain than was charged on that coming from the most favoured nation." The deputation replied, that such a stipulation was certainly a very conclusive argument in favour of a moderate fixed duty. Sir Robert, in conclusion, gave expression to his strong desire to encourage our trade with the United States, promised to give his attention to the statements the deputation had then made, as well as to any suggestions they might hereafter think proper to make to him.—An attempt has recently been made to set fire to Bunny church. It seems that one of the pew-doors had been smeared with oil and turpentine or some other combustible liquid, and underneath it had been kindled a fire with some shavings, which had blazed up and blackened the pew-door, but had fortunately gone out without doing any further damage. The incendiary is supposed to have made his entrance through a casement of the church, out of which one of the panes had been removed. The back wall of a line of houses, it seems, forms the boundary of the churchyard, so that, had the attempt succeeded, it is thought that it would have been some time before the fire would have been discovered, which might, in consequence, have attained a serious height.

Portsmouth.—On Thursday considerable excitement and alarm was created in this town by the report that H. M. frigate *Vindictive*, Capt. T. Nicholas, C.B., had been driven on shore on the Dean Bank, during the heavy gale of wind that blew the whole of that day from the Westward. It seems that she remained in a perilous situation through the greater part of the night, during which time she was lying on her broadside, with the sea beating over her; and it is thought that had the wind veered at all to the south, she must have been entirely wrecked, and all on board have perished. She succeeded, however, at length in getting off by cutting away her mizenmast and otherwise lightening herself, and by the aid of a steamer sent to her assistance. Besides the loss of her mizenmast, she has sustained other injuries, being much strained and making a considerable quantity of water; and she will, it seems, require being at once taken into dock to be repaired. It is announced that Sir Thomas Cochrane will hoist his flag in the *Hastings*, 74, as the flag-ship in the East Indies, and that the *Winchester*, 52, now expected from North America, will be re-commissioned for the flag of Sir Jocelyn Percy as commander-in-chief at the Cape.—A few days since a message, it is said, was received in this town from the Home-office, to ascertain if accommodation could be found in the *Isabella* convict-ship, lying at Spithead, and bound to Hobart Town, for Mr. Beaumont Smith's passage to his place of transportation, keeping in view that he was to be placed separate and apart, during the passage, from the other felons. The answer was at first thought to be in the affirmative, as it was supposed that Mr. Smith was the following day brought down by the railway to Southampton, and conveyed on board the ship; but the report appears to be without foundation, as he still remains at Woolwich.

Southampton.—A special general meeting of the shareholders of the Southampton Dock Company has been held, to consider the propriety of applying to Parliament for power to raise an additional 100,000*l.* for completing the docks; for converting the present share list of 250,000*l.* into the same amount of stock (as also the 100,000*l.*), and to extinguish 2000 shares, on which the calls could not be obtained. The chairman, Mr. J. Liggins, entered fully into the nature of the undertaking, and the advantages it would hold out to the proprietors when completed. Mr. Hill said 100,000*l.* would not be sufficient, and objected to the manner in which the concern had been managed; and was followed by Mr. Richards, who entered fully into the items of the estimate, and concluded by pressing for an adjournment of a fortnight to consider the subject. Mr. Giles, the engineer, then went into particulars respecting the state of the docks, one of which, it was expected, would be opened by midsummer. After a long discussion between the proprietors and the directors, the resolution, embodying the objects of the meeting, was carried by a large majority.

Stockport.—The overseers of the poor of this township not being able to meet the call of the Board of Guardians in consequence of the large amount and frequency of the calls, and the great number of ratepayers in arrear, have been driven to the necessity of summoning the defaulters before the magistrates, who amount to about 3000 persons. The overseers themselves, it seems, were summoned before the magistrates at the recent county petty sessions for two calls, amounting together to upwards of 900*l.*, and orders were made upon them for payment.

Tiverton.—A few days since this town was thrown into a state of excitement by the intelligence that nine prisoners had escaped from the borough bridewell. They have, however, been all re-captured except one. It appears that they broke through the wall with a small chisel, and the building not being a strong one they soon got through without the keeper's hearing them. This, it seems, is the second escape from this jail within a short time. All the men recaptured have been re-sentenced at the sessions which have just been held.

Windsor.—His Majesty the King of Prussia, accompanied by Prince Albert in one of her Majesty's travelling-carriages, and attended by a guard of honour of the 11th Hussars, arrived in this town about seven on Saturday evening, after his landing at Greenwich. The King was loudly cheered by numbers of persons who, notwithstanding its being dark and the weather very inclement, had assembled to witness his arrival; and on his reaching the grand entrance in the quadrangle of the Castle, his Majesty was received by the Queen, the Duchess of Kent, and all the great officers of the household. The King had a short interview with her Majesty, after which he was conducted to the apartments allotted for his reception. On Tuesday, the day appointed for the christening of the Prince of Wales, this town presented a scene of great gaiety and rejoicing; and the streets were crowded with persons who had been attracted from London and the neighbourhood, with the hope of obtaining a view of the interesting ceremony, an account of which will be found in another part of our paper. In the evening a public dinner, at which the Mayor presided and about 150 persons were present, took place at the Town-hall, in honour of the great event of the day; which was also celebrated by general illuminations, and every other demonstration of joy. On Wednesday new colours were presented by the Duke of Wellington, in the name of Prince Albert, to the 72d Reg. of Highlanders, in the quadrangle of the Castle. In consequence, however, of the unfavourable state of the weather, and there being no admission to the public except by means of tickets, few persons were present on the occasion. The Duke in presenting the colours, complimented the regiment on the high character it had always maintained, and on its present efficient state; and expressed his confidence that the colours now given to them by the Consort of their Sovereign, and in the presence of one of the most poweful monarchs of Europe, would never be tarnished whilst in their possession. Col. Arbuthnot briefly returned thanks for the honour conferred on the regiment. The regiment, which had formed a square whilst the ceremony was taking place, was then drawn up in line, and the King of Prussia, in the dress of a Prussian field-marshal, Prince Albert, in the uniform of his regiment, and the Duke of Wellington in a British field-marshal's uniform, inspected the men; and his Prussian Majesty expressed himself much pleased with their soldier-like appearance. The regiment then went through several evolutions, and retired from the ground. Her Majesty witnessed the ceremony from one of the windows of St. George's Hall. In the course of the day the King of Prussia visited Eton College, with which, it is said, he was highly gratified.

Railways.—A few days since a man named Blanchard, the guard of the luggage-train from Selby to Hull, in attempting to alight at the Staddlethorp station before the train had quite stopped, owing to the slippery state of the ground fell between the platform and the rails, and several waggons passed over him, whereby he was so much injured as to occasion his death the same evening. An inquest has been held on the body, when the jury returned a verdict of "Accidental death, in consequence of deceased having stepped incautiously from the step of the tender whilst the train was in motion." A deodand of 1*s.* was laid on the tender.—The works on the upper portion of the line of the London and Dover Railway are said to be drawing fast to a conclusion, and the line is expected to be opened in May. Between Tonbridge and Ashford the works are in active progress at every point, and the country in this district of the line seems to be very favourable. There are no works of any importance, and for many miles the way is little more than the thickness of the ballast above the natural surface. The "Railway Times" informs us that the proceedings in the French Chambers as to the formation of railways in France have given a favourable impetus to the Dover line. The Anglo-Belgian line, as it is termed, is intended to connect Paris with Belgium by way of Lille, and the two with Calais, by a branch from Arras. The report sent in to the Chambers places this line as the foremost in point of importance and first to be executed; and it is added that since the opening of the Chambers, Government engineers have completed their surveys and detailed estimates for this work, which have been within the last week laid before the Ministers. The French authorities, it is stated, are prepared to expedite the matter, the subject being popular among all classes in France. Hopes, therefore, are entertained that this union between England and France will soon be carried into effect, whereby the three capitals of England, France, and Belgium will, it is said, be brought nearer to each other in point of time than London, Bath, and Birmingham were six years ago.

IRELAND.

Dublin.—A few days since, while the Lord Lieutenant was riding through the streets, accompanied by an aide-de-camp, his Excellency's groom was thrown from his horse and severely hurt. Lord de Grey at once dismounted, sent his aide-de-camp for surgical assistance, and, having committed his own and the groom's horse to the care of the orderly, got on a common hack jaunting-car, and supported the groom to the Castle, where his Excellency himself saw every attention paid to him that his situation required.—Lord and Lady Jemima Eliot left Dublin on Saturday for London.—The convict Delahunt, whose trial and condemnation we noticed in our last, has made a full confession of having committed the murder for which he has been convicted. He has acknowledged that he had no accomplices in the transaction, and that he committed the murder solely with the view of obtaining a reward, by his endeavours to implicate innocent parties in the affair. He remains in prison awaiting his execution, but is represented to be in so weak and debilitated a state that some doubts are entertained whether he will live until he day appointed to carry the sentence into execution.—An adjourned meeting of the Repeal Association was held on Saturday, for the purpose of affording Mr. O'Connell an opportunity of making known his plan of operations for the current year. Mr. O'Connell began his address by saying that he had to propose his mode of action for the year, and suggest those means which might increase their hopes and tend to secure their success. He said he might anticipate all he had to say by one simple sentence, that the people of Ireland were entitled to repeal, and could obtain it whenever they pleased. Mr. O'Connell then proceeded to support this proposition by endeavouring to show that Ireland had never reaped anything but injury and loss from her connexion with England, and that it was an impossibility that she could ever obtain anything useful from an English Parliament. There was no calamity, he said, which Ireland had not suffered; but her hour of tranquil triumph was approaching; her day of rejoicing had yet to come. He had four-fifths of the Roman Catholic clergy with him; indeed he had heard of but one declaring openly against him: and he knew that he had the universal people of Ireland with him. They must, however, consider that they had done nothing as yet. If they did not wish the present state of things, let them seek for the means of preventing them. Let them recollect that no country strong enough to be a nation ought to consent to be a province. That they had the strength, could not be denied; the only thing to be considered was, how they should use it. The first step to be taken was to ascertain how many Irishmen were for Repeal. It was quite manifest that if the whole 8,000,000 were for it, it would be carried at once. Let them all then become members of the association. 1*s.* a year, 1*d.* a month, or ¼*d.* a week, with four weeks' discount, was all that he asked. Let them remember that each shilling signified a man, that it signified one stout heart and two stout arms. Now, he knew that the readiness to enrol was checked by the want of opportunity to enrol, and he would therefore propose a new plan for more effectively carrying out the objects of Repeal by dividing the whole country into districts, and appointing certain wardens in each, for the enrolment of members. Mr. O'Connell concluded a long address by moving that his proposed plan be submitted to the consideration of the association at their next meeting.—The Lord Lieutenant held a levee on Tuesday, which was numerously attended.—On Monday the nomination took place of the candidates for the representation of this city. The Hon. Mr. Caulfield proposed Lord Morpeth, who was seconded in a long speech by Mr. O'Connell. Sir J. K. James then rose and proposed Mr. Gregory, whose nomination was seconded by Mr. G. O. Moore. A show of hands having been called for, it was declared to be in favour of Lord Morpeth. A poll was then demanded, which commenced on Tuesday, and has been proceeding with great vigour on both sides, producing much excitement, but without occasioning any disturbance of the peace of the city.

SCOTLAND.

Edinburgh.—The election of a representative peer of Scotland, in the room of the late Earl of Elgin, has taken place in the Palace of Holyrood; and, there being no contest, the Earl of Home was unanimously elected.

Fife.—Some excitement has prevailed within the few last days in the town and neighbourhood of St. Clairtown, Perth-head, in this county, in consequence of a report that the body of Janet Forret, an aged woman, who lived with one Fergus Wilson, teacher and repairer of watches, of that place, had been found buried in Wilson's garden. As far as has yet been made public, the following appear to be the particulars of this affair. Deceased had lived with the prisoner many years, and, though both had formerly been in easy circumstances, they had latterly become much reduced; so much so, that at last deceased, with the permission of the prisoner, had been in the habit of going about the streets begging. For some months past, however, she had been unable from weakness to perform this task, and had been confined to her apartment. Wilson a few weeks ago applied to the Dysart Kirk Session for relief, which for some reason, not specified, that body refused to grant. In consequence of this refusal he entered the case with the Court of Session, where it is still pending. Deceased having about this time been missed for several days by the neighbours, the prisoner was called on, and inquiries made respecting her; but he always gave evasive answers, stating that she was not in, or that she was ill and could not be seen. Suspicions being at last raised that all was not right, an entrance was demanded by the police, and the house examined, but deceased was nowhere to be found. On searching the garden, however, where the prisoner had been seen digging a few days previously, the body of deceased was at length found buried some feet below the surface. It was removed, and a medical examination made, the result of which was that the surgeons unanimously agreed that the woman had died of starvation, there being nothing in the shape of food in the stomach, and the body being reduced to the merest skeleton. Wilson has since been removed to the jail, and his declaration taken. He asserts that he has done no wrong, that the woman died a natural death, and that the session having refused aliment, he did not apply to them for burial. The case has been taken up by the proper authorities, and will be duly inquired into.

Glasgow.—A few days since, two men, named M'Ginty and M'Culley, two pugilists from Glasgow, were tried before Sheriff Campbell for a breach of the peace, in fighting a pitched battle at Logan's well, in the county of Renfrew, last month. They pleaded "Guilty," and were sentenced both to 40 days' confinement and hard labour in Paisley prison, and to find caution to keep the peace for a limited period, under the pain of further imprisonment. The Sheriff remarked that this was a case that could not be visited with fine, as the probability was, that the equally guilty instigators of the fight might pay the fine, and enable the prisoners to escape without any punishment at all.—A local paper, the *Chronicle*, states that an amended account of the population of Scotland has just been published by authority. It appears that the population of six counties was stated erroneously in the previous account, in consequence of the haste with which it was prepared, in order that it might be laid as soon as possible before Parliament. The following are the counties, with the correct returns of the total number of inhabitants in 1841: Forfar, 170,400; Nairn, 9,218; Orkney and Shetland, 60,796; Ross and Cromarty, 78,980; Roxburgh, 46,003; and Wigtown, 39,179. The population of Glasgow was stated incorrectly to be 257,592, whereas it amounts to 267,463. There is a slight error also in the return of the population of Great Britain, and the islands in the British Seas. The correct number, including the army, navy, and merchant seamen on shore at the time of the census is said to be 18,656,414.

Paisley.—It is stated that the Queen continues to entertain deep sympathy for the sufferings of the distressed operatives in this town, which are represented as still on the increase; and that it was with a view to relieve this distress that her Majesty resolved to appear at the Christening festivities this week in a shawl of Paisley manufacture. In furtherance of this resolution, it seems that an order, by special direction of her Majesty, was received a few days previously to the christening, from the Office of Robes by Provost Henderson, requesting him to select and forward immediately to Windsor Castle samples of the finest patterns of Paisley-made shawls which he could find in the town.

Miscellaneous.

The Niger Expedition.—Letters were received in town on Thursday from Liverpool, announcing the arrival in that port, on the previous evening, of Capt. Trotter, Commander of the Niger Expedition. He was brought home by the Warree from Africa, and is accompanied by the Rev. Mr. M'Shane and Dr. Stranger, with four invalids, one of the men belonging to the expedition having died on the passage home. The following statement of facts respecting this unfortunate expedition is chiefly derived from Capt. Trotter's official report to the Board of Admiralty, and will be read with interest, as giving a summary of all the events that have transpired in connexion with it. On the 20th Aug. the vessels of the expedition commenced the ascent of the river, having passed safely over the bar six days previously. On the 26th they anchored opposite to Eboe, a place situate at the upper angle of the Delta, and distant 120 miles from the sea; and up to this time no case of sickness had occurred amongst the Europeans which did not immediately yield to medical treatment. The weather was very favourable, the thermometer ranging from 74 to 84 degrees, with a clear sky and occasional refreshing showers. After receiving a visit from Obi, the King of Eboe, on which occasion a treaty was concluded with him for the total abolition of the slave trade and human sacrifices, the expedition proceeded on its course, arriving at Iddah, 100 miles higher up, on the 2d Sept. Here, for the first time, the African fever broke out amongst the crew with violence, commencing on board the Albert, and rapidly spreading to the Wilberforce and the Soudan. Capt. Trotter, however, considered it his duty still to persevere, in which resolve the other officers of the squadron fully concurred. Accordingly, after the ratification of a treaty similar to the one already described, with the Attah (King) of Iddah, and the purchase from him of a piece of land, to be chosen higher up the stream, for the establishment of a model farm, the vessels ascended to the confluence of the Niger and the Chadda, 270 miles above the sea, which they reached on the 11th Sept. A tract of land having been fixed on, not far from this point, for the farm, and having been duly made over by accredited agents of the Attah, the stores were landed, and the persons originally appointed to the office left in charge of them. In the mean time disease continued its ravages; and to such an extent did it spread, that on the 19th it was resolved to put the sick, now amounting to 46, on board the Soudan, and to despatch her to the sea. Lieut. Fishbourne, of the Albert, was placed in charge of her, while her Commander, Capt. Bird Allen, removed on board the Albert. The Soudan happily fell in with H.M. steamer Dolphin, to which the sufferers were transferred, and which proceeded with them direct to the Island of Ascension, while the Soudan continued her course to Fernando Po. Meanwhile it was determined by the Commanders of the vessels still up the river to prosecute their voyage, the Wilberforce ascending the Chadda, and the Albert the Niger. The particulars thus far recounted have, by scraps, been already given in this Paper at different times. It seems necessary, however, briefly to recapitulate them, in order perfectly to understand the remainder of the narrative. By sunset on the evening of the 19th (the day on which the Soudan sailed from the confluence) several entirely new cases of fever had broken out on board the Wilberforce; amongst which were her Commander, Capt. William Allen, her Master, and Purser; and the botanist and mineralogist attached to the expedition. It being now considered out of the question either to proceed or remain where they were, it was determined to follow the Soudan; and accordingly on the morning of the 21st the Wilberforce began her downward voyage, having previously taken on board several fresh patients from the Albert. Owing, however, to various stoppages, she did not reach the open sea until the 29th; but on the morning of the 3d Oct. she anchored safely in the port of Clarence, Fernando Po. During her passage to the mouth of the river she lost her Purser, Mr. Wakeham, and after her arrival at Clarence, Mr. Harvey, the Master of the Albert, and Mr. Collman, Assistant-Surgeon of the Soudan. On the 9th the Wilberforce again set sail for Ascension, where she arrived after a tedious passage of more than five weeks, on the 17th Nov. The last accounts received from the Wilberforce convey the gratifying intelligence that the fever appeared to have been almost subdued, and that no serious case of illness remained on board. Returning now to the Albert, we learn that on the 21st Sept. she commenced her ascent up the Niger, and on the 28th arrived at Egga, situate between 50 and 60 miles above the junction of the Chadda, and 320 from the sea. During this short passage she lost two of her seamen, whilst several others were taken ill. Capt. Bird Allen was also attacked within four hours after the departure of the Wilberforce, and Capt. Trotter himself whilst the vessel lay at Egga. At this place the Kroomen were employed in taking a large quantity of firewood; and as soon as this duty was completed, Capt. Trotter, who now saw the necessity of abandoning the enterprise, and whose judgment was confirmed by that of the surgeon, Dr. M'William, gave the necessary orders for returning down the river; and on the 4th Oct. the Albert followed her consorts to the sea. Her condition at this period may be judged of by the fact that she had but a single officer and two or three European seamen capable of performing their duty. The confluence was passed upon the 9th, and immediately afterwards the model farm, where, finding the Europeans all ill of the fever, Capt. Trotter took them on board, and continued to pursue his voyage. On the 12th the vessel anchored off Eboe, and was supplied by King Obi with a quantity of wood, which he had previously got ready for her, and which with great kindness he put on board with the least possible delay. Here Mr. Kingdon, the clerk of the Soudan, died. He had remained ashore at the farm during the Albert's absence at Egga, and was dangerously ill at the period of his re-embarkation. Thus far the Albert had made her way in safety; but her suffering crew could not forget the dangerous bar which was still to be passed before they could leave the region of pestilence and death behind them. Happily, their anxieties on this head were soon relieved, for in the afternoon of the 13th they fell in with the Ethiope steamer, which had been sent after her, and whose Commander, Capt. Becroft, at once put his first engineer on board the Albert, and by great exertions both vessels crossed the bar soon after sunrise on the 16th, and cast anchor in Clarence Cove late in the evening of the following day. Next morning 28 patients were taken ashore, and kindly received into various private houses. Amongst the sufferers were Captains Trotter and Bird Allen; the former was then happily convalescent; the latter, as our readers are aware, died shortly afterwards. The following passage from Capt. Trotter's report describes the results of the voyage: "I have no exact return of the number taken ill in the Wilberforec, but I believe it may be stated that only five white persons escaped the fever in that vessel, whilst there are only four who have not been attacked in the Albert up to the present time, and no white person in the Soudan escaped it; and when I add that Dr. M'William is of opinion that few, if any, will be fit to return to the coast of Africa who have had the fever, and that every Lieutenant excepting Mr. Strange, all the medical officers but Dr. Pritchett and Mr. Thompson (it is doubtful yet whether Dr. M'William has the river fever or not), all the mates, masters, second masters, and clerks, the whole of the engineers and stokers of the expedition, and the gunner of the Albert (the only vessel that has an officer of that rank), have been attacked, their Lordships will be able to form an idea of the paralysed state of the steam-vessels." From these reports it appears that the Albert remained in the river about 45 days; the Wilberforce 25 days; and the Soudan 21 days. The mortality among the officers of these vessels, so far as it was ascertained when Capt. Trotter left Fernando Po, is as follows:—17 deaths on board the Albert; 4 on board the Wilberforce; and 9 on board the Soudan; making altogether thirty deaths already ascertained—including those of Lieut. Stenhouse; Mr. Woodhouse, assistant-surgeon; Mr. Wilmot, clerk; one seaman, and a marine of the Albert, and one seaman of the Soudan, all of whom died subsequently to their arrival at Fernando Po.

Law.

COURT OF CHANCERY.—*Walker* v. *Aston.*—This was an appeal from the Vice-Chancellor. The bill was filed for the administration of the estate of the late Mr. Harvey Aston; and the petitioners, Messrs. Storr and Mortimer, conceiving that the proceedings in the Master's office were going on too slowly, applied, as creditors of the estate, to have the conduct of the cause. The Master refused to report in favour of such a change, and the Vice-Chancellor dismissed their petition with costs. The Lord Chancellor thought the order of the Vice-Chancellor must be confirmed, and the appeal dismissed with costs.

The Attorney-General v. *Wimbourn Minster.*—In this case an information had been filed against the governors of the school at Wimbourn, which is regulated by a charter granted in the fifth of Elizabeth, and its prayer was, that the governors, Mr. Henry Bankes and others, be compelled to make good out of their estates all losses sustained by the charity from imperfect valuations of the tithes which form the principal part of its income. The Master of the Rolls decreed in favour of the relators, and directed the defendants to pay all deficiencies from the year 1836, when the information was filed, such deficiencies to be calculated on the last valuation of the tithes. The relators now appealed against that part of the decree which fixed the commencement of the calculation at so recent a period as the year 1836. After the case had been argued, it was finally arranged that the defendants should pay a sum of 4,000*l.* to the charity, and an additional 1,000*l.* if the new valuation of the tithes should prove higher than the last. It was also agreed that there should be a reference to the Master for a new scheme to administer the charity property.

Walker v. *Fletcher.*—This was a motion to discharge an order of the Vice-Chancellor. It was a case where a ship of defendant's had been run down at sea by a vessel belonging to the plaintiff, the consequence of which was that both were lost, and cross-actions have been commenced by the parties to recover damage for the loss. The Lord Chancellor said the motion must be dismissed with costs.

VICE-CHANCELLOR'S COURT.—*Cockburn* v. *Raphael.*—The object of this petition was to bring under the notice of the Court an alleged misapplication of the dividends of a fund of upwards of 46,000*l.*, which is annually transmitted, with the approbation of the court, to the abbot of the convent of St. Lazarus, and Armenian Archbishop at Venice, under a direction contained in the will of the late Edward Raphael, for the foundation and maintenance of a school for poor Armenian boys, known as the "Raphael College." The Vice-Chancellor thought that the abbot had not misapplied the funds, and the petition was dismissed with costs.

Walker v. *Jefferys.*—His Honour Vice-Chancellor Wigram finally disposed of this case, which has been noticed in a previous Number. He had on a former day expressed himself disposed to direct two issues as to the drowning out of a mine. The parties, however, had concurred in asking the court to decide the case; and after carefully considering the evidence, he felt himself compelled to say that the plaintiff's bill must be dismissed, and with costs.

Wilkinson v. *Page.*—In this case the question related to the validity of an award in certain matters of dispute between the plaintiff, lately partner with Mr. Charles Pearson, the city solicitor, and the defendant, who had agreed to purchase Mr. Pearson's interest, and to join the plaintiff. His Honour Vice-Chancellor Wigram thought that the award was bad. He said it was with great regret that he refused the defendant's motion and acceded to that of the plaintiff. He gave no costs on either motion.

Jones v. *Hughes.*—This was a motion for an interim injunction to restrain proceedings at law in ejectment to recover a leasehold property, which had been taken in execution under a *fi. fa.*, and which, it was contended, was not properly delivered over to the defendant at law without the proper formal assignment. His Honour granted the injunction.

ROLLS COURT.—*Robinson* v. *Bainton.*—The object of the present application was to restrain the defendant from receiving certain sums of money which it was alleged by the plaintiff he had possessed himself of contrary to the provisions of a will of which plaintiff and defendant were both executors.—Order granted.

Bassford v. *Blakesley.*—This was an application on behalf of the plaintiff, Joseph Bassford, for an order to compel the defendant, John Blakesley, his nephew, to produce various deeds and other documents relating to the transfer of some property. Order granted.

Wilson v. *Tindall.*—This was an application to commit William Tindall for the breach of an injunction which had been granted to restrain him from making stearine and elaine out of cocoa-nut oil, but in consequence of his manufacturing the same substances out of the cocoa-nut, the plaintiffs complained that it was a breach of the injunction. The Court considered there had been no wilful breach of the injunction, but directed that the defendant should pay the costs.

COURT OF QUEEN'S BENCH.—*Waters* v. *the Earl of Thanet.*—This was an action on two bills of exchange for 658*l.* and 465*l.* 10*s.* drawn by the defendant, then Mr. H. Tufton, in 1802, who in that year went to France, and was among the prisoners detained there by Buonaparte. Application was at this time made to him for the money, and being unable to pay it, he entered into the following agreement:—"I hereby debar myself the plea of the statute of limitations, in case of being sued; and I promise to pay the full amount, with legal interest, whenever my circumstances enable me to do so, and that I am called on for that purpose." The bills were not put in suit till 1838, when the defendant denied his handwriting to the agreement, and pleaded the statute of limitations as to the bills. A verdict was taken for the plaintiff at the trial, but a rule had since been obtained to set aside the verdict and have a new trial, on the ground that the claim was barred by the statute of limitations. The question was argued at great length some time since, and the Court having taken time to consider it, now delivered an elaborate judgment, deciding in favour of the defendant.

Green v. *Murray.*—This was an action to recover the value of a share in the Metropolitan Wood Pavement Company. The action was founded on a promise, in which the defendant engaged to deliver the share when demanded by the plaintiff. There were circumstances, however, connected with the case that led the Court to decide in favour of the defendants.

Milward v. *Hibbert.*—This was an action to recover, as on an average loss, from the defendant (representing the Mutual Marine Insurance Company) who had insured the steam-boat *Kilkenny* in a sum of money which the proprietors had been obliged to pay to the owner of a number of pigs which had been put on board the vessel for a voyage from Waterford to London. The pigs had been thrown overboard to lighten the vessel in a gale of wind, and the plaintiff having been compelled to pay their owner for them, now sought to be reimbursed by the insurers. The Court granted the rule.

The Queen v. *the Inhabitants of Rishworth.*—In this case the justices had granted an order for the removal of Elizabeth Bothomley, from Rishworth to Stayley, on the ground of a settlement by birth, which was proved by her evidence alone. An appeal had been entered against this order and the sessions had quashed it. The court expressed a clear opinion that the evidence was totally inadmissible. The order of the justices founded on such evidence was bad; and the decision of the sessions quashing it must be confirmed.

The Queen v. *Macnamara and others.*—An indictment against the defendants for conspiracy to procure the return of a particular person as Bridgemaster of the City of London, by means of falsely representing themselves entitled to vote at the election. A jury had convicted some of the defendants on proof that they had actually voted, having no right to vote. Application was now made for a rule to show cause why the judgment should not be arrested, or a new trial granted, on the ground that the verdict could not be supported by the evidence given at the trial.—The court granted the rule.

Brown v. *Chapman.*—An action against the defendant, the Marshal of the Queen's Bench prison, for allowing the escape of a prisoner, who had been arrested by the plaintiff, and committed to the charge of defendant. It appeared, however, that whilst in such custody an indictment was preferred against the prisoner for perjury. On this he was taken by a *habeas corpus* to Newgate. He was at first imprisoned there, but was afterwards bailed, and was then taken back to the Queen's Bench prison, and delivered by the keeper of Newgate to the custody of the marshal. The marshal's officer at first refused to receive him, but at last consented. The prisoner afterwards escaped, and this action was brought. The question under these circumstances was, whether this action would be against the marshal. The Court gave judgment in favour of the defendant.

Exparte Somerrille.—An application on the part of the plaintiff, a naval officer of Plymouth, for a rule to show cause why a criminal information should not be filed against a Devonport newspaper for a slanderous attack upon his character. Rule granted.

Exparte Roper, Esq.—An application for a rule to show cause why leave should not be granted to file a criminal information against a gentleman named Parry, for making statements injurious to the character of Mr. Roper as a magistrate of the county of Flint. Rule granted.

In the matter of the Brighton Gazette.—An application on the part of the magistrates, holding the police court at Brighton, for a rule to show cause why a criminal information should not be filed against the editor of the "Brighton Gazette," for a libel published in that paper on these magistrates. The alleged libel stated that by their decisions they had ceased to command the respect of the public, with other imputations and remarks of a similar kind. The Court was of opinion that the characters of the gentlemen thus impeached would amply protect them against attacks of this kind, without filing a criminal information, and refused the rule.

The Queen v. *The Inhabitants of Whipendine, in the County of Rutland.*—The question in this case was whether a pauper who had gained a settlement by apprenticeship in the parish of St. Martin, Leicester, and had afterwards gained a settlement by estate in the parish of Whipendine, in the county of Rutland, had been deprived of the latter settlement by being removed as a lunatic to the County Asylum at Leicester, more than 10 miles from the parish in which his estate lay. The Recorder at the sessions had decided in the affirmative. The Court, however, now said that although it felt strongly that serious inconvenience might arise from its decision, and that most probably the legislature did not contemplate the case of lunatics when the Poor-law Amendment Act was passed; still it thought that the words in that Act were too strong to be got over, and that the decision of the sessions must be reversed.

The Queen v. *The Poor-law Commissioners—In the matter of the Greenwich Union.*—This was an application for a rule upon her Majesty's Poor-law Commissioners to show cause why a writ of *certiorari* should not issue to bring up two orders made by them respectively, bearing date the 12th Oct., 1840, and the 12th Nov., 1840, for the purpose of being quashed. Rule granted.

The Queen v. *The Mayor of Lichfield.*—In this case the rule which had been obtained on a former day, calling upon the Mayor of the borough of Lichfield to show cause why a *mandamus* should not issue, to insert on the burgess-roll of that city the name of George Alsop, who claimed to be placed upon that roll, as being entitled to vote at the election of corporate officers, was made absolute by the Court.

The Queen v. *Mitchell and Another.*—The defendants in this case, who were constables of Stamford, had been found guilty by a jury at the sessions of an assault preferred against them, but had since obtained a rule to show cause why a new trial should not be granted, on the ground of the former one having been mistried. The Court made the rule absolute.

COURT OF EXCHEQUER.—*Peppercorn* v. *Haffman.*—This was an action of trespass to recover compensation in damages, for an illegal distress for poor's-rates. Application was now made, pursuant to the leave reserved by the judge at the trial that had taken place, for a rule to show cause why the nonsuit directed to be entered should not be set aside and a verdict entered for the plaintiff for 32*l.* 6*s.*, being the value of the goods of the plaintiff that had been distrained. Rule granted.

BAIL COURT.—*The case of Bernard Cavanagh.*—This was the case of the fasting man, which our readers will remember. Cause was now shown against the rule for granting the *habeas corpus*. The court, however, decided that the conviction was bad, and that therefore the rule must be made absolute; the prisoner was discharged accordingly on being brought up before the Queen's Bench in the usual manner.

The Queen v. *the Proprietor of the Hampshire Independent.*—This was an application for a rule to show cause why a criminal information should not be filed against the proprietor of the "Hampshire Independent," for a libel upon Mr. Dickson, the mayor of Southampton, accusing him of being a "disgusting political partisan," and stigmatising his conduct. Rule granted.

Eaton v. *Johns.*—This was an action for a libel, contained in a printed placard, entitled, "A Statement of Facts," relating to the plaintiff as the vendor or proprietor of a certain hair dye. The alleged libel stated that the plaintiff was "a man of straw," which, it was alleged, by way of innuendo, meant a man in insolvent circumstances. The declaration was demurred to, on the ground that the expression, "a man of straw," did not necessary convey any imputation on the solvency of the plaintiff. The Court was of opinion that taking the expression, "a man of straw," with other allegations in the printed statement, it was properly said to convey that the plaintiff was in insolvent circumstances. The defendant was allowed to amend, however, by pleading "Not guilty" to the declaration.

TATTERSALL'S, THURSDAY.—The betting touched upon the Chester Cup as well as the Derby, and, towards the close, was tolerably brisk; but, except that it established Lanercost as premier for the first event, and confirmed the advance of Auckland to 20 to 1, nothing of any importance was transacted. The final averages were thus:—

CHESTER CUP.

5 to 4 on Lanercost agst any other (offered)
15 to 1 agst Rory O'More
17 to 1 agst Jolly Tar
1000 to 20 agst George (taken)
50 even between Rory O'More and Jolly Tar (taken)

DERBY.

26 to	1 agst	Mr. Gregory's lot (tak.)	40 to	1 agst	Moss Trooper
7	1	Attila (taken)	50	1	Meteor (taken)
10	1	Chatham	50	1	Defier (taken and afterwards offered)
20	1	Auckland (taken and afterwards offered)	60	1	The Artful Dodger (ta.)
23	1	Wiseacre	5000	75	William le Gros (taken)
27	1	Robert de Gorham (ta.)	1000	15	Curator (taken)
35	1	Joanna colt	6666	200	All the mares (taken)

OAKS.

25 to 1 agst Colonel Westenra's Rapture (taken)

MARK LANE, FRIDAY, JAN. 28.—We do not observe any alteration in the value of dry Wheat since Monday, but the samples out of condition are very unsaleable. There has been a fair retail trade in free Foreign; but although there is still some inquiry for Bonded. the buyers will not pay the rates demanded.—Barley, Peas and Beans are unaltered in value, but good boilers are in demand.—Fine Oats find buyers, but the lower Irish are very unsaleable.

BRITISH, per Imperial Quarter.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, January 29, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.
THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.
No. 6. SATURDAY, FEBRUARY 5, 1842. PRICE 6*d*.

Jan. 1, was published, price 6*d*., stamped to go free by post,
THE FIRST NUMBER FOR 1842 OF
THE GARDENERS' CHRONICLE;
A WEEKLY RECORD OF RURAL ECONOMY AND GENERAL NEWS.
The Horticultural Part Edited by Professor Lindley.

TWELVE MONTHS since, the Proprietors of THE GARDENERS' CHRONICLE announced their objects in undertaking this Journal, and if the support they have received may be considered as a test of the satisfaction of the Public, they have every reason to believe that their exertions have been appreciated, for it has already attained a sale far beyond any contemporary of a like character—a sale which has gone on progressively increasing from January to the present moment, and has so far exceeded their own sanguine expectations THAT NO LESS THAN THREE EDITIONS OF THE EARLIER NUMBERS HAVE BEEN REQUIRED TO MEET THE CONTINUED DEMAND, AND YET NOT A PERFECT SET OF LAST YEAR REMAINS FOR SALE. They now, therefore, need only refer to the past as an earnest of the future, and announce, for the information of the public generally, the nature of the publication.

The plan followed is, in THE FIRST PLACE, to make THE GARDENERS' CHRONICLE a weekly record of everything that bears upon Horticulture, Floriculture, Arboriculture, or Garden Botany, and to introduce such Natural History as has a relation to Gardening, with Notices and Criticisms of every new work of importance on these subjects. Connected with this part are WEEKLY CALENDARS OF GARDENING OPERATIONS, given in great detail, and adapted to the objects of persons in every station of life, so that the Cottager, with a few rods of ground before his door, the Amateur who has only a greenhouse, and the Manager of extensive gardens, are alike informed each week of the routine of operations which the varying seasons render necessary—Foreign and Domestic Correspondence upon Horticultural subjects, with illustrative wood-cuts (112 have already been given) —Reports of Horticultural Exhibitions and Proceedings at home and abroad—Notices of Novelties and Improvements—in short, everything that can tend to advance the profession, benefit the condition of the workman, or conduce to the pleasure of his employer. Replies to all questions connected with the object of the Paper are also given weekly in great detail. And although the Paper is not, strictly speaking, an Agricultural Journal, yet it contains full reports of the proceedings of the Royal Agricultural Society, and much valuable information upon the more interesting subjects of discussion in this branch of inquiry.

IN THE SECOND PLACE, that description of domestic and political News is introduced which is usually found in a Weekly Newspaper. It is unnecessary to dwell on this head further than to say, that the Proprietors do not range themselves under the banners of any party; their earnest endeavours are to make THE GARDENERS' CHRONICLE a full and comprehensive *Record of Facts* only—a Newspaper in the true sense of the word—leaving the reader to form his own conclusion and opinions; their object being the elucidation and discussion of the laws of Nature, not of man. The reader is thus furnished, IN ADDITION TO THE PECULIAR FEATURE OF THE JOURNAL, with such a variety of information concerning the events of the day, as supersedes the necessity of his providing himself with any other Weekly Paper.

The Proprietors are happy to announce that they have received the support of the most distinguished Botanists, Florists, and Practical Gardeners, amongst whom the following may be more particularly mentioned, as having already enriched the pages of THE GARDENERS' CHRONICLE with their communications:—

Professor Henslow, Cambridge
Professor Daubeny, Oxford
Professor Royle, King's College, London
Professor Graham, Edinburgh
Professor Morren, Liege
The Hon. and Very Rev. W. Herbert, Dean of Manchester

Mr. Booth, Gardener to Sir C. Lemon, Bart.
Mr. Lauder, Gardener to Sir W. R. Boughton, Bart.
Mr. Whiting, Gardener to H T. Hope, Esq., M.P.
Mr. Hislop, Gardener to the Hon. Colonel Howard
Mr. Butcher, late Gardener at Ealing Park
Mr. Perrin, Gardener to R. Harrison, Esq.
Mr. Appleby, Gardener to T. Brocklehurst, Esq.
Mr. Wells, Gardener at Redleaf
Mr. Insleay, Gardener to G. Barker, Esq., of Birmingham
Mr. Falconer, Gardener to A. Palmer, Esq.
Mr. Gordon, Hardy Department, Horticultural Garden, Chiswick
Mr. Fortune, Hothouse Department, Horticultural Garden, Chiswick
Mr. Thompson, Fruit Department, Horticultural Garden, Chiswick

THE GARDENERS' CHRONICLE is published every Saturday, price 6*d*., and may be ordered of all Newsvenders.

J. DAVIS, of OAK-HILL GARDENS, EAST BARNET, HERTS, has for sale Thirty Fruiting PROVIDENCE PINE PLANTS, in No. 6 and 12-size Pots, which for health, strength, and vigour of growth, he invites to be inspected.

LISIANTHUS, MELONS, AND CUCUMBERS.

J. CUTHILL begs most respectfully to announce, that Packets of his celebrated early, prolific, and very hardy MELON SEED, with printed Directions for growing it, are now ready. Also Snow's horticultural prize CUCUMBER and LISIANTHUS RUSSELLIANUS SEED. The above, 2*s*. 6*d*. per packet each. Address to J. Cuthill, Florist and Horticulturist, Love-walk, Camberwell, London.

JOSEPH HEADLAND, Florist, &c., London Road, Cambridge, begs to inform the Growers of DAHLIAS, that a coloured Plate of Headly's Phœnix has appeared in "Wakeling's Florist's and Amateur's Guide," for December last, published by Steill, 20, Paternoster Row, London.

TWITCHETT'S DON JOHN CARNATION.—(The Finest Scarlet Bizarre in England.)—A few pairs of this Unrivalled CARNATION remain for sale, at two guineas per pair. They will be sent by post, prepaid, and carefully packed. A Post-office order for the cash must accompany each order. (Upwards of 100 orders have failed in this respect.) For character and coloured figure of DON JOHN, see "Wakeling's Florist's Guide for August and September last. Twelve blooms of DON JOHN can be backed against any other Scarlet Bizarre in the world.—No. 2, Coronation-street, Cambridge.

NEVILLE'S CYCLOPS DAHLIA.—Bright Crimson Petals (margined with fiery crimson, imparting to the Flower a most brilliant appearance), stout, cupped, close, and of first-rate form, with fine rising centre, filled with petals before the first tier are expanded, and constant show flower; warranted equal to the description. A few Ground Roots, with two or more crowns, in fine condition, at 2*l*. 12*s*. 6*d*. each. Plants may be had of the Trade in Spring.—Peckham, Jan. 26, 1842.

MYATT'S VICTORIA RHUBARB.

J. AND W. MYATT having a good Stock of Strong Roots raised by offsets from the original Seedling, can supply them at 10*l*. per hundred.—N. B. As various spurious sorts have been sold and are now selling under the name of "Myatt's Victoria," purchasers would do well to require them warranted. —Manor Farm, Deptford, Oct. 23, 1841.

ROBINSON'S NORTHERN BEAUTY DAHLIA.

S. GIRLING having purchased the entire Stock of the above DAHLIA, plants will be sent out in May next at 10s. 6d. each; admitted to be one of the most distinct and beautiful Dahlias to be sent out next season. For particulars, refer to the *Floricultural Cabinet* of January. It took the 5th Prize at Salt-hill Open Show in Sept. last, and was generally admired.

BRACHYCOME IBERIDIFOLIA SEED in small packets at 5*s*., to be had of W. J. NUTTING, Seedsman, 46, Cheapside. Lisianthus Russellianus, 2*s*. 6*d*.; Pink, from fine named flowers, 2*s*. 6*d*.; Calceolarias, from 30 varieties, 2*s*. 6*d*.; Pansies, selected from a few first-rate flowers, 5*s*.; do, from a superior collection, 2*s*. 6*d*.: Dahlia Scapigera Mexicana, 1*s*.; Clintonia pulchella, 1*s*.; Schizopetalon Walkerii, 1*s*.; Phlox Drummondii, 1*s*.; &c. &c.—Packets of the following Cucumbers at 2*s*. 6*d*.: Man of Kent (Barnes'), Victory of Suffolk (Allen's), Prize-fighter, Weedon's Frame, Roman Emperor, and Windsor Prize.

☞ A Catalogue of Seeds to be had on application.

NEW WHITE DAHLIA—BIANCA (WILDMAN'S).

MESSRS F. and A. SMITH and Co. beg respectfully to announce to the Floricultural Public that they have purchased the above splendid Dahlia, and, should the root break well, intend sending out plants on the 24th of May next, at 21s. each.

The constant qualities of this variety need no comment, being well known as the best white of last season, having obtained the following awards:—It was placed as a first-class flower, Aug. 3, 1841, Floricultural Society of London; 2d prize, Sept. 14, 1841, South London Floricultural Society of London; 1st do., Sept. 23, 1841, Floricultural Society of London, Grand Show.

Orders executed in rotation as received.—A general Catalogue of Dahlias, &c. (containing nearly every variety worth cultivation) will be ready early in February.—Hackney, London, Jan. 27, 1842

NEW DAHLIAS.

GEORGE WHEELER, Nurseryman, &c., Warminster, Wilts, begs to announce the following for the ensuing Season:—ASMODEUS (Davis's), a Seedling of last year, colour nearly black, shape "the mould of form," rich velvet petal; obtained the 1st Prize at Bath, 1st at Chippenham, and 4th at Salt Hill, the only Shows at which it was exhibited; and from the confidence the raiser has of its being a first-rate flower, it is offered this season at 10*s*. 6*d*. per Plant. All orders to be executed immediately after the 20th of May. This flower was raised by Mr. Davis, whose "Maid of Bath" is so well known to all growers, and which by the *Gardener's Gazette* is shown to have been the most successful Dahlia of last season, having been exhibited in 51 winning stands, whereas the next in point of success came not within 20 of that number.

PRINCE ALBERT (Adams's), fine shaded bronze, quite a distinct variety, most perfect in petal, and altogether a noble, first-rate show flower. Strong Plants early in May, 10*s*. 6*d*. each.

WESTBURY RIVAL (Hall's), fine bright puce, very constant, a full high centre; a decided improvement on "President of the West;" one of the finest selfs of the season, and a first-rate show flower. Strong Plants early in May, 10*s*. 6*d*. each.

G. W.'s Catalogue of first-rate Show Dahlias will very shortly be ready, and will be forwarded, post-paid, on application.—G. W. embraces this opportunity of acquainting his friends and the public in general, that by the kindness of the Rev. Mr. Rous, the raiser of those beautiful Cinerarias, Prince Albert, and Lavertonense, he is enabled to offer good Plants of each kind at 5*s*. each. The stock of Seed of that fine and very superior long-frame Cucumber cultivated by Mr. Hamlett, and universally admired by the numerous growers who saw the fruit, is in G. W.'s possession, and will be sold at 6*s*. per dozen seeds; warranted to be all good, and of the genuine kind.

CUCUMBER and MELON BOXES and LIGHTS.—For SALE, one, two, and three Light BOXES and LIGHTS, of all sizes, ready for immediate use, warranted of the best materials, packed and sent to all parts of the Kingdom: two Light Boxes and Lights complete, from 1*l*. 8*s*. Garden Lights made, glazed and painted from 1*s*. per foot. Sashes and Frames made, glazed, and hung complete, 1*s*. 8*d*. per foot.—At JAMES WATTS' Sash Manufactory, 8, Claremont Place, Old Kent-road.

⁂ An Apprentice wanted.

WANTS a SITUATION as GARDENER, a married man without family, aged 28. Can produce satisfactory testimonials as to ability and character. Letters to be addressed to B. Y., at Messrs. Warner's, seedsmen, Cornhill, London.

WANTED, a GARDENER, in the country (a few miles from Leicester), where a few Pines, Vines, Cucumbers, and Melons are grown, and where also there is a small Kitchen Garden. All the houses and pits are heated by hot-water pipes. A Married Man would be preferred. Wages 15*s*. per week, and a house (rent free). Apply (if by letter, pre-paid), to Mr. Fowler, Printer and Bookseller, Atlas Office, Leicester.

WANTS a Situation as GARDENER, in a Nobleman's or Gentleman's Family, a Married Man, about 43 years of age, with one son: has lived 17 years in a Nobleman's Family, and left at the death of his Lordship, and has since lived five years in a respectable family. Can give the most satisfactory references as to ability and character. Direct to J. B., Mr. Palmer's, Nurseryman, Derby. Further reference can be had by applying to Mr. Stafford, Richard Arkwright's, Esq., Willersly Castle, Derbyshire.

WANTS a Situation as GARDENER, a steady active Man, aged 34, who has had a very extensive practice in all the pursuits of Gardening, having lived in families of distinction, and is now about to leave a most practical place, from which he can have four years' character, which will enable him to obtain any situation that may suit his wishes; his wife is fully competent in the dairy or laundry. Direct to N. K., Post Office, Little Randolph-street, Camden Town.

D. FERGUSON, Stowe, Buckingham, will feel great pleasure in recommending to any Nobleman or Gentleman in want of a Gardener, a middle-aged Single Man, of long and great practical experience.—2d February, 1842.

JAMES STRACHAN, Gardener to the late William Hobson, Esq., of Markfield House, Stamford Hill, is disengaged, on account of the death of his master, where he has lived twelve years. He had the superintendance of the meadow land, and understands getting up Hay on an extensive scale. He will be happy to meet with a similar situation,

Letters addressed J. S., at the Nursery of Wm. Rollisson and Sons, Tooting, Surrey, will be punctually attended to.

S. VENABLES, Gardener to the late W. Harrison, Esq., of Cheshunt, Herts, in consequence of that gentleman's death wishes to obtain a SITUATION as GARDENER. He is well acquainted with all the departments of his business, and can have an excellent character from Thos. Harrison, Esq., of Cheshunt, to whom reference may be made for abilities, character, &c. He is a Married Man. Address, with particulars, to S. Venables, Wafer-lane, Cheshunt, Herts.

JAMES MAY begs to inform his Patrons and Friends that his new descriptive List of Pansies with a list of Fuchsias, is now ready, and may be had on application at the Pansy Nursery, Edmonton. At the same time he begs to say he has still a small quantity of his superior PANSY SEED left, which may be had at the following places, viz.:—Messrs. Warner's, 28, Cornhill; Messrs. Flanagan and Co.'s, Mansion-house-street, London: Mr. Watkinson's, Market-place, Manchester; Mr. Edward's, York; Mr. Parsons's, Brighton; Mr. Wm. May's, Hope Nursery, near Bedale; or at the Pansy Nursery, Edmonton; at the following prices:—2*s*. 6*d*., 5*s*., to 10*s*. per packet. None warranted genuine unless they bear J.M.'s seal and signature. A remittance respectfully requested from unknown correspondents. —Pansy Nursery, Edmonton, January 1842.

WARNER & WARNER, SEEDSMEN, 28, CORNHILL, LONDON, beg respectfully to call the attention of their Friends and the Public to their List of New and Choice Flower-Seeds inserted in "HARRISON'S FLORICULTURAL CABINET" for the present Month, and for March, embracing all that is new and rare, and worthy of cultivation, among which will be found—

BRACHYCOME IBERIDIFOLIA, at 3*s*. 9*d*. per packet.
GERANIUM, from fine varieties, 1*s*. to 2*s*. 6*d*. ditto.
HEARTSEASE, from the best kinds, 1*s*. to 2*s*. 6*d*. ditto.
And the following at 1*s*. per packet:

Alstrœmerias, of sorts
Anagallis, ditto
Asters, imported German, mixed colours
Auricula
Calceolaria, shrubby and herbaceous
Carnation, from stage flowers
Cinerarias
Clintonia pulchella
Centaurea americana
Dahlia, from choice varieties
Elichrysums, new varieties
Ipomœa rubro-cærulea
Ipomœa Quamoclit
Ipomopsis
Lobelias
Lupinus Hartwegii
Mimulus
Pentstemons
Petunia
Phlox Drummondii
Picotee, imported
Pink, from a choice collection
Primulas
Ranunculus, saved from superb varieties
Schizanthus
Stocks, imported German, mixed colours
Verbenas
Zinnia elegans—&c. &c.

Also a few choice Vegetable Seeds, including the following kinds of Frame Cucumber, at 1*s*. per packet:—BARNES' Man of Kent, Farmer Allen's Victory of Suffolk, Walker's Improved Manchester, Weedon's Superb, Windsor Prize, Prize Fighter, and Perkins' Victoria. Greave's Prince Albert Melon, 1*s*. per packet. Lake's New Superb White Roman Broccoli, and Metcalf's New Pink Cape ditto, at 1*s*. per packet. Imported Brussels Sprouts, &c. &c.

Martin's superior Frame Potatoes, 3*s*. per peck. New Bokhara Clover, 1*s*. per packet. Myatt's British Queen Strawberries, 5*l*. per hundred; Myatt's Eliza ditto, 1*l*. per hundred; Myatt's Victoria Rhubarbs, 2*s*. each.

General Catalogues can be had on application.

Cornhill, Feb. 4, 1842.

SEYMOUR'S SUPERB SOLID WHITE CELERY.

H. LANE and SON, Great Berkhampstead, Herts, having received the most flattering testimonials of the great estimation in which the above celebrated CELERY is held, and of the general satisfaction experienced by those to whom they supplied the seed last year, are happy in being enabled again to offer it for sale in packets at 2*s*. 6*d*. each, postage included.

N.B.—The usual allowance to the Trade.

ROSES.—H. L. and Son take this opportunity of acquainting Ladies and Gentlemen who have not yet supplied themselves with Roses, that notwithstanding the vast quantity they sent out during the autumn, they can still execute any orders with which they may be favoured to a considerable extent, by an early application.—Catalogues sent free by post.

BLUE TREVIRANA, OR ACHIMENES LONGIFLORA.

MESSRS. MOUNTJOY AND SON have much pleasure in informing their Friends and the Public, that they can supply good Bulbs of the above most beautiful Plant, at 21*s.*, which, before they vegetate, might be transmitted by Post. M. & Son take this opportunity of mentioning that they will have Plants in May, price 10*s.* 6*d.*, of their fine Seedling DAHLIA "Horace," the colour of which is a very rich and extremely dark plum. From its erect habit, it is a beautiful border variety, as well as being a first-rate Show Flower.

A remittance or reference is respectfully requested from unknown correspondents.—Ealing, Middlesex, Feb. 1, 1842.

SEEDLING DAHLIAS to be sent out in May next, by N. GAINES, FLORIST, SURRY-LANE, BATTERSEA.

Gaines' ORANGE PERFECTION; beautiful orange, at times shaded. This flower was sent for the opinion of the Horticultural and Floricultural Societies of London; at both places considered first-rate. It is a fine grower, throwing its flowers well above its foliage. A good show flower. 4 feet. 10*s.* 6*d.*

Gaines' EMPEROR; beautiful rosy crimson, very superior petal, with great depth of flower, and well up in the centre. A constant good show flower. 3 feet. 10*s.* 6*d.*

Gaines' COMPACTA; fine purple, very superior form, of excellent habit, throwing its blooms well above its foliage; its centre well up. A good show flower. 5 feet. 10*s.* 6*d.*

N.B. The above were considered first-rate flowers by those that saw them growing. Plates of them will appear in "Wakeling's Amateur Guide," in April and May next.

N. Gaines' extensive List of first-rate Dahlias, Geraniums, Pansies, Calceolarias, &c. may be obtained by post-paid application as above.

HUGH LOW & CO. have much pleasure in submitting to the attention of their Friends and the Public the two under-named first-rate DAHLIAS. Strong Plants will be ready for delivery the first week in May at 10*s.* 6*d.* each.

WINTERTON RIVAL (Nelson), Primrose, good form, fine habit, flowers well above the foliage, height five feet. A figure will appear in the March number of the *Florists' Journal*.

DUKE OF CORNWALL, Rosy Ruby, fine habit, well up in the centre, very constant, has all the properties of Le Grand Baudin, with the additional recommendation of being of much dwarfer habit: height four and a half feet.

The last-named was raised by the person who obtained Le Grand Baudin and Conservative, acknowledged to be two of the best Dahlias of 1840, and exhibited in more winning stands than any two of the same season.

H. L. & Co. think it needless to inform those who have hitherto favoured them with their orders as to their way of doing business; but think it right, for the satisfaction of strangers, to state that should the two Dahlias now offered not answer the description given, they will most willingly deduct them.

Roots of most of the leading sorts of last year may be had on early application.—Clapton Nursery, Nov. 24th, 1841.

RANUNCULUSES, ANEMONES, AURICULAS, CARNATIONS, PICOTEES, AND GERANIUMS.

H. GROOM, of WALWORTH and CLAPHAM RISE, near LONDON, by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and the Public, that he has a fine Selection of the above Flowers, which he can offer at the following very moderate Prices:—

RANUNCULUSES.	£	s.	d.
100 Roots in 100 superb sorts, with their names	5	0	0
100 ditto very fine sorts, ditto	2	10	0
Superfine Mixtures, from 7*s.* to 21*s.* per hundred.			
ANEMONES.			
100 Roots in 100 superfine sorts, with their names	3	10	0
100 ditto in 50 ditto ditto	2	10	0
Superfine Mixtures, from 10*s.* 6*d.* to 21*s.* per hundred.			
AURICULAS.			
25 superfine sorts, with their names, 1 plant of each	3	13	6
CARNATIONS.			
25 superfine sorts, with their names, 1 pair of each	3	10	0
PICOTEES.			
25 superfine sorts, with their names, 1 pair of each	2	10	0
YELLOW PICOTEES.			
12 superfine sorts, with their names, 1 pair of each	2	2	0
GERANIUMS.			
25 superfine sorts, with their names, 1 plant of each	3	10	0

J. KERNAN begs to inform his Friends that he has now completed his selection of FLOWER-SEEDS, among which will be found every novelty worthy of cultivation recently introduced, as well as the seeds from first-rate collections of Calceolarias, Mimulus, Ipomœas, Stocks, Asters, Balsams, Zinnias, Thunbergias, &c. &c.; as also all the better and more esteemed Vegetable Seeds: Grainge's Early White Broccoli, Mercer's Cauliflower, Brussels Sprouts (foreign seed), Seymour's superb Giant Celery; Kerrison's Hothouse, Syon House, Roman Emperor, Horticultural, and Windsor prize Cucumbers; as well as Seeds of the very choicest Melons, all the better early and succession Peas, principally saved by the most select growers, who supply this unequalled market.—4, Great Russell-street, Covent Garden.

All the better kinds of Agricultural Grasses, separate or mixed. Selected Field Turnips, White Carrot, Winter and Spring Tares, Ash-leaved and Early Frame Potatoes, New Globe Mangold Wurzel, &c. &c., Mats, and Mushroom Spawn; Pruning and Budding Knives.

FLORICULTURAL SEEDS, DAHLIAS, &c.

THE Undersigned begs leave to inform the Nobility, Gentry, and his customers in general, that his new Catalogue of FLOWER SEEDS for 1842 is now ready, and may be had on application. Also the following DAHLIAS in Pot Roots:

Amato, Dandy's, purple	1	0
Argo, Widnall's, yellow	1	0
Andrew Hofer, crimson	1	0
Beauty of the Plain, white-edged	2	0
Constancy, Keynes', fine purple	2	6
Countess of Pembroke, peach	1	0
Duchess of Richmond, bronze	1	0
Egyptian King, shaded bronze	1	6
Fanny Keynes, shaded rose	5	0
Grace Darling, rose	1	6
Le Grand Baudin, rosy bronze	1	6
Lewisham Rival, white	1	0
Maria, Wheeler's, fine rose	1	6
Maid of Bath, light, edged with purple	3	6
Nicholas Nickleby, bronze shaded with pink	1	0
President of the West, crimson	1	6
Queen, Widnall's, peach	3	6
Scarlet Defiance, light scarlet	3	6
Uxbridge Magnet, mottled purple	2	6
Unique, Ansell's, yellow	0	9
One of each of the above	35	0
Fine mixed sorts, Pot-roots, per dozen	10	0

James Carter, Seedsman and Florist, 238, High Holborn, London.—Jan. 29, 1842.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained to any size of JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

NATURAL GRASSES.

MESSRS. SUTTON having been engaged many years in growing and collecting PERMANENT GRASSES for eminent Agriculturists in Berkshire and the surrounding counties, have great confidence in soliciting the commands of the readers of the *Gardeners' Chronicle* in any part of the United Kingdom, to whom will be given references to Noblemen and others who have expressed themselves desirous of recommending Messrs. Sutton's Seeds.

It is necessary that the nature of the soil should be described, when the most proper sorts and proportions will be supplied; the names of which and other relative information may be previously obtained by application.—Reading Nursery, Feb. 1st.

DAHLIAS.

E. HEDLEY and SON, Rose Hill Nursery, Yarm, York, beg to call the attention of the Trade and the Cultivators of the DAHLIA to the two following Seedlings, raised in 1840, and proved in 1842:—BEESWING, Hedley's beautiful creamy blush, tipped with bright primrose and cherry, four feet, quite a distinct and novel variety, exquisite shape, beautifully cupped, full and rising centre, showing its blooms well above the foliage; the above is a faithful description of this superb flower. E. Hedley and Son will warrant the above Dahlia to give entire satisfaction, or the price will be deducted. Plants in May at 10*s.* 6*d.*. NEGRO PRINCE, large, dark, bold back-row flower, darker than any Dahlia yet known, four to five feet. Plants in May, 10*s.* 6*d.* Both the above Plants gained first-class prizes in September last, at the Sunderland Show—open to all England.

Rose Hill Nursery, Yarm, York, Feb. 1st, 1842.

HEATING BY HOT WATER, WITH THE CIRCULATION OF ATMOSPHERIC AIR.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER; see the 3rd and 37th Numbers of the *Gardeners' Chronicle*.

References may be had, and their works seen, at Mr. Perry's Nursery, Banbury; Mr. Green's, Lower Cheam; Messrs. Henderson's, Pine-apple Nursery; Messrs. Rollisson's Nursery, Tooting; Mr. Knight's Exotic Nursery, Chelsea; Messrs. Low's, Clapton Nursery; Mr. Catleugh's Nursery, Chelsea; Mr. Gaines's Nursery, Battersea; Mr. Buck's, Portland Nursery; Mr. Young's, Milford Nursery; Mr. Smith's Nursery, Dalston; Mr. Woodroff's Nursery, Kensall Green; Mr. Hopgood's Nursery, Bayswater; Mr. Willmer's Nursery, Chelsea; and at most of the Nobility and Gentlemen's Seats in the country.

Every particular to be had at their Horticultural Manufactory, Gloucester place, Chelsea, near Sloane-square.

HOT-WATER APPARATUS, upon the most improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, annex the following list of prices of Hot-water Pipes of the best description, to assist persons desirous of adopting this mode of heating in their calculations of the probable expense, and respectfully solicit an opportunity of tendering their price for the completion of any work required. Socket-pipe for Hot Water, of two, three, and four inches diameter, at 2*s.* 3*d.*, 3*s.* 3*d.*, and 4*s.* 3*d.* per yard. Ditto, with Troughs for Orchidaceous-houses, three and four inches diameter, at 4*s.* 9*d.* and 6*s.* 9*d.* per yard.

The much-approved Conical Boilers made of strong plate-copper, and which require no furnace or setting in brickwork, from 5*l.* 5*s.* upwards. Also, every other description of Boilers of the most approved construction. Further particulars may be obtained at the Warehouses, Gracechurch-street, where also may be seen a variety of patterns of Iron and Strained-wire Fencing, Hurdles, Brass and Iron Bedsteads, &c. &c.

PATENT ASPHALTE PROTECTING MATERIAL. —Extract from *Gardeners' Chronicle*, Dec. 25, 1841, p. 843.—"In the midst of frost it will not be unseasonable to warn all our Readers of the great importance of preventing their more tender Plants that may have been frozen from being thawed suddenly by the sun. All Gardeners know how often Peas frozen below a south wall are killed, and that if any contrivance to prevent their being suddenly thawed is made use of, they recover. What is true of Peas is, to a great extent, true of other things. A few weeks ago we had a severe frost, 16°; at that time young Araucarias exposed to the south died, while others within a few yards, but screened from the sun by stone, did not suffer at all. We may remark by the way that CROGGON'S ASPHALTE ROOFING forms a most excellent material for such screens." In page 8 of same Journal, Jan. 1, 1842, is fully described the purposes to which it is applied by the Royal Horticultural Society. Being a non-conductor it effectually protects from heat or cold.—THOMAS JOHN CROGGON, 8, Ingram-court, Fenchurch-street, London.

ANNUITIES.—In the AUSTRALASIAN, COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, Annuitants participate in the Profits of the Company, and receive a rate of ANNUITY much more favourable than can be granted by any Company making its investments wholly in England. The Company is enabled securely to grant these favourable terms from the advantage it possesses of investing a portion of its Funds at a high rate of Interest.

DIRECTORS.

Edward Barnard, Esq., F.R.S.	C. E. Mangles, Esq.
Henry Buckle, Esq.	J. B. Montefiore, Esq.
John Henry Capper, Esq.	J. H. Ravenshaw, Esq.
Gideon Colquhoun, jun., Esq.	Capt. Sir Jas. Stirling, R.N.
John Edwardes Lyall, Esq.	William Walker, Esq.

SOLICITORS.—Messrs. Swain, Stevens, and Co.

Prospectuses, with Tables, Forms of Proposal for the purchase of an Annuity or for making an Assurance, and every information, may be obtained by application at the Office of the Company, No. 126, Bishopsgate-street, City.

By order of the Board, CHRISTOPHER COUSINS, Accountant.

FOUNTAIN NURSERY, CAMBERWELL GROVE.

MESSRS. PROTHEROE & MORRIS are instructed by the Trustees of Mr. Ferry to offer to public auction on the premises, early in March, if not previously disposed of by private contract, the valuable Lease; also the Stock, consisting of three newly-built Greenhouses, Pits, Frames, &c.; about 8000 Greenhouse Plants, comprising Geraniums of the first class, Camellias, Fuchsias, Verbenas, &c. May be viewed, and particulars had on the premises, and of the Auctioneers, Leytonstone.

TO GENTLEMEN AND AMATEUR FLORISTS.

TO BE PARTED WITH, a few Hundred Roots of that choice and beautiful Flower the RANUNCULUS, at 42*s.* per hundred, with Names. Planting-time, February and March. Apply, pre-paid, Mr. Eyre, Farnham, Surrey. Also he has a few healthy young Plants left of his superb Seedling GERANIUM "Lavinia," at 40*s.* per plant (no abatement); and which gave so much satisfaction to every gentleman who saw it in his house.

SLATE CISTERNS, SHELVES, TROUGHS, &c., for Horticultural purposes.—EDWARD BECK, Manufacturer, Isleworth, near Brentford. Orders, Working Drawings, &c., forwarded by post, will receive due attention.

*** Slate Edgings for Flower Borders, &c.

Publishing Monthly, with Four coloured Engravings,
Price 2*s.* 6*d.*

PAXTON'S MAGAZINE OF BOTANY.

The Number for FEBRUARY contains beautifully-coloured figures of *Cattleya Aclandiæ*, *Brugmansia floribunda*, *Mahonia aquifolium*, and *Loasa Pentlandica*, with the history and directions for the culture of each: also comprehensive Papers on the science of Gardening, including the phenomena of impregnation and germination in the seed of plants; the Culture of Gesnera rupestris; on Arranging and Planting Specimens in Conservatories; the Propagation of Tropæolum tricolorum; Notices of Plants figured in the floral periodicals for December and January, and of those flowering in the suburban nurseries; with a copious Calendar of Operations for the month.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed on zinc by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commences with this Number, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

On the 12th instant, price 3*d.*

PUNCH'S VALENTINES!

With Twelve large Illustrations of

THE POLITICIAN,	THE LITERARY MAN,
— DRAWING-ROOM CAPTAIN,	— FOOTMAN,
— MAN ABOUT TOWN,	— ACCOMPLISHED LADY,
— MILLINER,	— MEDICAL STUDENT,
— POSTMAN,	— FASHIONABLE PARSON,
— LAWYER,	— SPECULATIVE MAMMA.

Engraved from Designs by Leech, Phiz, Kenny Meadows, Crowquil, Henning, Newman, &c.

The above will be the 31st Number of PUNCH; OR, THE LONDON CHARIVARI. Published every Saturday. Office, 13, Wellington-st.

THE NEWEST WORK ON FARM MANAGEMENT.

Lately published, in a thick 8vo Volume, of nearly 700 pages, illustrated with numerous Cuts and Plates, the Seventh Edition, Revised, Enlarged, and greatly Improved, by a Member of the English Agricultural Society, price 17*s.* cloth.

THE COMPLETE GRAZIER; or, Farmer's and Cattle Breeder's, and Dealer's Assistant. Comprising everything useful to the Farmer, the Country Gentleman, the Land Steward, and all interested in the Management of Land, Horses, Cattle, Sheep, Swine, Poultry, &c., being a "Complete Body of British Husbandry," in its present improved practice. By a VERY EMINENT AUTHORITY.

London: printed for Cradock and Co. (late Baldwin and Cradock), 48, Paternoster-row.

THE FLOWER, FRUIT, AND KITCHEN GARDEN, &c.

Lately published, in a neat pocket volume of nearly 200 pages, price 2*s.* cloth.

THE GARDENER'S MANUAL; containing Practical Instructions for the Cultivation and Management of the Flower, the Fruit, and the Kitchen Garden—the Hothouse, Greenhouse, and Conservatory; adapted either for small or large gardens. Also the same size, price 2*s.* cloth,

The HOUSEKEEPER'S MANUAL; containing Practical Directions in English Cookery, Preserving, Pickling, Confectionery, Pastry, Cakes, Jellies, and Bread-making; Domestic Brewing, and British Wine-making of every description, for the use of small or large families.

London: Cradock and Co. (late Baldwin and Cradock), 48, Paternoster-row.

KNIGHT'S HORTICULTURAL PAPERS.

Just published, in royal 8vo, with Portrait and Seven other Plates, 15*s.* cloth.

A SELECTION FROM THE PHYSIOLOGICAL and HORTICULTURAL PAPERS published in the Transactions of the Royal and Horticultural Societies, by the late THOMAS ANDREW KNIGHT, Esq., President of the Horticultural Society of London, &c. &c. To which is prefixed, a SKETCH OF HIS LIFE.

London: Longman, Brown, and Co.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured *to participate in the profits*, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 9 0

The BONUS declared in 1834 amounted upon an average to 16*l.* per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31*l.* per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam-vessel) from any one Port thereof to another during peace, to Assurers not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors.
CAMPBELL JAMES DOWNER, Secretary.

READ'S New Patent HYDRAULIC MACHINES or Portable Garden Engines, by which a Lady may enjoy the pleasure of watering her plants and flowers without the least fatigue. Water may be thrown in various densities, from a powerful current to a gentle shower or dewfall. The working cylinder is surrounded by an air-vessel which protects it from injury, so that it cannot get out of repair. Made also of larger dimensions, the best adapted for all Horticultural purposes of any engines now in use, which the Patentee can warrant from forty-one years' practical experience in that science, in all its branches. Also Fire-Engines on the same principle, with Double-Action Pump, adapted for Villages, Mansions, Factories, &c., or for Exportation. May be seen and proved at 36, Regent Circus, Piccadilly.

N.B.—None are genuine except stamped with the words, 'Read's Patent."

Saturday Morning.

We find from the News Agents that so many of our Subscribers have ordered *Extra* copies, that should they not receive them at the same time as their regular copy, they will have the goodness to wait over Monday's post, as it is more than probable that we shall not be able to deliver the extra copies to the Agents till too late an hour to admit of their being all posted to-night. We have made arrangements with the Printers to keep the Paper in type till Friday morning; this will enable such of our Subscribers as may wish to distribute further copies to obtain them. They can either have them of their regular News Agents, or direct from the office by forwarding money or a post-office order.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 5, 1842.

MEETINGS IN THE ENSUING WEEK.

Monday	Entomological	8 P.M.
Tuesday	Zoological	8½ P.M.
Wednesday	Medico-Botanical	8 P.M.
Saturday	Royal Botanic	4 P.M.

We to-day redeem our promise of presenting our readers with a complete Calendar of the garden-work which a cottager—that is to say, a labouring man—can have occasion to perform in the course of the year. Being written by Mr. Paxton, whose great experience in all such matters is well known, we trust that this, together with the excellent papers on Cottage gardening published in the course of last year, will enable our country friends to give their poor neighbours that really useful assistance which the most benevolent intentions cannot administer unless properly directed.

Now that the subject is once more before us, we seize the opportunity of making a few observations on the prizes which are offered at cottagers' exhibitions.

The first point is to obtain funds to defray the expenses of the prizes. We should hope there are no neighbourhoods where the gentry will be found unwilling to subscribe the small amount of money required for such a purpose. The means, however, adopted at Haughton-le-Skerne, near Darlington, deserve to be especially noticed. The kind-hearted rector there allows the overseers a small portion of his glebe for the purpose of affording aid to such poor labourers as have families; the overseers divide the land into ten allotments, and let it to ten poor families at a small rent, which, after any necessary expenses are deducted, is given as prize-money amongst them, the rector taking no rent. We greatly wish this excellent system was adopted in every parish, either by the clergyman or the landlords, or both. To none of these can the expense be a matter of importance; and it is certainly a great benefit to the industrious labourer—much better than letting him live rent-free. A system of this nature is already in existence in other parts of the country, and was long since practised by Sir John Sebright, one of the wisest and most liberal of our great country gentlemen.

The funds for prizes having been obtained, the next question is, how to dispose of them. Many persons prefer the distribution of books; and for their convenience we have noted at the end of our Calendar a few of those which seem to us best adopted for the purpose. But we do not ourselves consider books the best incentives to a poor man's industry. It is always to be remembered that he is *poor*, and that the most useful assistance to be afforded him is what will increase his personal comforts. Books will not do that. The body must be cared for in the first instance; the improvement of the mind by education can only follow. Give a poor man comforts, let him know the advantage of them, and they will speedily become absolute wants. Only make them necessary, and he will strive of himself with all his energy to procure them. Squalidness and brutality once removed, he who was formerly unconscious of them, or indifferent to them, looks back with shame and disgust upon his early habits. Books will not effect this end—money, or money's worth, will; for with what heart can a poor man sit down to read—if he can read—when cold and hunger, and half starved children, are around him? With what heart could *we* read under such circumstances? We say then to our noble and wealthy country friends, Give your poor cottagers, who have the spirit and courage to strive against their lot, money, or money's worth, as the reward of their industry and skill; give them clothes for a Sunday, tools, household implements, plants or seeds, a pig, a spade, a jacket, tea-things, an apple-tree; anything of that sort will stimulate them more than all the books in the world, for these simple reasons—that the one is virtually an augmentation of the labourer's wages, and helps him to procure comforts and necessaries, without which life is but a bitter lot, and that he clearly understands the use of the one, while it is doubtful if he will comprehend the value of the other when he has obtained it.

Let it not be inferred from this that we object to putting books into cottagers' hands; far from it: if suitable to their condition in life, they are most useful. What we object to is, giving them books for prizes. Upon this subject we recommend to those who are interested in this subject—and what right-minded man is not?—the following letter from *a labourer*, the spelling and language only corrected:—

Many well-meaning people recommend books to be given for cottagers' prizes instead of money, and undoubtedly this idea is good and benevolent; but I would beg these persons to consider the very little portion of time that a cottager possesses. That time he generally contrives to turn into something valuable—something that will bring immediate interest. Many of the books which have been recommended are undoubtedly good books for practical men, but they become worthless when they get into the hands of the unlearned, and would, I think, often lie unopened on the shelf. If choice fruit-trees, choice roots, or first-rate seeds were given, I think they would be generally appreciated, for they would in time yield fruit, and encourage the cottager to persevere in industry; and when looking at a tree richly laden with fruit, he might point to it and say to his children, 'Through industry I obtained that tree.'

We are unwilling to close these observations, which must be the last we can make upon the subject for some time to come, without adverting to a circumstance connected with gardeners' prizes which deserves to be generally known. There are many who object to money-prizes being given even to gentlemen's gardeners; but if such prizes were often applied as they are by our correspondent Mr. Henderson, Gardener to Lord Fitzwilliam at Milton, they would cease to be regarded as objectionable. The money this excellent gardener obtains for horticultural and floricultural prizes he applies to the purchase of maps, books, &c., for the promotion of knowledge among his gardeners, many of whom can bear witness to the advantage they have derived from this liberal system.

We trust the evidence now produced will satisfy the most sceptical person that fast-grown Oak is, both in theory and in fact, greatly superior to that grown slowly. In the first of the tables we last week produced, the best in quality was from Strathfieldsaye, and grew as much on an average as an inch in diameter annually; and all those others which grew above four-tenths in diameter were of good quality. On the other hand, all the slowest-grown timber in both tables was bad or indifferent. It is true that some of the Navy Oak of bad quality was fast-grown, as the French, Styrian, and Istrian; but this may have been caused by soil, or have been owing to the species. We have reason to believe that some kinds of soil will grow Oak fast without furnishing the matter required for hardening the timber, and that some species common in the South and East of Europe, particularly Q. pubescens, the Downy Oak, are never of value as timber. The specimen of wood marked French, from the dockyards, was very like that of the Downy species.

Where so much erroneous opinion prevails, we thought it better to produce positive evidence of our own to prove our case. But if we had looked to published evidence of incontestable value, we could have brought forward what ought to satisfy any reasonable man; to say nothing of the declared opinions of persons of great authority, both as regards practice and theory.

If the reader will turn to a pamphlet published in the year 1829 by Mr. Withers, of Holt, in Norfolk, a planter of great experience, he will find a considerable body of evidence in support of the statement that fast-grown Oak is the best. The pamphlet was called a Letter to Sir Henry Steuart, and was written for the purpose of doing away with any impression which might have been made by that gentleman when he stated that slow-grown timber is the best. By the evidence of timber-merchants, and other persons familiar with the subject, Mr. Withers proved that the very reverse was the case. Mr. John Stenning, of East Grinstead, expresses himself thus:—

"Another very desirable quality which quick-growing timber possesses is, that it is much stronger and tougher than that which grows slow. The one would bend where the other would break. I am convinced that a ship built exclusively of quick-growing timber, and striking against a rock, would be in safety, when one exclusively built of slow-growing timber would fall to pieces: the former, from strength and toughness of the wood, would yield and clear off; and the latter, from the shortness of the grain of the wood, and its consequent tenderness, would break without reaction. I contend, in contradiction to Sir Henry Steuart, that the heart of such timber is very superior, that it is considerably heavier, and must consequently contain more virtue and condition than that which he recommends to the public as the best.

"Independent of the advantage which the quickness in growth gives to the quality of Oak timber, the bark from the same cause possesses an equal if not greater superiority; as the very highest price is given by the London tanners for bark from this county, where the growth, as I have before mentioned, is very rapid compared with its progress in many parts. The bark from such timber is very thick and fleshy, whereas from that which grows slowly it is thin and drossy.

"The only inducement I have to fall in with Sir Henry Steuart's notions on the quality of timber is, the consideration 'that the strength of work is the decay of trade.'

"Before concluding my remarks, I beg to state that my observations are the result of thirty years' experience; during that period I have superintended the management and growth of Oak timber, have purchased no inconsiderable quantity, and have been a good deal engaged in the conversion and application of it for different purposes; and I can assert, without fear of contradiction from any experienced individual, that *the quicker Oak timber is produced, the better the quality will be.*"

The opinion of Mr. Andrew Knight, the late President of the Horticultural Society, was to the same effect:—That gentleman's answer to the query put by Lord Glenbervie—'Whether Oaks which grow in poor soils, and slowly, are of a firmer nature and more durable timber than when grown in richer land?'—was as follows:—'No; their timber is more *porous, lighter*, and *less durable*. The heaviest and best Oaks for *all* purposes grow in strong, deep, red loams, where the Oak frequently increases annually more than an inch in diameter. A layer of very porous wood marks the commencement of each year's growth; and when the growth is small, these *porous layers touch each other.* The superior value of the English Oak *depends on its vigorous and rapid growth*, which frequently exceeds that of the Oak imported from the North of Europe in the *ratio of ten to one*.'"

And finally, the experiments of Professor Barlow, at Woolwich, quoted by Mr. Withers, all prove exactly the same fact. In one instance, two specimens of Oak were selected; one (No. 1) from a fast-grown tree, and the other (No. 2) from a slow-growing tree.

"The former was grown, Mr. Boorne informs me, upon a very *strong, good soil.* Its age was, he supposed, about sixty years, and it contained from 38 to 40 cubic feet of timber. The other (No. 2) was about 120 years old, and was grown upon a light soil with gravel about two feet below the surface. This tree contained about 80 cubic feet; but Mr. Boorne considers that if No. 1 had stood to attain the same age as No. 2, it would have made at least 40 feet *more than that tree.*"

Professor Barlow gave the following as the result of his examination:—

"The two pieces were squared down each to two inches. They were broken on props 50 inches asunder. Their specific gravity, elasticity, and ultimate and comparative strength, were as below:

	Spec. grav.	Deflected 1-50th of its length with	Broken with	Comparative strength.
No. 1.	903	660 lbs.	999 lbs.	1561
No. 2.	856	414 lbs.	677 lbs	1058

"No. 1, it appears, is therefore about of medium strength, my mean number being for English Oak 1470. No. 2 is very weak, my weakest specimen being 1205 (*see Essay on Strength of Timber*).

"We tried, besides your two pieces, two very choice specimens of English Oak which had been very long in store, and the numbers were,

Spec. grav.	Deflected 1-50th with	Broken with	Comp. str.
748	896 lbs.	1447 lbs.	2261
756	680 lbs.	1304 lbs.	2037

"These again, compared with your weakest piece, show that your No. 1 is about the common run of English Oak."

Another experiment upon strength gave exactly the same result. But it is needless to pursue the subject further. We regard it as proved that the fastest-grown Oak is the best; and as the rate of growth depends partly upon soil, and partly upon sufficient thinning, we are entitled to add, that attention to thinning is of the most essential consequence to the planter.

We may also add, that all evidence goes to show that what is true of the Oak is true of other trees.

ON RAISING CONIFEROUS PLANTS FROM SEED.

The Pine and Fir tribe can only be increased on a large scale by seeds, which are produced in great abundance when the plants attain a certain age, and which are generally ripe in the autumn, the cones taking from 15 to 18 months before they come to maturity. The cones should be gathered at the beginning of winter; they should be placed in some cool but dry place until the end of March, at which time the seeds should be taken out of the cones, which in some cases is difficult, without injuring them, particularly if they are kiln-dried, as the seeds are easily damaged by fire-heat. The cones of some kinds are so hard—of Oocarpa, for example—that it would take weeks on the kiln before they would open. The safest way is to bore a hole through the centre, beginning at the base, or stalk end, and afterwards to drive a round piece of hard wood through the hole, which will split the cone; then with a chisel to commence taking off the scales in layers, beginning at the base of the cone. The seeds may then be removed without injury; this, of course, only applies to the more rare ones, all the others are easily opened by drying, and particularly the Silver, Spruce, and Balm of Gilead Firs; the Cedar, Weymouth, Larch, and Scotch Pine, also part with their seeds freely.

The next operation is that of sowing the seeds, which is best done in the following manner:—If the kinds are new or rare, they should be sown in pans filled with dry, sandy loam, and without any mixture of either peat, leaf-mould or rotten dung, all of which are injurious, and cause the young plants to damp off when they first come up, more especially if it should be damp weather at the time they appear above ground. If the loam is a little stiff, a small portion of sand may be used; but this must be avoided as much as possible, because the more sand there is in the soil the weaker the plants come up. If they are in a doubtful condition, sow the seeds in pans filled with very dry loam, and place them in some dry situation, out of the reach of damp, they will then not be injured; whereas, if they were not placed in dry soil, they would be sure to perish, or if sown in damp soil the like destruction would attend them. When spring advances, place the pans in gentle, but by no means in a damp heat, taking care, however, to remove them to a much cooler place before the young plants are fairly above ground, and afterwards harden them off by degrees, giving them but little water at first; for much depends upon the use made of water at this period, and the treatment given to them when in this state (that is, when the young plant has exhausted the nourishment supplied by the seed, and has to seek subsistence from its own roots) after which there is little danger of their damping off, except they are over-watered. When the plants are fairly up, and a little hardened, they may be potted off singly into small pots, filled with a mixture of loam and sandy peat; if the loam is rather poor or stiff, a little leaf-mould may be added, for the bad effects of the two latter substances seem only to occur during the time the young plant receives its support from the seed. When potted, they should be placed in a close pit or frame for a few days, until they recover the effects of the shift, and afterwards air must be freely admitted, but water given rather sparingly at first. They will require little trouble afterwards, but probably may want shifting into larger pots in the autumn (particularly the strong-growing kinds) as it is injurious to their future growth to allow their roots to get pot-bound when young. The more rare or tender kinds should not be planted out before the third season, but the commoner ones may be planted out after the first year.

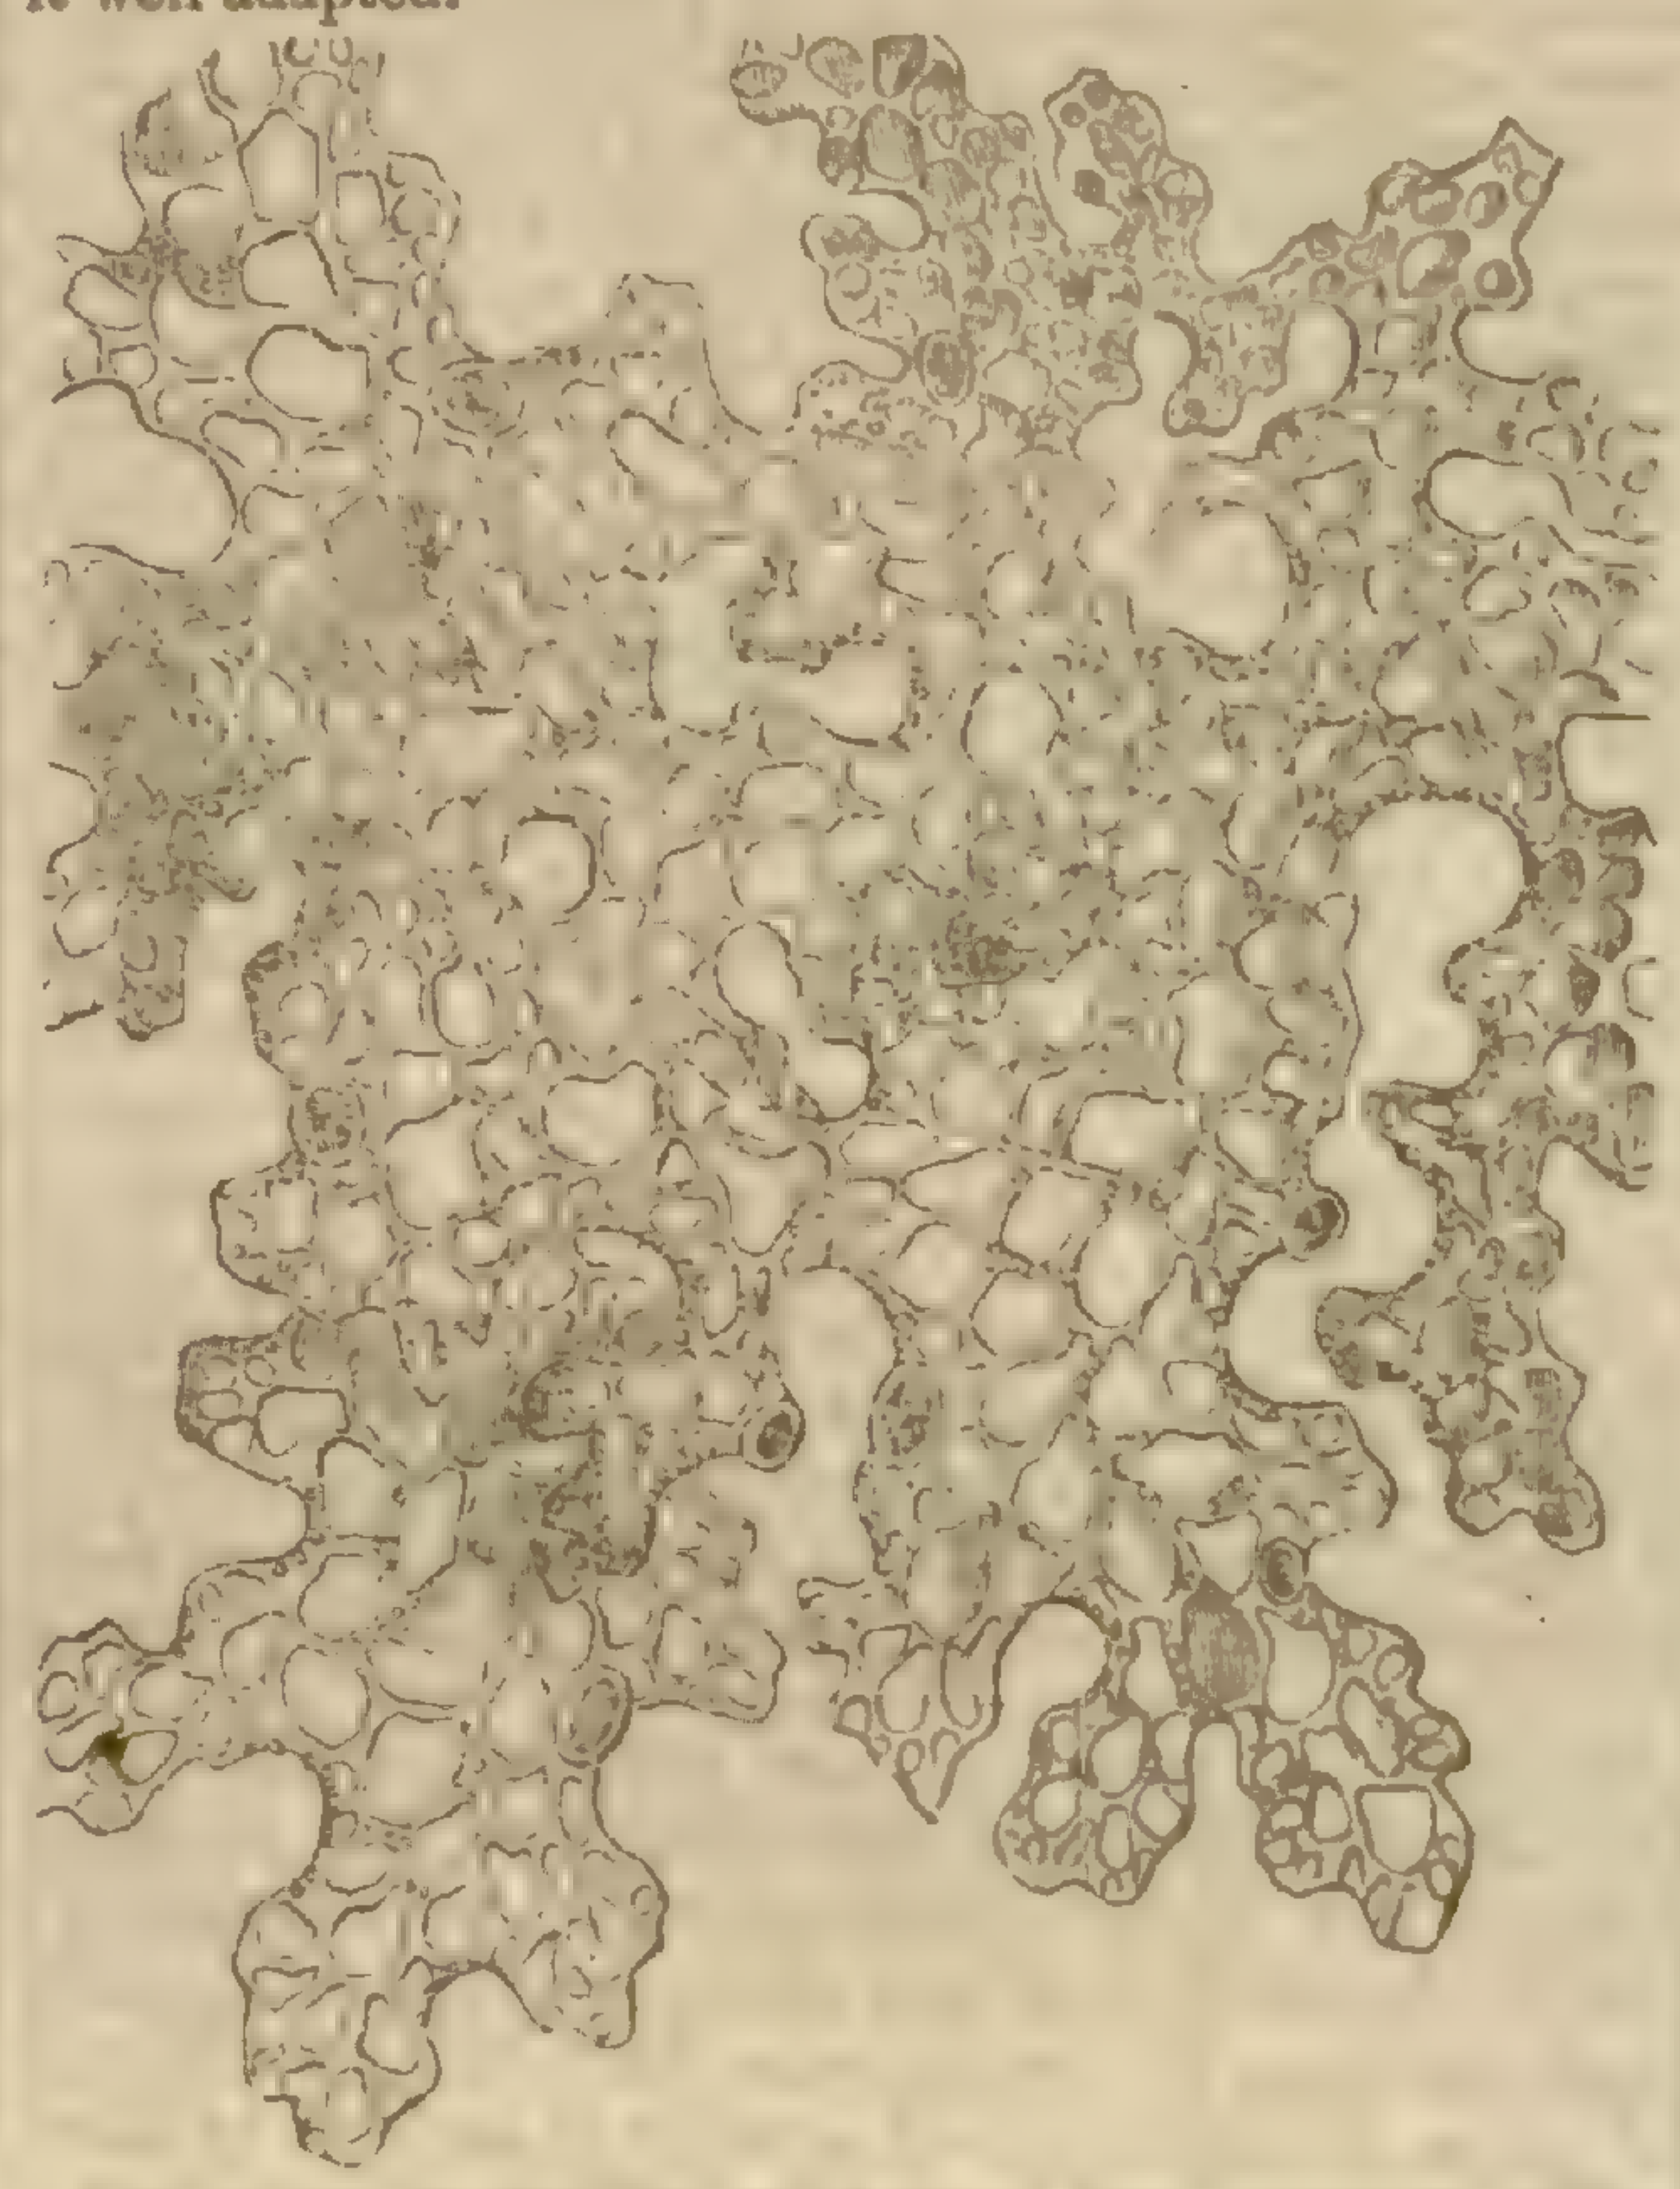
The common kinds, such as the Scotch Fir, Larch, Spruce, and Silver Firs; Pinaster, Stone, and Weymouth Pines—and, in fact, all those kinds with hard-shelled seeds, and even the Deodar and Cedar of Lebanon, may be sown in the open border with great advantage in the following manner: select a good fresh loamy soil which is not stiff, but rather sandy, and about the end of March dig and break the surface rather finely; then mark the ground out into beds about 4 ft. wide, leaving an alley of a foot wide between each bed; and on some fine dry day sow the seeds broadcast rather thickly, covering them over from a $\frac{1}{4}$ to $\frac{1}{2}$ an inch deep, according to the size of the seeds; then smooth the surface by gently beating it with the back of the spade (this must only be done if the soil is dry and rather light). They will then require no other care, except keeping them from weeds and the attacks of birds, mice, and slugs, which are very destructive to them when they first make their appearance above ground. By placing some small branches thickly over the beds until the young plants have thrown off the old seed-coat, they may be protected from the ravages of birds; if attacked by mice, traps must be set for catching them, as the only safe mode of preventing such pests: and if subject to be eaten by slugs, some wood-ashes should be sown over the beds, just as the young plants are making their appearance.

The seeds of the greater part of the Pine tribe come up in about six weeks after sowing in the open border, and the most of them will be fit for transplanting into nursery rows the first year after sowing; afterwards they may be treated in the same way as other forest-trees.—*G. Gordon.*

FAMILIAR BOTANY.—No. I.

Lungs of the Oak.—On the trunks of trees, especially of the Oak, in many counties of England, is found a plant, spreading flat over the branches, and forming broad patches with many lobes. Its colour is olive green when fresh, but it becomes a light brown when old; its surface is marked with shallow pits, which look as if a small finger had been pressed into the plant when soft. On the under side are found many downy fibres, by which it adheres to the bark it grows on. Here and there upon its edge are little pale warts, made of powder as it were, and also dark brown oval or roundish cups, with a thick border. These last are the shields, as botanists call them, and form the fructification, that is to say, the part which stands for flower, fruit, and seed in this plant. Flower, fruit, and seed, however, there is none of the nature of those parts in more conspicuous species; but these shields contain, embedded in their hard, horny substance, many atoms invisible to the naked eye, called spores, which multiply the race, and which, although not seeds, have the same property of increase.

The peasants of England call this "the lungs of the Oak," and find it useful as a nourishing diet when persons are weak, and unable to bear more stimulating food; in fact, they use it for the same purpose as the rich employ the "Iceland Moss," sold in the druggists' shops. It is very bitter as well as nutritious, and that circumstance adds, no doubt, to its value as a medicine; it, however, renders it so unpalatable, that it is desirable to remove a portion of the bitterness in the process of preparing it for the sick. For this purpose the lungs of the Oak should be steeped for some hours in cold water, to which carbonate of potash has been added in the proportion of a tea-spoonful to a quart; it may then be boiled in water or milk and flavoured with sugar and lemon-peel, to which a little white wine may be added. The plant, thus prepared, is used in hooping-cough and in consumption; it also communicates a fast brown colour to linen. In the North of Europe, where Hops will not succeed, it is employed in making beer as a substitute for Hops, for which its excessive bitterness, in the unprepared state, renders it well adapted.



Useful properties are to be found in many more of the Lichenaceous order, as well as in the Sticta; for these, although among the meanest and humblest parts of the creation, have manifold important purposes to which they may be applied, as we shall show in due time.

The proper name of this plant is *Sticta pulmonária*; it belongs to the order of LICHENS, of which Iceland Moss is another species, and many of which have similar properties. Nothing can be more varied than the appearance of Lichens, which are extremely numerous in this country. If the grey, and yellow, and brown stains upon old walls, ancient churches, and other buildings are carefully examined, those appearances will always be found to arise from minute Lichens having taken possession of the surface of the stones, to which they adhere, drawing their food from the atmosphere; small shields are scattered over their surface, sometimes round, but not unfrequently like dark clefts or lines, giving the Lichen the appearance of being covered with broken letters. Others are found on trees and pales, forming broad patches of various colours, one being of the richest golden yellow; some spread upon the ground in plantations and heaths—these have usually a much larger growth; some again hang from the branches of venerable trees, which they clothe with a long and shaggy beard of grey; and, finally, a few start up upon the heath, grey and deformed, but eventually fashioning themselves into fairy goblets, the border of which is studded with crimson specks or shields.

It is by the shields that these humble plants are known. Mosses have leaves and seed-vessels covered by a cap. Fungi have a soft brittle texture, no leaves, and their spores buried in a soft substance. Lichens alone have shields, which grow upon a tough or hard expansion, composed of leaves and stem all blended together, into what is called a frond.—*R. E.*

ON THE CULTURE AND IMPROVED VARIETIES OF THE GOOSEBERRY.

(*Continued from p. 69.*)

I WILL now proceed to notice one or two points in the culture of the Gooseberry which I think should be attended to in order to have a healthy and profitable plant. In the first place, I think it is of great importance that the roots should spring as nearly as possible from one common centre; I mean, there should not be one tier or whorl of roots above another; and this will not be the case, or at least not to an injurious extent, if the cuttings have not been planted more than about three inches deep. When selecting the plants, if it is found to be the practice of the Nursery to plant the cuttings at a nearly equal depth, then select the best-shaped and most vigorous plants, because they are sure to have the best roots. But I have sometimes found, where there is an abundance of cuttings, that many have been planted to six inches deep and upwards, and roots are generally emitted the whole length of the part inserted; and as the ground has generally been under manured crop in the previous year, and as the cuttings themselves contain a much greater quantity of pre-organised sap than the smaller ones, they grow with great vigour the first year or two, and soon become saleable plants. But I have had three or four trees of this description, and I never could make them grow well, nor produce fine fruit. I see by an observation of Harrison's, in his "Treatise on Fruit-trees," that he has noticed the unthrifty character of Apple-trees with roots like these. These trees are also generally very troublesome on account of suckers. It would be good economy to throw these trees away rather than plant them with such roots, because after they were four or five years old, I am satisfied that twice the original cost of the tree at least would be lost annually by the difference in the value of the produce. But instead of throwing them away, the stems may be cut off below the uppermost tier of roots, and the branches cut back in proportion, and so planted again as cuttings.

I believe too much can hardly be said in praise of shallow planting. Both naturalists and practical gardeners agree on the advantages of attending to this. The health and productiveness of the tree and the quality of the fruit are much influenced by the depth at which the tree is planted.

Of a lot of trees which I once cultivated with a view to competition, the one which was the shallowest planted was the most successful. The main roots were so near the surface that I had much difficulty each year in paring off a sufficient quantity of earth to apply manure without coming in contact with them. It was the size of the fruit of this tree which first induced me to subscribe to a Horticultural Society. I showed a plate of twenty of this variety (the Lion) in three successive years. In the first and third years I obtained the first prizes for them, and they were all the produce of this tree. In the second year 15 were the produce of this tree and five of another, and not one of these was under one ounce weight. It was the heaviest plate of Gooseberries ever produced at the shows of that society; but to this and to the plate of White Eagles second prizes were awarded, for the reason before mentioned.

Any one who knows aught of Gardening does not need to be told of the advantages of mutilating the roots as little as possible in transplanting, of preventing them from being injured by exposure to any winds, and of selecting a moist rainy day for the operation, and I suppose all will know of the advantages of spreading the roots over as great a surface as possible. Independent of the beneficial effects which the sun and air are said to have on the roots near the surface, it is evident, what with the descent of rain in wet weather, and the ascent of moisture to supply evaporation in dry weather, that there must be a continual motion in the fluids of the soil, by means of which a fresh supply of food must be continually presented to the roots.

This will probably be one cause why plants with roots springing from one common centre like the spokes of a wheel are more vigorous than plants with three or four tiers of roots one above another. By the time the plants were five or six years old, the roots of one would be spread over a circle of at least three yards in diameter, whilst the roots of the other would probably not extend to half that distance. In planting, after I had spread the roots, I used to scatter some soil over them, and then a layer of manure; I then applied the water and levelled the ground with dry mould.

In training, I think it is desirable that the tree should grow somewhat in the shape of a cup, because the branches will not then shade each other, a greater breadth of foliage will be exposed to the light, and the fruit may be more readily gathered. The tree may be easily made to grow this shape by attention in pruning: all shoots which grow where they are not wanted should be cut clean out; and it should be borne in mind in pruning that it is the end buds which generally produce shoots, and consequently you may make a shoot grow in any direction you please by cutting the wood back to a bud which points in that direction.

It is customary to manure Gooseberry-trees, grown for ordinary purposes, every other year; but I consider it more advisable to apply manure every year, if it be only half the quantity. I would not apply the same sort of manure two years together, if I could avoid it. It is not a profitable practice to allow the whole of a crop of fruit to remain on the tree to ripen. It should be gathered at three or four different times; for if half of the crop is only ripened, owing to the superior size of the fruit there will be nearly an equal bulk or weight when ripe as there would have been if the whole had remained.

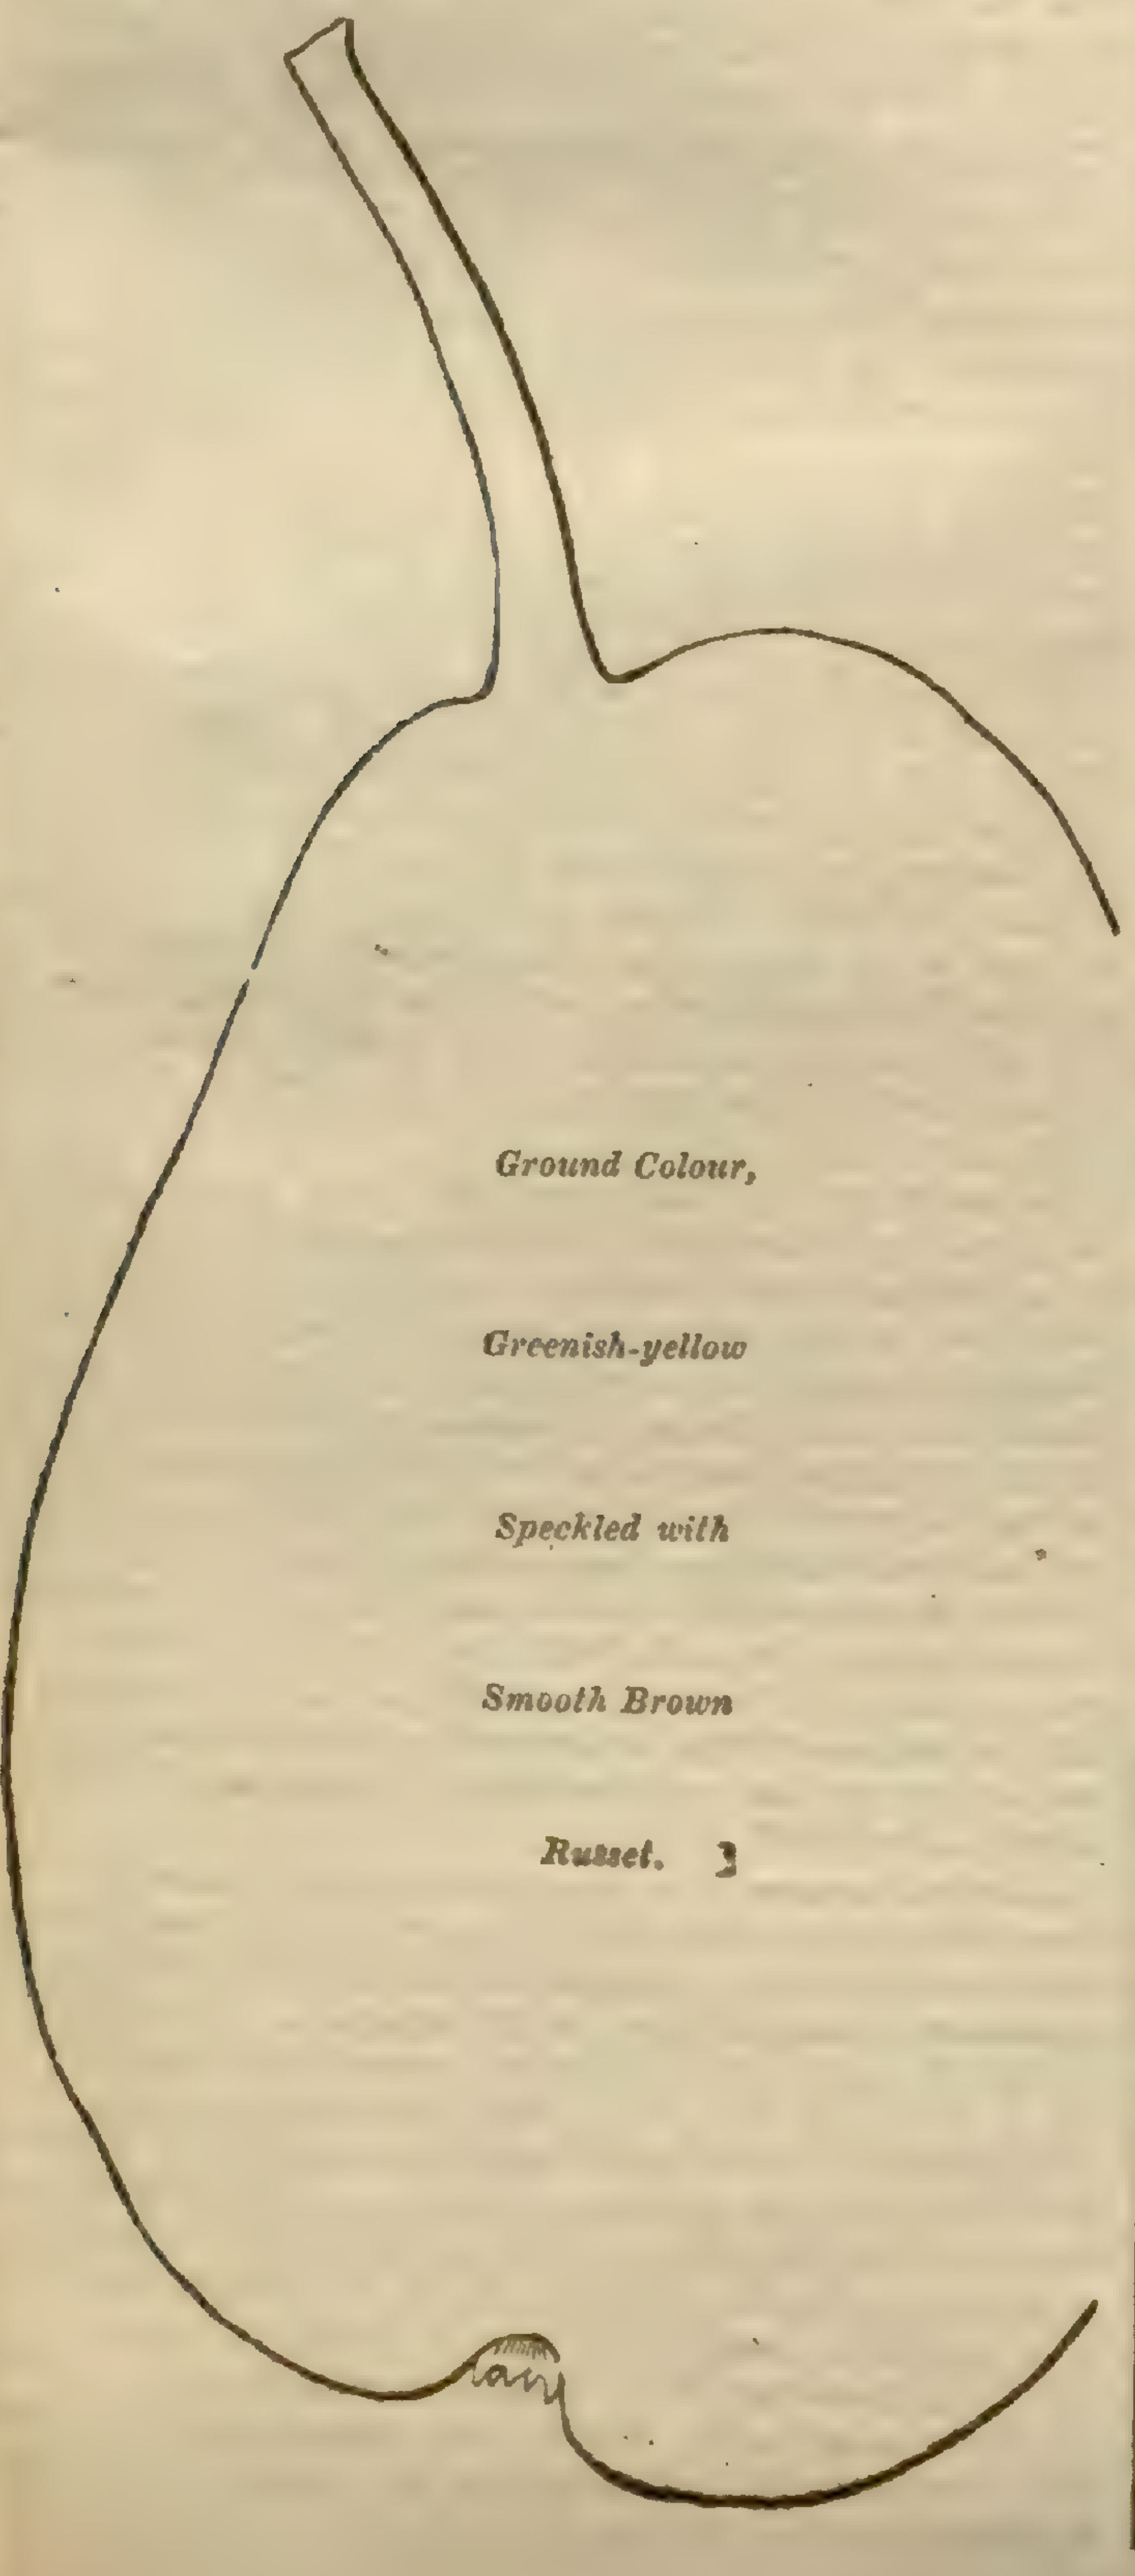
As there may be some readers of the *Chronicle* who may wish to grow the Gooseberry with a view to competition, I will briefly notice the mode of culture I should now adopt if that was my object. If I had trees of the varieties I intended to cultivate, I would raise my own trees. In the beginning of August I would remove a ring of bark from the lower part of several shoots which I intended for cuttings; a callus would soon be formed, and by applying wet moss or soil to the part, roots would be readily emitted. In September, when nearly all the leaves had fallen, I would cut them from the trees and plant them; and as soon as all the leaves had fallen, I would cut them down to the three or four buds which I intended to form the branches, and of course all buds below these must be carefully picked out. I would prepare other cuttings by ringing them in September; but instead of rooting them on the tree, I would plant them in the same bed with the others to see if there would be any difference in the growth, and if so, which were the best. I would prepare a bed for the cuttings by removing the soil to the depth of three inches; I would then put on a layer of compost two inches thick, composed principally of decayed leaves, and on this an inch deep of the soil of the garden. The fibrous roots of plants are stimulated to grow, more or less, in that direction in which they meet with most food; and what with the ringing of the cuttings, and preparation of the bed, I expect I should have plants with the sort of roots I had found to be the best, viz., springing from a common centre, and spreading horizontally. In this bed they should remain two years;

and instead of planting the trees in the common soil, and placing the manure over the roots, as was my former practice, I would now remove the soil to the depth of one foot or eighteen inches, to be replaced with a mixture of the soil of the garden if good, old stable manure, broken bones, and a considerable proportion of decayed leaves. At the back or north side of the bed in which I grew my trees, I had a row of the taller-growing common Gooseberries, and two plants of the same at each end; there were then two rows of the prize trees in front, then a walk or alley about a yard wide, and by the side of this a row of Scarlet-runners on common pea-sticks, so that my trees were effectually sheltered from the adverse influence of strong winds, while at the same time they were fully exposed to the sun—and this I consider a point of some importance.

I used to apply water only in spring, and liquid manure in summer, and this I should do again; but I should now use pigeons' dung to make the manure water with, instead of the old manure from the previous year's hotbed, which I formerly used. The branches I would train nearly horizontally as before, and I would not now allow the trees to bear fruit until they were four years old, unless it was one or two in the third year. In consequence of this treatment, I expect the plants would grow with great vigour, and when four years old would contain great store of elaborated sap; and the size of the fruit would doubtless be increased in proportion. I would also try what on the size of a single fruit would be the effects of ringing a branch. It is in vain, I think, to expect very large fruit from trees after the seventh or eighth year. I have noticed several trees which have been grown with a view to competition by nurserymen, as well as gardeners, yclept amateurs, which have been too old; and the older they grew the harder they seemed to prune them, so that when a tree was seven or eight years old, there did not appear to be a greater amount of foliage than there would have been when it was four years old; but at eight years old there will be about twice the extent of branches and roots, and if a layer of wood is to be formed annually on them of nearly the same thickness as in the fourth year, together with the further extension of roots and branches, it will be seen that under these circumstances it is impossible for the tree to produce fine large fruit.—*John Townley.*

THE DUNMORE PEAR.

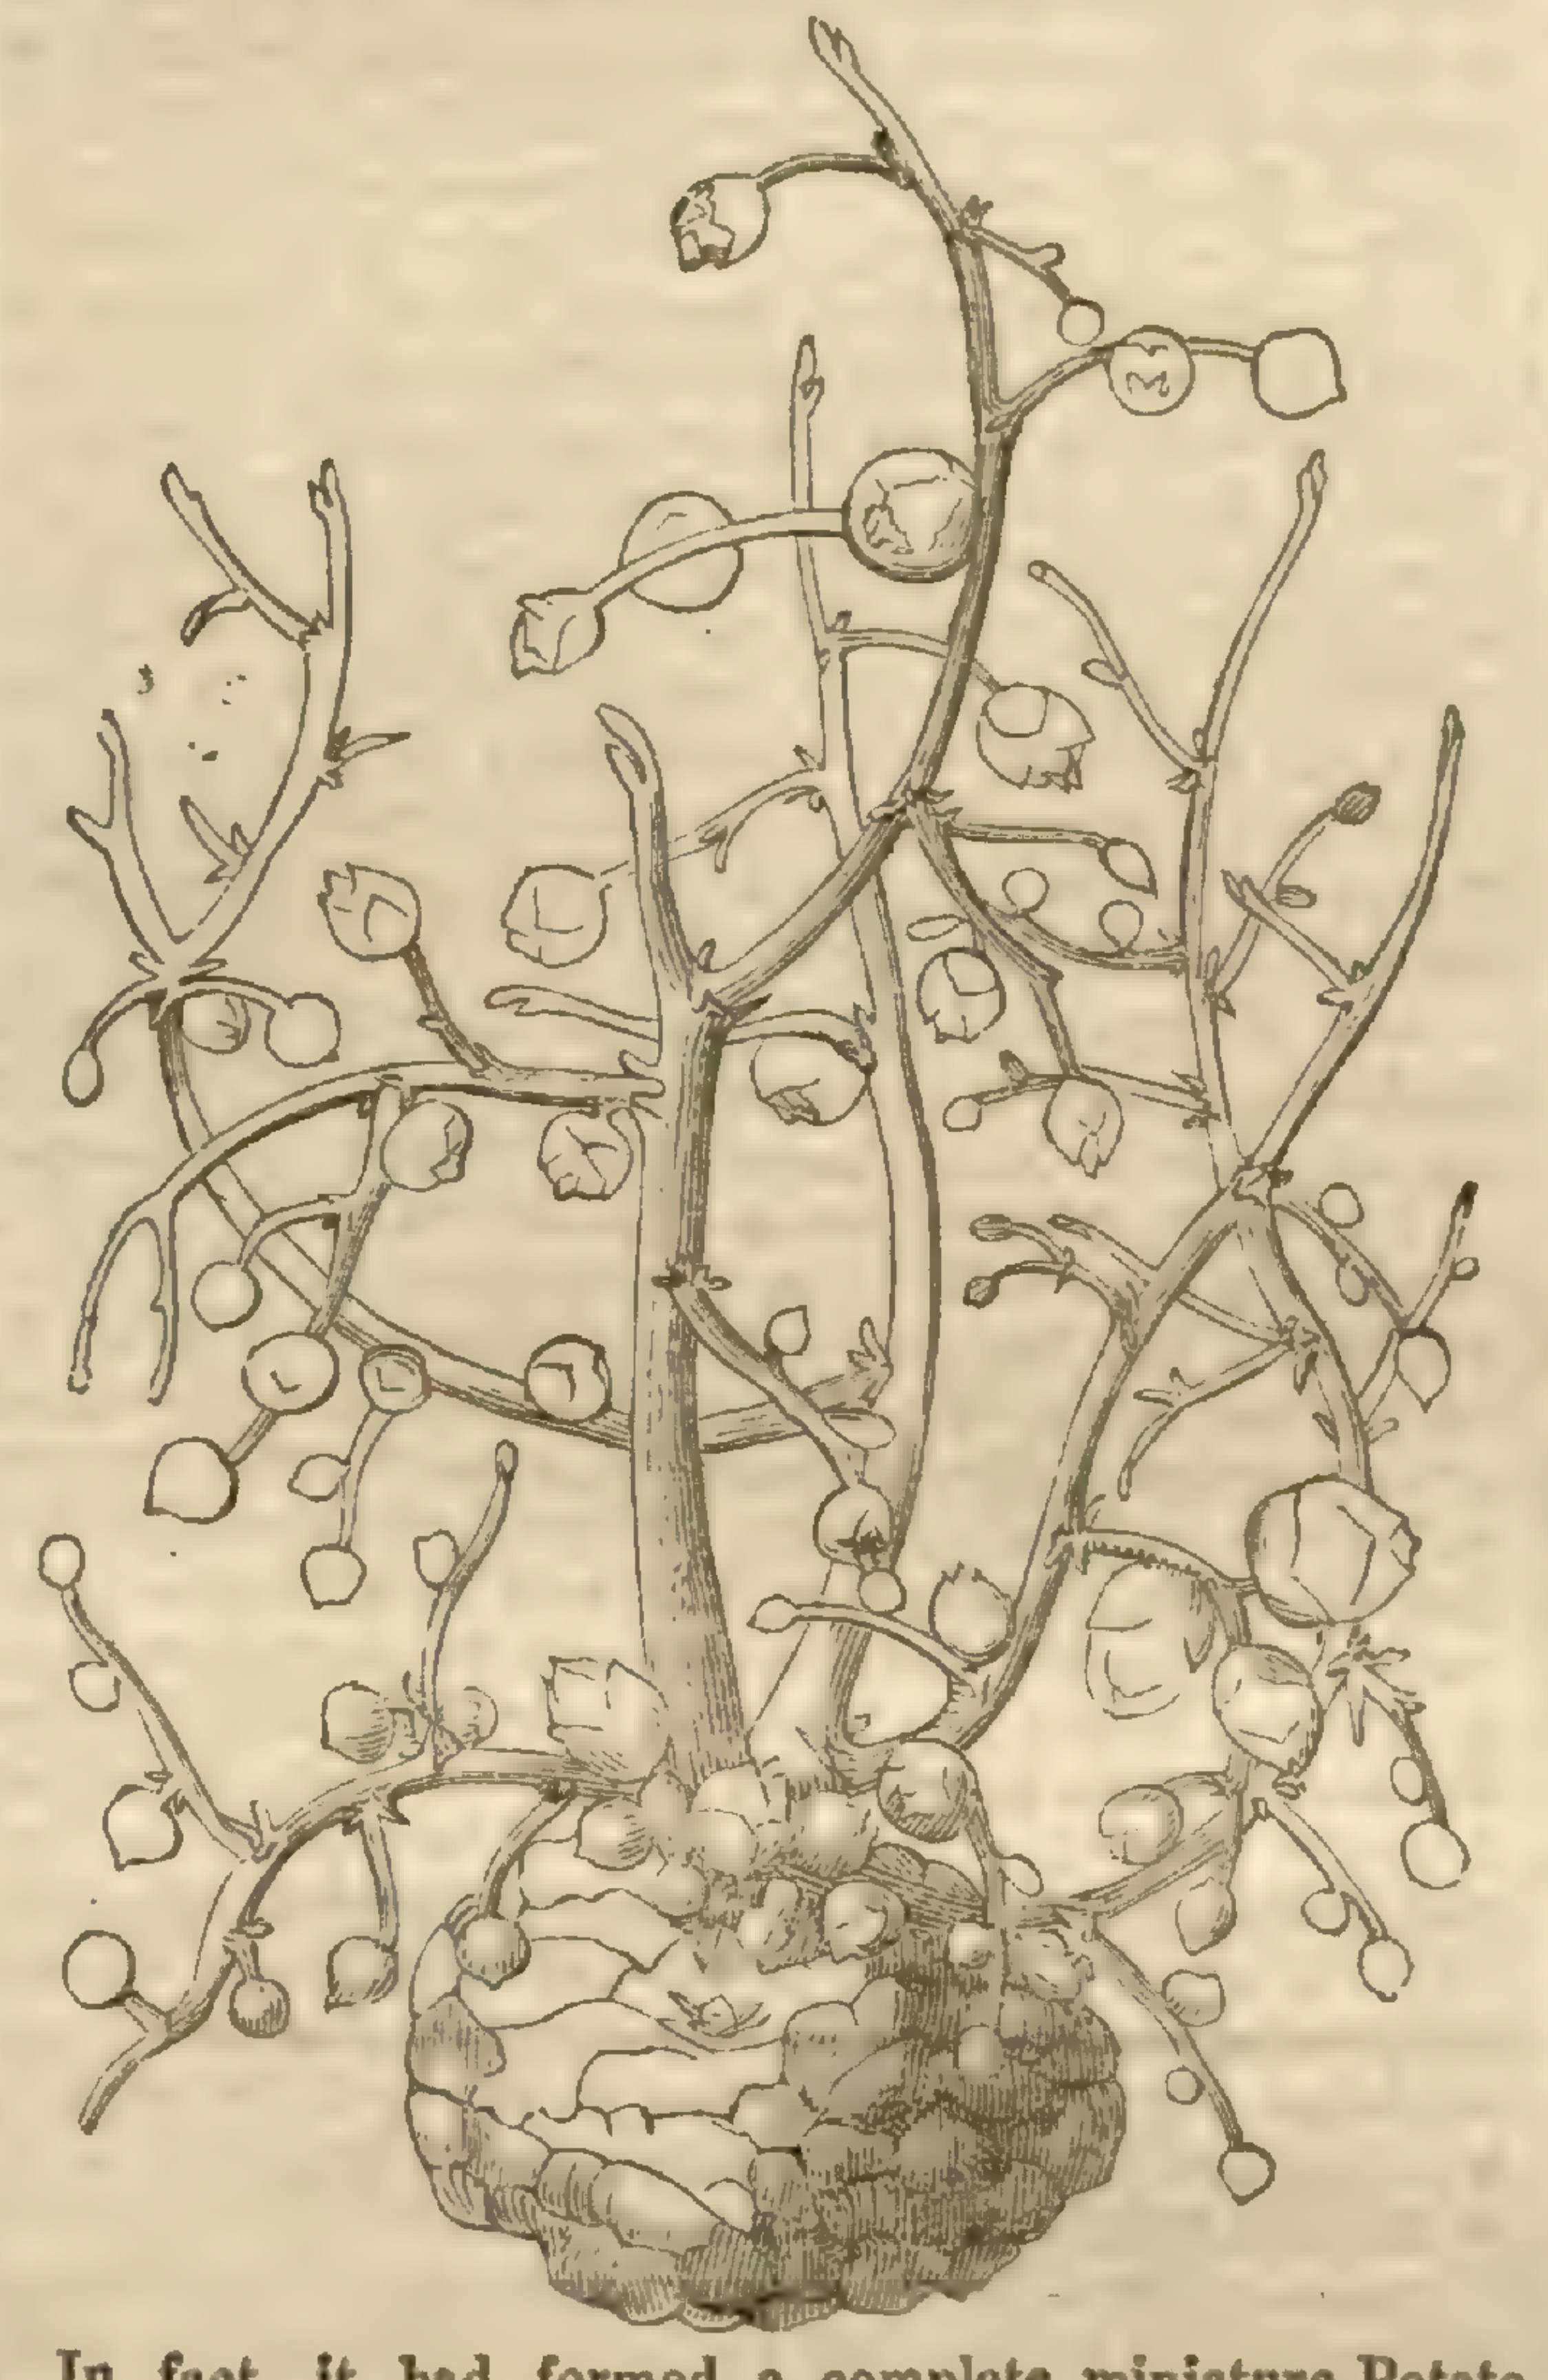
THE following sketch of this excellent Pear, from a fruit grown on a standard, will not be uninteresting to those who have been induced to procure it from the character given of it in pp. 671, 702, 717, 816 (1841), as it will enable them to ascertain, when their trees fruit, whether they are correct.



THE POTATO.

ONE would as soon expect a man to doubt his own identity as believe a Potato not to be a root. It grows under ground; everybody has called it a root from time unknown, and in botanical books it is to be found set down as a kind of root; how then can it be anything else? How indeed! A friend of ours regards it as a serious reproach to Naturalists of the present day that they never will let alone the name of anything, but are perpetually turning all established notions topsy-turvy. To be sure it *is* very wrong to doubt the infallibility of our forefathers, or to believe that the times which have gone by were not the perfection of human knowledge as well of human morals; and far be it from us to range on the side of the innovating theory. Nevertheless "a fact 's a fact for all that," and we fear that some few instances may really be found in which our venerated ancestors were mistaken, and that amongst them we must place the Potato.

A few weeks since, an acquaintance brought us a Potato plant, such as is represented below, which had thought proper to grow beneath an inverted flower-pot in a dark cellar, where, being starved for lack of food, it had formed itself into a very perfect abortion, in which everything was present that a Potato should have, but nothing of due size and fair proportion.



In fact, it had formed a complete miniature Potato plant, such as would have grown irregularly under ground had it been surrounded by soil, but which, branching in the air only, and meeting with no resistance, had grown with the same regularity as an ordinary plant above the ground. The set was shrivelled up, and formed a wrinkled knob, out of which grew many branches and branchlets. Of the latter, some, thickening at the points, became small Potatoes; others, having no power of lengthening, swelled close to the parent stem; and all were covered with tiny scales, the rudiments of leaves. Roots, the plants seemed at first sight to have none, for the set had furnished all the food the branches required; but upon looking carefully over the specimen, it became evident that little roots were in reality just beginning to appear on the surface of them, singly or in clusters.

We fear, then, we must now admit that Potatoes are not roots, but underground swollen branchlets. and that the eyes are the places where the scale-like leaves have appeared, in imitation of the real leaves that grow upon those other branchlets which are formed above ground under the influence of light and air. So that the modern botanists for once are right.—*Astor.*

THE AMATEUR'S GARDEN.—No. VI.

IN laying out small gardens, so much depends upon local circumstances and the peculiar objects the proprietors have in view, that this can only be done well by actual inspection. There are a few points, however, to which it may be useful to advert at this season of the year, when many persons are either making new gardens or altering those already made; and for this purpose it will be most convenient to divide them into two classes: first, where general effect only is studied; and secondly, where this gives way to the cultivation of fruits or vegetables for the table, or to the taste for florists' flowers. All who have been in the habit of visiting gardens of the first description, must have remarked that in some the taste displayed was of a much higher order than in others. In the former a kind of harmony prevails in all their parts: the dwelling-house, lawn, borders, walks, shrubs, and trees, are all in unison with each other, thus forming a beautiful whole on which the eye rests with pleasure and satisfaction; in the latter, a sort of jarring effect is produced, rendered more so by the conviction that the desired end has not been accomplished. If it is evident that the end in view has been attained, the whole may be very beautiful, although no picturesque effect has been produced—indeed the latter can scarcely be expected in very small gardens—but where no arrangement is apparent, where the shrubs and trees have been thrown together, as if the only object of the planter had been to get clear of them, it cannot be beautiful as a work of art, and it is much too clumsy to be mistaken for natural scenery. A few examples may be given of a bad style, which will enable the amateur to avoid them in laying out his garden. Curving walks made to the side of straight walls or hedges, and *vice versa*, supposing the wall or hedge is seen from the walk, never look well. Parallel walks are also objectionable, particularly when both can easily be seen at the same time; and the bad effect produced is greater or less in proportion to the length of the walks. A walk broader than the others, which does not lead to some particular object, creates disappointment in the mind of the stranger; curves in walks, without any apparent reason, are also bad. Artificial rockwork, built on the middle of a level lawn, or having the latter cut out into numerous small irregular figures, resembling hearts, tadpoles, and all sorts of gingerbread forms, pretending to represent a natural style of gardening, cannot be recommended where general effect is the object. Confused masses of trees and shrubs in the middle of small gardens, or in front of the dwelling-house, are generally objectionable.

I will take another opportunity of adverting to what I consider to be the beauties of this style of laying out small gardens; in the mean time the amateur may examine the examples now brought forward, which are not difficult to find, and judge for himself. If the weather continues open and fine, the various out-door operations formerly recommended can now be done.—*R. F.*

HOME CORRESPONDENCE.

The Treatment of Leonotis Leonurus.—Having successfully grown Leonotis Leonurus some years, I have been induced to make these remarks from seeing in the *Gardeners' Chronicle* of Jan. 1st, a paper by *P. W. J.*, which, with all deference to his motives, I believe calculated to discourage the cultivation of this desirable autumn flower. You have also referred another correspondent to the paper in question, thus giving it an importance it did not otherwise possess. It is, in the first place, to be observed that no plant, requiring a minimum temperature of from 50° to 75° in the early part of the season, say from April to June, and from that time till Sept. or Oct. a temperature of 120°, is likely to have many growers. I have, however, found it one of the most accommodating inhabitants of the greenhouse, being quite as hardy as any of the Fuchsias and as easily cultivated. The following is the method which I have so successfully adopted:—About the beginning of March, plants of Leonotis struck from cuttings last summer will have begun to grow; they should then be shifted into 32 pots, filled with any good loamy soil, with plenty of drainage, consisting of chopped turf and well-rotted manure in lumps, about equal parts. The plants should be placed in a light part of the greenhouse, where they will get plenty of air, and they must have but little water for the first two or three weeks, after which they may be set in pans, but they must not stand constantly in water. By the 1st of May they should be shifted into the pots they are intended to flower in, No. 4's; about the middle of the month, when all danger from frost is over, plunge the pots up to the rim in a south border and supply them plentifully with water; and once in eight or ten days give them some liquid manure. They will require nothing else but tying up and occasionally turning the pots round to prevent the roots from running into the border till the end of September or beginning of October, when they should be removed into the greenhouse, where they will flower for eight or ten weeks; after this they may be cut down and put under the greenhouse stage, and kept nearly dry till the following growing season. Treated in this manner, Leonotis forms handsome plants of from five to six feet in height, and from eight to ten in circumference, clothed with foliage from bottom to top.—*J.*

Mollet's Guernsey Beurré Pear (p. 36).—I beg to correct an error respecting the origin of this fruit into which you have probably been led through imperfect information. The merit of raising this very excellent variety from seed belongs to the late Charles Mollet, Esq., of this island, a gentleman much attached to horticultural pursuits, who died about twenty-three years ago. This is but one, and that not the most esteemed, of several new fruits raised by him. Two of his seedling Apples and one of his Pears have long been pretty generally cultivated in these islands, where they are highly valued; while this Pear, though known to exist, has been almost entirely neglected up to the present time—probably because few persons, if any, were aware that it required a wall to bring it to perfection. The specimens I sent were gathered from a young tree grafted on a Quince stock, and planted against a south wall. Under these circumstances it appears disposed to bear abundantly. I should think it likely to succeed well in a good exposition—at least as far north as London—especially as it parts very early from the tree. Even in such a cold season as the last it began to drop naturally at the end of September; and I think the best fruit was that gathered a week before that time. There is nothing to add to the description you have given, except that when tasted immediately after a Chaumontel its flavour is found very distinct: it is, besides, more acid and less sugary. These qualities give it additional merit as a variety among the midwinter Pears, which generally possess a cloying sweetness unrelieved by the slightest perceptible acidity.—*Hilary O. Carré, Guernsey, Jan. 21.*

Whitethorn.—The statement made by your Manchester correspondent, in page 54, concerning the Whitethorn, which he says succeeds so much better by division of the roots than by seeds, I have proved to be correct; for last February, having a great many Thorns to plant, I preserved the small roots, which were cut off for the convenience of planting, and set them in rows in the same way as seedling Quick, just leaving the ends an inch or two out of the ground; and they had no further care during the summer. They grew from a foot to a foot and a half high, and are now quite fit for planting fences. I have propagated Œnotheras, Campanula pyramidalis, and Pelargoniums, in the same manner.—*John Hick, Scarborough.*

On Raising Quick Fences.—Having marked out with the line the whole length of the intended ditch, and also the breadth; say 2 feet 18 inches of that breadth are dug out a spit deep in square turf, which is placed grass-side downwards in a straight line along the margin of the ditch on that side intended for the hedge; the top is levelled with the spade, and the crumbs are spread on the surface behind, on which is placed the quick, leaning against the turf; the remaining breadth of turf is then brought from the ditch and placed neatly and firmly against it. The quick is headed down, and all that is used is three years old. The bottom of the ditch is completed; the soil from which is laid in a ridge all along, and behind the last-placed turf; if a little of the soil falls down over the quick, it will do it no harm. Nothing more is required than to keep it free from weeds, to stir the surface-soil occasionally for three or four years, and to cut back the strongest leaders every year. If the soil is poor, a little rotten dung may be spread on each side the hedge. This was the method adopted by my employer, the late Thos. Knowlton, Esq., of Darley Dale, Derbyshire, whose success in this, as well as other horticultural pursuits, I was for upwards of fifteen years witness to. The number of beautiful hedges on the estates of the Duke of Devonshire, in this and the Sister Kingdom, planted by him during the time he was agent to his Grace, give abundant proof of the value of this system.—*J. M. Brambley, West Leake Rectory.* [We decidedly object to the practice of heading back the quick the first year.]

Genus Citrus.—If I could have foreseen that my treatise on the Genus Citrus would have entailed upon your pages so much encumbrance, in drawing forth the remarks and questions of your two correspondents in the Number of Jan. 29, I certainly never would have written it. To Mr. Murray I say, there are, I think, three of the Genus Citrus, nicknamed Adam's Apple. There is also one, a Pompoleon (Citrus Pompelmus), named Forbidden Fruit, but which of them is supposed to be the real Tree of Knowledge I cannot pretend to say. They are all "pleasant to the eye," but neither of them "good for food." In fact the names for the varieties are endless, but not so much so or so absurd as the fancy names now given to Dahlias, Pelargoniums, Carnations, Pansies, Calceolarias, *et hoc genus omne.* The Bigaradier of the French and Italian nurserymen is, as he supposes, the Citrus Bigaradia, or Bitter Orange, of which the varieties are infinite. To Col. Mason I take the liberty of remarking that if I had wished my Orangery to become the shrine at which any other pilgrims than swallows and cuckoos should worship, I should not have adopted a fictitious signature. My literary subscription is easily construed by my intimate friends; but to those with whom I cannot boast the honour of acquaintance, it is, what I had intended it should be, a strict incognito, and so will it remain. To the other remarks of Col. Mason, I cannot suppose that any answer, except perhaps a reference to my former paper, can be required or expected.—*C. A. F. A. E. H.*

Forcing.—To prove how true the theory is as to the necessity of light as well as heat in the forwarding flowers, I have two conservatories about the same size, one facing the north, the other the south; in the former there has been heat applied since the beginning of November, and I see by the register that on one sunny day (for it is a double-spanned roof, and so receives some of the sun's rays, though of course partially,) the thermometer has been as high as 70 at one o'clock P.M.; in the other, only as much heat has been applied as to keep out the frost; and the plants are nearly as forward in the southern as the northern house. I have endeavoured to follow Mr. Errington's (of Oulton Park) plan, given in p. 99 (1841), and although it tries one's patience a little, the plants are all breaking as if they were out of doors in April and May.—*X. X. X.*

The Double Yellow Rose grows and flowers most luxuriantly, both on a wall and as standards in the garden, at Monaltrie-house, near Ballater, on Deeside, in Aberdeenshire. The standards are large bushes, fully 6 feet high, and produce a great number of flowers.—*Frutex.*

The Anthæum at Brighton.—The remarks of your correspondent "Argus" on this subject are perhaps liable to mislead. It would appear that he attributes the fall of that building to the lightness of its roof, whereas there can be, I believe, no doubt that the catastrophe was owing to the great weight of the rafters or ribs. One half the iron, and a few feet more elevation in the centre of the dome, would probably have produced a building which might have stood for centuries. The great fault of the Anthæum was too much daring: it was an immense space to cover with so flat a roof. If, nevertheless, the difficulty had been met by *form* or *construction*, instead of *quantity* of material, the most splendid conservatory ever imagined would now possibly have been in existence.—*A.*

Rivers on Root-pruning.—If I had not been the first of your correspondents to call attention to Mr. Rivers's paper on Root-pruning, I should not trouble you on the subject, having nothing new to add, and there has already been enough said on the question. I do not think, however, Mr. Rivers has in all cases had full justice done to him; hardly one of your correspondents quits the subject without some notice, that the subject is "as old as the hills," and that Mr. Rivers is "not the inventor," &c. Now Mr. Rivers never assumed to be the discoverer of Root-pruning; all he did was to give his own experiences, and to state the train of reasoning which led him to adopt root-pruning to young Pear-trees. Hear what he says, which shows he was aware the practice was old: "Irregular amputation of the roots of fruit-trees too vigorous, is, I am aware, an old practice; but the regular annual or biennial pruning of them, so as to keep a tree full of youth and vigour in a stationary and prolific state, has not, that I am aware of, been recommended by any known author, although it may have been practised." And in this sentence is comprised all the merit which Mr. Rivers is entitled to, and all he claims. Although he may not be an inventor in one sense of the word, in its true spirit he is, just as much (to compare small with great) as Davy was the inventor of the safety-lamp, &c. As has been observed on a more important subject, "a simple fact in nature may lie for ages, which to common men means nothing, and to the eye of genius alone contains a multitude of applications and deductions only brought out when it comes into contact with certain others, and then becomes as it were fecundated and productive." There is one part of Mr. Rivers's instructions which must not be forgotten—viz. the keeping up the vigour of the plant by the application of strong manure, so as to ensure full power during the process of setting the fruit and ripening it: otherwise the result will be a mere stunted unprolific shrub. As regards my own experience, I root-pruned some large vigorously-growing common Pears which had been planted 15 years, and were about 20 feet high, in the autumn of 1840, and this year every branch is covered from top to bottom with bloom-buds; whereas, in former years, some 40 or 50 bunches of bloom were all I got in a season. I put in the trench made in pruning an ample layer of Skinner's scutch.—*Totty.*

Hot Water.—Mr. Hood, in his Treatise on Heating Buildings, has given the necessary directions for calculating the quantity of pipes and coals required for keeping up any given temperature in a hothouse; and I find, by comparing the results of such calculations with actual experiments, that they coincide in a remarkable degree. But the rules given by Mr. Hood only apply to such houses as are not protected from the cold air by a covering. Suppose a house is covered with any protecting material, such as boards, straw, Russia mats, &c., with or without an intervening space of air; this will prevent the escape of a great quantity of heated air; and as nothing is mentioned about these substances in any work with which I am acquainted, I should be obliged to you or any of your correspondents who could furnish the necessary data for calculating the effect of any of the above-mentioned materials. It would likewise be interesting to know the difference of the cooling effect of glass under different angles to the horizon, as a sloping roof must radiate much more than upright sashes in the front of a house.—*A. W.*

Ice and Salt.—Avoid the foul fiend—Salt. An intense degree of cold is given out by ice in the process of thawing. To produce that intense degree of cold being the object of confectioners, they add salt to accelerate that process; and to continue it, salt would be an excellent thing to add in packing an ice-house, if the process of thawing could be confined to such a portion only of it as would make the entire a solid body; but as the process must continue so long as any of the salt remains in the ice, it of course becomes an antidote to the preservation of it. One of your correspondents recommends occasionally pouring boiling water on the ice; this would be troublesome, as such a large quantity would be required. The process I adopt is, the ice is thrown into the well, and there pounded with wooden pounders as small and compact as possible; when about 18 inches of ice is so settled, it is well watered with lukewarm water from a watering-pot with a large rose; it becomes a solid mass in a few seconds. This is repeated on every 18 inches thick of ice. When required for use in summer, it is necessary to break the mass with a pick-axe, it is so solid. Snow, if well managed as above, and made a solid body, will answer remarkably well, is much cheaper to collect than ice, and can frequently be procured when ice cannot. I have used it three seasons, and found it nearly as good.—*Anon.*

Ice and Salt.—When ice or snow and salt are mixed together, they unite and pass to the liquid state of salt water. Solids, in becoming liquids, abstract heat from surrounding objects. Hence pastrycooks plunge their vessels of flavoured cream into mixtures of ice and salt; which mixtures, dissolving rapidly, abstract the heat from the cream, &c., producing an intense degree of cold which freezes the cream, but is not sufficient to freeze salt water. Nothing could possibly be more erroneous than to add salt to the ice in an icehouse. Its effect is to dissolve the ice, and the result is so much salt water.—*J. S. Henslow.*

Exhibition of Roses.—The council of the Nottingham Floral and Horticultural Society having determined to give an exhibition of Roses this year, they would be particularly obliged by the opinion of any of your correspondents as to the best manner of exhibiting the numerous families of this flower.—*Samuel and Richard Parr, Shilton, Nottingham.* [If some of our Rose friends will favour us with their ideas upon this subject, we will willingly publish them.]

Cottagers' Prizes.—I believe much good might be done to members of horticultural societies by means of prizes, if the plan recommended by "W. H. M.," page 813, (1841,) were more widely acted upon. The mind of man has often been compared to a well-cultivated garden on a barren soil, according as it has received instruction or cultivation. It is beautifully described by Bowring, in his poem entitled "Instruction." After delineating a delightful landscape reclaimed from a desert, he says—

> "And such is man—a soil which breeds,
> Or sweetest flowers, or vilest weeds;
> Flowers lovely as the morning's light,
> Weeds deadly as the aconite;
> Just as his heart is train'd to bear
> The poisonous weed, or floweret fair."

Certainly it would be a desirable thing to behold well-cultivated gardens in every district of our country; but if the minds of the great mass of the population remain in ignorance, it is more melancholy to look upon than what was once "a paradise of mysteries," now covered with Hemlock and Henbane. Well-selected books given for prizes might be of great benefit both to gardeners and cottagers. The plan adopted by the committee of the horticultural society of this place was, first to supply the members with prizes, consisting of spades, rakes, drain-hoes, Dutch hoes, garden-lines, weeding-irons, pruning-knives, also small works on gardening; also some books on gardening were got for the circulating library, so that all the members might have an opportunity of reading them if they had a mind to do so. For some years past, the successful competitors have received for prizes useful household articles, and books treating on a great variety of subjects; they appear to be very well pleased with them. If those that receive them give them a careful perusal, it is not to be doubted but that they will become more enlightened members of the community.—*Peter Mackenzie, West Plean.*

Foresting.—Your correspondent (see p. 51, 1842) who objects to your assertion that a crowded plantation deteriorates the quality of the timber, as well as diminishes its rate of formation, seems to have founded his hypothesis on data opposed to general experience. In Herefordshire, especially on the northern and eastern sides, Oak timber abounds; and in many of the woods it is usual to have felling at periods varying from sixteen to twenty years; the straightest and handsomest trees are left for timber, or, as it is called, groved; and they are from time to time thinned, and a regular distance kept between them. The effect produced on these groved trees is, that from being exposed to air and sun, the rapidity of their growth is increased in bulk, height, and quality; and in sixty or eighty years they become valuable timber. On the other hand, those woods which have been left to themselves present, at the expiration of the same period, a mass of weedy, drawn-up poles of great length, but of no size, with little heart, as it is termed; they are very tough, but with so much sap as to render them unfit for anything—the commonest purposes. I think your correspondent will find that an acre of Oak trees that has been groved and attended to, will, at the expiration of a few years, if felled, produce at least four times the value of a plantation, of the same size, that has been suffered to grow as they could; also, that the timber of the groved Oak would be firmer and riper than the other. It is unreasonable to suppose that Oak trees, or timber of any sort, should deviate from natural principles, those of seeking light and moisture; the close-planted trees seek these by growing upwards, whilst the effects produced on those which have ample room is a general and uniform expansion; this is evidently the reason why the largest, straightest, and best-conditioned forest trees are those growing separately in hedge-rows, in avenues, or as single trees. So completely was the late Sir Uvedale Price convinced of the necessity of giving ample room for the growth of timber, that he never went into his woods surrounding Foxley without taking with him pieces of card and nails to mark those trees which he considered to be in the way of other growing timber; and these woods will now show the happy result of his care. Timber trees require space to thrive in, and a soil that suits them, and I will undertake to say that let them grow as rapidly as they may, the wood will ripen sooner and be of a finer quality in those thinned than in those left in masses.—*Walter Henry Hill, Rectory, Pembridge.*

Gooseberry Caterpillars.—I have been much annoyed for years by Gooseberry caterpillars, and I destroy them in a simple manner, with little trouble and no expense. I take a roll of brimstone and place it in an iron pot, about five inches over, with a perforated tin cover to fit exactly the top; the brimstone is melted, and afterwards a sufficient quantity of hemp is mixed with it to make it thick; when it is wanted for use, a piece of lighted paper may be put on the brimstone. The handle of the pot should be hollow, so as to admit a stick about three feet in length. In fumigating the bush, take great care not to place the pot so near as to damage the leaves; by this means I have always been successful in destroying the caterpillars, without injury to the crop.—*George Jennings, Shrubbery House, Buckland, Dovor.*

Large Pines.—At p. 764 (1841), I gave some particulars of the manner in which Pines were grown at Thornfield near Stockport; and a correspondent at p. 846 (1841), questions the correctness of my account. I have since visited the place, and find that I committed a small error, but it is on my side, viz.—that instead of cutting fruit from suckers in from seven to twelve months, I ought to have said from six to twelve months. That 200 lbs. of fruit were cut out of one pit is proved by Mr. Hamilton, who, on referring to his garden-book, found that ten Pines weighed 79lbs. 11oz., or 1275 oz.; so that if they were all anything like these, it would only require the pit to hold 24 plants to make the weight; but these being his larger sorts, of course he had more than 24 plants in the pit.—*A Manchester Gardener.*

THE COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

BY JOSEPH PAXTON,

Gardener to His Grace the Duke of Devonshire.

JANUARY.

The operations in this month will be but trifling, and the weather may prevent them altogether; but should it be open, refer back to November, and endeavour to bring up any arrears. The protection of choice plants will now require particular care; as the sun gains power there is more danger of their serious injury by frost, but not so much from damp. Any creepers trained on the cottage, as a Vine, Roses, Pyracantha, Clématis, or Honeysuckle, may be neatly trained, if it has not been done before. Water plants in pots sparingly, and never at the decline of day.

VEGETABLES.

Beans.—If none were sown in autumn, or have perished, some should now be sown, as recommended in November, for transplanting in March. Early Mazagan is the hardiest and most early kind.

Cabbage.—Towards the end of the month, if the weather is open and mild, vacancies in the autumn-planted may be made up; and a few of the largest plants of Early York set one foot apart, for earliest use.

Peas.—A sowing of double-blossomed Frame or Early Charlton may be made on a sheltered border, which should have been ridged crosswise; draw the drills within two inches of the bottom, on the warmest side of the ridge; this keeps the seed drier than if sown in the bottom. The seeds for this early crop should be sown thick. If the whole of the border is intended for Peas, a yard between each row will be room enough; but if it is purposed to crop between them with early Potatoes, Celery, Cauliflower, or dwarf Kidney-Beans, which is the better plan, then double the distance may be left between the rows. It used formerly to be the plan, even in gentlemen's gardens, to sow Peas in a plot by themselves, as is now too often the case in small ones; this should never be done, as experience has taught that two rows at a good distance apart, will yield as much as three near together, besides the seed saved, and ground gained, by being enabled to crop close to them; and their place can always be occupied the moment they come off. Defer sowing if the weather is not favourable.

FLOWERS.

Should any bulbs, as Narcissus, Anemones, or Tulips, remain unplanted, choose the first interval of open weather to get them in, planting the dwarfest nearest the walk; those bulbs put in in October will probably be showing through the ground; the more choice sorts should be protected from severe frosts and heavy rains, to ensure good bloom; a layer of Fern or Spruce branches will be found suitable. The digging of flower-borders containing bulbs, if not completed early last month, had better be deferred until they show through the ground; it can then be done more safely. In watering Auriculas, take care that none enters the heart of the plant. Carnations, Stocks, and other similar plants contained in the pit, must receive the same treatment as recommended last month.

FEBRUARY.

If frost or snow has prevented the operations recommended last month from being completed, take advantage of the earliest opportunity to make up the delay; the sowings are not of so much consequence, but avail yourself of the first open weather to get seeds in. No vacant ground should be left undug until this time; yet that which produced the main crop of Potatoes is too often seen in cottage-gardens, throughout the winter, in the same weedy, rough state as left when the crop was taken off; this ought never to be the case; should the season be too far advanced to crop it with winter greens, then dig or ridge it immediately. A great deal more harm will be done than a short delay will occasion if the ground is trod or worked when in a wet state; and short delays from weather are always readily made up by taking advantage of the first favourable interval after. If pruning has been deferred, it should be finished now; the Grape-vine especially should not be delayed if it was not cut in the autumn; also any transplanting, for which see November. It will be well to look at next month, which is, perhaps, the most important one, that every preparation may be made beforehand. Any creepers on the cottage should not be delayed pruning and training neatly; drooping flowered plants should be trained horizontally; Roses and others upright, at regular distances, and spurred in.

VEGETABLES.

Beans.—A main sowing may be made this month of the Early Long-pod, in drills three inches deep and two feet and a half apart; but, as with Peas, detached rows, a good distance from each other, and cropped between, are the best.

Cabbage.—The August-sown, which were pricked out, may now be finally planted, and the vacancies of the autumn-set should be made good, if not previously done.

Chives may be divided for increase. This useful little plant will grow in any soil or situation, and does well planted as an edging to a back wall; it may be used for all purposes for which Onions are early in spring, when they cannot be had.

Onions may now be planted for seed; draw a drill about three inches deep for them, and set them one foot apart.

Peas.—If not put in, sow as recommended last month, the first favourable opportunity; those sown now will not be much later than the same kinds sown in November, and exceed them in point of crop. Draw the drills wide at the bottom, and spread the seed regularly, which is better than huddling them together in narrow drills; this should be particularly attended to in sowing Marrowfats and other branching kinds, which are usually sown too thick.

Radishes.—Choose a dry and sheltered situation for a sowing of early Radishes; they must be covered up from severe weather, for which Fern is the best material, but any light litter will do; they must be uncovered at every favourable opportunity. The Scarlet Short-top is the best kind to put in now, and a few Bath or Green Egyptian Cos Lettuces may be sown at the same time.

Rhubarb and Sea-Kale may have an increase of covering now, to cause their early growth.—See March.

FRUIT.

If new plantations of Strawberries were not made in July or August, they may be now; the old beds should be cleaned, and have a top-dressing of fresh soil and dung mixed; if in rows, they should be dug between, and a little of the fresh soil spread over the plants. For a cottage-garden, Keen's Seedlings, in four-feet beds, top-dressed as above, and renewed every three years, will be found the most productive. Prune and tie Raspberries, and make fresh plantations, if required.

FLOWERS.

In favourable weather, edgings of various kinds may be planted, as Box, Thrift, Daisies, Pinks, Polyanthus, and London Pride. Auriculas, Carnations, and other plants, should have free exposure in mild weather. Ranunculus roots must be planted in mild weather, in rich loamy soil; draw neat drills about two inches deep (if planted in a bed) and five inches apart; choose the roots for having full, prominent buds, in preference to size; plant the first week in the month, if possible; and as in their early state of growth they are extremely susceptible of frost, some covering should be given them if it occur.

Roses.—Chinese kinds, and those of robust growth, should now be pruned; but do not shorten strong-growing varieties much, except those shoots intended to produce wood for next season. Roses may also be planted, and the soil for them cannot be too rich.

Thorn or Privet hedges may be cut.

MARCH.

This most important month for getting in main crops of several kinds is proverbial for boisterous weather, but with fine intervals, of which advantage must be taken, for upon Onions, Carrots, and Parsneps being sown whilst the ground is in a good state, and the weather favourable, a great deal of their after success depends. We will presume that the soil has been prepared as we have recommended, or as circumstances seemed to dictate; but there yet remains a subject not spoken of, which is equally important in every garden—namely, a proper rotation of crops; for although the same plot may produce for several successive years good crops of Onions, for instance, by being well manured, it is, notwithstanding, a bad practice; and the plan of successive planting of many other kinds upon one piece of ground will ultimately so exhaust it, that no amount of manuring will again fit it for the same plant until a system of rotation cropping has been followed. It is unnecessary here to enter into the reasons for this, and we therefore give the best general rule for avoiding this sterility. After early Potatoes any of the Cabbage tribe may be planted; all tap-rooted vegetables, as Carrots and Parsneps, for which it is wrong to manure at the time of sowing, should be succeeded by dissimilar kinds which require dung at the time of planting, as Celery, Potatoes, and the Cabbage tribe. Let this be thought of now, that after arrangements may not compel you to occupy the same piece with a similar crop this year as the last. Where the ground has been ridged, the great advantage of the practice over flat digging will now be seen by the facility with which it is levelled in a fine pulverised state, enabling you to sow it immediately whenever a short period of fine weather may happen, whilst soil of a similar texture dug flat will be quite wet and unfit for working.

VEGETABLES.

Beans.—The first favourable weather, the plants from the autumn-sown beds may be transplanted in rows, across a warm border, about two feet apart; but if it is intended to crop between them, which is the best plan, with early Cauliflower or Celery, they should then be set at greater distances.

Broccoli.—The early purple sprouting and dwarf late purple may be sown in the last week of the month; these are the most profitable kinds, as they yield an abundance of sprouts, and being of dwarf growth may be planted close: otherwise Broccoli is not a profitable crop for small gardens, the late kinds occupying the ground twelve months, besides being great impoverishers. The early purple sprouting sown now, will come into use about Michaelmas, and the dwarf late purple in the March following, when they are valuable.

Cabbage.—In the first or second week, sow on a warm border a few for summer and autumn supply; they must be protected whilst young if severe weather occur; either Fulham, Early Brompton, or Large York will be found suitable kinds; water the seed-beds if necessary. A few Red Dutch may be sown at the same time if those put in in autumn have failed.

Carrots.—The first open weather, a few Early Horn may be sown in a warm situation for use before the main crop is ready; at the latter end of the month the main crop should be sown; a calm day must be chosen for the purpose, and the seed be previously separated by being rubbed between the hands with sand, dry soil, or ashes. The land should have been well prepared in autumn at least one foot and a half deep; for strong soil, the scrapings of roads, when dry, will be found an excellent dressing; if it is well incorporated in digging, it will keep the earth open and enrich it also; this may be done just previously to sowing, but manure should never be added at that time. The ground intended for Carrots and other tap-rooted vegetables should be prepared in the autumn, as the addition of fresh dung now would encourage the roots to fork, and become cankered; shallow drills an inch deep, and nine inches apart, are preferable to broadcast sowing, as the seeds are difficult to rake in, and the earth for covering the seed should be broken very fine: sowing in drills admits of the hoe being used much more expeditiously, besides a more regularly-disposed crop and a saving of seed; old roots may now be planted to produce seeds.

Cauliflower.—Sow in a warm situation for the summer supply to succeed the August-sown; choose a piece of the lightest and richest ground for this purpose: cover the seed lightly and evenly, and do not sow thick. In the last week the autumn-raised plants should be planted out in rich ground and attended to with water if necessary.

Celery.—Where there is a desire to have early or large Celery for exhibition, and plants cannot be procured from some large garden, and in the absence of a dung-bed, sow seed in a shallow box filled with rich soil, and cover it lightly with mould: it may be either protected in the Cucumber pit in April, or with hoops and a mat, or taken into the house at night, exposing it in fine weather.

Horse-Radish.—To grow fine roots, plant about two inches of the crowns in a deep trench, and cover them with sifted coal-ashes, or drop the sets into deep holes made with a large dibble, and fill them up with light earth; choose any out-of-the-way situation, as it is rather an unsightly plant, and not easily eradicated except by constant hoeing over for a season.

Leeks.—Sow the broad-leaved London in a warm situation the first favourable opportunity. The seed should be scattered thinly over a small bed, and covered lightly from the alley, beating it in with the head of the rake when levelling the surface.

Lettuce.—A few seeds may be scattered thinly amongst the Onions and Carrots, or on a small bed by themselves; the Green or White Cos are the best: and if Cabbage Lettuce is desired, the Imperial or Grand Admiral may be sown: they must be protected from birds. Endeavour to obtain a few Cos Lettuce plants which have been wintered in frames to set now in a warm rich plot.

Mint.—Roots may be divided, and new plantations made.

Onions should be sown about the middle of the month, or before, if the weather permits; the ground should have been bastard-trenched and ridged in autumn, and manured at the same time; therefore nothing but levelling down the ridges will be necessary now. For light soil, clay and pig, or cow-dung mixed, will be found the best dressing; a piece of the best ground in the garden should always be devoted to Onions. Sowing in drills is preferable to broadcast, as it ensures a more regular crop, which is easier kept clean. After the ground has been levelled, mark it off in beds four feet and a half wide, with fourteen inch alleys; then draw drills an inch deep along the beds about six or eight inches apart, sow the seed immediately, and after covering tread it in regularly; if the ground should be in such a state as not to admit this without binding the surface, it will be hardly prudent to sow; but if it has been ridged, this will scarcely happen. After the plants are fairly above ground, nothing is so beneficial to their well-doing as having the soil about them frequently stirred, and being kept free from weeds. The best kind is the new white Globe—it is extremely handsome, a good keeper, and being of a globular shape, a much greater weight is produced upon the same space than by any other kind.

Parsley should be sown the first favourable opportunity—the seed usually takes six or seven weeks before it makes its appearance above-ground; it may be sown as an edging to the walks, or on a border. When put in for an edging, the drills should be drawn with great care and regularity about an inch deep, and three from the edge of the walk; if in a plot, six or eight inches apart. In covering let the soil be well broken. When the plants are full-grown, any bearing uncurled leaves should be drawn out, and as soon as the earliest leaves begin to turn yellow a portion may be cut over close to the ground in succession; this will cause the plants to produce finer leaves, and stand the winter better.

Parsneps.—These should be sown at the same time and on an adjoining piece to the Carrots, as they require similar treatment; the drills for these should be about one and a half inches deep, and one foot apart; they are an extremely nutritious and profitable crop, and should therefore be grown largely by every cottager; boiled and eaten with salt fish or meat in the spring, they are delicious, and cows fed with them yield an abundance of milk; in sowing them, three or four seeds may be dropt in the drills, six or eight inches apart. The hollow crown Parsnep is the best.

Peas.—A succession may be sown of Dwarf Blue Imperial or Blue Prussian—they both grow about three feet high, and no better or more prolific Peas can be sown at this season. Earth-up and stick the early kinds as soon as they are high enough; they cannot be sticked too soon at this season, as they act as protection. In drawing drills, either make one wide at the bottom, or draw double drills, and sow thinly; the rows should always range north and south if possible.

Potatoes.—This is by far the most important plant we have to speak of; and although the season for the main crops has not arrived, there needs no excuse for introducing the subject, that some of the features in its successful culture may be impressed on the mind. Various interesting experiments have been made upon the manner of growing this root, which we might detail, but we will content ourselves in this instance with giving the modes of treatment which have proved the best. The time of planting depends a good deal upon the locality and nature of the soil; and although they have succeded well from the end of February to the same time in June, yet either very early or late planting ought to be avoided: we shall, however, detail a method which in light soil and warm situations will amply repay the trouble either for home consumption, or with a view to profit—this plan is practised in Lancashire, Devonshire, and many parts of Ireland, and is termed the "lazy-bed" planting; it is performed as follows:—Mark out the ground, four feet and a half for the beds, and two feet for the alleys; then remove about four inches off the surface of the beds into the alleys, afterwards digging the beds; and if the soil is not in good heart, manure must be added under the Potatoes if at all heavy, but if very light place it above them. By putting manure under early Potatoes on strong soil, it acts as drainage. The sets, which should be good-sized Potatoes of the Ash-leaved Kidney, Early Frame, Fox's Seedling, or any other dwarf-growing early kind, must then be planted about eight inches apart all over the surface, placing them carefully with their crown-eyes upwards; they will then rise stronger than if laid on their sides, as the crown-eyes of a Potatoe bear the same reference to those at the sides, as the terminal buds of trees do to the lower ones; should the Potatoes be so large as to make two good sets, keep the crown separate and plant each by themselves, and they will form a succession. Small Potatoes should not be used for planting at this or indeed any season, for reasons which shall be explained hereafter. As the plants appear upon the surface, a little soil must be added to keep off frost; in very small gardens this plan may be adopted with good success at a later period with dwarf-growing kinds.

Radish.—Some seed of the Scarlet Short-top and Turnip-rooted kinds may be scattered with the main crops of Carrots, &c.: they will be fit for use before the crops can be damaged by them: but if room is no object, sow them by themselves, and cover as before.

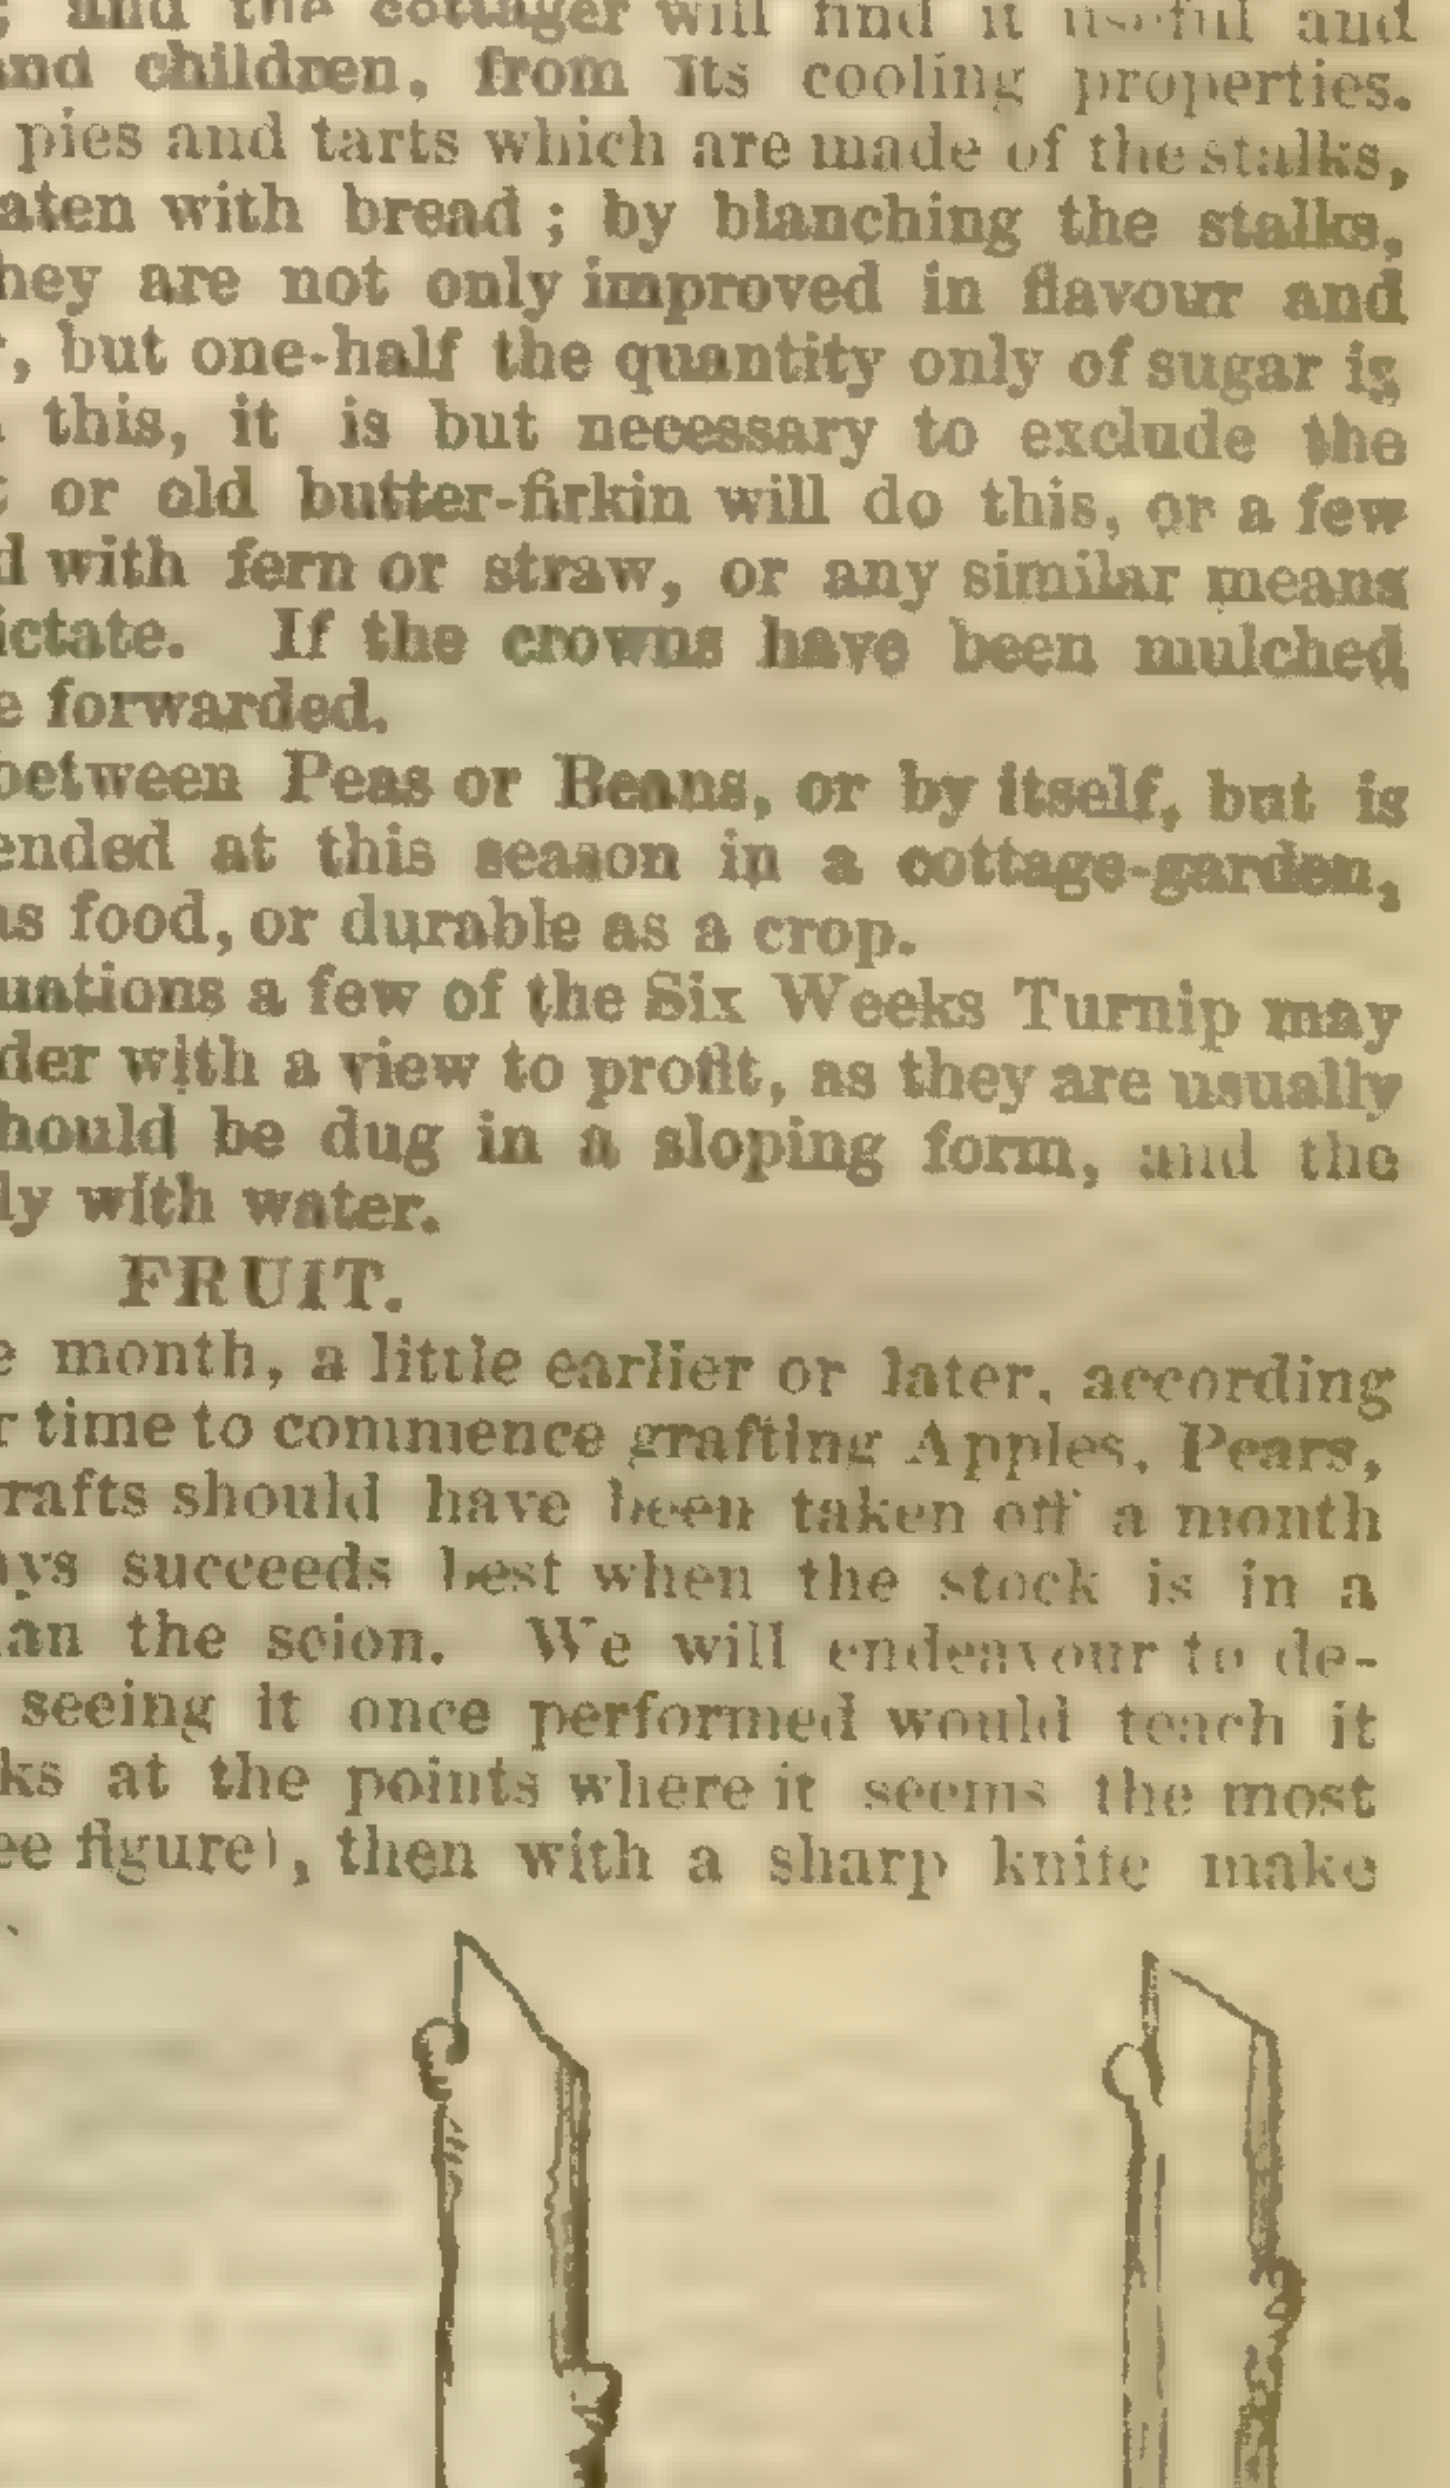
Rhubarb.—This valuable plant should occupy a corner in every garden, however limited; and the cottager will find it useful and wholesome for himself and children, from its cooling properties. Independent of the cheap pies and tarts which are made of the stalks, they may be boiled and eaten with bread; by blanching the stalks, which is readily done, they are not only improved in flavour and come to perfection earlier, but one-half the quantity only of sugar is required; to accomplish this, it is but necessary to exclude the light; a large flower-pot or old butter-firkin will do this, or a few hazel-rods or rails covered with fern or straw, or any similar means as circumstances may dictate. If the crowns have been mulched during winter, they will be forwarded.

Spinach may be sown between Peas or Beans, or by itself, but is not a crop to be recommended at this season in a cottage-garden, being neither nourishing as food, or durable as a crop.

Turnips.—In warm situations a few of the Six Weeks Turnip may be sown upon a south border with a view to profit, as they are usually very scarce; the border should be dug in a sloping form, and the plants attended to regularly with water.

FRUIT.

About the middle of the month, a little earlier or later, according to the season, is the proper time to commence grafting Apples, Pears, Plums, or Cherries: the grafts should have been taken off a month previous, as grafting always succeeds best when the stock is in a greater state of activity than the scion. We will endeavour to describe the operation; but seeing it once performed would teach it better. Cut over the stocks at the points where it seems the most desirable to fix the graft (see figure), then with a sharp knife make a smooth cut (*a*) upwards of the same width as the diameter of the scion, and about an inch and a half long, just penetrating to the wood: then make a slit downwards from the top across the cut, a quarter of an inch deep (*b*); cut the scion about four inches long, and cut the lower end obliquely at one cut, to fit that made in the stock, making a similar slit at *c* as that in the stock; then fix the two together, making one or both the outer edges fit neatly, according to the size of the branch grafted (*d*). Nothing more remains to be done but to tie them together securely without shifting their position with bast or tape, and cover the union with adhesive clay which has been well beaten up with some short hay, to prevent its cracking; if a little Moss is tied over the clay, and kept damp, it will assist the union. There are many different methods of grafting, but this is the one most practised, and all are on the same principle.



Any wall-trees or dwarf Pears coming into blossom may be protected from frost with branches of Spruce Fir or fronds of Fern tied amongst the shoots.

Hoe about the stems of Gooseberries and Currants.

FLOWERS.

Annuals.—Towards the end of the month, in light soils, a few of the hardiest annuals may be put in, and some of the autumn-sown thinned out and planted. Sow in small patches, and cover with a little dry soil; if a garden-pot is turned over the patch, it will protect the seeds from birds or frost; before sowing, ascertain their individual heights and colour, and attend to what is said upon this subject at the head of the list of annuals.

Anemones.—If any roots were left over the autumn-planting, they may be put in now for succession.

Auriculas.—As soon as the plants throw up their trusses of bloom, pinch them all off but the strongest one; and if any plant appears to require top dressing or potting, it should be done immediately; give them free exposure during the day, and allow them the benefit of any gentle rains towards the end of the month; but, above all things, guard against frost, for if the buds become in the least injured, they will not come up level in the truss; when the buds are formed, thin out the smallest or middle ones, leaving only as many as can expand without being crowded. Sow seeds of Auriculas and Polyanthus in shallow pans or boxes, and press them down only with a piece of flat board, sprinkling a little sand over them; place them under an east aspect, and protect them from heavy rains.

Borage.—Sow in the neighbourhood of bees, for which no plant is more valuable; it does not require transplanting.

Carnations.—Last year's layers should, towards the end of the month, be either planted out in the borders or in a bed, to flower; many growers pot them in large pots and flower them upon a stage; they delight in rich soil, composed of loam, dung, and sand.

Chinese Chrysanthemums may now be divided and potted in small pots, or planted out on a rich border, and trained, taking them up carefully, and potting them, during wet weather, for flowering in August.

Ranunculus.—As early as the weather will permit, Ranunculuses should be planted; the soil should be loamy, and prepared in November, by being loosened 18 inches deep, and having a good dressing of cow-dung. The bed should not be disturbed now, except in leveling. Plant the roots an inch and a half deep, choosing them for their prominent buds, in preference to size. Set them in rows six inches apart, and four inches asunder in the row.

Flower-borders containing hardy bulbs should be dressed as soon as they make their appearance above ground; if done before, there is danger of injuring them.

APRIL.

It often happens for want of opportunity, or from unfavourable weather, many of the operations recommended last month remain undone the beginning of this, but they must no longer be delayed. This is a month of shower and sunshine, the one soon chasing the other away; and all vegetation is making rapid progress, therefore every spare moment may and should be profitably employed; weeds, especially if neglected, will speedily flower and shed their seeds, ensuring a numerous offspring, that will take years to eradicate. As a matter of first importance, then, never allow weeds to flower, or let the hoe, during showery weather, remain idle, as it will not only destroy weeds, but encourage a rapid growth of the crops; and insects, like weeds, may be rendered comparatively scarce by diligence and adopting prompt measures for their destruction the moment they are detected; for, like them, if neglected they multiply beyond credibility. All planting in the kitchen-garden in spring and summer should be done in drills, because the plants are more effectually watered; and the first hoeing, by filling in the drills, acts as an earthing-up also. Some frosty nights usually occur, the effects of which on fruit-blossoms, young seedlings, and early growths of even hardy plants, must be carefully guarded against, as the fluids of plants are now active; a slight frost is capable of doing more mischief than a severe one in winter, when the plants are dormant.

VEGETABLES.

Beans.—When the last-sown show their first perfect leaves, to ensure a regular succession, some more should be sown in an open situation—Early Longpod is the most prolific kind: let the rows range north and south if possible, and do not sow together in a plot, but in detached rows, and crop between—the produce will be nearly double; and the space they occupy can be planted with Colewort or other greens in July and August.

Borecole, or Scotch Greens.—This valuable and hardy vegetable should be sown about the second week, if two sowings are made; but, generally speaking, for small gardens one will be found sufficient. If the smallest plants are pricked out to strengthen in some open spot about three inches apart, they will make stout plants, and by being planted out later will form a succession. The sowing may be made in any vacant part of the garden, but if sown rather thin in an open situation they will rise stronger.

Brussels Sprouts.—This deservedly esteemed vegetable is seldom seen in cottage gardens, although no kind of greens merits more extensive cultivation, it being very hardy and productive, and when cooked is extremely delicate and wholesome. It should be sown at the same time and in the same manner as Borecole.

Cabbage.—The seed-beds of last month must be watered in dry weather. Hoe between, or earth-up, those advancing.

Celery.—The main crop should now be sown in a warm situation and light rich soil: the seed being small, should be covered lightly and carefully with well-broken earth: do not sow it very thick, or the plants will rise feebly. The bed should receive some slight protection from heavy rains or cold nights; if a hand-glass is possessed, it may be placed over it for a short time. The Manchester Red and Solid White are the best kinds; the Red is the largest and most hardy one.

Cress and Mustard may now be sown under a south wall or fence.

Cucumbers.—To grow this vegetable, and for other purposes which shall be mentioned, we would recommend the following proceeding in some dry sheltered corner of the garden facing the south. To form a pit: mark out a suitable spot six feet wide, of any required length, and drive down stout stakes at the corners; then procure a quantity of grass sods cut square about three inches thick, and build with them a back wall two feet three inches high, and a front one fifteen inches: the walls may be a foot or fifteen inches thick to resist frost in winter. The stakes should be driven to the exact height of the walls on the inside; and when finished, a strip of wood may be nailed along their tops to make a level surface for the lights to rest upon: these must be formed by nailing four light pieces of wood together, the side pieces six feet six inches long, and the end ones three feet six inches. These frames should be crossed with twine to support a covering of oiled calico or paper, as a substitute for glass. If turves cannot readily be obtained, a number of stakes may be driven down, and wattled with rods, or lined inside with slabs, and a wall of earth, as above, built against these. This simple erection may be speedily made by any person, and will prove of great use. The surface surrounding the pit should be somewhat lower than the interior, to preserve it dry. In this homely pit any kind of Cucumber may be grown during summer. If a plant or two can be obtained of a size fit to plant out early in May, it will save some trouble; otherwise, about the middle of this month, throw into one corner of the pit two or three barrow-loads of dung, which will communicate a little warmth; then sow in a pot, half filled with light rich soil, the required number of seeds of the Southgate or long prickly Cucumber, covering them lightly, and place over the mouth of the pot a piece of flat glass, setting the pot upon the dung. When the plants are developing the first rough leaf, they may be potted off two or three in a pot, replacing them on the dung, and keeping the lights close for a day or two. As soon as they have perfected the first rough leaf, stop them—that is, pinch off their top close to that leaf; and prepare for planting them out in a few days after, by laying some long litter or turfy soil, about three inches thick, as drainage; then along the centre of the pit form a ridge of rich light soil one foot thick, and plant a pot of plants under each light. The reason for first forming a ridge of soil along the centre, is to allow frequent earthings to the plants as their roots appear on the surface, by which means they grow faster than when planted at first in a great body of soil. All that will be required after, besides these earthings, is a regular supply of air, removing the lights wholly the greater part of the day, after the end of May,—the stopping and training a certain number of bearing shoots, removing all that are weak or seem crowded, and pegging out the remainder without confusion. Male flowers, and leaves, when too numerous, must be thinned, and regular supplies of rain or soft water given to the plants. By these means abundance of Cucumbers may be had until late in the season. By some they are considered a delicacy, but it should be remembered that they are attended with a good deal of trouble, and afford little or no nutriment: the pit, however, should be built.

Lettuce.—A succession of these should always be kept by sowing a few at a time once a month, as they are cooling in summer, and excellent for allaying thirst. Sow the same kinds as recommended last month, and never neglect watering them whenever dry weather occurs: this rule holds good for all plants used as salading, and if neglected they lose their crispness and flavour.

Onions.—If the main crop was not got in last month, it must not be delayed after the beginning of this, or if sown last, they will be up this, and will probably require hand-weeding, accompanied with careful hoeing after a shower.

Peas.—When a succession is required without intervals, a fresh sowing should be made when the last-sown are fairly through the ground. In large gardens it is the practice to sow, as above, two kinds at one time which will follow each other; but this is not necessary in small ones, neither do we recommend tall sorts, on account of the space they require. No better kinds than those recommended for last month can be; but Knight's Marrows, especially the dwarf green, are delicious Peas, and very prolific. They may be sown thinner than other sorts, in double drills; being robust growers, they require stout sticks. The dwarf sorts grow from three to four feet high, and the tall kind from five to six.

Potatoes.—The second early crop should be planted the first fortnight, and the main crop in the latter end of the month. It is nearly useless to mention any particular kinds, as everybody has his favourite varieties; but for small gardens those producing the dwarfest haulm should be chosen for the second crop, if the lazy-bed plan spoken of last month has been adopted. Choose good-sized, well-ripened Potatoes, and lay them in a warm, dry place until the eyes sprout a little; when they have done this, cut them carefully, and, as recommended, before the crown sets, may be kept and planted by themselves; as they contain the strongest and best-matured eyes, they always rise stronger and more regular than those from the sides; sets cut from large tubers, each containing one good strong eye, have by numerous experiments been proved superior to either whole small Potatoes, or sets containing several smaller eyes: but we will give Dr. Lindley's own words for the reason of this, which we are sure will convince every one capable of thinking for a moment. Dr. L. says—"Large tubers cut into sets, each containing a single eye, are preferable to small Potatoes with the eyes cut out excepting one, even supposing the weight to be the same in both cases. Here lies the difference: the large Potatoe has a large eye or bud, which remains undiminished in the section composing the set; on the contrary, the small Potato has a small eye or bud, from which, in the first instance, only a weakly shoot proceeds; whereas the other starts vigorously, producing early an extensive breadth of foliage, supported on a stem capable of bearing it up in the light, and hence producing better tubers than either one weak stem or a multitude of such." The extra weight or quantity of Potatoes required for sets, if large ones are used, bears but a small proportion to the increase and quality of produce which the same space would yield if planted with weaker sets; dry weather must be chosen for planting, also a dry situation and light soil, in preference to heavy land. In planting, open good wide drills with the spade, from 18 inches to two feet apart, according to the height the kinds grow; six inches wider apart than the height the tops attain may be taken as a guide. The drills must be from three to four inches deep, along the bottom of which place the sets about eight inches apart, with the eye upwards; this is of more importance than many suppose, the plants rising then stronger and quicker than when the sets are reversed. If the land requires dung—which it usually does unless the soil is fresh maiden loam, the sets had better have some light mixture spread over them, as decayed tree-leaves, littery dung, with ashes, or any like material which will act as drainage; it should at all times be of an open nature; fresh horse, cow, or pig dung is improper, but may be used when well rotted and mixed with either of the above-named open materials. By planting with dung, the ground in the autumn will be found in a fine pulverised state for receiving the succeeding crop. Potatoes for seed should never be kept in a great bulk together, as the fermentation, or sweating, which they undergo often destroys their vegetating power and to this we have traced the failure of many crops; they should be placed where they can be frequently turned, to prevent their early growth and consequent exhaustion. For late planting observe the same rules, and choose kinds which do not grow very tall or produce abundance of flowers. A good method of planting to prevent the ground from being trod is to dig them in as follows:—Take out a trench, as for digging, and having a stick at each side of the piece of the exact length the rows are to be apart to measure with, when the trench is brought parallel to these sticks a line must be stretched between them, and the drill formed; then plant the sets and cover them with dung; after which shift the two sticks their length backwards and dig on to them as before, covering the planted row carefully as you proceed; this will be found, especially in strong soils, worthy of adoption, as the ground is left neat and level, and as loose as possible.

Radishes.—A succession of Short-top, Salmon, or Turnip-rooted kinds should now be sown in a moist situation, which should always be chosen for the summer crops of salading, as it saves watering, and renders them naturally more crisp and juicy. Radishes sown on a dry soil soon become woody and hot.

Rhubarb.—Seed for young plants should be now thinly sown, in drills, where they are to stand until autumn. Choose a light, rich spot of ground, and draw shallow drills a foot or 18 inches apart, and drop in the seeds in patches six inches from each other. It is a good plan to raise young plants for planting in boxes, to be placed in a warm cellar, or a closet where they will receive moderate warmth and no light: by some simple contrivance of this sort blanched stalks may be obtained, when they are considered a luxury even by the great.

Savoys.—The Dwarf Green Savoy should be sown and treated in the same manner as Borecole or Brussels Sprouts. The merits of Savoys are well known; their hardiness, ease of culture, and great produce are sufficient to recommend them in every family.

Sea-Kale.—We have seldom or never seen this vegetable in a cottage-garden; why it should be excluded we do not know, unless its being considered one of the luxuries of large gardens should unfit it for humbler ones. It is not only extremely wholesome, nutritious, and of easy culture, but, planted on a north border, which is little esteemed for other crops, it comes into use when vegetables of all kinds are usually scarce, and is always a saleable commodity if grown as a source of profit. It may be raised by sowing seed early in the month, or by slips of the root, or small crowns planted in February or early in March. For seeds, draw drills two inches deep, in light, rich soil, and let the seed be dropped about three inches apart in the rows, which should be one foot wide; seedlings are preferable to root-slips. The first season they will only require to be kept free from weeds, and in the following spring they should be planted out permanently; the ground for them should be well manured, and broken up about 18 inches deep, by being bastard trenched; plant in patches three together, about six inches apart, in the form of a triangle, and two feet from patch to patch. After some of the seedlings have been planted out in rows to strengthen, they may be placed thick in large pots or boxes, in November, and treated as recommended for Rhubarb, any time during winter, or early in spring. To blanch in the open ground, the buds or crowns must be covered with clear sand about two inches thick, and then have placed over them large pots inverted, old boxes or hampers, or any other available thing which will prevent them being broken when they are covered with long dung, fern, or leaves, sufficiently thick to exclude frost; or they may be planted one foot apart, and covered with sawdust, old tanners' bark, or sand one foot thick above their crowns, and allowed to grow to the top at their natural season; but this is not so good as the other method for blanching. The covering up with long dung, &c., is only necessary when it is desired to have it early; otherwise, in its natural season, the exclusion of light is only necessary. The plants will last many years. Sea-kale is an excellent natural sweetener of the blood in spring, and may render the use of medicine or doctors' visits unnecessary.

Slips of Sage, Thyme, Rue, Hyssop, Lavender, and other herbs, may be planted in a shady place.

FRUIT.

Remove foreright or ill-placed shoots from any trained trees; grafting may still be performed early in the month. Clear fruit-trees and bushes from suckers, and keep the ground about them frequently loosened by the hoe; destroy slugs and snails, likewise caterpillars, as soon as they appear. This is a proper season to layer vines, which is readily done by loosening a convenient and healthy shoot, and making a slit half through the shoot under the eye which it is intended should be the bottom of the future plant upwards two or three inches; then bend it into a pot or in the ground, securing it there with a hooked peg, and tying it upright to a stake to prevent its being broken; it will be well rooted by November, when it may be permanently transplanted.

FLOWERS.

Annuals.—The main sowing of hardy kinds should be sown this month as directed in March. The half-hardy kinds may be put in at the end of the month in the same manner as the hardy ones.

Auriculas when in flower should be protected from the sun or rains, but allow them all the air possible; they should receive regular supplies of water: if manure-water is given alternately, they will be much benefited; but never water them over the leaves. Polyanthuses in pots may be treated in a similar manner.

Biennials, as Wallflowers, Brompton and Giant Stocks, Hollyhocks, Campanulas, Sweet Williams, &c., should be planted out early in the month, if not done in autumn; and towards the end the same kinds may be sown to procure them strong for another season.

Cuttings of Fuchsias, Heliotropes, Salvias, Verbenas, and Petunias may be planted in pots half filled with soil, and plunged in a warm situation, placing over the pot a flat piece of glass to exclude air, or the pot may be placed in the window of a dwelling-room; many plants rather difficult to root may be struck this way, the sides of the pots acting as a sufficient shade; the piece of glass should be wiped or occasionally turned during damp weather; the earliest shoots of China Roses taken off close to the old wood when about four inches long and treated thus, will make blooming plants by autumn.

Dahlias.—The old roots should be started to grow before dividing or planting them; they may be placed in a box of light soil or decayed leaves, and kept moist, setting them out in the sun during the day, and taking them in, or effectually securing them from frost at night, by some Willows and a covering of Ferns. As soon as the shoots are three or four inches long, they may all except one be taken off close to the old tuber, and struck either as recommended for other cuttings, or in phials of water, or in damp moss; it is important to preserve the lowermost eyes in plants intended to store away for another season, although cuttings taken off higher up the stem will make equally good flowering plants for the present year. It is unnecessary to strike cuttings if the roots can be divided into as many pieces, each containing an eye as there are plants required: the buds should be allowed to shoot an inch or two before they are divided; by large cultivators artificial heat is usually employed to start the Dahlia earlier in the year, but plants started towards the end of this month under a south wall or in a box, as above, will make stronger and shorter jointed growths, and usually flower the best.

Carnations.—The planting out or potting in large pots must not be delayed.

Mignonette should be sown in the open border and in pots or boxes for flowering in the window in July; let the soil be mixed with one-half well-rotted dung, in which the plants will grow strong and become less liable to suffer from the effects of heat and dry weather.

Tigridia Pavonia bulbs should now be planted two inches deep.

Watch the advancing buds of Roses, and if the leaves appear curled search for a grub whose presence this indicates, or the bloom will be destroyed by it. Window plants should be repotted, and the branches trained or thinned out if necessary; put sticks to any advancing flower-stems; choice Tulips should be protected from heavy rains or frost if possible; where this cannot be done, shade them from the sun, and water the leaves when frozen early in the day. Clip box-edgings; turn the walks if of gravel, and rake down the beds or borders smooth and neat.

MAY.

Towards the middle of this month all kinds of tender plants may be placed or planted out of doors; and for cuttings or seedlings which have been housed, either morning or evening in showery weather is the best time. No plant should be planted out without first ascertaining its habit, height, and colour of the flower, so that the most proper situation may be determined for it. Half-hardy plants, as Fuchsias, Hydrangeas, and Agapanthuses, or African Lilies, may now have their winter coverings removed. In dry weather water becomes necessary to many plants in the open gronnd; but it should not be used unless positively required, as the benefits arising from artificial watering are but temporary, and it has the effect of exciting the roots, thereby rendering them more susceptible of drought after the water given them has been evaporated. When, however, it becomes really necessary to water, it should be given morning and evening, much more abundantly than is usually done, and never discontinued after its commencement, until a change in the weather renders it no longer necessary. A proper discrimination in the selection of objects for watering should be made, preferring seed-beds and crops which can be regularly and thoroughly watered, as Radishes, Lettuce, or newly-set plants. In the case of Strawberries or fresh-planted trees, mulching with straw or grass, to prevent the rapid evaporation of moisture from the soil, should be adopted.

VEGETABLES.

Hoe between and thin out the Onions where they are too thick, and fill up the vacancies, in wet weather. Hoe and thin Carrots, leaving them about six inches apart, and Parsneps nine inches. Strew soot or lime over any seedlings infested with insects. Keep the hoe industriously employed between all advancing crops; any plants intended for seed should have stakes placed to them to prevent them from being broken. Never attempt to save seeds of two varieties of the same kind of vegetable at one time; as, for instance, Cabbage and Cauliflower, or Broccoli, it being impossible to prevent them from being mixed by insects; and instead of producing the true kinds, a race of worthless mules will be the consequence; therefore, if seed-saving is adopted, which is not to be recommended except in a few instances, only save one of a kind—as, one Lettuce, one Bean, Curled Parsley, Celery, &c.

Beans.—Sow as recommended last month; the Long-pod is the most profitable. Should the weather prove dry, the seed may be soaked 24 hours before planting, and the open drills watered. Top the early crops as soon as they are in full flower, or when the black fly makes its appearance, which it always does upon the tops. Pinching them off is the best and surest remedy; draw earth to the stems when about six inches high.

Borecole.—If sufficient were not raised from the sowing made last month, some more should be put in immediately.

Brussels Sprouts.—The same treatment may be given as for Borecole.

Broccoli.—Another small sowing of the Early Purple Sprouting may be made to succeed the first; also White Broccoli for spring, if room is no object.

Cabbage.—Sow, about the third or last week, some quick-heading sorts for use during the autumn. These will continue good until severe frost spoils them, and renders winter Greens tender. Early York, Battersea, or similar quick kinds should be chosen. Some of the stoutest plants of the March sowing should now be planted out one foot apart, leaving the smaller plants for succession. Cabbages should have dung given them at planting, unless the land is strong. Tie up the leaves of some of the earliest to assist their hearting.

Carrots.—The Early Horn may be thinned to about three inches apart; and when they get too thick again, every other one may be drawn for immediate use.

Cauliflowers.—In the second or third week, the crop to come into use in October should be sown, and those raised in March should be finally planted out; choose for them an open spot of deep, well-enriched soil, and supply them copiously with water if the weather renders it necessary, as they delight in moisture. They may be watered with manure-water from the cesspool occasionally.

Celery.—Early this month the first plants will probably be sufficiently advanced to prick out in a warm sheltered situation to strengthen. The best plan is to choose a perfectly hard surface; and upon this, spread a layer of rotten dung about three inches thick, beating it tolerably firm with the head of a rake. Upon this spread a thin coating of soil, say half an inch thick, and into this prick the plants three inches apart. The advantages of this method are, that the plants root better in dung than soil, and are much easier kept moist, which is essential to them; and by having a hard surface beneath, they are prevented from forming tap-roots, and rendered less likely to run to seed prematurely; and on removing them to plant in the trenches, they may be cut out with balls of matted fibres, and being then well watered, will scarcely flag at all. Shade them for a few days after they are pricked out, and guard them from slugs.

Cress may be sown every month for a succession in a moist situation. Mustard must be sown every fortnight. The seeds do not require covering, but the ground should be made quite level, and watered; then strew the seed thickly on the surface, and press it in with a flat piece of board, or the back of the spade.

Kidney-Beans.—This delicious vegetable may be eaten freely by the most delicate person; the ground intended for Beans should never be manured at the time of sowing; but if fresh soil has been trenched up in a suitable place, sow them in it. Fulmer's Early, or Negro, may be sown, for the first crop, the first or second week; for a succession, sow according to the demand, once a month; the cream-coloured is the best for a main crop; the rows should be 18 inches or two feet apart, and the drills two inches deep. In dry weather, water the drills before sowing the seeds, which should be dropped in two inches apart.

Scarlet-Runner Beans.—This prolific and important crop to the cottager should also be sown the first or second week this month. For a plant so familiar as this, particular circumstances will always point out the most desirable situation either in the garden to form an arbour, to hide something unsightly, or to cover the cottage-porch. No creeper is more suitable, or has more claims for such situations. Scarlet Runners will grow in nearly any soil; but if sown in the open part of the garden, the rows should range north and south; draw the drills from two to three inches deep, and drop the seeds the same distance apart. To ensure good crops, detached or single rows are preferable to sowing them in a plot, even if a good width be left between, which should never be less than three feet. They are sometimes grown without stakes, and kept dwarf by having their tops frequently pinched off; one important matter is, never to leave pods for seed over the whole piece, but gather clean, and leave sufficient for seed ungathered in one place, as most plants after they have matured a few seeds cease to be so prolific as before.

Leeks.—The young plants will probably be ready by the end of the month, or as soon as they are six inches high, for transplanting out permanently. A piece of the strongest land should be chosen for them, which has been deeply dug and well manured. They may be planted in drills a foot apart, and about nine inches in the row; or a large dibber may be used for each to make a wide hole, about four inches deep, into which the plants must be dropped, and fixed by pouring some water from the spout of a watering-pot into the holes; make some puddle, in which the roots must be dipped before planting.

Lettuce.—A succession may again be sown; let the surface of the ground be freshened up, if it has not been recently dug, and sow thinly upon a piece sufficiently large to hold plants for a fortnight's supply; and let the thinnings be planted on an adjoining piece of the same size. If the ground is moderately dry, tread the seeds in, and cover them lightly with soil from the alleys.

Marjoram.—The sweet or knotted kind may now be sown in a warm situation.

Marigold.—Those who like the flavour of the flowers in soups should sow now; they will grow in any soil or situation.

Nasturtium, or Indian Cress, is not only useful, but exceedingly ornamental; it should, therefore, be sown early, where it will climb, to hide any unsightly object, or cover an arbour; the dark-flowering kinds produce fruit as plentifully as the light one, and make a beautiful variety. The seeds pickled resemble capers, and by some persons are preferred. If not used by the cottager, they will find a ready sale. The young points of the side shoots and the flowers may be used with Mustard and Cress, and are considered highly beneficial to persons subject to flatulency and weakness of the bowels. Sow the seeds in drills an inch and a half deep, in any situation. There is a dwarf kind, which is more an object for the flower-garden—it possesses the same properties; also a double-flowered variety, worthy a place in the window or flower-border.

Onions.—The surface-soil about them cannot be too often loosened; and the autumn-sown ones must be planted out during the first moist weather; choose for them a piece of rich deeply-dug soil, and in planting take great care not to bury the bulb of the Onion, only inserting its roots in the soil, settling it about them by a copious watering in the evening, which must be continued until it has made fresh roots. Plant the Onions in rows eight inches apart and six inches from each other.

Peas.—Sow as before for succession; and earth-up and stick those advancing.

Potatoes may still be planted as directed last month. Draw or add earth to any rising through the ground, especially to those planted in March, for fear of frost.

Radishes.—Sow as recommended last month.

Savoy.—See Borecole.

Summer Savory may be sown the first week; it is an excellent seasoning for Peas, and other similar vegetables, and is said to correct their tendency to create flatulency; it likes a dry situation, and may remain where sown.

Spinach may be sown in a shaded situation, but will soon run to seed. The round-leaved kind is proper to sow now. Spinach is not a profitable summer crop.

Turnips.—About the middle of the month a moderate sowing may be made of Early Dutch; this sowing will not stand long; if dry weather occurs it must be watered. Turnips are nourishing food, and if grown upon poor soil and dug in they enrich it considerably.

FRUIT.

Vines, towards the end of the month, or as soon as the fruit-bearing shoots can be distinguished, should have the weak and ill-placed ones rubbed off. There is usually too much young wood left in Vines, which only crowds, and prevents the fruit and the bearing-rods of the next year from ripening. When the runners of Strawberries are not required for propagation, cut them off, as they withdraw considerable nourishment from the plants; water them regularly and copiously, if the weather renders it necessary. Any grafts which appear firmly united, and are growing freely, may have the clay removed from them in wet weather, and the union newly tied, as the first will soon pinch. On removing the clay, if the union is not perfect, a little damp moss may be tied on in its place, and stakes put to them. Remove suckers or strong growths from the middle of Gooseberry and Currant bushes, and stop the shoots where large fruit is desired. Thin out the suckers of Raspberries to four or six of the strongest. Look over trained trees, and regulate the shoots by removing foreright and ill-placed ones. Watch narrowly for insects, and destroy them.

FLOWERS.

Creepers against walls should never be allowed to become entangled in their growths before they are trained. Keep all advancing flower-stems neatly tied; if this is neglected too long, no amount of after care will make them look neat. When the stems of Fuchsia have become a good length, some may be layered, by making an incision on the upper side, &c., as recommended for Carnations in July; they will soon root, and make fine plants for flowering late in autumn in pots.

Annuals may be sown for late autumn-flowering.

Auriculas.—Unless seed is wanted, cut down the flower-stems as soon as the bloom is over; they should then be potted, using plenty of drainage, with the following compost:—One-half rich turfy loam; one-fourth well-rotted cow-dung, or prepared night-soil; and one-fourth sharp river-sand: these should have been well mixed, and frequently turned in winter; if a few half-decayed tree-leaves are added at the time of potting, they will assist in keeping the soil open. After they are potted, set them on a stage of boards facing the east. Polyanthuses, when done flowering, may be planted out under an east fence or wall.

Dahlias, about the middle of the month, or as soon after as the plants can be ready, may be planted out permanently; a fresh loamy soil suits them best, when it can be had; but if circumstances render it necessary to plant year after year in the same situation, some of the old soil should be taken away, and fresh brought to replace it. The holes for them should be broken up 18 inches deep; where the soil is of a light texture, loam should be added, and the crowns of the roots placed so deep as to admit of their being mulched, and then made level with the border with a thin covering of soil, which will not only obviate the unsightly appearance of mulching, but prevent insects harbouring in it, which they otherwise would do. If Dahlias are planted in straight lines, adhere to the following arrangement of colours as near as possible, without, at the same time, losing sight of the importance of regulating them according to the height they grow, which is also necessary in creating a good effect:—white, orange, purple, yellow; white, lilac, purple, scarlet. We do not suppose that in many cottage-gardens all these colours, with their shades, will be possessed; but this arrangement will show the mixture of colours in the manner that the best judges consider the most harmonious. Orange should always be separated from yellow or red, blue from violet, and so on. White will harmonise with any colour.

Heartsease.—Propagate by cuttings in a shady place for autumn-flowering; young plants always produce the largest and finest flowers.

Hydrangeas.—Thin out the shoots when too thick, leaving only the strongest; some of the points may be put in as cuttings. Many methods of turning the flowers blue have been recommended; planting them in peat-earth will generally accomplish it.

Marvel of Peru roots may now be planted out in a warm place, as recommended for Dahlias.

Pelargoniums (Scarlet) which have been kept in the cellar may now be planted out; also Fuchsias.

Pinks of choice kinds should have their weak flower-stems removed, leaving only the centre one, and the blooms on each plant should be reduced to four or five to have them fine; water them with manure-water. In tying up the stems, do not tie over a joint, or in growing they are liable to be broken.

Propagate by cuttings, as recommended in April, Double Wallflowers, Rockets, Double Lychnis, &c.

Stocks.—Sow Giant and Brompton, covering the seeds lightly.

JUNE.

Watering out of doors is more or less necessary during this month, for newly-planted vegetables and flowers, and from drought. After watering, the ground round the plants becomes hard upon the surface, if not loosened with the hoe. Gather herbs for drying just before they are in full flower, as they then contain their essential oils in greater abundance than at any other time. Gather them in dry weather, and spread them in the shade to dry, as if placed in the sun it destroys their colour and aroma. Remove Cabbage-stalks not required for sprouts, and all kinds of decaying crops.

VEGETABLES.

Beans.—The last crop may now be sown of Early Longpod or Mazagan; if the weather is dry, soak the seeds and water the drills as before. Top any in full bloom, and draw earth to those advancing.

Borecole.—Towards the end of the month some of the stoutest plants will be ready for final transplanting, which should be done, if possible, in moist weather. Draw drills 18 inches or two feet apart; if 18 inches apart, place the plants the same distance in the rows, or 15 inches if in drills two feet apart. The roots had better be puddled before planting.

Brussels Sprouts.—Treat precisely as the above.

Broccoli.—Some plants of Purple Sprouting will now be ready for planting out in a similar manner to Borecole. A well-prepared plot of strong ground should be chosen in an open situation for all these winter crops; but if there is a scarcity of room, some may be planted between the potatoes and the haulm kept from smothering them. If it is wished to grow the spring kinds of Broccoli, they must be sown early this month.

Cabbage.—A few more of the March-sown may be planted out, to succeed those planted last month. About the 25th of the month sow a few of the Early York for a first crop of Coleworts: these are much neglected in cottage-gardens, although the circumstance of their occupying the ground so short a time, and being equal to young spring Cabbage, from growing so quick no crop can be more profitable. The main sowing is made next month.

Carrots, if not permanently thinned, should be now, hoeing deeply among them at the same time.

Celery.—As soon as the earliest plants have become pretty strong, prepare a bed for them as follows:—Take out the earth from a deeply-dug piece of ground, where the soil is rich and light, about six inches deep and four feet wide, laying it in a ridge along the side of the opening; then add to the surface of the bed a layer of well-rotted dung three inches thick; turn this in carefully, bringing about two inches of soil to the top; then plant in rows crosswise 15 inches apart and six inches plant from plant, reducing the tops slightly. By this method a great number of plants are raised upon a small piece of ground, and it answers equally well for single rows for early use. In earthing up, two pieces of board are used of the same length as the width of the bed, placing one along each row, and filling between them, lifting the boards out carefully and proceeding with the next row, always taking care not to add too much soil at a time. Do not allow the plants to want water at any time, nor earth too soon, as the object of earthing is merely to blanch for use; and a fortnight or three weeks will accomplish this. After the plants are earthed they cease to grow fast.

Cress and Mustard may again be sown as before.

Kidney Beans.—Sow cream-coloured. See the directions given in May. If the weather is dry, soak the seeds before sowing for 24 hours, and water the drills.

Leeks.—Plant, if not previously done, as recommended last month.

Lettuce.—Towards the end of the month sow for succession as recommended in May.

Onions.—Hoe between and keep free from weeds.

Peas.—In the first week the last sowing for the season may be made, for which choose Knight's Dwarf Green Marrow, as it is better able to withstand drought than many other kinds. In dry soils, if a narrow trench be taken out, and some rotten dung put in it, sowing the Peas above it, they will not be so liable to mildew. These late Peas must be sown thinner than the early kinds, as they branch a good deal: they also require stronger sticks. Water them in the rows if dry weather occur; draw earth to the stems and stick those advancing.

Potatoes.—Earth-up after rain, when the surface soil is tolerably dry; leave the ridges rather wide at top than otherwise.

Radish.—Sow any of the kinds upon a north border or other moist situation.

Scarlet Beans may yet be sown. Draw earth to those sown last month, and stop any intended to be grown without sticks.

Turnips.—A main sowing may now be made. If space be an object, sow White Stone; but otherwise Yellow Dutch or Swedish will be found to keep longer and more solid; and any roots left in the ground will produce an abundance of delicious and wholesome greens early in spring. Tread the seed in lightly, and water it when necessary. When the plants come up, sprinkle them with soot or lime.

FRUIT.

Cherry-trees on walls usually become infested with black fly at this season, which, if not checked, will extend to the fruit. An effectual and simple remedy is, immediately they are perceived mix some clayey soil with water in such proportions as will form a thin puddle, into which dip the infested points, leaving them to dry in the sun. After the enclosed insects have perished, the clay may readily be washed off; but it will do no harm in remaining. Roses and many other plants may be cleaned in the same manner. Vines trained against the house or walls must now be looked over weekly, and all weak and superfluous shoots removed. The earlier this is attended to the better, and more likely to forward the ripening of the fruit. A common fault committed in the management of Vines, is leaving in too much wood, which not only hinders the fruit of the current year from receiving the greatest nourishment, but prevents the fruiting wood for next season from maturing its buds, to assist which all the sun and air possible should be permitted to penetrate. This should be borne in mind when thinning out young and useless shoots; do not allow one spur to support two bunches of grapes, but remove the smallest or uppermost one, and stop the shoots at an eye above the fruit. Continue to water Strawberries, if necessary. Keep newly-grafted shoots securely tied, and the summer shoots of trained trees fastened in.

FLOWERS.

Small plants of Pelargoniums or Fuchsias intended for the windows in autumn will make fine specimens for that purpose, if planted out early this month; or they may be potted at once into their winter pots, and plunged out of doors, taking care that they have good drainage, and using precautions against their rooting through the bottoms or over the tops of the pots.

Annuals.—Some of the quick-flowering kinds may yet be sown, as Virginian Stock, Venus's Looking-glass, Clárkia, Collinsia, Gilia, &c. Some of those thinned out from the border may be potted for flowering in the window, or be placed in a shady place, to form a succession. They will require plenty of water. Some of the more tender kinds which were sown in pots, and raised in the cucumber-pit, may be planted in the open borders, as French and African Marigolds, Ten-week Stocks, China Asters, Zinnias, and Phlox Drummondii.

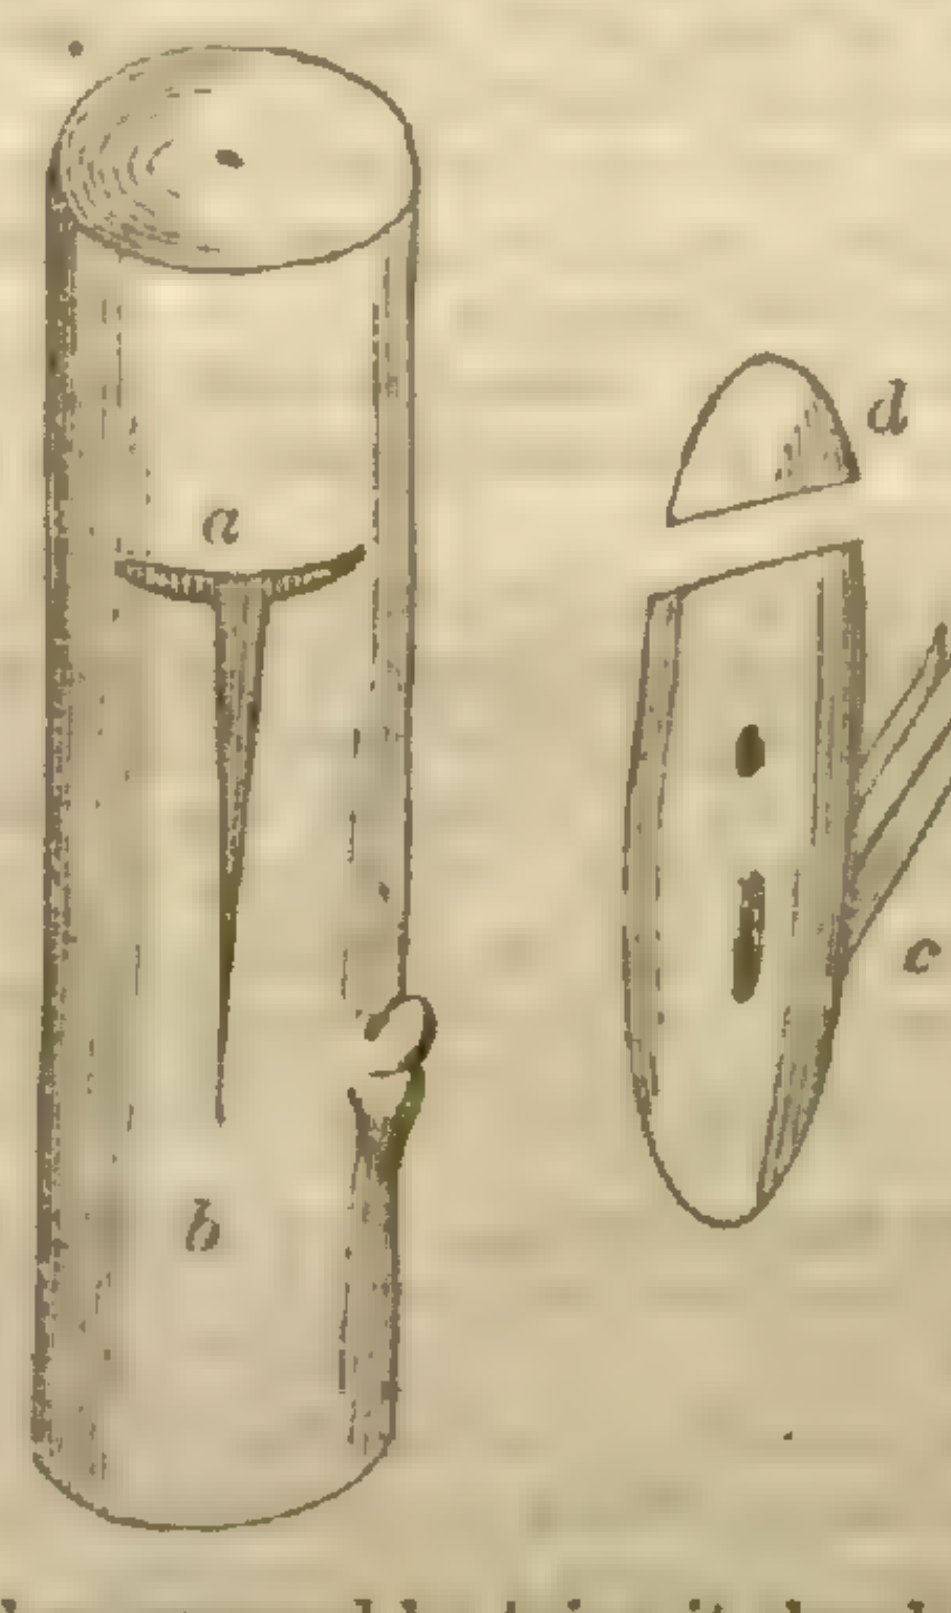
Bulbs of Ranunculus, Hyacinths, Anemones, and Tulips, as soon as the foliage has turned yellow, must be taken up, if they are choice kinds, and stored away when dry in paper-bags until the planting season. If suffered to remain in the ground, they shoot again in the autumn, which weakens the bulbs, and spoils their blooming at the proper season: and Tulips, when left in the ground, become run in their colours. The soil should be carefully cleansed from them, but none of the skins removed. Care must be taken in handling Ranunculuses and Anemones, not to break their claws.

Carnations should have neat sticks placed to tie their flower-stems to. This should be done loosely, to admit their elongating without breaking. If aphides infest the young buds, which is apt to be the case, they may be brushed off with a stiff feather, or dusted in the morning, when damp, with Scotch snuff. Pale-coloured kinds will be much benefited by applications of liquid manure once or twice a week. Liquid manure will be found of great advantage to other florists' flowers when putting forth their flower-stems—namely, Pinks, Ranunculuses, Polyanthuses, and Hyacinths.

Dahlias.—Keep them neatly and securely tied up, and water them if necessary.

Fuchsias, Verbenas, Heliotropes, and similar plants, readily strike by cuttings now.

Roses may be budded towards the end of the month. This operation is performed as follows:—Select a healthy, free-grown shoot, and at an eligible position for a bud make a cross-cut through the bark, as is shown in the figure at *a*; then from the centre of this, by passing the knife downwards, make the longitudinal incision *b*, taking care that the knife does not penetrate deeper than the inner bark. If the stock is in a proper state for budding, the edges of this T-shaped wound may be readily raised. Then from the kind to be budded choose a healthy, full-grown bud, and with a very sharp knife pare it off with a small portion of the wood, in the form of a shield, as at *c*. This, after the wood has been carefully separated from it without injuring the base of the bud, is pushed below the bark by introducing its lower end at the cross-cut *a*. When it has been pushed down nearly its length, the upper end of the bud must be cut off, *d*, so as to fit the upper side of the cross-cut *a* exactly. The bud is then secured by tying it closely with bast or worsted; and some recommend a coating of clay and cow-dung, to exclude air. Unless the bark rises freely from the stock, it is not in a good state for budding. Roses which are not readily raised from cuttings should be layered early in this month. The operation is precisely similar to that described for Carnations.—See July.



Perennials and Biennials, raised from seed, may be pricked out, to strengthen before their final transplantation.

Pinks.—Many kinds of choice Pinks, in expanding, are liable to burst their calyx, either from robust growth, or a naturally short calyx. To prevent this, a narrow strip of parchment or bladder may be passed round them, and secured with a little gum-water; or if bladder is used when moist, it will adhere of itself, and can be readily removed before exhibition. Some circular pieces of card should also be cut of the same width as the flower, to arrange the petals upon; for although the guard petals of a first-rate pink should expand even and level, it is better secured by this contrivance. Slit the card to the centre on one side, and in the centre make two or three cross-cuts, to admit its being fixed upon the calyx without bruising it. As the flowers expand, the small or irregular petals must be extracted, and the others laid out horizontally, so as not to interrupt the circular lacings. Some short-calyxed Pinks will burst in defiance of these precautions. To prevent this being done irregularly, it is better to slit the calyx of such kinds a short distance down at each of their segments before placing the ligature round them. Expanded flowers must be shaded from the sun if it be wished to retain their beauty any length of time. Various means in the absence of an awning will suggest themselves for this, as caps of stout paper, painted, and supported above them with a stick, like a miniature umbrella, or square pieces of thin board, about six inches wide, fixed upon a stick. The best time for piping is when the plants are in full bloom; if delayed much longer, the shoots get hard, and do not root so readily. They should be taken off when about two inches long, and have the leaves from the two lowermost joints stripped off. Do not shorten the remaining leaves, as is frequently practised. Then in a shady part of the garden prepare some light soil, by digging it fine and level, watering it until it becomes a puddle. Whilst in this state plant the pipings, but do not water them after they are planted. To ensure success, a hand-glass should be placed over them; or they may be planted in wide-mouthed pots with a piece of flat glass over, as recommended in April; or place them at the front of the Cucumber-pit. These early pipings make handsomer and stronger plants than later ones, and are therefore much to be preferred.

Water copiously all plants in pots, newly-planted seedlings, &c., in the evenings. Gather all decayed flowers, as it prolongs the flowering season of such plants as Calceolarias, China Roses, &c., and is, besides, a nice occupation for children. Destroy weeds. Tie up all advancing flower-stems at an early period; for if allowed to grow straggling at first, no after management will make them look neat. Examine the buds of Roses for grubs: any plants infested with worms may be cleansed of them by watering with lime-water.

JULY.

Remove all crops of Peas, Beans, &c., the moment they cease to be useful, as they not only continue to exhaust the ground, but encourage snails and slugs. The Pea-haulm may be dried in the sun for bedding a pig or cow, and some lengths of the stoutest Bean-stalks saved for earwig traps; sow the ground where they have grown with soot or quicklime to destroy slugs, and immediately prepare it for winter Greens or Colewort; preserve ripening seeds from birds, by stretching some dark-coloured worsted over them, and gather any that are ripe. Cut herbs in flower for drying. The principal crops of winter Greens should be planted this month; any plants found to be diseased with clubs should have the callosities pared off, and their roots and stems dipped in a puddle of earth and soot, or a little lime should be sprinkled in the holes at planting; discard any plants which are blind, that is, when their heart has been destroyed by an insect and grown over by the footalks; they require examination to detect the faulty ones. Advantage should be taken of rainy weather for planting, otherwise copious waterings will be necessary; dipping the roots in puddle before planting is beneficial in dry weather.

VEGETABLES.

Beans.—Mazagan Beans may be sown, but they cease to be profitable at this late season; earth-up and top those advancing.

Borecole.—The main plantation must be made as soon as the plants are fit and the weather favourable.—See last month.

Brussels' Sprouts and Savoys.—Treat as Borecole.

Broccoli.—Plant out the main crop of the Purple Sprouting, for which choose the strongest ground the garden affords; or it may be planted beside Borecole, and treated in a similar manner.

Cabbage.—Some of those sown in May may now be planted for autumn and early winter use, a feet apart. A few more seeds for Colewort should be sown as before, about the middle of the month, and in late cold situations Large York, Nonpareil, Vanack, or any favourite kind, may be sown in the last week, for the principal spring and summer crop; in early situations next month will do for this. An open spot of light soil should be chosen for the seed-bed, and sow rather thin, which will cause the plants to rise stronger; the beds must be kept watered in dry weather and shaded until the seeds vegetate.

Cauliflower.—If any were sown in May, they will be ready for transplanting this month; choose for them a moist situation, and let the ground be rich and well dug; plant them in drills two feet apart, and give them copious supplies of water whenever dry weather occurs.

Celery.—The main crop should now be planted the first favourable weather, in shallow trenches, 15 inches wide, into which plenty of well-rotted dung has been dug; stretch a line along the bottom, and plant a row on each side of the line; the trenches may be about three feet apart, when more than one is required; if it is intended to grow a few plants of an extra size for exhibition, they should be planted in detached holes expressly prepared for them, by breaking them up deep and adding plenty of good dung; set the plants upon the surface, and supply them regularly and copiously with water when necessary. To blanch them, the leaves may be tied together loosely, and wound round with straw or hay-bands, a little at a time—or four narrow pieces of wood may be nailed together, forming a square tube about one foot long and eight inches square, and slipped over them, filling up the sides with dry sand or gravel; when the first length becomes filled up, another may be added. Earthing-up Celery with a great mass of soil prevents its becoming very large, particularly in dry seasons, as it precludes the roots of the plants from receiving much moisture, which is of the greatest importance to them.

Cucumbers will require the bearing shoots to be regularly distributed, and all weakly ones removed, also bad leaves or deformed fruit; and they must be supplied regularly with water.

Kidney-Beans.—The last crop should be sown the first week; none will be found more profitable than the cream-coloured; draw a little earth to the stems of those advancing.

Lettuce.—A few more may be sown for succession (see May). In dry weather never neglect the watering of Lettuce, both in the seed-bed and when fit for use, and stir the soil frequently about them.

Onions.—Potatoe-Onions may be taken up as soon as the stems have withered; leave them exposed root upwards a few days in the sun before they are stored by; preserve sufficient to replant in December. Large bulbs produce the greatest weight, but small bulbs form the handsomest Onions; these should be used before the spring or autumn-sown.

Peas.—Earth-up and stick as they may require. Put sticks to them immediately after they are high enough to be earthed.

Potatoes.—Draw earth up to their stems, in a rounded ridge, but not to a pointed one; pick off the blossoms as soon as they begin to expand; children can perform this, and it has been proved to increase the weight of produce over others where blossoms had been left.

Radish.—A few of the Turnip-rooted kinds may be sown in a shaded place.

Scarlet-Beans will now require staking, which must not be neglected, or their growths become entangled. The stakes should be about six feet high, and thrust firmly in the ground; about midway up two smaller rods may be wreathed between them; or if the rods are small at top, they may be secured to each other to form a bower; this will, however, prevent the inner sides of the rows being so productive. Remember what was said in May respecting leaving Pods for seed.

FRUIT.

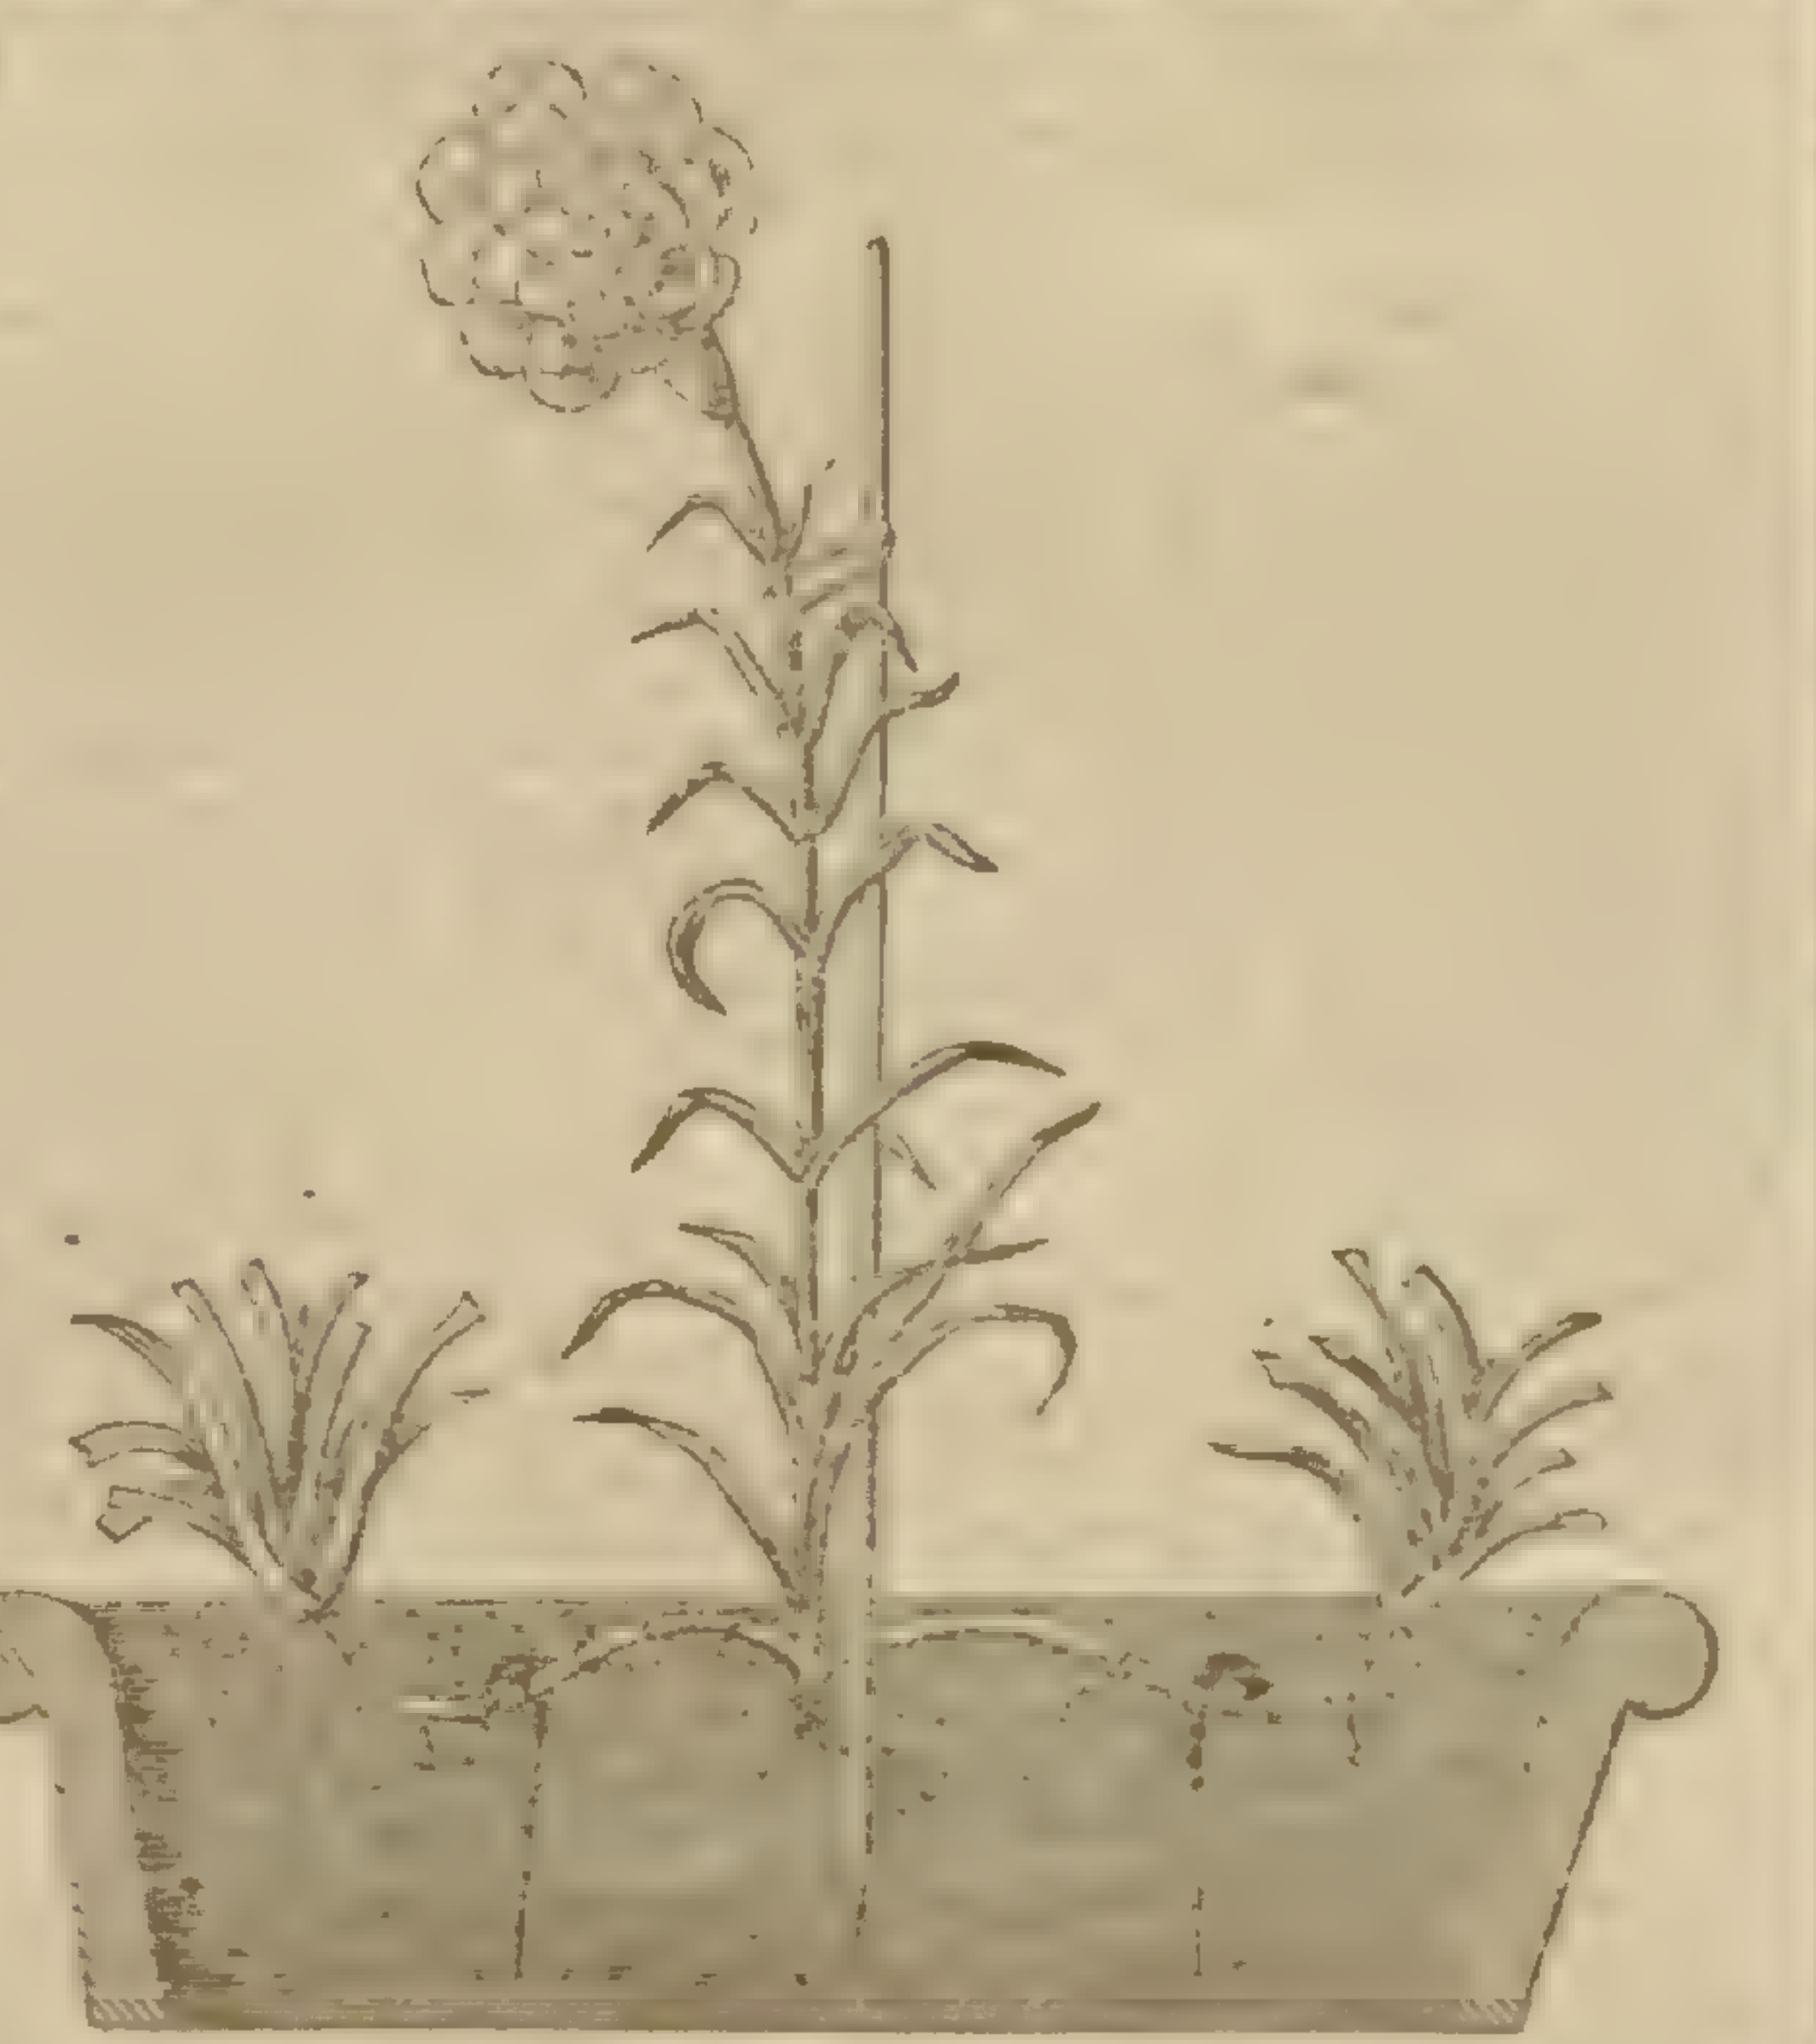
If it is intended to make new plantations of Strawberries, select now some of the strongest runners for that purpose; by planting out during showery weather at this season, they become well established before winter, and usually produce a few fine fruit the following season, which can hardly be the case when delayed until spring. Cherries, Peaches, or Plums may now be budded in the same manner as described for Roses last month; examine grafts, and remove any shoots or suckers that may withdraw nourishment from the scion, and keep it secure from injury by winds. Trained Pears, Plums, Apples, or Cherries, should have all the summer growths, except those intended to be trained in, shortened back to two or three eyes, to encourage the formation of fruit buds. Vines must be regularly looked over, and have all weak, useless shoots removed, as last month; if the smallest berries are thinned out regularly and carefully with a pair of scissors, the remaining berries will swell much larger, and in favourable seasons be scarcely distinguishable from hothouse fruit. Currants and Gooseberries should have any of their summer wood that may shade the fruit cut out. Gooseberries intended for exhibition must have no rain upon them; many growers place a saucer of water beneath each fruit, of which only four or five are left upon a young vigorous tree, which is either mulched with well-rotted dung or watered with manure-water whilst the fruit is swelling.

FLOWERS.

Annuals, during showery weather, may be thinned out, and the thinnings planted.

Bulbs.—Continue to take up as their foliage decays, and supply their places with annuals or other plants.

Carnations.—Towards the middle or end of the month is the most proper time to layer these, for which choose dry weather, as the shoots are then much less liable to snap off when bending them after the incision is made. The operation is performed as follows:—First remove the leaves from the part of the stem to be buried in the soil, and about an inch of the extreme points of the terminal leaves; then with a sharp knife make an incision a short distance below the most eligible joint to be found within about two or three of the top; the cut should pass half through the stem, and then upwards, nearly to the joint above, and cut the small portion of stem remaining at the tongue immediately below the joint (see figure); then bend the shoot down to the soil, which has been loosened for its reception, and secure it there with a small hooked stick, covering it with some finely-broken soil, an inch deep, considerably firm about it: after this, a watering renders the operation complete. All common layering is managed on the same principle, a layer being "a cutting not separated from the parent plant until it has emitted roots for its own support." In layering many kinds of brittle plants it will be found a good plan to make the cut upon the upper side, instead of the lower one, for this reason: when the layer is bent down, after the incision is made at top, the strain is upon the stem, which will stretch a little without breaking; but when made at the under side, the strain is on the flat-sided wound, which readily snaps. Where the Carnation stems are very numerous it may be worth while to put some in as pipings, in the same manner as recommended for Pinks, about the 1st of the month; these are much less certain than layers, but are said to make healthier and stouter plants when they do strike; a gentle bottom-heat would be of advantage to them. The opening flowers must be protected from sun and rain, the calyx tied or secured, and the petals arranged as has been recommended for Pinks. If seedlings were raised last year, they will now be in flower; select those worth keeping.



Dahlias.—Thin out weak branches, and keep the plants neatly and securely tied; cuttings may now be struck, for preserving in pots during winter.

Heartsease.—Plant out seedlings, and propagate choice kinds by cuttings, in a shaded situation.

Hydrangeas may be increased at this season by cuttings, as recommended in April, or by layers, making the tongue at the origin of this season's young wood, and shortening the top.

Pelargoniums which have flowered may be cut down, and cuttings of the best kinds put in; they will readily root now.

Pinks.—Pipings may be still put in, and the decayed flowers removed.

Roses may be budded if the bark rises freely. The stems which have flowered should be cut down to a good eye; a succession of flowers will be thus encouraged; examine the earliest buds, that the ties are not pinching.

Stocks.—In leaving single-flowered plants to produce seed, choose those containing the greatest number of petals.

When double-flowering herbaceous plants are going out of flower, they will be usually found in the fittest state for increase. Clip Box-edgings—also deciduous hedges. Keep creepers neatly trained up, and allow no weeds to be seen.

AUGUST.

During this month the hues of autumn will begin to make their appearance; but its approaches in the flower-borders may be deferred by regularly removing decayed flowers of such plants as throw up a succession. Chinese Chrysanthemums should have their tops taken off now at different heights, so that the flowers may range above each other, and the plants become furnished with numerous flowering branches instead of one; some of the strongest of the top-shoots removed may be immediately planted into small pots as cuttings—they will soon root and make dwarf flowering plants. The bandages round buds or late grafts will by this time require loosening, and retying if they are not firmly united. Plants intended for late flowering in the window, as Calceolarias or Fuchsias, should be kept free from flowers now; and, for the same purpose, a few of the best late annuals may be potted and placed in a shady situation. Examine bulbs that they are not damp, or they will soon become mouldy and injured. Destroy weeds and insects whenever detected. Gather herbs in flower for drying, and articles for pickling. Keep the soil about winter crops regularly loosened.

VEGETABLES.

Beans.—Earth up and top when in full bloom.

Borecole, Brussels Sprouts, Savoys, and all other advancing crops of Greens, should be frequently hoed between. As soon as they become sufficiently advanced, some earth may be drawn to their stems; this will not be required so soon where they have been planted in drills, as these become filled up in hoeing between, which answers the same purpose.

Broccoli.—Plant out the last crop of Sprouting, or any kind of Broccoli, as recommended in June; choose the strongest soil for them.

Cabbage.—In the first or at latest second week, prepare an open spot or bed for sowing Cabbage for the main spring or early summer supply; the Battersea, Early Brompton, or Vanack, are the best kinds; sow them rather thin, as it is important the young plants should rise with strong stems. A little seed of the Red Dutch may be sown at the same time and in the same manner; the seed-beds must be kept regularly watered if necessary, and they should be better shaded should the weather prove dry and hot. Towards the end of the month some of the first-sown seed for Colewort will probably be sufficiently strong for transplanting in drills a foot apart; the roots should be dipped in a puddle if the ground is dry.

Carrots.—A small patch of Early Horn may be sown on a warm border to stand the winter; they often prove valuable in spring.

Cauliflower.—Those who have built a turf-pit or possess other means of preserving young plants through the winter for heading in May, when they are valuable, should sow about the 20th to the 25th, upon a warm open aspect, in rich well-prepared soil; sow them thin, for the same reasons as mentioned for Cabbage.

Celery.—Earthing-up the earliest Celery must not be neglected, but it should never be commenced until after the roots have been well supplied with moisture, either naturally or artificially, as water does not penetrate to them so readily afterwards, without which they will neither grow large nor be good; for this reason late Celery should never be earthed up too soon, as it not only retards its growth, but injures its keeping through the winter: the outer stems should be well matured before earthing, as the only object in earthing is to blanch it, which may be accomplished in three weeks or a month. Do not add much earth at a time, and take care none enters the heart. Some late plants may be planted out in double drills about two feet apart; these will be found extremely useful for broths or soups after the earlier has been used or destroyed by frost.

Cucumbers.—Protect them from heavy rains. By closing down the lights early in the afternoon, mildew will not attack them so soon. Remove from them all diseased fruit or leaves, and stop young weakly shoots.

Leeks.—Those intended for earliest use if they were not planted deep, should have some earth drawn to their lower ends to blanch them.

Lettuce.—About the middle of the month sow for standing through the winter. Brown Cos, Brown Dutch, Cabbage, Black-seeded Green Cos, and Hammersmith Hardy Green, are the hardiest kinds.

Onions should now have their necks bent down horizontally without breaking them; those with thin necks, as soon as they become weak, should be drawn up and turned root upwards in dry weather; if they are allowed to remain in the ground after this and wet weather ensue, they will emit fresh roots, and begin to grow again, which impairs their keeping. About the third week some Brown Portugal or White Spanish should be sown for transplanting in spring, and in the first week some may be sown thick for drawing young with Radishes.

Parsley which is very thick and crowded may now be cut over close to the ground.

Radishes.—The White and Black Spanish, if sown early this month, will be fit for use in November, and through the winter.

Spinach.—At the latter end of the month the main crop of winter Spinach must be sown; for this crop the Flanders Spinach is the best; it is a round-seeded kind, by which means it may be easily known if true, the common winter Spinach having a prickly seed; it should be sown rather thin, broadcast on four feet beds, choosing for it a rich light soil and a dry situation.

Salading may be sown as before.

FRUIT.

New plantations of Strawberries may still be made, and all the runners cut off from the old plants. To protect Plums or other ripe fruit on walls from flies and wasps, some bottles hung up in the trees partly filled with beer-dregs, sweetened with treacle, will decoy them. Examine Vines regularly, and remove all useless growths, particularly any formed above the fruit, which should be exposed to the sun; the smaller berries may still be thinned out; keep all the branches neatly nailed in. Raspberry canes which have ripened off their fruit should be cut down; by so doing those intended to bear next season will be strengthened.

FLOWERS.

Annuals should be removed as soon as their flowers decay, unless seed from them is required, when a portion may remain; but in the majority of cases, the earliest flowers will have perfected their seeds before the plant becomes unsightly.

Auriculas.—Many growers prefer the first week in this month to pot their plants, alleging as a reason that when potted in May (which see) they are [illegible] in autumn, but this [illegible]. However, many successful growers have adopted both seasons. If they were potted as soon as their flowers were over, a top-dressing of the same soil will benefit them now, removing any decayed leaves, and taking off-sets from them for increase.

Bulbs.—Continue to take up any whose leaves are decayed.

Carnations may be layered in the beginning of the month, and as soon as the plants have rooted, which will be in five or six weeks, they must be taken off and potted two or three in a small pot, and placed in a shaded situation to get established before winter; they may then be placed in the pit, or be hooped over and protected during severe weather; drain the pots well, as too great abundance of wet is more to be feared than frost; the commoner kinds may be planted out without potting.

Chrysanthemums should now be shifted into their flowering-pots, using strong rich soil. It will be found a good plan to save watering, of which they require a great deal, to cover the surface-soil in the pots with moss, to prevent it from drying so quick; when they get established in these pots they may receive waterings of liquid manure twice a week.

Dahlias.—Gather seeds of any choice kinds. Keep them neatly tied, and examine the early ties that they do not pinch; loosen them if they do, or the wind will easily break them at that point. Remove decaying flowers, and watch for Caterpillars. Flowers intended for exhibition [illegible] dews and heavy rains. To entrap earwigs, place a small flower-pot inverted upon the stake with a little hay in the bottom, or put some short lengths of bean stalks amongst the branches, and examine them every morning, blowing the insects into a basin of hot water.

Heartsease.—[illegible]

Pelargoniums.—[illegible]

Pinks.—The pipings should be pricked out immediately that they are rooted, to strengthen before they are finally planted at the end of next month.

Propagate by cuttings such plants as Petunias, Verbenas, Calceolarias, scarlet Pelargoniums, and [illegible], for next year; prepare pots filled with light soil and [illegible] thickly round their sides the cuttings which will readily root if placed in a shaded situation, or in the turf-pit, or frame, where they may remain all the winter.

Stocks.—Biennial kinds, as Giant or Brompton, should now be planted out where it is intended they should flower.

Seeds of Calceolarias and Pelargoniums should be sown now in pots; if deferred until spring, they do not flower the same season. Gather any that are ripe.

Keep all plants in flower neatly tied up, and remove their flowering stems as soon as they cease to be interesting. Evergreen hedges or shrubs may be cut in, and keep every part of the garden in as perfect order as possible.

SEPTEMBER.

The shortening days, cold nights, and decreasing gaiety of the flower-borders this month, must not relax the endeavours to preserve cleanliness and neatness, but rather tend to increase perseverance in keeping the plants that remain in perfection, and all parts of the garden in still better order; this will be found the best means of extending the gratification to be derived from the garden, a clean, neat garden being at all times a pleasing object even in the depth of winter. There is, however, a great deal to do this month; flower-seeds of various kinds must be collected and dried, keeping each in a separate paper, with its name, height, and colour, or any other observation marked upon it. Any choice or half-hardy plants which have been growing in the open border during the summer should now be potted for the window, or be placed under protection. In the absence of better means of keeping scarlet or other Pelargoniums, they may be lifted with the soil adhering to their roots and hung up in a cellar. Beds for choice bulbs should now be prepared; they should be broken up eighteen inches deep, but no manure added so near their surface as to come in contact with the bulbs. Pinks also should be planted in their flowering beds, as they never do so well when disturbed in spring. Dahlias which have not been mulched, and whose crowns are near the surface, should have a layer of saw-dust spread over them, as much to keep them dry as to preserve them from sudden frost.

VEGETABLES.

Two hoeings while weeds are small will more effectually extirpate them, and be found far better for the crops, than a deferred hoeing, which will require raking off. Any spot well cleaned now will remain so, but the hoe should be employed between the advancing winter crops, whether there are weeds or not. Thin out to about six inches apart the winter Spinach, and Turnips to double that distance. Continue to gather articles for pickling, and remove all failing crops as soon as they cease to yield profit.

Cabbage.—Continue to plant out for Coleworts until sufficient ground is occupied, reserving plenty of room for the August-sown plants; as soon as they are sufficiently advanced they must be pricked out about three inches apart; it is important to do this, as it checks their quick growth, and renders them both stouter and hardier for winter.

Cauliflower.—Some of the August-sown, when they have made two perfect leaves, should be pricked out in the most sheltered place; they may survive if a mild winter ensue, particularly if some Fern is spread over them during frost; some others may either be pricked out in pots or in a box, and placed in the turf pit; or a portion of one light may be prepared for their reception, that is, by levelling the Cucumber soil, and planting them in it at three inches apart.

Celery.—Embrace fine opportunities for earthing-up, adding but little at a time.

Lettuce may be planted out to stand the winter under fences or in other sheltered situations.

Onions will be ready to draw, if it has not been done. In storing, any thick-necked ones should be separated from the others and used first; never peel off any of the coatings, or bruise them, if possible. As soon as they are perfectly dry, they should be tied up in ropes or bunches, and suspended in a dry airy place.

Potatoes.—Take up as soon as ripe, that is, when the haulm or tops are decayed. Any intended for seed should lie exposed to the sun for some days previously to storing away. The best way of preserving them is that which will keep them most effectually dry and exclude frost; if a dry cellar is possessed, nothing more will be required; if pitted out of doors, choose a dry situation; and when the Potatoes are dry, lay them in a narrow ridge, then cover them with straw, and upon this place a layer of soil, taken from the edge of the ridge, which will form a drain for the water below the surface where the roots are laid.

Spinach.—The winter crop may be sown in the first week, if it has been delayed.—(*See last month.*)

FRUIT.

Gather, during dry weather, any kinds of Apples or Pears which may ripen this month: to ascertain whether they are ready for gathering, raise them gently, and if they part readily from the tree, or if, on cutting one through the middle, the seeds are becoming brown, they may be taken. Early fruit had better be gathered a little before they are quite ripe than after. Strawberry runners may yet be planted. Examine Vines, as recommended last month.

FLOWERS.

Annuals.—Various hardy kinds if sown now will stand ordinary winters without protection. The Californian kinds, introduced by the London Horticultural Society, and through the liberality of that body now common, are very beautiful, and well suited for this purpose; they will flower in great profusion, making the garden gay at a usually dull time, that is, between the decline of the early-flowering bulbs and the summer flowers. A poor soil, in a sheltered situation, should be chosen for them. The following are some of the best:—Clárkias, two sorts, pink and white; Collínsias, blue and white; Œnothera bifrons, pink and crimson; Nemóphilas, two kinds, beautiful blue and white; Gílias, blue and various-coloured; Leptosiphons, &c.

Auriculas.—Towards the end of the month, sooner or later, according to the state of the weather, these must be placed in their winter-quarters, but they must receive all the air and light possible, only protecting them from heavy rains and frost; the turf-pit will be found the best place for them.

Cactus.—Early in the month any which have stood out after flowering must be taken in, and receive but little water.

Chrysanthemums.—Keep their shoots neatly tied, and do not allow them to suffer for water.

China Roses.—Cuttings taken off now, and treated as recommended last month for cuttings, will make blooming plants early next summer.

Calceolarias.—Offsets of the herbaceous kinds may now be taken off and potted in small pots, using turfy loam for them.

Carnations.—See last month.

Dahlias will require constant attention; children may catch the earwigs, search for caterpillars, and remove decaying flowers. After the seeds are ripe, they should be taken out directly, or they are apt to rot if left in the flower.

Edgings of Box, Thrift or Sea-Daisy, Gentianella, and Saxifrage may be made new or repaired; beat the edging of soil they are to be planted against very firm with the back of the spade, or they are apt to be loosened by frosts, which causes many plants to die.

Pinks.—If a bed is prepared expressly to grow these as show-flowers, it should be done now; the soil should be good loam, about a foot and a half deep, enriched with a coating of well-rotted cow-dung and lime-rubbish, six inches thick; the bed should be raised about six inches above the surrounding surface, to throw off wet. Choose plants for possessing an upright strong leader and few side shoots, in preference to larger plants having numerous leaders; as to obtain fine flowers, one leader to a plant must only be allowed to remain for flowering. Set them about nine inches apart; the remaining plants may be put in the flower-borders.

Propagate by cuttings early in the month, as recommended for August.

Snowdrops, Crocuses, Persian Iris, Dog's-tooth Violets, Crown Imperials, and Narcissus—any that are out of the ground must be planted without delay; they may be set from two to three inches deep, according to the size and strength of the bulbs. In many kinds, as Crocus, the new bulbs are formed every year above the old one, which brings them annually nearer the surface, and renders their replanting necessary every three or four years.

Tigrídia pavónia.—The roots may now be taken up, and, after being dried, stored by in bags.

Seeds.—Gather any desirable kinds immediately they are ripe, or in many plants the most perfect and best seeds will be lost.

Keep walks and borders as neat as possible, and allow no disorderly growths for the want of early tying.

OCTOBER.

The principal operations of this month consist in storing Apples and Pears, and various vegetable roots, planting bulbs, and sheltering tender plants. The best criterion for gathering late fruit is the ease with which they leave the tree; in gathering keep each kind separate, and handle them with the greatest care, as upon this their keeping very much depends. Codlins and other kitchen sorts liable to shrivel had better be laid carefully in small heaps and covered with straw; they will thus keep longer and plumper, retaining their weight. The best material to lay Apples or Pears upon is Fern, or Straw perfectly dry and free from mouldiness; a dry room, a cellar, or any other place if it can be found less influenced by the weather, is the best situation to keep them in; but for the most valuable late-keeping Apples or Pears, the following plan cannot be too strongly recommended:—Get some fine pit-sand and heat it hot, to dry it and destroy any vegetable remains it contains; then procure some large jars or garden-pots, put a little sand when cool in the bottom, and then a layer of fruit, barely touching each other, filling up between them with the sand until the vessels are full, when they may be placed in the bottom of a cupboard, or any other place where they will be safe from frost and kept dry. The best and most perfect fruit should be selected for this purpose, which may be ascertained after they have been gathered a short time. Any choice or late-keeping kind intended for exhibition should be preserved in this manner.

VEGETABLES.

Cabbage.—Towards the end of the month some of the stoutest August-sown may be planted out permanently in light rich soil. It will be found a good plan in digging the ground to leave it in shallow ridges 18 inches or two feet apart, with some dung placed under the hollows, in which the plants must be set. A few may also be planted in rows one foot apart; and before they become large enough to crowd each other in spring, every intermediate one may be drawn for present use, leaving the others for cabbaging. The remaining ones should be pricked out from the seed-bed, three inches apart, on a sheltered border, either to plant in spring or fill up vacancies.

Cauliflower.—Watch for slugs on the last sown, or they will soon destroy many plants.

Lettuce.—The August-sown will now be fit for transplanting under the shelter of a hedge, at the foot of a wall, or fence, or in any situation where they will be partially protected, and have light dry soil.

Onions.—Keep seed-beds free from weeds.

Parsneps and Carrots should be taken up when their tops have turned yellow, and the roots must not be injured in lifting. The better way is to open a wide trench on one side of the piece and trench them out.

Potatoes.—Continue to take up in favourable weather; those intended for seed should be kept where they can be occasionally turned, to prevent their growing as much as possible.

Spinach.—Hand-weed and loosen the surface-soil about them.

Earth-up Celery during fine dry weather, and ridge or dig any ground as soon as vacant, preparing it in the best manner for the crop next intended, unless the land is very light and porous, in which case manure added now would be in a great measure filtered away before spring.

FRUIT.

Commence pruning Gooseberry and Currant bushes; towards the end of the month they may also be transplanted. The best soil for them is a rich deep loam, on a dry bottom, although they will grow in any soil. They should have some well-rotted manure dug in about them every second or third year. In pruning Gooseberries those intended to produce large fruit for exhibition must have their young wood cut out very thin, and be shortened back about half its length; but others intended to produce heavy crops should have the young wood left its whole length, only thinning out the middle of the tree, and removing any branches that cross close to each other. Few private growers produce such fine Currants as market-gardeners, which is attributable, in a great measure, to the inferior methods of pruning pursued. The best plan is, after the head of the bush is formed, by allowing several main branches to rise at regular distances of six or eight inches from each other, to prune the laterals or side branches produced every year back to one or two eyes; the spurs, if they become very thick, should be thinned out, and the leaders shortened about half their length, first observing the direction of the bud you intend to cut to, which should point outwards; this is of consequence, as it will keep the heart of the bushes open, and must be attended to when shortening back Gooseberries. Those of a pendulous habit must be cut to a bud on the upper side of the branch; and, indeed, in every kind of pruning the direction of the terminal eye is of great importance. Currants can scarcely be pruned too close. As soon as the prunings are collected, burn them, and spread the ashes beneath the bushes. A thin coating of hot lime dug in about the stems is of service against the caterpillars. The branches of Black Currants may be thinned out, but not shortened. Lay in by the heels some of the strongest shoots, if required, for propagation. Top-dress Strawberry-beds with well-rotted dung.

FLOWERS.

All plants which require protection should be placed in the turf-pit this month, which, by judicious management, will shelter a great number. The pots should stand on a layer of coal-ashes, and if they are plunged the roots will be less affected by the weather; worms will not get in, and water will be seldom necessary; whether this be done or not, water must be given very sparingly, and always on fine mornings, bearing in mind that many plants are sooner injured by damp than by frost, if kept dry. Remove dead leaves from them, and give them all the exposure possible, only excluding frost, rain, and cold winds. Covers of the same size as those used in summer (which must now be stored by) should be prepared to be thatched with straw, over which a layer of fern or long litter may be spread in severe weather.

Bulbs of any kind intended for flowering in the windows during the early spring months, should now be potted. Let the soil be dry, and place the bulbs just deep enough in the pots to admit of their tops being covered. They should be placed in the pit, or plunged in a warm dry situation, and covered six inches deep with sawdust, ashes, or sand. Any beds intended for Tulips, Hyacinths, &c. should be prepared early now, or sufficient time for their settling before planting-time will not be allowed. The beds should be 18 inches deep and well drained.

Chrysanthemums trained against the cottage should be neatly spread out: those for flowering in the window must have plenty of water.

Herbaceous Perennials, as Pæonias, Iris, Phlox, and Lychnis, may now be divided for increase: in replanting them arrange the kinds according to their height, colour, and time of flowering. Flower-borders, where this is attended to, will assume an appearance of regularity, and present a constant succession of flowers throughout this season. This is of paramount importance, although sadly neglected in all gardens.

Hollyhocks and other biennials should now be planted in preference to spring, attending to the last paragraph respecting arrangement.

Lobelias.—As Cardinalis and Fulgens sometimes rot during the winter when left out, to avoid this they may now be divided and kept in small pots, or planted thick in larger ones, and protected like Carnations.

Roses.—The garden kinds may now be pruned and the suckers removed. In pruning, cut back to a good eye two or three inches from the origin of the young wood. Robust-growing kinds should not be pruned so severe as weaker ones: strong shoots pegged down on the surface at nearly their full length, of the Moss Rose for instance, will throw numerous flowering shoots all the way up.

Thrift and other edgings may still be planted. Destroy weeds, and keep the walks and other parts of the garden neat and clean. Protect any choice flowers, as Carnations and Heartsease, from heavy rains.

NOVEMBER.

This is the best month in the year for pruning or transplanting. The pruning of fruit-trees and bushes is sadly neglected in most cottage-gardens, the trees often presenting a complete wilderness of crowded branches, producing in some seasons great numbers of small, worthless fruit, and in others failing entirely; besides, by their impenetrable shade, permitting nothing to grow beneath them. One great cause of these evils is want of pruning; therefore, those who do not understand the principles of pruning will do well to thin out yearly, at this season, the weak spray wood, and removing all branches that cross each other, leaving the trees and bushes regular and uniform, and keeping them open in the centre; for although they do not cut so judiciously as a practised gardener would, they will find, nevertheless, that they have done a great deal of good, which will be apparent in the increased health and fruitfulness of their trees. After standards have become old, this thinning and regulating is all that is required; but pruning should be commenced in the early stage of a tree's growth, for if it becomes necessary to remove large branches the tree suffers by it, and it tells of previous bad management; therefore do not suffer any branches to remain in your young trees which you know it will be necessary to remove hereafter. In pruning dwarf standard Apple-trees, cut back until sufficient shoots are produced to form main branches, which may be trained out to the proper form by placing two hoops of the desired width in the centre of the tree, training the young main branches over on their outside; in the early career of the tree, these young vigorous shoots should not be much pruned back, but only their unripened points removed, always looking at the direction of the eye before the cut is made, as the form of the tree will depend upon this. If this is neglected, perhaps the shoot may grow sideways, or, what is worse, inwardly; therefore, always prune to a bud that points outwardly; this should be attended to in every species of pruning. When your trees have arrived at the desired height, nothing more will be required than to prune the top shoots close off every year, and the side ones to one or two eyes; by which means an abundance of fruit-spurs will soon be formed; and from trees kept thin in this manner the finest fruit is obtained, besides the great advantage of their occupying little room. Dwarf Pears, of some of the best kinds, should also be procured to be trained like pyramids, that is, one straight stem made to throw out numerous side branches up its whole length by yearly heading it back; which side branches are tied down to each other, making them assume a pendent or weeping form; by this means some of the choicer Pears may be grown to great perfection without occupying much space. Pears do not become fruitful if severely pruned, which should, therefore, be confined to thinning out the young branches in July, leaving little to be done now, shortening only in cases where a supply of young shoots is required; but the things on which fruitfulness most depends are their first planting, and after root-pruning when necessary. First, then, in planting, the roots must by no means be buried deeply, and in wet situations, or retentive clayey soils, they should be rather raised into a little mound above the surrounding surface; the holes should be dug wide, say four feet, and deep enough to admit being partly filled up with stones, brickbats, or some material that will prevent the roots penetrating deep into the subsoil and serve as draining at the same time; two feet will be sufficient depth of soil. This precaution will contribute to the health of the trees, bring them to a bearing state at a much earlier age, and materially improve the quality of the fruit. The strong tap-roots, if any, should be pruned off at the time of planting, and the others laid out carefully; if, after this, there may seem any disposition in the trees to grow too strong, the roots must be cut off with a sharp spade all round at about a yard from the stem; and any established unfruitful trees may be treated in the same manner, which will cause them immediately to form fruit-buds: by this system a mass of healthy fibrous roots are produced near the stem, enabling you to dig and crop near the trees without injuring them; and any mulching with dung, or watering when necessary, is sure to have the desired effect, from the certainty of the range of the roots. It cannot be too strongly borne in mind in lifting trees, that it is the small roots which chiefly supply nourishment to the plant; too much care cannot, therefore, be taken to preserve them from injury in the removal; and the little additional labour this may cost over removing them carelessly, will probably be repaid by a crop of fruit a season earlier, or, at all events, by success in the operation. Unless the tree is too thick with wood, there is no necessity for removing branches on account of transplanting, or, at least, only as many as may seem equivalent to the loss of roots, which, with care, will be little or nothing. When the trees have begun to grow again, they may be regulated, taking out, or shortening only, the weakest shoots. Now is the most proper time, also, for planting or pruning the Vine: if a young layer is to be planted, the soil should be light and rich, and precautions taken as recommended before to prevent the roots penetrating deep, beyond the sun's influence; for this and badly-drained soil is the main reason of Grapes so often failing to come to maturity out of doors in this climate; the bottom of the border should, therefore, be well drained with broken stones, and about two feet of soil above them, well enriched, for the plant to grow in; crushed bones, or pounded oyster-shells, are lasting manures, and the light scrapings from a high road will be found an excellent addition. Many authors recommend exciting manures, as bullocks' blood, pigeons' dung, &c., which cause a robust growth; but this is not so valuable as firm, round, short-jointed wood of a moderate strength. What is termed spur-pruning is the best system for out-door Grapes, that is, leaving only one or two eyes of the last year's wood on the main branches, and a few short rods, four or five eyes each, in situations where it may seem expedient to replace an old shoot from, or cut down to at some future time, which should always be considered, as by this means your Vine may be kept furnished with young, healthy, fruit-bearing branches, even where the space intended to be covered is considerable. The young wood at the end of the main stems should not be left too long, as some are apt to leave them, thinking to gain time; or the consequence will be that the lower part of the Vine will become weakened, and its regularity destroyed by the upper eyes breaking strongly, and the lower ones feebly: endeavour rather to have a regular distribution of young wood by short rods throughout the tree without crowding, which is a great fault. The neatest and best plan for training is to carry the main stem horizontally near the ground, into which it may be allowed to dip and root, if the distance it has to go is considerable, taking up from it, at regular intervals, perpendicular main branches. Some of the strongest, straightest, and best-ripened cuttings of Gooseberries and Currants may be planted, previously picking out all the eyes quite clean except three or four of the terminal ones; they may be reduced to about a foot long; by removing a portion of their unripened points and by picking out the eyes, the bushes are prevented from throwing up suckers. Bushes with about one foot of stem look much best, besides, in some measure, assisting to prevent the fruit becoming dirtied by heavy rains. Neither prune nor transplant during frosty weather; dull, mild weather is best. All vacant ground, unless it is very light, should be immediately prepared for future crops; the only objection to preparing light land is, if dung is added in autumn it filters away before spring with the heavy rains; but to other soils autumn preparation is of the greatest benefit. For the main crops of Onions, Carrots, and Parsneps, the ground should always be prepared in autumn or winter, and the increase of produce and other advantages that are gained by having the soil broken up two spits deep for most vegetables are very great over common digging; of this, nothing will be so convincing as a trial; the best plan to do it, and one which we would strongly recommend in all small gardens, is to bastard-trench the ground, which is performed as follows:—open a trench two feet and a half wide, one full spit and the shovellings deep, and wheel this soil to where it is intended to finish the piece; then dig the bottom spit in the trench, in upon which the dung and surface of the next trench must be shovelled; then filling up this trench with the top spit, &c., of the second (laying the surface in a ridge) and digging its bottom as before, and so on until the piece of ground is completed: some of the advantages of this plan are, it allows the rain to pass quicker off the surface and the roots to penetrate deeper; and if weeds have been allowed to get large, by paring the surface into each trench first they are effectually buried; the top spit of good soil is also retained uppermost, which, if turned down in some land, years must elapse before that replacing it would equal it; for all crops it amply repays the little additional labour over digging; from the roots penetrating deeper, the crops seldom suffer from drought in summer; strong soils are rendered capable of absorbing more moisture and remaining drier at the surface, and it insures a thorough shifting of the earth. The surface of all strong land should be laid up in ridges during the winter, as the action of frost, by expanding the moisture in it, leaves it, when thawed, in a fine, pulverised, friable, or loosened state, by which it is rendered fertile and ready immediately after levelling in favourable weather to receive the intended crop.

VEGETABLES.

Beans.—A small sowing of early Mazagan may be made in light earth and a sheltered situation. They should be sown thick, in a small bed, and covered about two inches. After they rise, they must be protected in severe weather by Fern or litter.

Brussels Sprouts, Savoys, and other winter crops, should have the dead leaves gathered off them, and be cleaned between.

Cauliflowers, Lettuce, Cabbage, and other young crops, should be kept clean, and free from slugs.

Peas.—Double-blossomed Frame may be sown close under a fence or wall; covering the surface above the drill with a layer of sand six inches wide has been practised with success against the attacks of mice.

Rhubarb and Sea-Kale should have the old leaves cleared from them, and the crown covered with a layer of dung, sand, or some protecting material.

FRUIT.

Mulch any newly-planted trees with dung or litter; and, if necessary, put stakes to them. Prune and nail any fruit-trees on walls. In pruning Cherries do not shorten the young wood, unless a supply is wanted to fill up a vacancy; but where the shoots are too thick, shorten them back to within an eye or two of their origin.

FLOWERS.

Keep the plants in the pit, or window, constantly free from dead leaves or any mouldiness; for this, if allowed, will prove to many plants more fatal than severe cold. Give water sparingly, if required at all. Window-plants may be placed out during the middle of fine days, and the pit fully exposed. Any choice herbaceous plants, as Calceolarias or Heartsease, may still be taken up.

Dahlias should be taken up very carefully on a fine morning, fixing the labels securely to them; these should either have their merits written upon them, or, what is safer, bear a number referring to a memorandum of their heights, colours, &c. Let them dry gradually, and become perfectly so before they are stored away. The roots may be placed in a shallow box, and covered with dry earth or sand, and put under the stairs, or in any situation which is not damp, and out of the reach of frost. Even in the absence of this convenience, with plenty of dry straw or Fern about them, they may be placed at one end of the Potatoe-pit; the roots of Marvel of Peru may be treated in a similar manner.

Hyacinths should be planted the first week, if possible; set them four inches deep, and six apart. They should be protected from heavy rains until they have rooted, with thin turves grass-side downwards, or fern or straw secured with willows. Surround each bulb with a layer of sand; it acts as drainage, and preserves its coats from decaying.

Roses.—Stocks of the wild Rose should now be obtained from hedges; choosing those with straight stems for budding at any required height next season.

Tulips must be planted in the first week, if the weather will permit. They are usually planted in seven rows, six inches apart, along a four-foot bed. They should be set from three to four inches deep, and surrounded with sand, in the same manner and for the same reason as recommended for Hyacinths.

This is the proper season for procuring and planting any choice flowering shrubs. The following are a few of the most suitable and showy for small gardens: Scarlet and Yellow-flowering Currants, Red Pyrus japonica, Persian Lilacs, Mock Orange, or Philadelphus coronarius; China Roses, Laurustinus, Rhododendrons, Azaleas, Gueldres Rose, Climbing Roses for training (see list), Córchorus japonicus: all these may be obtained at little expense.

DECEMBER.

The general operations recommended for November apply also to this month, when the weather permits; trenching, digging, and ridging, may proceed if the ground is not too wet; in mild weather transplanting and pruning may be performed, and in frosty weather dung may be got on the ground. The evenings may be occupied in making rustic flower-vases or stages; young hazel or other rods may be pointed and tied up in bundles to keep them straight for flower-sticks, shades, labels, hooks for layering, and numerous other little matters of this kind, which if made ready, will save time at a busier season. The store plants in the pit must be kept dry, and have full exposure whenever the weather is fair and not frosty; keep them free from dead leaves or damp litter, and loosen the surface soil in the pots, if it becomes hard or green; take care that all the plants have perfect drainage. If any of the Dahlia tubers appear damp, they should be kept in the dwelling-room for a few days.

VEGETABLES.

Keep all winter crops free from dead leaves by gathering them off and digging them in when preparing any ground.

Onions.—Potatoe Onions should be planted in deep drills about one foot apart in a light rich soil, any time during the month, when the ground is dry.

FRUIT.

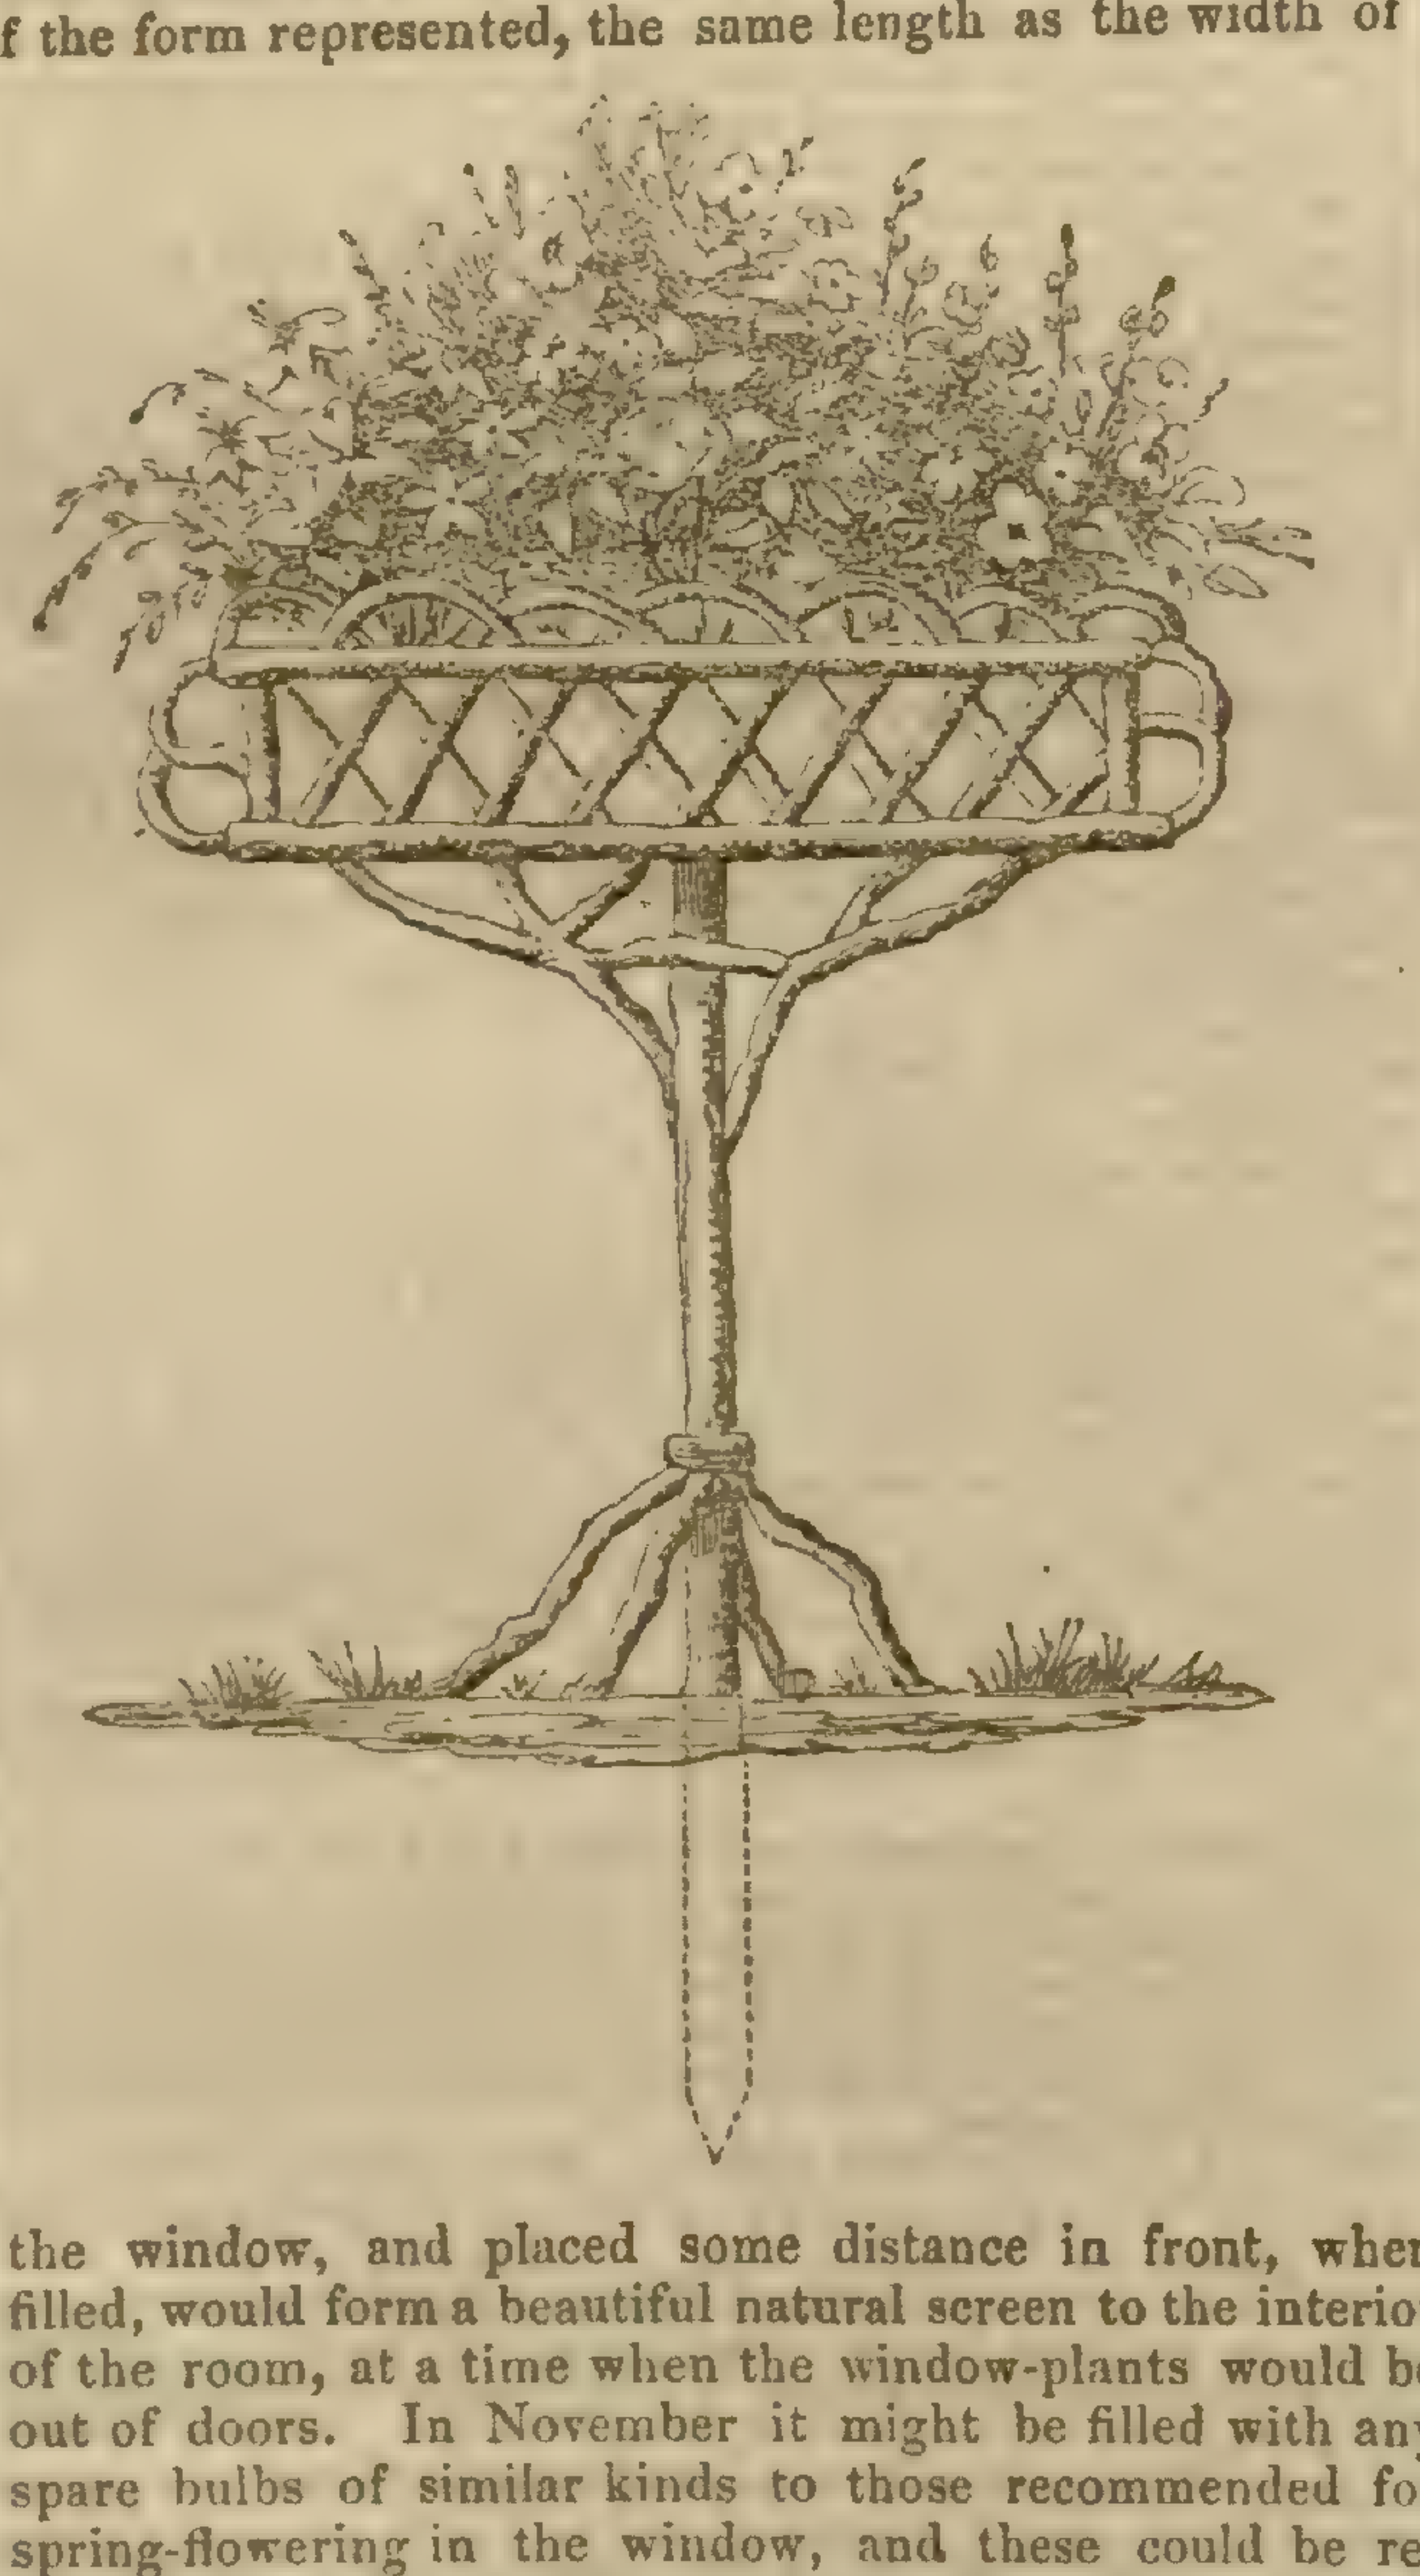
The roots of a Vine, Peach, or Apricot, had better be mulched with dung, if not previously done, to protect them, as intense frost often injures their roots, to the loss of a crop the next season, besides causing weakly and sickly developments.

FLOWERS.

Cut down any decayed flowers, and dig the borders, taking care not to injure any bulbs. Plants whose hardiness there is any doubt about should have some mulching of light litter or leaves laid round above their roots: if the latter, cover them lightly with soil, to prevent them being blown about. Hydrangeas, Fuchsias, Salvias, tender Roses, and many others, may be preserved in this manner.

ON RUSTIC VASES SUITABLE FOR COTTAGE GARDENS.

The introduction of vases even of a rustic character into cottage-gardens will by many be considered a startling proposition; but we can conceive nothing which would so alter the appearance of a cottage front, or that would tend to give it so elevated a character and so attractive an appearance, as a rustic vase similar to the one represented in the woodcut, if judiciously filled with Pelargoniums, Fuchsias, or Roses in the centre, and surrounded by plants of a drooping habit, allowed to hang over the sides. The vase itself, as the sketch will show, is of the most simple construction, composed entirely of rough sticks, requiring only a little skill to put them together; and if the square shape, which we give as being the simplest, be not approved of, any other may be substituted to suit the taste and fancy of the designer. But one of the form represented, the same length as the width of the window, and placed some distance in front, when filled, would form a beautiful natural screen to the interior of the room, at a time when the window-plants would be out of doors. In November it might be filled with any spare bulbs of similar kinds to those recommended for spring-flowering in the window, and these could be removed before it would be prudent to trust choice plants outside. A layer of moss in the inside will render any further lining unnecessary; and as it parts with moisture slowly, the plants would be less liable to suffer in dry weather; they will, however, require regular and copious waterings. The kind of soil which will be found most suitable is three parts of good turfy yellow loam and one of perfectly rotted dung mixed together.



The following are a few of the most suitable plants for filling the centre of such a vase:—
Pelargoniums of any kinds,
Calceolarias, shrubby kinds,
Fuchsias,
Hydrángea,
Petúnias,
Cinerárias,
China Roses,
Eútoca víscida,

Plants of a dwarf or pendulous habit, suitable for the sides:—
Verbena melindres,
,, Tweediana,
Nemóphila insignis,
Mignonette,
Maurándia Barclayana,
Anagallis, all the kinds,
Petúnias,
Nolána paradoxa,
Mímulus moschatus.

Many more might be mentioned, although the plants possessed may be the guide when their heights and habits are known. Any of the more interesting Annuals may be placed round the sides, and such as Schizanthus or Balsam may occupy a portion of the centre.

ON MANURES.

The difficulty of obtaining a sufficient supply of manure is an excuse often made as an apology for indifferent gardening, whilst many substances of a most enriching and beneficial nature and of easy attainment are overlooked.

In the first place, for strong retentive soils or light sandy porous ones, the materials which will alter their texture and permanently improve them should be the first considered, and these are generally to be obtained if sought after. For strong soils the following will be found very suitable, rendering them easier to work, and the dung which had little or no effect before will then become doubly beneficial. Some of these substances may be mixed with the dung, as road-scrapings, sandy soil, ditch-bottoms, paring of hedge-banks, &c.

Road Scrapings from great thoroughfares, when gathered dry; no dressing equals this for strong land intended to grow Carrots and other roots.

Lime, when readily obtained, is exceedingly valuable, sweetening the land, and rendering it more friable, and consequently fertile; but animal manure should not be added at the same time.

Oyster Shells, pounded, are excellent, being similar in their effects to lime, of which they are chiefly composed.

Sand, Burnt Clay, Ditch Bottoms, and any loose vegetable substances, will be found useful.

For very light or sandy soils the following will be found the best:—

Marl or Clay, which has been previously mixed with dung. This will render the soil adhesive, and prevent the manure being so soon washed down. For such soils cow and pig dung are preferable, they being less readily washed away, retaining their moisture a considerably longer time than most other manures.

Many of the following substances are easily obtained, and are all of great service as manures.

Night Soil.—This is a powerful manure. It should be laid in alternate layers, with double its bulk of soil, mixing a little quicklime with each layer, which removes its offensiveness. By being turned either in winter or in dry weather, it soon becomes pulverised, and may then be spread on the ground, or mixed with the composts for choice flowers, as Auriculas and Carnations. If some is sown in the drills with Onions, its effects will be very conspicuous. This substance enters largely into the composition of many patent manures.

Fowl Dung is powerful, like the last. It should be used in a fresh state, mixed with soil, and spread thinly. Rabbits' dung is similar.

Soot is another powerful manure, and one whose effects become almost immediately visible if kept dry, and sown with the crops of Onions or Turnips, besides being disliked by insects.

Pure Dung, as that of horses, which is often gathered from public roads by cottagers, should always be mixed with a considerable quantity of soil or the parings of hedge-banks. These, by becoming impregnated with the ammonia from the dung, are equally valuable, besides increasing the bulk. Using the pure dung without doing this would in many cases produce disease; therefore always add a considerable portion of turfy soil to the dung-heap, and let it be well incorporated together before spreading on the ground.

Manure Water will be found most beneficial if judiciously applied. For collecting this, a tank or old barrel should be sunk near the dung-heap, that its drainings may run into it. If sheep or deer dung be added, its strength will be increased; but it should only be administered moderately, being so very powerful that some tender plants may be destroyed by overdoses. For out-door crops moist weather should be chosen for administering it. Where a cow or horse is kept, a channel should be made for their urine to run into this tank. The effects of this will be surprising if administered to florists' flowers, prize Gooseberries, root-pruned fruit-trees, or indeed to any plants whose range of roots can be ascertained, and where assistance or robust growth is desirable.

Dead Animals, Offal, &c., should have a portion of quicklime added to them, and be covered with a thick layer of soil, which will become impregnated with soluble matter, and after a season may be spread on the soil.

Bones and Horn.—These are both powerful and lasting substances when crushed. The former has been used unbroken in the soil for a Vine with wonderful effect. They decompose and part with their animal matter so slowly, that they are exceedingly valuable in the formation of rich borders or composts required as permanencies.

Fish.—In some counties these may be obtained in abundance, and are excellent as manure in any state, but are best when dug in in a fresh state, or covered with soil and spread after a time.

Vegetables, as refuse Turnips, Cabbage, and other green crops which can be readily dug in, should not be allowed to decompose first, but be dug in in a green state. They then commence a gradual decomposition, becoming immediate food for the succeeding crop.

ON THE CULTIVATION OF FLOWERS IN WINDOWS.

The cultivation of flowers is of all the amusements of mankind the one to be selected and approved as the most innocent in itself, and most perfectly devoid of injury or annoyance to others. The employment is not only conducive to health and peace of mind, but probably more good-will has arisen and friendships been founded by the intercourse and communication connected with this pursuit than by any other. The pleasures arising from the culture of flowers are harmless and pure; a streak, a tint, a shade, becomes a triumph, which, though often obtained by a chance, is secured alone by morning care, by evening caution, and the vigilance of days. It is an employ which in its various grades excludes neither the opulent nor the indigent, teems with boundless variety, and affords an unceasing excitement to emulation without contention or ill-will. There is no other pursuit alike calculated for peer and peasant in which the distinctions are so trivial; for the cottager may possess and enjoy the same beauteous Rose or fragrant Mignonette in his little plot or his window that occupies a place in the garden of the richest. There are few surer tests of a happy home within than the flower-decorated window and neat-kept garden; and there is no occupation for the leisure hours more calculated to keep it so, or to soothe the mind. It yields pleasure without surfeit: the more we advance, the more eager we become. And how unlike this is to most of our worldly engagements! To those parents blessed with children, how delightful it is to bend their young minds to a pursuit so full of utility and intellectual instruction, combined with the advantages usually accompanying industry! and in children carefulness and thought about their plants will lead to the same feelings respecting other matters.

Let me endeavour, therefore, by laying down a few simple rules for the management of flowers in room-windows, to turn the cottager's attention, or that of the female portion of his family, to this pleasing and innocent employment; for it is a subject calculated to give much more real enjoyment at a far less expense than what are usually termed amusements.

The first thing to be attended to is procuring proper plants for the purpose, as there are many which would defy the skill of the most experienced gardener to keep any length of time in health in such situations; therefore a list of plants is given, the most suitable for the purpose being easily obtained and not difficult to manage. The three principal things requiring consideration are *air*, *light*, and *moisture*.

Plants kept in windows naturally extend their branches and leaves to the light, and they thereby become one-sided; and it is wrong to endeavour to make them otherwise by frequently turning them, as the plants will as constantly turn their growth to follow the light, which not only weakens them, but spoils their appearance. As for plants receiving no perpendicular light, it is more natural to spread them out, forming one good face or tier of healthy foliage to the window; for well-balanced heads under such circumstances are almost out of the question. Place them as near the glass as possible; of course windows having a south aspect possess the greatest advantage.

Judicious watering of plants in rooms is perhaps the most important feature in their management, and it is unfortunately in most cases ill understood, being too often given mechanically as it were at stated times, whether required by the plants or not; and by a too eager desire for their welfare, they are frequently surfeited to death with water, which is justly termed "killing by kindness," and is practised with success, especially by ladies, from a false apprehension of their wants. In summer this cannot be easily accomplished, unless the plants are allowed to stand in saucers constantly filled with water, which, by overloading them with juices, will soon engender sickly soft growths, unsuited for the production of flowers or healthy foliage. An exception to this rule is the growth of annuals in pots during summer; they, if well drained, may stand in feeders; but these, whenever used, should be half-filled with fine gravel or sand, which may be kept in any state of moisture. The best and only general rules that can be adopted is, in *winter* keep plants not then growing fast rather dry; in *spring* increase the quantity with their activity, and the sun's power, keeping them in a medium state of moisture; in *summer* water daily, and in *autumn* decrease with the length of day and the returning torpidity of the plants until the dry state of winter is again reached. All this resolves in the following:—Plants when growing fast may have free supplies of water, which must be lessened as their growths approach maturity, and cease or nearly so when that is attained until the return of their growing season. As regards *air*, similar rules to those given for watering may be followed; and indeed they are analogous. In *winter*, when the plants are not growing, large supplies of air are not so important, enough being usually given by the room-door. As *spring* advances increase the quantity, carefully guarding against the cold of mornings and evenings, or cutting winds; and if the plants are placed out in the middle of fine days, take care to bring them in before the chill of evening comes on. After the first or second week in May they may be set outside for the *summer*, and towards the end of September, or as soon as heavy cold rains occur, they should be placed again in their quarters for the winter, setting them out of doors when fine, or supplying them with plenty of air by the window, until the cold weather and decrease of moisture at their roots bring them to a state of comparative rest. It should be remembered in spring and autumn that the plants must not go out to-day because they were placed out yesterday, but the weather alone must determine: sudden changes must at all times be avoided. The leaves of plants act as lungs, by which they breathe; if they become dirty, their respiration is impeded; therefore an occasional careful sponging will be useful to them. In spring and summer allow them the full benefit of genial showers, which will do them more good than any artificial watering. Never use spring-water if soft or rain water can be had; and always let it be about the same temperature as the air in which the plants are growing. It should hardly be necessary to mention the removal of decaying leaves and flowers: the last are exhausting as well as unsightly.

Judgment is required in stopping some plants at proper times to induce bushy growths and increase the flowers, which will be gathered from the various plants treated in the Monthly Calendar.

One principal potting is usually required (see Calendars for April and June), and afterwards as often as the plants may fill their pots with roots or seem to require it. The most important thing is good soil, which if composed of three parts loam of a fibrous open texture, with a fourth dung, most plants will thrive in, using plenty of drainage to allow water to pass off readily. Never suffer the surface-soil in the pots to become hard or moss-grown, but let it be loosened occasionally with a piece of stick.

Although a long list of suitable plants is given, we would not advise too many to be attempted, as nothing looks much worse than a great quantity of crowded unhappy-looking plants, which must be the case if too many are grown, although the turf-built pit recommended for Cucumbers will in a great measure relieve the windows, enabling many to be grown through the winter, which will only occupy them when in flower. The whole of those mentioned for spring are of this class.

Succulents are well suited for growing in rooms, as they are not so impatient of either air or water as most other plants; and the abundance of their beautiful flowers renders them objects of interest. Cactus speciosus, Jenkinsónii, flagelliformis and speciosíssimus, Mesembryánthemums, and flowering Aloes, deserve especial notice.

Green-fly is apt to infest the young shoots or under sides of the leaves; to destroy them, moisten the infected parts, and dust with Scotch snuff or brush them off as soon as detected with a feather, or dip them in tobacco-water. Fumigation with tobacco will also destroy them.

FLOWERS IN POTS.

For Spring.
Snowdrops,
Russian Violets,
Early Tulips,
Crocus,
Narcissus,
Hyacinths,
Heartsease,
Mignonette,
Mimulus moschatus,
Ranunculus,
Anemone,
Myrtle.

For Autumn.
Pelargoniums,
Lobélias,
Campánulas,
Sálvias,
Hydrángea,
Verbena,
Fúchsias,
Petúnias,
Calceolárias,
Myrtles,
Heliotrope.

For Summer.
Pelargoniums,
Mignonette,
Ten-week Stocks,
China Roses,
Double Wallflowers,
Pinks,
Carnations,
Cactus,
Aloes,
Annuals, as Nemóphila, Schizanthus, Collínsia, &c.
Myrtles, Heliotrope.

For Winter.
Chrysánthemums,
Pelargoniums,
Heliotrope,
Myrtles,
Fúchsias,
Aloes,
Cactus.

Creepers suitable for training round the outside of Windows:
Rhodochiton volúbile,
Maurándya Barclayana,
Lophospermum scandens,
Convólvulus major,
Tropæ'olum atrosanguíneum.

SELECT VEGETABLES AND FRUITS.

In the following list of vegetables and fruits their order in succession may be taken as a guide to their respective merits, when the contrary is not expressed.

VEGETABLES.

BEANS.
1. *Early Mazagan*, for earliest crops.
2. *Early Long-pod.* The most prolific kind.

BORECOLE.
1. *Tall Green, or Scotch Kale.*
2. *Dwarf Green, or Canada Kale*

} Of equal merit, their difference being the height they grow, and the consequent difference in the space required between them.

BRUSSELS SPROUTS.—There is only one kind. The best and truest seed is imported: therefore, apply to a respectable seedsman for it.

BROCCOLI.
1. *Early Purple Sprouting.* For first crop.
2. *Dwarf Late Purple.* A more hardy kind than the last, and taking longer time to come to perfection.
3. *Knight's Protecting.*
4. *Late Dwarf Tarton.*

} If room can be spared, these may be grown.

CABBAGE.
1. *Early York.* Dwarf and early, very suitable for a small garden on account of the little distance apart it requires to be planted.
2. *Vanack.* A valuable spring cabbage; not the earliest, but one of the best.
3. *Early Brompton*
4. *Early Battersea Nonpareil*

} are about equal in merit, being early, heading quick, and delicate.

5. *Red Dutch*, for pickling.

CARROT.
1. *Early Horn*, for first crop.
2. *Altringham*, or *Long Orange*, for main crops.

CAULIFLOWER.

CELERY.
1. *Red Solid*, or *Manchester*. Large and hardy.
2. *White Solid.* Similar to the above in quality, but neither so large nor hardy. May be sown for a first crop.

CRESS.
Curled-leaved. Lasts longer in perfection than the plain-leaved.

CUCUMBER.
Southgate, or *Long Green prickly*, will be found easier to manage than newer kinds.

KIDNEY BEAN.
1. *Negro*, for an early crop, as they come in very quickly, but do not last long.
2. *Fulmer's Early.* Suitable also for an early crop, and more prolific than the last.
3. *Cream-coloured.* The best, and should be sown largely.
4. *Scarlet-Runner Bean.* The seeds should be carefully selected, choosing the darkest marbled ones.

LEEK.
Broad-leaved London.

LETTUCE.
1. *Black-seeded Green Cos* is an excellent kind, and does not readily run to seed. It is also very hardy.
2. *Bath Cos* is the best to stand the winter in the open ground.
3. *Brown Dutch Cabbage* is a very hardy good kind.
4. *Grand Admiral* is a very fine Lettuce, and continues a long time without running to seed.

Hammersmith Hardy Green is the most hardy kind for winter.

MUSTARD, *White.*

ONION.
1. *New White Globe* is the best for main crops.
2. *White Spanish and Brown Portugal* are large kinds for autumn-sowing.

Potatoe or Under-ground Onion is very mild for eating raw, and very early.

PARSLEY.
Best Curled.

PARSNEP.
Hollow Crowned is large, hardy, and tender-fleshed.

PEA.
1. *Double-blossomed Frame* or *Charlton* for first crop.
2. *Dwarf Blue Imperial* is a productive kind.
3. *Dwarf Blue Prussian* is of equal merit with the last, but rather later.

Knight's Dwarf Green Marrowfat, an unequalled Pea in every respect, should be sown for late crops.

POTATOE.
1. *Ash-leaved Kidney.* Very early, prolific, and fine-flavoured.
2. *Early Manley.* An excellent and prolific kind.
3. *Early Shaw.* Similar to the last. These three are peculiarly adapted to garden-culture, requiring a shorter distance apart than most kinds.
4. *Bread Fruit.* An excellent white dry potatoe.
5. *Lancashire Pink-eyed.* A mealy good-keeping kind, and very profitable.

RADISH.
1. *Early Scarlet Short-top* is the best kind.
2. *Scarlet Turnip.*
3. *White ditto.*

} Well known and equal in merit.

RHUBARB.
1. *Elford* for early; it has scarlet stalks.
2. *Hybrid* is a strong-growing tender-leaved kind.

SPINACH.
1. *Round-seeded Spinach* for summer.
2. *Flanders* for the winter or main crop. The common Winter Spinach has prickly seeds, but this valuable kind has smooth ones.

TURNIP.
1. *Early Dutch*, if an early crop is desirable.
2. *White Stone*, for autumn and early winter.
3. *Scotch Yellow*, for winter.
4. *Swedish* is a good solid Turnip, and the tops produce excellent early greens.

FRUIT.

APPLES.
1. *Hawthornden.* This Apple has many claims upon the attention of the cottager; it is of a good size, bears at an early age, and so abundantly as to require thinning in some seasons. The tree is not subject to disease, and thrives in almost any situation. It ripens in October, and keeps until Christmas, or longer.
2. *Manx Codlin* in a cottage-garden is a most serviceable fruit, being an abundant bearer; and it may be thinned out for use before the fruit is ripe. Like Hawthornden, it is a hardy healthy tree, thriving in almost any soil, and keeps till November.
3. *Dutch Mignonne.* A delicious, large, and handsome kind. The tree is a good bearer, and the fruit keeps well until March. It is a superior Apple to Golden Reinette, which it resembles.
4. *Kerry Pippin.* An excellent Apple of middle size: the tree is of dwarf growth, and a great bearer. The flesh is yellow, melting, and rich.

5 *King of the Pippins.* This beautiful Apple is very hardy and a great bearer: fruit middle size.

6. *Ribston Pippin* is not surpassed by any, where the soil and situation are suitable. It is subject to canker in stiff wet soils and low situations: it is a good bearer, and continues in perfection until March.
7. *Fearn's Pippin.* This is a very handsome fruit and good bearer, and worthy of a place in any collection. The tree is very hardy. It keeps a long time if packed in sand.
8. *Old Nonpareil.* This excellent table-fruit should find a place in every collection: its dwarf habit renders it suitable for small gardens. When well ripened and packed away in dry sand, they may be kept until they are valuable.
9. *Scarlet Nonpareil.* If a fine loamy soil, with a gravelly subsoil, is possessed, then no Apple becomes so valuable as this. It is a beautiful regular fruit, of a fine red colour next the sun, and almost equals the old kind in flavour, but does not keep quite so long.
10. *Cockle Pippin* makes a handsome dwarf tree, and is a good bearer. The fruit is of a middle size, and frequently keeps till Midsummer. The tree is very hardy.

PEARS—for training on walls, or as dwarf standards.
1. *Jargonelle* is so well known as to require little said of it; it is an early bearer, easily managed, and a delicious fruit. One tree will, however, be enough, unless it be grown for profit. The tree should not be allowed to over-bear.
2. *Marie Louise* will succeed the above, and is in perfection in October. It is somewhat of the same size and shape, very handsome, and the best Pear of its season.
3. *Beurré Diel* is a most hardy tree, and good bearer. The fruit is large, becoming of a russety yellow when ripe, through November and December.
4. *Passe Colmar* is a most prolific bearer, and an excellent Pear. It is hardier than the old Colmar, and in perfection from December to February.
5. *Glout Morceau* is extremely hardy and prolific. It is a good-sized pale-green fruit, in perfection from December until March.
6. *Easter Beurré* is, perhaps, the best of late Pears. It is a late bloomer, and therefore not so liable to suffer from spring frosts. It bears whilst the trees are quite young, and is in use from January to April or May. It should be packed in dry sand.

PLUMS.
1. *Green Gage* needs no comment, as it has always stood in the highest repute, and is well known.
2. *Purple Gage.* An excellent Plum, resembling the Green Gage except in colour. It bears well as a standard.
3. *Coe's Golden Drop.* A splendid Plum and excellent bearer. It has the good quality of hanging a long time on the tree, becoming almost dried, sugary, and delicious.
4. *Early Orleans* is an excellent bearer, and an improvement upon the well-known old kind.
5. *Blue Imperatrice* is well known in gardens, a good bearer, becomes shrivelled and exceedingly rich; may be kept until November.

CHERRIES.
1. *May Duke.* Its merits are well known; it bears the knife well, and produces fruit freely on dwarfs.
2. *Morello* is a valuable fruit. It may be trained against a shady wall, or as a dwarf standard; is an abundant bearer. In pruning, the branches, being slender, are apt to be left too thick, which is a great fault. The fruit is borne from the young wood of the last year, which should be remembered at the time of pruning.
3. *Late Duke.* An excellent late Cherry as a standard.
4. *Bigarreau.* Well known for its merits, but requires space; and its large foliage and drooping branches render it impossible to grow anything under it.

GOOSEBERRIES.
1. *Red Warrington.* Keeps late; a great bearer; of a good size and rich flavour. It is a strong grower.

2 *Rombullion* is the best and most profitable for preserving, or for wine-making.

3. *Pitmaston Green Gage* is a late variety surpassed by none.
4. *Red Champagne*, an upright-growing bush, producing middle-sized fruit, unequalled in point of flavour.
5. *Yellow Champagne*, similar to the last, except in colour.

The following are a few of the largest prize Berries:

6. *Massey's Heart of Oak* is a prize Berry, but not of the largest; its other merits, however, entitle it to a first place.
7. *Woodward's Whitesmith* is an upright grower, a good bearer, and of excellent flavour.
8. *Taylor's Bright Venus* deserves a place equally with the latter.
9. *Farmer's Roaring Lion.* One of the largest and latest; it is of a drooping habit, often requiring to be supported by forked sticks.
10. *Brotherton's Huntsman.* A large globular rich fruit. When grown as a prize fruit it is apt to crack in wet weather, which is its only fault.

CURRANTS.
Red Dutch, *White Dutch*, and *Black Naples* are the best.

RASPBERRIES.
1. *Red Antwerp.*
2. *Yellow Antwerp.*

STRAWBERRIES.
1. *Keen's Seedling* is, perhaps, the best for a cottager, being a most prolific handsome fruit, although there are some others superior in flavour.
2. *Old Pine.* If the soil is loamy and rich, this kind is not surpassed; being a strong grower, it requires more room than the last.
3. *Elton* is a fine late kind, and a free bearer; raised and approved by Mr. Knight, the greatest modern horticulturist, which is a sufficient guarantee of its merit.

GRAPES.
1. *Miller's Burgundy.* A hardy black Grape, easily distinguished from other kinds by its mealy-looking leaves.
2. *New White Sweetwater.* An excellent early white Grape.
3. *Esperione.* A fine early, large black Grape.

SELECT FLOWERS.

In the following alphabetical list of flowers, we have given in the first column the English or popular name; in the second column, the height they grow; in the third column, the colour of their flowers; and in the fourth, their season of flowering. No annual flower should be sown, nor any plant permanently placed, without first ascertaining these particulars, after which something like arrangement may be attempted as regards the proper position for each in the borders or beds.

Of height nothing need be said, except that the dwarfest should be placed nearest the edges; but respecting colour, the simple fact that some colours being placed near each other have a better and more harmonious effect than others, will at once be admitted; and we recommend particular attention to this. The principal things to be avoided are—the placing of rose-coloured or red flowers next scarlet or orange, or orange next yellow, blue next violet, or rose next violet; on the contrary, the following colours harmonise:—white will relieve any colour, but should not be placed next yellow, orange with light blue, yellow with violet, dark blue with orange yellow, white with pink or rose, lilac with yellow; by observing these rules the cottager may have his flower-borders vie in beauty and arrangement with those of greater pretensions, and even surpass many of them. The season of flowering with annuals will, of course, vary accordingly as they are sown, but the earliest period of their flowering is given if they are sown out of doors.

ANNUALS, OR PLANTS OF ONE YEAR'S DURATION.

English Name.	*Height.*	*Colour.*	*Season of Flowering.*
	f. i.		
Chinese Aster	2 0	Various	July to Sept.
Prince's-Feather	2 0	Crimson	June to Sept
Love lies Bleeding	2 6	Crimson	June to Sept.
Sweet Sultan	1 6	Lilac	July to Oct.
Yellow Sultan	1 6	Yellow	July to Oct.
Corn flower or Blue bottle	2 6	Blue & var.	June to Sept.
Garden Chrysanthemum	2 0	Yell. & white	July to Oct.
Pretty Clarkia	1 6	Reddish pink	May to Oct.
White		White	May to Oct.
Two-coloured Collinsia	1 6	Blue & white	May to Oct.
Large-flowered do.	1 0	Blue	May to Oct.
Dwarf Bind-weed	1 0	Various	June to Oct.
Tall do.	12	Blue	June to Oct.
Two coloured Coreopsis*	2 0	Yell. & blood	July to Oct.
Rocket Lark-spur	1 6	Various	July to Oct.
Clammy Eutoca*	2 6	Blue	June to Oct.
Three-coloured Gilia*	1 0	Lilac, purple, and white.	May to Oct.
Milfoil-leaved do.*	1 0	Purple	May to Oct.
Headed do.*	2 0	Blue	May to Oct.
Pretty Godetia	1 0	Pink	May to Sept.
Elegant Gypsophila	1 0	White & pink	May to Sept.
African Hibiscus	1 6	White & purp.	July to Sept.
Candy-tuft	1 0	Divers	July to Sept.
Amellus-like Kaulfussia	0 6	Blue	July to Sept.
Californian Lasthenia	1 6	Yellow	May to Sept.
Sweet Pea	6 0	Divers	May to Oct.
Androsace-like Leptosiphon	0 6	Various	May to Oct.
Cluster-flowered do.	0 6	Purple	May to Oct.
Douglas's Limnanthes	1 6	Yell. & white	May to Oct
Two coloured Lupine	0 6	Blue & white	May to Sept.
Large Rose do.	2 6	Rose	June to Sept.
Yellow do.	2 6	Yellow	June to Sept.
Large-flowered Malope	2 0	Crimson	June to Sept.
Ten-week Stock	1 6	Divers	June to Sept.
Showy Nemophila*	0 6	Blue	May to Sept.
Speckled do.*	0 6	White & spot.	May to Sept.
Two-faced Evening Primrose	1 6	Purp. & prim.	May to Sept.
Red and white do.	1 6	Red & white	May to Sept.
Four winged do.	1 6	White	June to Sept.
Poppy	2 6	Various	June.
Californian Platystemon	1 0	Yellow	May.
Mignonette	0 6	Straw-colrd.	All the year.
Schizanthus	2 0	Lilac-purple	June.
Groundsel	2 0	Purple	June.
French Marigold	1 6	striped, yellow & red	July.
African do.	3 6	Yell.-orange	July.

Those marked with an asterisk in the above list will, if sown in September, stand the winter, unless very severe, and will then flower earlier and stronger than when sown in the spring. The following list comprises some of the most suitable and showy permanent plants for a small garden; those marked with an asterisk should be treated as directed for biennials; all may be increased by division of the roots or seeds, which can be procured for a trifling sum:—

English Name.	*Height.*	*Colour.*	*Season of Flowering.*
	f. i.		
Yellow Madwort	0 6	Yellow	May & June
Hollyhock*	8 0	Various	July to Oct.
Garland Poppy Wind-flower	0 6	Various	May to Sept.
Large Snap-dragon	2 0	Various	June to Oct.
Amellus-like Starwort	2 0	Blue	July, Sept.
Pyramidal Bell-flower	5 6	Blue & white	July, Sept.
Canterbury bells*	2 0	Blue & white	June, Sept.
Garden Wall-flower	2 0	Orange and brown	
Californian Chryseis*	1 6	Yellow	May to Oct.
Orange-coloured do.	1 0	Orange	May to Oct.
Showy Cineraria	2 6	White & purp.	June & Sept.
Bee Larkspur	5 6	Blue	June to Oct.
Large-flowered do.	2 6	Blue	June to Sept.
Superb Pink*	1 0	Various	June to Sept.
Sweet William do.*	2 0	Various	June to Sept.
Carnation do.	2 6	Various	July to Sept.
Many-flowered Eutoca*	1 6	Pink	June to Sept.
Two-coloured Gaillardia	2 6	Yellow & red	June to Aug.
Large flowered Avens	2 0	Scarlet	July to Sept.
Double Purple Rocket	1 0	Purple	June to Aug.
Double White do.	1 0	White	June to Aug.
Scarlet Lobelia	3 0	Scarlet	June to Sept.
Many-leaved Lupine	2 0	Blue	June to Oct.
White-flowered	2 0	White	June to Oct.
Shining Lychnis	2 0	Scarlet	June to Sept.
Brompton Stock	2 6	Various	June to Aug.
Musk-scented Monkey-flower	0 6	Yellow	May to Sept.
Scarlet do.	2 6	Scarlet	May to Sept.
Grand-flowered do.	1 0	Spotted	May to Sept.
Handsome Evening Primrose	3 0	White	July to Sept.
Missouri do.	1 6	Yellow	June to Sept.
Oriental Poppy*	2 6	Scarlet	June to Sept.
Dark Red Pentstemon	1 0	Dark red	June to Sept.
Beautiful Cinquefoil	1 0	Purple	June to Aug.
Dark Bloody do.	1 0	Purple	June to Aug.
Heartsease	0 6	Various	May to June

The most suitable plants for covering a cottage, after a Vine, are climbing Roses, as Boursault or de Lisle, upon which other kinds may be budded, any sorts of Jasmine or Honeysuckle, Glycine sinensis, or the Blue Passion-flower; but for a north or damp wall nothing equals Ivy, which is not only always green, but will soon dry the wall.

VEGETABLE COOKERY.

In preparing vegetables for cooking, care should be taken first to thoroughly wash them. Cauliflower, Cabbage, Spinach, &c., should remain some time in cold water, in which a handful of salt has been dissolved; this will cause insects to leave them, however close their hearts may be; rain-water should be used to boil them if it can be procured, as many kinds of hard water will spoil the colour of greens; another important thing is to have the water boiling when they are put in, and remove them from the fire the moment they are done, draining the water well from them.

BROAD BEANS may be boiled with bacon or pickled pork until they are tender; but it is objected by many to boil them together, as the colour of the beans is affected by the meat. If the beans are boiled alone, a bunch of Parsley must be put in with them, to be chopped and served in their sauce, which is composed of a little flour and water, with a bit of butter, boiled together.

KIDNEY BEANS.—First string them, that is, remove the tough thread-like part that unites the backs and fronts of the pods: then cut them in four, lengthwise, and put them into the water, which must be boiling, with a little salt.

SCARLET BEANS are cooked precisely as the above.

BROCCOLI.—When the stalks appear hard, the tough outer skin should be peeled off. If the small sprouts or shoots are tied in a bunch, they are quicker removed from the water when done; they require particular watching, as they will fall in pieces if over-boiled. Some salt must be put into the water with them.

CAULIFLOWER should lie in salt-and-water an hour before it is put in to boil. They then require to be watched closely, and boiled like Broccoli; the water they are boiled in should be skimmed of any impurities previously to taking the heads out, or their appearance will be spoiled.

CELERY is usually eaten raw with bread and cheese, or to flavour soups; but if a few heads are cleaned and cut into pieces four or five inches long, and stewed tender, serving them with a little milk, flour, and butter, seasoning them with pepper and salt, they are delicious.

CARROTS are usually boiled with salt beef or pork, and in broths or soups; in either case they require a good deal of boiling, and should be first scraped.

LEEKS are exceedingly wholesome, and used in broths and soups in the same manner as Onions.

ONIONS, as is well known, are not only savoury but exceedingly nutritious, and used in ways two numerous to mention here; but weakly persons should never eat them raw or fried. Large ones stewed for two hours gently in a little broth, having been first fried brown and dusted with flour, when seasoned with salt and pepper, are nourishing: large ones are also very nice when roasted with their skins on, and eaten with salt and butter.

PARSNEPS.—This vegetable is not esteemed by the cottager as its value entitles it, being exceedingly nutritious and profitable. After they are scraped cut them down the middle, and boil them tender. They may either be served whole, or mashed with a little milk and butter, adding pepper and salt.

PEAS.—This popular vegetable is considered nourishing. They should not be boiled in too much water, but just enough to cover them, taking care not to overdo them. A bunch of Mint or Savory should be boiled with them, and afterwards chopped and stirred with a piece of butter among them. This is said to remove their tendency to create flatulence. If gathered green and dried, they are much better for soup than when left to become ripe.

POTATOES.—It is well known that a good Potatoe may be spoiled by bad cooking, and by good management a bad one may be rendered comparatively good. In fact, no vegetable depends more on the cooking than a Potatoe. In the first place, if the skin is taken off them before boiling, it should not be peeled, but scraped, for the following reason: if peeled, it is reduced in size considerably; besides, the outside removed is the very best portion of the root. An iron saucepan is preferable to a tin one for cooking them, as it prevents their boiling so fast; but the best way is, first, to wash them very clean, then put them on the fire with just cold water enough to cover them: when it has begun to boil, throw in a handful of salt, and add a pint of cold water, which checks their boiling, and gives them time to be done through without allowing them to crack; as soon as done rather under than over, which may be ascertained with a fork, pour the water off them, and replace the pan on the fire for a short time, until the remaining moisture is evaporated. If not immediately wanted, do not place the lid upon them, or the steam will be confined, but cover them with a cloth; new Potatoes require great caution not to overboil them, or they will be tasteless and watery.

POTATOES TO MASH should be boiled fast as above, then peeled; afterwards break them smooth, adding a little milk and salt; a piece of butter or beef-dripping will improve them greatly.

POTATOES TO ROAST should be of the largest size, and be first half boiled, then have the thin skin peeled off, and afterwards be roasted of a fine brown colour.

POTATOES, when left cold, may be fried in a little thin batter or dripping, and are excellent.

SEA-KALE.—The heads should be tied together and lie in cold water an hour, then be put in boiling water, adding a little salt, and well boiled, and afterwards drained dry. A slice of toasted bread is usually placed on the dish under them, and a sauce made of a little milk, flour, and butter, poured over them.

SPINACH, though not very nutritious, is cooling and wholesome, and may be eaten when other vegetables would be improper food; it requires no water to boil in, except what remains attached to the leaves after rinsing, adding a little salt when done; and the water drained off, a little butter may be beaten with it.

ON PREPARING ARTICLES FOR EXHIBITION.

THE most important things to be attended to in preparing florists' flowers for exhibition, are to shade them from violent sunshine, and protect them also from heavy rains; in the absence of a canvass awning, the readiest means of accomplishing this will suggest themselves according to the circumstances of the possessor. Easy methods have been described for Dahlias and Pinks, or Carnations, and for Heartsease similar means may be adopted. Protecting them from the ravages of insects is best accomplished by watchfulness and diligence in destroying them. Beds of Heartsease and other dwarf flowers may also have an occasional watering with clear lime-water. What is termed the *dressing* of flowers for exhibition, except the withdrawal of a blemished or run petal in a Pink or Carnation, is only a species of trickery, and unworthy of notice.

Let EVERYTHING be perfectly clean.

VEGETABLES, as Cabbage, Cauliflower, &c., should be sent with all their leaves, except any damaged or decaying ones.

ROOTS, as Carrots, Turnips, or Parsneps, should not have their tops removed or roots shortened, but be shown entire, and washed very clean; Celery the same.

For FRUIT nothing is required except placing the requisite number to make a dish neatly upon plates. Apples and Pears may be wiped with a soft flannel; but any artificial blooming of Plums, Cucumbers, or Grapes, is unworthy, and generally detected.

PIGS.

THE best sort to purchase is a spayed sow; it should be bought early in the spring, or rather late in the autumn; it should then be not less than four months old, six would be better: and if a baconer, a year old is still better. The best breed is the small Essex, the Suffolk, or the Berkshire, with a cross of the Chinese, as the latter is disposed to fatten in an expeditious manner. The largest sort is the most profitable, because there is growth and fatting going on at the same time. Pigs at the above ages will eat Cabbage-leaves, Mangel-wurzel, Swedish Turnips, the refuse of the garden, &c., and until they are put up to fat, they should have plenty of clean fresh water, at least thrice a day (in hot weather) and at the same time a few Beans strewed amongst the litter in the yard, which should be kept very clean by frequently adding small quantities of fresh straw. If colour deserves consideration, the light sandy and yellow spotted are to be preferred, as their skins appear the most delicate when dead.

When you first begin to feed in the sty (obtain a trough called "a witch*") do it by degrees, introducing into their food for the first five or six days as much powdered sulphur and as much powdered antimony as will lie on a shilling (for each pig) which will effectually cleanse them; but if you feed high all at once, the pig or hog is apt to surfeit, and then a great loss of food takes place. Put up two together, for they feed best in company; and they should be rung when first put up, otherwise they will not be quiet. Peas or Barley-meal is the best food; the former certainly for a baconer, but the latter does its work quicker; and with every mess afterwards salt should be rather freely introduced. In cold weather the food should invariably be given luke-warm, the pigs should be kept very clean; and although they are proverbially dirty, and fond of wallowing in mud and mire, yet it is a great mistake not to keep them scrupulously clean, for uncleanliness will be almost certain to bring on one or other of the skin-disorders to which they are so liable, and the irritation thence produced will injure their appetite, and prevent them from improving in condition. Should any eruption appear, a little sulphur and madder may be advantageously mixed with their food. The author has been told by an experienced Norfolk farmer, that he put up six pigs of nearly equal size or weight at the same time, and treated them in every respect the same as to food and litter for seven weeks. Three of them were left to shift for themselves as to cleanliness, the others were kept as clean as possible with comb and hard brush†. The last consumed in seven weeks fewer peas by five bushels than the other three, yet weighed more when killed by two stone and two pounds upon the average. Pigs should be regularly fed at least thrice a day, and their troughs should be well cleaned each time. Why they should be so fed is that they may be constantly in a state of rest, as in that case they fat in a more expeditious manner. It is constantly asserted that they will fat faster on dry food, giving them water half an hour afterwards. Corn-fed pork is the best, Peas, Barley, or Oats. The Bean and Acorn-fed pork are both hard, and the Potato-fed (in the usual way) is very loose (a waste of about 3 ozs. in the pound). A porker will eat four or five pecks of common meal per week, in fatting; and a baconer (in proportion to its size) upwards of a bushel per week; by all means make the latter quite fat, because lean bacon is the most wretched unprofitable thing which any family can use. A porker should be fatted in the course of a month or six weeks at the longest, and a baconer in ten or twelve weeks. A pig or hog should have no food the day before killing. It is frequently observed in fatting hogs, that they pay better for their keep in the latter part than in the early part of their fatting.

Baked (roasted) potatoes are the most excellent food for pigs. The pork produced was equal to that from Barley or Oats, and the roasted or baked Potatoes (considering the improvement of the hogs) is the cheapest food that can be given them. Roast the Potatoes on a kiln like to that used by Oatmeal-sellers for drying their Oats. The difference in expense between roasting and boiling the Potatoes is prodigious, with regard to both labour and fire. A kiln costs only 3*l.*, and will roast Potatoes enough for more than 20 hogs. The fire, by dissipating juices that are contained in raw Potatoes, reduces them to a state highly wholesome and nutritious; boiling does this in part, but not so effectually.

When the hog has been killed, the first thing to be done is to get the hair off. Scalding and shaving is the common method: but as it makes the meat loose and flabby, singeing, as practised in Hampshire, is much preferable.

It must be admitted that the hog is altogether a most capital thing in a poor man's cottage; inasmuch as bacon, either cold or hot, goes to the field or coppice conveniently. In harvest and other busy times it demands to be boiled only once a week, has twice as much strength in it as any other meat of the same weight, and in short, has in it every good quality which tends to make a labourer's family able to work and be well off. One pound of bacon, such as here described, is, in such a family, worth at least two pounds of ordinary beef or mutton (which they usually buy), a great part of which is bone, and, in short, is gone in a few minutes; but recollect, that good fat bacon is the very best of all animal food for the labourer.

The hog should be purchased in the month of March, four months old, which can then be generally done for about 15*s.* The cost till fatting time is next to nothing to a cottager; and then the cost (at the present price of corn) would, for a hog of 20 to 25 stone, not exceed perhaps 60*s.*, and in the whole from 80*s.* to 84*s.* Let the poor man recollect that a pot of poison a week bought at a public-house comes to 26*s.* of the money; and more than three times the remainder is generally flung away upon miserable tea, which, if laid aside, the labourer might supply his family well with beer all the year round, and have a hog of the above weight for the cost.

N.B. If a pig or hog is ill, give it a strong dose of Glauber salts and jalap in warm gruel; repeating it every three hours till it is restored.

When the hams have lain three days, rub them with an ounce of saltpetre each; and when they have lain a week from the time of killing the pig, lay them in the following pickle:—1 lb. of bay salt, 1 lb. of coarse sugar, one handful of common salt, boiled in half a pint of vinegar; pour it over them boiling hot, rubbing it well with the hand. Let them lie a month, turning them daily.

TENANTS should apply to their landlords to assist them in carrying into effect this laudable proposal by building suitable pig-sties for the purpose; and in the month of March the tenants should assist each two of their labourers (working constantly on his premises) in the purchase of a pig, and let that pig shack about his yards and premises until it is fit to put up fatting, and then put it into the sty and feed it upon Pea and Barley meal till it weighs from 20 to 25 stone, during all which time the tenants should keep a strict account of the costs, and weekly detain out of each such poor man's wages the amount thereof and of the feeding, for which the tenants for their outlay, kindness, and trouble should have the full benefit of the manure of these animals. When each hog is killed, it should be equally divided between each two such labourers, who shall thereupon be prepared to pay the amount of the balance for keep, &c., if any, to his master, before he proceeds to take away his share of the hog. This plan would remove all temptation from the labourer, and would have the tendency to keep up the intercourse and good feeling between the farmers and their labourers, which cannot be too much encouraged, and as the hearts of the farmers are always alive to the impulses of humanity, and as they are the friends of poverty, they can but know of the imperious demands upon them, to assist in and save their poor neighbours from distress, and to give them, by instruction and support, a chance for happiness; and oh! what a pleasing reflection it must be to such men to think that, by a well-directed bounty to such poor objects, they at once become the "friends of the poor."—*Abridged from a Pamphlet by J. S. of Norwich.*

LIST OF BOOKS ADAPTED FOR COTTAGERS.

THE following works may be obtained at any respectable bookseller's, and the cost of none exceeds 10*s.* 6*d.*:—

A Bible. A Prayer-book. A Catechism of Gardening, for Village Schools. Bagster on Bees. Burn's Popular Guide to Health. Cham-

---

*** A witch is a trough having a hanging lid, which the animal presses open when it eats, and which falls back when it withdraws its head, and thus keeps the food from being defiled.**

† If not combed and brushed, a post should be placed in the sty, for the animal to rub and clean itself against.

bers' Domestic Economy and Cookery. Channing's Lecture on Self-Culture. Clay's Geological Sketches. Dodsley's Economy of Human Life. Doyle's Flower-Gardener and Monthly Calendar. England's Happiness Improved. Gardener's Manual. Gardener's New Companion: on Bees. Gentleman Farmer, or Observations on the Husbandry of Flanders. Hartley's Geography for Youth. Henslow's Botany in Lardner's Cyclopædia. Howitt's Book of the Seasons. Jackson's Treatise on Agriculture. Lindley's School Botany. Loudon's (Mrs.) Ladies' Companion to the Flower-Garden. Loudon's (Mrs.) Instruction in Gardening. Mackintosh's Orchard and Fruit Garden. Main's Domestic Poultry. Mason's English Garden. More's Flower-Garden. Morton on Soils. The Bee Preserver, translated from the French of Jonas de Gelirn. The Handbook of Fruit-trees. Waterton's Essays on Natural History.

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

Feb. 1st.—R. W. Barchard, Esq., in the chair. Mr. Finney was elected. A description of the method practised at Cocolan, in Chili, for the extraction of syrup from the Júbea spectábilis, was read, from Mr. Lucas. The Palm, it was stated, grew in great abundance on the estate, particularly in moist, sandy soil, through which a rivulet runs. It is in the dry season that the sirop is made; and in order to do this the tree is cut near the root with a hatchet, and a rope being attached to the branches, it is gradually pulled down to the ground. The leaves are then stripped off, and a piece of the stem is cut out, when the juice begins to run from the wound; when it ceases, another incision is made higher up, and so on till cuts have been made nearly to the top of the tree. It is said that in the top there is a pith which when cooked is excellent, and much esteemed by the natives. Júbea spectábilis blooms in October, and that is the proper season to collect the juice, which as soon as it is obtained is put into copper vessels, and subjected to a considerable heat till it attains the necessary consistence. In flavour and appearance the sirop is like molasses, and it may be refined, and by distillation good rum, it is expected, will be produced. The most remarkable plant exhibited was a handsome specimen of Dendróbium cærulescens, with between 200 and 300 flowers on it; they are white and bluish, with a dark centre; it was from Messrs. Rollisson, and with it were, a new Vanda, with dingy brown flowers; Stanhópea oculata, with yellow blossoms spotted brown, which exhaled a most powerful odour; and a specimen of the singular Cypripédium insigne. A silver Knightian medal was awarded for the Dendróbium. From J. Allnutt, Esq., there was a flower of Camellia Doncklaerii in its true character. Mr. Mills sent a brace of Cucumbers, grown according to the system recommended in his treatise. The plants from the garden included Cymbídium sinense, with several spikes of dingy yellow flowers; the chief merit of this plant is the length of time it will remain in a drawing-room without the flowers either falling off or losing their delicious scent; Oncídium Cavendishianum, with a fine yellow mass of bloom; O. pergameneum, with yellow and brown flowers and curious leaves, feeling like parchment; and Zygopétalum rostratum, remarkable for its flowers lasting many weeks. There was also a singular prostrate variety of the Mediterranean Heath, found in Ireland, and the pretty Acácia longifólia, with spikes of yellow flowers. The cut flowers consisted of two varieties of Chimonanthus fragrans.

FLORICULTURAL SOCIETY.

Feb. 1st.—Mr. C. Palmer in the chair. Messrs. Chapman, Whale, and Spory were elected. Five shows were appointed for the ensuing season, and will take place as follows:—For Auriculas and Polyanthuses, April 26th; for Tulips and Heartseases, May 24th; for Pinks, Pelargoniums, Ranunculuses, and Roses, June 21st; for Carnations and Picotees, July 19th; and for Dahlias, Sept. 20th.

LINNEAN SOCIETY.

Feb 1.—The Bishop of Norwich in the chair. Mr. J. W. Griffith was elected a Fellow of the Society. A paper was read on the development of the embryo in Tropæolum majus, by Dr. Jerrold. A minute account of the changes undergone by the ovule and the embryo, from the first appearance of the former, when the flower is in bud, to the perfect formation of the latter, was given. The principal conclusions of importance to which the author had come were:—1. That the primary utricle (vesicule embryonaire) is developed previously to the act of impregnation. 2. That the primary utricle is distinct from the embryonic sac, and not arising from it, as stated by Brogniart and others. 3. The pollen tubes are not to be traced to the micropyle, and never reach the embryonic sac. 4. The formation of the embryo results from a dynamic action of the fovilla upon the primary utricle, and is not the result of growth of matter independent of it. The President proposed that Sir Wm. Jackson Hooker be appointed a vice-president of the Society in the place of Mr. Lambert, deceased. The election of librarian was announced to take place on the evening of Feb. 15, between the hours of half-past 7 and 9 o'clock.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Onci'dium longifo'lium. Long-leaved Oncidium. *(Stove Epiphyte.)* Orchidáceæ, § Vándeæ. Gynándria Monándria.—Under the name of Oncídium Cebolleta many very different species exist in our gardens, among which the finest is O. longifólium, which, although it has the foliage of that species, is really very different, forming dense panicles, three feet long, of very large and showy yellow and brown flowers. Its leaves are often three feet long, and hang down or spread upon the ground instead of standing stiff and erect. It has been imported abundantly by the Horticultural Society from Mexico, and has flowered both in their garden and with Messrs. Loddiges. It is very handsome, and well worth growing. Fom all the allied species it differs in the great length of its whip-like leaves, and in the form of its labellum, whose lateral lobes are something like bird's wings in shape, while the intermediate lobe has an unusually long unguis gradually dilating into a two-lobed extremity. In cultivation it requires a warm damp atmosphere, where such plants as Cáttleyas, Læ'lias, and Stanhópeas flourish. A temperature ranging from 55° to 65°, with artificial heat, will be quite sufficient. It will grow very well amongst turfy peat in a pot; but we prefer suspending it in a forked block of wood, and allowing the long leaves to hang gracefully down, as they do in its native woods. If grown in this way, the cultivator must fix it firmly to the block, and pack the roots all round with turfy peat or sphagnum, and take care that it is freely watered, particularly when it is growing. Plants which are hung up in this manner are not likely to suffer from too much water. It is propagated in the usual way, by division.—*Bot. Reg.*

Leschena'ultia bi'loba. Large Blue Leschenaultia. *(Greenhouse Subshrub.)* Goodeniáceæ. Pentándria Monogýnia.—Few plants have, from the report of travellers, excited more interest than this. For the beauty of the old Leschenaultias has rendered them universal favourites, and a new species of the genus with large blue flowers could not fail to be still more ornamental; and its merits can scarcely be said to have been exaggerated: for what can be more lovely than its deep azure flowers on so delicate and breath-like a foliage? If it should prove to be as profuse a bloomer as the others, it will be one of the best species recently acquired for gardens. If it should not, we would advise those who are in correspondence with Western Australia not to despair; because there are other species, one too with blue flowers, the L. grandiflora of the Sketch of the Swan River Flora, which appear from the dried specimens to be loaded with blossoms of a much larger size than this. It is believed that Messrs. Lowe and Co., of the Clapton Nursery, had the honour of raising this plant first: it was, however, earliest flowered by Messrs. Veitch and Sons, of Exeter, who exhibited it before the Horticultural Society, and obtained the large silver medal for it. It is a hardy greenhouse plant, and as easily managed as the old L. formosa. Cuttings root freely in spring and summer, if covered with a bell-glass and plunged in a mild bottom heat. The young plants ought to have their shoots carefully stopped, to enable them to send out numerous branches and form compact bushes. It grows well in a mixture of peat and vegetable mould, and would succeed well if planted out in the border of a conservatory.—*Bot. Reg.*

MISCELLANEOUS.

Recollections of French Gardening.—Although we are much indebted to our neighbours of France for many articles which we now cultivate with success, it does not appear that either agriculture or horticulture has made such progress in that kingdom as we might be led to expect from the talent we find displayed in various works issuing from the French press. The truth of the matter seems to be, that as Paris is the focus of opinion, or we should rather say, the point from which opinion diverges, in order to be dispersed and adopted everywhere else, so it is the centre of rural science; but there is this difference, that while Parisian politics are adopted, and revolutionary impulses at once obeyed, there is yet little tendency in the rural population to adopt improvements, even when they are suggested and made known. The education of the people has only begun, and it is only of late we find able Frenchmen travelling over Britain to obtain insight into our methods of proceeding. There is scarcely a town in France in which there is not an agricultural and horticultural society; but, unless something occurs to excite attention by the prospect of instant profit, such as the cultivation of plants yielding dyes, the knowledge that such societies may obtain seems to accumulate within the walls in which the meetings are held, and to be unknown beyond them. For example:—in the district called the Garden of France, alias the Touraine, they have a society which has been long established; but a traveller can see nothing to induce him to imagine that the kindred arts of agriculture and horticulture are less than two centuries behind their progress in other countries. Here and there we do see improvement. The noble proprietor of that singular chateau, Chenonçeaux, has a Flemish coachman, of strong good sense and observation, who has induced his master to cultivate much waste land, after the Belgian system, and we have seen it carrying excellent crops; but the gardens of the chateau are somewhat behind, though better than in other places of the district. There is one very zealous horticulturist at Tours, Dr. Bretonneau, who is taking much trouble to collect good fruits; and his chief hobby is the Cherry, of which he possesses an extraordinary collection. He is experimenting, also, with new sorts of Stocks for the finer fruits; and as he is a very liberal man, we need not doubt of benefiting by his experience. There are several amateurs who have collections, but not much variety of flowering plants. The climate is admirable, and there is considerable variety of soil resting on the lower chalk. But art does little, and there are no good operatives to be found; this last deficiency cannot be easily supplied until education shall spread more among the lower orders. On expressing pleasure at seeing the garden of Dr. Bretonneau in good order, he said his gardener was a blockhead, and caused him much trouble. Agriculture is retarded by the subdivision of property and the smallness of the farms. The vineyards are treated in the ancient manner, and are well manured, but not well cleaned. The best fruit is got by the Restaurateurs from Paris, and it is often very bad. The only fine Apple met with was the Pepin Reinette, which retains its plumpness and flavour in May. The Potatoes in this quarter are excellent, and many other culinary vegetables; the market-gardens being rather well attended to. Walnut-trees abound; and from the nut an oil is extracted which is used for burning. The Almond trees are splendid; and also the Robinias, or Acacias. There is a street named from an avenue of them that runs its whole length in the western part of the town; close to a church, the name of which has for the moment escaped me, there are some beautiful specimens of the Platanus growing luxuriantly, and of a great height and thickness. The nursery-gardens are not kept with such neatness as in England, and they do not contain any great show. They keep a good many plants to furnish nosegays for the ladies, who never appear at parties without them; but there is nothing attractive. In such a climate, a person of taste and horticultural skill might form a paradise. The winters are, however, sometimes severe; and straw and mats are not to be dispensed with. Dr. Bretonneau pointed out to us the result of an experiment, which was certainly very remarkable. He had dug round every alternate bush in a row of Red Currants, and filled up the spaces with a yellow ferruginous clay found in the vicinity; the quantity of fruit on the bushes so treated, compared with that on the others, was immense. Melons are cultivated in the open air, after having been raised under hand-glasses. They are planted on narrow ridges of horse-litter, nearly level with the ground; but the plants were stunted and the fruit small. Some of the best English varieties were left with some cultivators, but we do not yet know whether they succeeded. The French seldom apply steadily to anything; novelty attracts them for the moment, but it is not the national characteristic to persevere after first excitement has abated. Were the numbers of talented and well-informed persons in France to be compared with the amount of the population, it would be found smaller than in almost any other part of Europe, Turkey excepted. Yet we are indebted to the French for many brilliant discoveries in science and art. Our climate forces *us* to be watchful; and it is probably the climate of Scotland that has caused the operative gardeners of that country to be held in such great esteem.—*M.*—[We particularly recommend the curious fact about Currants, above mentioned, to the attention of Mr. Townley.]

Botanical Information.—We are glad to be able to announce, upon the best authority, that the next volume of De Candolle's Prodromus is in such a state of progress that its appearance may be confidently expected during the present year. M. Alphonse De Candolle has completed the difficult orders of Myrsinaceæ and Sapotaceæ; and the volume will contain all the orders up to Boraginaceæ, including the Asclepiadaceæ and Apocynaceæ, which will be arranged by M. Decaisne. It is the intention of M. Alphonse De Candolle to complete this immense undertaking.

Two Crops of Flowers.—A forced specimen of Phlox stolonífera, which blossomed freely in winter, made a second flowering in the month of June, after being turned out into the border.—*Hovey.*

Tomato Figs.—A new mode of preparing the Tomato-like Figs has been suggested. A sample deposited in the Patent Office in the United States is said to be of superior quality. From the taste, it is supposed all the good qualities of the fruit are retained. In appearance, the drum of Tomatoes resembles one of figs very nearly. The following recipe is given for the preparation:—Take six pounds of sugar to one peck (sixteen pounds) of the fruit; scald and remove the skin of the fruit in the usual way; cook them over a fire, their own juice being sufficient, without the addition of water, until the sugar penetrates, and they are clarified. They are then taken out, spread on dishes, flattened, and dried in the sun. A small quantity of the syrup should be occasionally sprinkled over them whilst drying; after which, pack them down in boxes, treating each layer with powdered sugar. The syrup is afterwards concentrated, and bottled for use. They keep well from year to year, and retain surprisingly their flavour, which is nearly that of the best quality of fresh figs. The pear-shaped or single Tomatoes answer the purpose best.

Climate of Massachusetts.—The following table, showing the periods of flowering of some common plants, will serve to convey to the English reader some idea of the spring climate of this part of the United States. It is taken from a paper by Mr. W. Oakes, in Hovey's "Magazine of Horticulture:"—

Names of Species.	Times of beginning to flower in the most favourable situations.		
	Mean.	Earliest	Latest.
American Alder, Alnus serrulata	March 22	Feb. 21, 1828	April 8, 1829
Wild Swamp Willow, Salix conifera	April 4	Mar. 26, 1828	April 17, 1829
Red Maple, Acer rubrum	April 15	April 1, 1828	April 22, 1832
Rue-leaved Anemone, Anemone thalictroides	April 21	April 8, 1827	May 3, 1841
Blue Houstonia, Houstonia cœrulea			
Field Horsetail, Equisetum arvense			
Early cudweed, Gnaphalium plantagineum			
Earliest Sedge, Carex varia			
Meadow Cowslip, Caltha palustris	April 22	April 8, 1827	May 3, 1841
Early Violet, Viola ovata	April 23	April 11, 1827	May 3, 1841
Wood Anemone	April 24	April 11, 1827	May 4, 1841
Early Potentilla, Potentilla canadensis			
Yellow Dog's-tooth Violet, Erythronium americanum	April 26	April 14, 1827	May 3, 1841
Dandelion			
Juneberry, or Shad flower, Pyrus botryapium	May 5	April 25, 1840	May 19, 1838
English Cherry	May 7	April 26, 1840	May 20, 1837
Plum-tree, Prince's Imperial Gage			
Pear-tree	May 12	May 1, 1830	May 21, 1837
Apple tree	May 14	May 2, 1830	May 23, 1837

Hedgehogs.—One of the most interesting facts in the natural history of the hedgehog is that announced in 1831 by M. Lenz, and which is now confirmed by Professor Buckland. This is, that the most violent animal poisons have no effect upon it; a fact which renders it of peculiar value in forests, where it appears to destroy a great number of noxious reptiles. M. Lenz says that he had in his house a female hedgehog, which he kept in a large box, and which soon became very mild and familiar. He often put into the box some adders, which it attacked with avidity, seizing them indifferently by the head, the body, or the tail, and did not appear alarmed or embarrassed when they coiled themselves around its body. On one occasion M. Lenz witnessed a fight between the hedgehog and a viper. When the hedgehog came near and smelled the snake, for with these animals the sense of sight is very obtuse, she seized it by the head, and held it fast between her teeth, but without appearing to do it much harm; for having disengaged its head, it assumed a furious and menacing attitude, and hissing vehemently, inflicted several severe bites on the hedgehog. The little animal, however, did not recoil from the bites of the viper, or indeed seem to care much about them. At last, when the reptile was fatigued by its efforts, she again seized it by the head, which she ground between her teeth, compressing the fangs and glands of poison, and then devouring every part of the body. M. Lenz says that battles of this sort often occurred in the presence of many persons, and sometimes the hedgehog has received eight or ten wounds on the ears, the snout, and even on the tongue, without appearing to experience any of the ordinary symptoms produced by the venom of the viper. Neither herself nor the young which she was then suckling seemed to suffer from it. This observation agrees with that of

Pallas, who assures us that the hedgehog can eat about a hundred cantharides, without experiencing any of the effects which this insect taken inwardly produces on men, dogs, and cats. A German physician who made the hedgehog a particular object of study, gave it a strong dose of prussic acid, of arsenic, of opium, and of corrosive sublimate, none of which did it any harm. The hedgehog in its natural state only feeds on pears, apples, and other fruits, when it can get nothing it likes better. Its ordinary food consists of worms, slugs, snails, frogs, adders, and sometimes rats and mice.—*Penny Magazine.*

Turnips.—William Hunter, Esq., of Dunmurry, has this season tested the produce of a portion of field Turnips (the purple-topped Aberdeen) on his grounds, and has found it to be at the extraordinary rate of 60 tons per Irish acre.—*Wexford Independent.*

GARDEN MEMORANDA.

J. Allnut's, Esq., Clapham.—The collection of Camellias here is extensive, and includes many fine seedlings. Among the kinds now in flower is a handsome specimen of Reticulata, having seven or eight of its gorgeous crimson blossoms in high perfection. We noticed a single white variety, bearing much larger flowers than the old one; and as it makes a handsome appearance, it is worthy a place in most collections. It is known here as the French White. Among the seedlings now in flower is one called superba; it is has a good deal of the character of Rossii, but differs from it in colour. Doncklaerii is flowering here in great beauty, and a large specimen of the old double-white will, in a short time, rival snow in whiteness. In addition to the Camellias, a choice collection of Heaths is cultivated here, and among them we observed good specimens of depressa, Massoni, eximia, and picta. With the Heaths are some Epacrises, and of these grandiflora, impressa, and pungens were in flower.—*Jan.* 31.

Messrs. Fairbain's, Clapham.—The most choice things now in flower are a few fine specimens of Heaths, among which we observed the yellow-flowered variety of Sebana, the singular white Banksiana, and the lively pink élegans. Lechenáultia formosa, covered with orange-flowers, formed a good companion to the Heaths, and with Pimelea linifólia, which had produced many heads of white flowers, made the greenhouse quite gay.—*Jan.* 31.

Review.

Proceedings of the Horticultural Society of London,
1841. No. XIV.

THE following extracts will interest many of our readers:

Jan. 19, 1841.—Mr. William Tillery, gardener to his Grace the Duke of Portland, gave the following account of the circumstances under which Citrons and Oranges are produced at Worksop:—'The plant that produced them is trained at the back of a large conservatory here, and has been planted about eight years; it has ripened ten of its noble fruit this year, the two I send being the average size. I find it likes plenty of bottom-heat, as the tub it is planted in is behind the hot-water apparatus that heats the house. The specimens of oranges and lemons are from trees planted out in the borders of the same house. Two lemon-trees here have produced more than 400 fruit, and are preferred to the foreign at table. The Guava, trained on the back of the same house, has ripened two or three dishes weekly all through the winter, and is preferred here for the dessert to any fruit. When well ripened, the berries become as black as sloes. and are really delicious, resembling a strawberry in flavour; we find no difficulty in their setting, as we have always to thin them out to get them fine.'

Garden Committee, Feb. 1, 1841.—Mr. Thompson reported from the Fruit Department, that keeping fruit in kiln-dried straw had been found to answer very well. It does not acquire the dampness, nor the mustiness, which straw does when not deprived of its natural moisture.

Feb. 16, 1841.—A paper was read by Mr. Fortune, the superintendent of the hothouse department in the Society's garden, upon the effect of mercurial vapour on vegetation. The author stated that in consequence of reports that wood prepared with corrosive sublimate under Kyan's patent was injurious to vegetation, a series of experiments had been tried in the garden for the purpose of ascertaining how far these opinions were well founded. In one experiment a small portable greenhouse was prepared with Kyanised wood, and, thus pickled, was introduced into the atmosphere of plants under handglasses, but without injurious effects in such cases. But when Kyanised wood, or shavings moistened with corrosive sublimate, or crude mercury, or salts of that metal, were introduced into vessels containing plants exposed to the dampness and high temperature of a hothouse, in every such case the plants became sickly, recovered when removed from the influence of the mercurial vapour, and sickened again when again exposed to it.

The following communication, on a means of producing flowers of Rhododendron arboreum soon after Christmas, was also read from Sir Charles Lemon, Bart. V.P.

"The circumstance which I am about to relate is of trifling importance, but may, nevertheless, interest those who, like me, cultivate the Rhododendron arboreum, and have seldom an opportunity of seeing its beautiful blossoms. I have for some years been in the habit of pruning the several varieties or sub-species of this plant as trees; and I find that they bear the knife well, and readily assume the character which I wish to give them. Last November, while engaged in this operation, it occurred to me that I might make some use of the branches which I had cut off, either by ripening the seed-vessels left from the flowers of last year, or by forcing into early blossom the buds already formed. With a view of accomplishing the first object, I placed some of the branches bearing seed-vessels in the dry stove; but they soon withered and came to nothing. Others were placed in the mud of a tank in the damp stove, in which were growing Limnocharis Humboldtii and other aquatics. This was done about the end of November. The leaves, however, drooped, and the cuttings remained unchanged for above a month; when, to my surprise, I found that the capsules were becoming turgid and full of sap, and that a strong shoot was coming from each cutting, which shoot, when I left the country, had attained nearly the length of five inches. Whether or not roots had been formed, I have not ascertained; for I was unwilling to disturb the cuttings so soon after their apparent vegetation; but it is difficult to suppose that such strong shoots should be pushed forward and sustained by nourishment derived only from absorption by the bark and wood. A cutting bearing a flower-bud was at the same time placed in the above-mentioned tank. In about a month it began to swell; and at the end of a fortnight afterwards, it expanded most beautifully. Thus I had an opportunity of seeing the blossoms of my own Rhododendron arboreum at a season of the year when I am usually at home, and when flowers for decoration are much in request. As the plants of Rhododendron arboreum are greatly improved by such pruning, I intend to repeat the experiment on a larger scale next season, and shall be happy if what I now write will enable others to partake of the pleasure of seeing the June flowers of Rhododendron arboreum in abundance soon after Christmas."

March 1, 1841. Garden Committee.—Mr. Fortune presented, from the Hothouse Department, the following 'Results of some comparative experiments with Coke and Anthracite, consumed in the conical hot-water boilers invented by J. Rogers, Esq.'

The experiments are now ended which have been in progress throughout the winter to test the efficiency of the improved conical boiler, and to ascertain whether coke or anthracite is the cheapest and best fuel to burn in it. So far as the boiler is concerned, the results have been perfectly satisfactory. When the apparatus connected with it is strongly constructed and well built in, as it has been in this case, it is easily managed, and as economical as any boiler with which I am acquainted. I think, however, its chief recommendation is the kind of fuel which it will burn—coke or common cinders—and the certainty with which it may be left without any attention for 10 or 12 hours to keep a stove to 60 degrees in the midst of winter with the external atmosphere so low as 6 degrees, or even zero of Fahrenheit. This is owing to the manner in which the fuel falls down into the fire, to the great quantity of air which is continually rushing through the bars, and to the complete power of regulating the supply of this, when the apparatus is as it ought to be. The fuel was tried in the following manner:—In the months of October and December we burned coke; in November and January anthracite, and in February coke and anthracite every alternate night. By referring to the quantity burned, and taking coke at an average price of 20s. a chaldron, and anthracite at 32s. per ton, we will find that the expense of heating the Orchidaceous house in October last with coke was about 1*l.* 3s. 10d., and the expense of heating it in November with anthracite was 2*l.*; or, if we take the alternate days of February, 14 against 14, we find the expense of heating with 28 bushels of coke 15s. 6d., and 16 cwt. of anthracite 1*l.* 5s. 7d. If we take the two months in which coke was burned, against the two in which anthracite was burned, which will not be fair, owing to the nature of the weather, the following are the results—coke, 3 chaldrons 27 bushels, 3*l.* 15s.; anthracite, 3 tons 1 cwt. 2 st., 4*l.* 18s.

"'These results speak for themselves so far as economy is concerned, and therefore the only thing to be considered beyond this is, which is most preferable with regard to management. A measure of anthracite will last much longer than one of coke, but the quantity of heat given out by each will be nearly the same. In the month of December last, when the weather was very cold, it was not possible to keep the Orchidaceons house to 60 degrees with one boiler filled with the best anthracite; but this could be done when coke broken into small pieces was used instead. When both boilers were filled with anthracite this temperature could easily be maintained, and they would last twice as long as one filled with coke. So that it comes to this: equal bulk produces an equal quantity of heat, or, at least, a chaldron of coke will give out as much as a ton of anthracite, the one being 20s., the other 32s. But as anthracite does not burn so fierce as coke, it lasts longer, and gives a very steady heat. This property may make it desirable for greenhouses where the expense is not considered; but in a stove with a well-regulated conical boiler, for everything depends upon this, coke is not only the cheaper of the two, but is much the easier to manage, requires less stoking, and burns clearer, as may be seen by referring to the quantity of ashes left by each. A mixture of the two kinds in equal proportions answers very well, with, of course, intermediate results.'"

CALENDAR OF OPERATIONS *for the ensuing Week.*

THE weather now promises to be more favourable for carrying on out-door operations, which should therefore be forwarded with all possible despatch. Whenever the ground becomes dry enough to work kindly, such vegetables as are indicated under the proper head, may be sown for an early crop. But, for the most part, this preliminary sowing cannot be confidently depended upon for a supply, and the greater part of the produce will probably soon run to flower, or be cut off by cold when very young. In heavy, wet soils, however, it will be useless to attempt putting seeds into the open ground at this early season; little or no time would be gained by such a proceeding, at the risk of wasting both seed and labour.

As fruit-trees will shortly begin to swell their buds, no time should be lost in completing their pruning, and the usual digging of the ground. Much harm is often done by deep digging between the rows of fruit-trees, which, besides being a loss of time, is a positive injury to the trees, by destroying the most important portion of their roots, and forcing those which are left to seek their subsistence in a wet or otherwise inappropriate subsoil. In digging among fruit-trees, therefore, the ground, unless intended to be cropped, ought not to be stirred deeper than suffices for the burying of the weeds.

KITCHEN-GARDEN AND ORCHARD.

In door Department.

PINERY.—Strong succession-plants intended for late fruiters might now be shifted into larger pots, if they require it, selecting for this purpose those only which have plenty of healthy roots. After shifting, a slight increase of bottom-heat should be given, to encourage their rooting; but the atmospheric temperature ought not to be raised beyond 60°, until the plants show signs of renewed growth; for increased excitement suddenly applied would probably cause them to start prematurely. The weather being now milder, the pits may be uncovered earlier in the morning.

VINERY.—The buds of the Vines which were started in the beginning of January will now be rapidly lengthening into shoots, and will consequently require to be kept warmer: 65°, by a gradual increase, will be sufficiently high until the bunches begin to develop themselves, and even up to the time of flowering, when the Vines are strong and the young bunches healthy. In this week another house may be set in motion, to succeed the one above alluded to. If a mass of fermenting dung can be taken into the house, fires will not be necessary the first week.

PEACH-HOUSE.—After the fruit in the early house is all firmly set, the night temperature should range between 55° and 60°, allowing it to rise a few degrees in sunshine, but always admitting fresh air, if possible, at some part of the day. The syringe or the engine should be used regularly, especially if the least sign of red spider is perceived. When the trees root only within the house, they will be benefited by taking three or four inches of the surface-soil off the border, and replacing it with fresh compost; this might yet be done in the late houses.

CHERRY-HOUSE.—Syringe daily with tepid water those trees which are not yet in blossom. The water given to the roots also should always be chilled.

FIG-HOUSE.—If the sashes have been kept upon the house all winter (which ought invariably to be done) the border will probably be dry, in which case a good supply of manure-water should be given. Increase the night temperature now to about 50°, and sprinkle the trees daily.

STRAWBERRIES.—Do not allow runners to grow upon the plants. Take in succession-pots as required, but never directly into a high temperature, if it can be avoided.

CUCUMBERS AND MELONS.—Keep a good store of young plants of different ages, for fear of accident. Common dung-beds should, when practicable, be placed upon a thick layer of fagots, which might be made of prunings of shrubs, or any wood of little value; then, when linings become necessary, a ready channel is afforded for the passage of the heat beneath the bed.

ASPARAGUS.—Let the lights be drawn off the beds in fine sunny days; this will improve the flavour of the grass.

POTATOES.—If potted as recommended in the beginning of last month, they will now be ready for planting out; and at the same time some tubers which are just beginning to sprout may be planted upon a similarly prepared bed, which will furnish a successional crop.

CELERY.—Sow a larger quantity; that sown last month will most likely run.

LETTUCE.—To succeed the autumn crops, sow some sorts which soon become fit for use, on a slight hotbed. Of Cos Lettuce, Atkins's Imperial is one of the earliest and best; it is also sold under the name of "Kernan's Acme Cos."

Out-door Department.

RADISHES.—Where there is the advantage of a very warm situation, some seeds may now be sown, and thickly covered with fern or dry litter; these, if the weather be tolerably favourable, will come into use soon after those in frames are over.

TURNIPS.—A small bed of Early Dutch should be sown on a south border. An equal space might be sown every week during this month, which will be a safer course than sowing a large breadth at one time.

PEAS.—The Frame, or whatever early kind may be preferred and a later sort, such as the Blue Prussian, to succeed it, should now be sown on a south border. These will succeed the latest transplanted crop.

BEANS.—Sow Marshall's Dwarf Prolific (not "Early Prolific," as erroneously written at p. 24).

SPINACH may be sown on a warm border, but not a large crop, as it will most likely soon run to flower.

CARROTS are in some soils a dubious crop. To remedy this, trench the ground two spits deep, mixing some rotten manure with the shovellings in the bottom of each trench. No manure is to be put upon the surface, which should remain rough till wanted for sowing. A piece of ground prepared in this way every year (autumn is the preferable time) will scarcely fail to produce sound Carrots.

Orchard.—Prune and nail Vines against walls. Do not covet too much bearing-wood. Peaches, Apricots, and other trees which face the south ought to be first done. Any large wounds should be covered with paint, or some other adhesive substance.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Gloxinias and Gesneras should be watered over the leaves now and then, and not exposed to direct sunshine. As the dried tubers vegetate, they should be shaken out of the old soil and repotted.

GREENHOUSE.—As the days increase in light and warmth a more liberal supply of water will be required by the plants, bearing in mind that small quantities frequently applied are much better than an overdose at once. Repot any plants that are likely to suffer for want of that operation.

CONSERVATORY.—Climbers had better be dressed and set in order before growth commences.

PITS AND FRAMES.—Annuals of various kinds for flowering in pots should be sown. The tenderest kinds, as Cockscombs and Balsams, can be forwarded in the Cucumber-pits, to which place, also, a few Gardenias might be removed. Bulbs of Polyanthus tuberosa will also require a warm situation; these ought not to be watered till they begin to grow.

Out-door Department.

If not already done, all vacant beds must be manured and dug without delay. Tulips, Anemones, and other bulbs and tubers not planted in autumn, ought to be immediately put into the ground.

NURSERY AND FOREST DEPARTMENT.

NURSERY.—Plant stocks of wild Roses for budding. Put in cuttings of choice Gooseberries and Currants, after taking out all the buds except the four uppermost. If the ground is in a fit state, sow seeds of all sorts of Forest-trees.

FOREST AND COPPICE WOODS.—Persevere in planting, always finishing the driest ground first. Thinning and felling, and other business of less importance, might be discontinued for a time, for the purpose of accelerating the planting of dry soils.—*J. B. Whiting, The Deepdene.*

ERRATUM.—Page 69, col. 2, line 39 from the top, read, "Any old unhealthy evergreens, &c."

State of the Weather near London for the Week ending Feb. 3, 1842, as observed at the Horticultural Garden, Chiswick.

	BAROMETER.		THERMOMETER.			Wind.	Rain.
Jan.	Max.	Min.	Max.	Min.	Mean.		
Friday 28	29.907	29.831	45	23	34.0	N.W.	.03

Jan. 28. Slight frost, clear; fine; cloudy: sharp frost at night.
29. Sleet in the morning; overcast and calm.
30. Cloudy, very fine; mild and overcast.
31. Hazy throughout; thickly overcast, heavy rain at night.
Feb. 1. Overcast; exceedingly fine; clear at night, with slight frost.
2. Slightly overcast; very fine; slight rain in the evening.
3. Mild with slight haze; wind veering east, and haze increasing.

State of the Weather at Chiswick during the last 15 years, for the ensuing Week ending Feb. 12, 1842.

Feb.	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

The highest temperature during the above period occurred on the 10th, in 1831—thermometer 65°; and the lowest on the 12th and 13th, in 1838—thermometer 14°.

REPORT ON COVENT GARDEN MARKET,

For the Week ending February 4, 1842.

SCARCELY any difference has occurred in the market since our last Report; the supplies of most articles have been tolerably well kept up. The sale has been unusually dull.—*Fruit.* Excellent Pines are plentiful; the kinds are chiefly Envilles and Queens. A few bunches of new hothouse Grapes, grown on plants in pots, have been offered at from 20s. to 25s. per lb.; Spanish are becoming very scarce. Apples are plentiful, and the kinds are the same as those mentioned last week. Pears are tolerably abundant, and the best samples fetch good prices. Pummeloes and Shaddocks have made their appearance. Chesnuts are scarce. A few Cucumbers have been offered during the week.—*Vegetables.* The remarks made on the Cabbage tribe in our last Report apply to the present. Some excellent Turnip-tops have been brought to market this week. Kidney Beans are scarce. The supply of Asparagus and Sea-kale is by no means large, and consequently the prices are pretty high. Lettuce, Endive, and other Salading are scarce and indifferent. Good Celery is hardly to be obtained. Rhubarb is plentiful and good. Mushrooms are not abundant.—*Flowers.* The different kinds of forced Hyacinths, Tulips, and Narcissus have rendered the market gay during the week.

PRICES, SATURDAY, FEB. 5, 1842.—FRUITS:—

Apples, Kitchen, per bushel, 3s to 7s
— Dessert, per bushel, 5s to 16s
Pears, dessert, per half-sieve, 4s to 16s
Pine Apple, per lb. 5s to 8s
Grapes, hothouse, new, p. lb., 20s to 25s
— Spanish, per lb., 1s to 1s 6d
— Portugal, per lb., 1s to 3s 6d
Oranges, per doz., 9d to 2s
— per 100, 4s to 16s
— Bitter, per 100, 6s to 16s
Lemons, per doz. 9d to 2s
Lemons, per 100, 5s to 14s
Almonds, per peck, 7s to 8s
Chesnuts, per peck, 5s to 10s
Walnuts, per bushel, 16s to 24s
Filberts, English, pr. 100 lbs. 120s to 140s
Cobbs, per 100 lbs. 140s to 160s
Nuts, per bushel—
— Brazil, 20s
— Spanish, 16s
— Barcelona, 20s to 24s
— Turkey, 16s

VEGETABLES.

Savoys, per dozen, 6d to 1s 6d
Cabbage, White, per dozen, 1s to 3s
— Red, for pickling, 2s to 4s
Cabbage Plants, per doz., 2s 6d to 4s
Brussels Sprouts, p. hf. sve., 1s 6d to 2s 6d
Broccoli, White, p. bunch, 2s to 5s
— Purple, 1s to 1s 6d
Turnip Tops, per bushel, 1s to 1s 3d
Kidney Beans, forced, per 100, 5s to 10s
Potatoes, per ton, 45s to 80s
— per cwt. 2s 6d to 4s
— per bushel, 1s 6d to 2s 6d
— Kidney, per bush. 2s to 3s
Artichokes, Jerusalem, pr half sieve, 9d to 1s 6d
Turnips, pr. doz. bunches, 1s 6d to 4s
Carrots, per doz. bunches, 3s to 5s
Red Beet, per dozen, 9d to 1s 6d
Scorzonera, per bundle, 1s to 1s 3d
Salsafy, per bundle, 1s to 1s 3d
Horse Radish, per bundle, 1s to 5s
Spinach, per half sieve, 2s to 3s
Onions, per bushel, 2s to 3s 6d
— for pick., per hf.-sieve, 1s 6d, to 4s
— Green, per bunch, 4d
— Spanish, per dozen, 2s to 6s
Leeks, per dozen bunches, 1s to 1s 6d
Garlic, per lb., 8d
Shallots, per lb., 1s
Asparagus, per 100, large, 8s to 10s
— Second or Middling, 4s to 5s
— Sprue, or Small, 3s to 4s
Sea-kale, per punnet, 1s 6d to 5s
Lettuce, Cabbage, p. hf. sve., 1s 6d to 2s
— Cos, per score, 2s
Endive, per score, 4s
Celery, Red, p. bdle (12 to 15) 6d to 1s 9d
— White, per bundle, 6d to 1s
Small Salads, per punnet, 3d
Watercress, per doz. small bunches, 6d
Parsley, per half sieve, 2s to 2s 6d
— per dozen bunches, 2s to 4s
Tarragon, per dozen bunches, 4s to 6s
Fennel, per dozen bunches, 3s
Thyme, per doz. bunches, 2s
Sage, per doz. bunches, 3s
Mint, per doz. bunches, 6s to 12s
Savory, per dozen bunches, 2s to 3s
Rhubarb Stalks, per bundle, 9d to 1s 3d
Mushrooms, per pottle, 1s 6d to 3s
Truffles, per pound, 2s to 3s

Notices to Correspondents.

L. T.—One of the best early Potatoes is the Manly, a round white one of moderate size, very prolific, and equal in size. One of the best late kinds is the Bread-fruit Potato, a rather large, round, white one, which is a good bearer, and keeps well.

A Subscriber.—Rogers's Conical Boiler can be obtained from any respectable ironmonger.

G. B.—Green's pit, described at p. 36 (1841), is an excellent one for growing Cucumbers and Melons in. In a short time another paper on the subject will appear, which may perhaps answer your purpose better.

J. D. B. D.—Received, with thanks. The plan will be published as soon as the woodcuts can be got ready.

X X X.—It is hardly fair to reproach us with not giving immediate insertion to letters. Yours was in type last week, but we had not room for it. Caprifoliums are twiners with long flowers; Loniceras are bushes with short flowers. The Honeysuckle left is Caprifólium longiflorum.

A Huntingdonshire Subscriber.—The large Pear is Beurré Diel; the smaller, Passe Colmar.

A Young Beginner.—Your Apples are,—No. 1, Reinette Grise; 2, Downton; 3, French Crab; 4, White Nonpareil; and the Pear, No. 5, is the Chaumontel.

G. M.—We are not acquainted with a good forester; better apply to Mr. Paxton, at Chatsworth.

C. Jones.—As soon as your tree begins to grow in the spring, bore a few holes near the root into the *sapwood*, not deeper; fill them with arsenic, or opium, or corrosive sublimate, and the tree will soon die.

Taxas.—We have not space at present to go into the comparative merits of wood and iron for conservatories. Iron is most durable, and we should employ it for *everything that did not require to be moved*. For moveable sashes it is not suited.

L. N.—Take "Stephens's Book of the Farm," of which the first Number is just out. It will only cost 50s. If you cannot afford so much, you had better confine your purchases to the other books. The "Farmer's Encyclopædia" is what we meant; it improves very much as it goes on.

Frutex and others who have asked for information concerning raising Coniferous plants from seeds are answered to-day.

We trust *Viator* will find our leading articles on foresting a sufficient answer to his letter.

Q. may obtain good turf in a few months by sowing his ground in March with such Grass seeds as the dealers in them would recommend. Crested Dog's-tail, Meadow Poa, Hard Fescue, Black Nonesuch, and White Clover will be a good supply for fine turf. Forty shillings' worth per acre will be enough, or less will do, but the lawn will in that case be formed more slowly.

Ilex.—It is evident that if a succession of wet weather can be depended upon, Hollies may be transplanted at any time. We prefer autumn, even for stiff land. They will root quicker when just budding in the spring, but if you have a dry north-easter woe to the experiment! Single plants may, no doubt, be secured at that season, even in dry weather, by a screen against the sun and wind, and by puddle-planting; but this cannot be applied to extensive work.

R. W. B.—About the end of February shift your Rose, and place it in a warm pit or greenhouse for a week or ten days, and when the plant begins to push and make fresh roots move it into a moderate hotbed frame. Before putting into the frame, you must with a sharp knife ring those shoots which are fit or can be spared for cutting, about three-parts round, at such lengths as will suit for cuttings. In about a week callosities will be formed on the upper surface of the ring, and then the cutting must be cut off and inserted either in light sandy soil or sand, and treated in the ordinary way; and if placed in the hotbed frame and covered with a bell-glass, they will soon root. For Asparagus choose a rather sandy soil; give it a good coat of dung, trenching the dung in. If the ground is not sandy, procure some fine river or bank sand, and mix it with the soil, particularly round the plants; then mark your ground out into beds four feet wide, and allow about two feet six inches for the alley; plant two rows in each bed early in spring, with two-years old plants. There is little variation in sorts, the great difference being caused by soil and cultivation.

Rusticus.—Your wall of 60ft. in length, facing a point to the east of south, may be planted with Hacon's Incomparable, Passe Colmar, and Easter Beurré Pears, and the Royal Apricot. These will ultimately fill the wall. With regard to Peaches and Nectarines, as you are doubtful of their succeeding in your locality, the Wolds of the northern district of Lincolnshire, you had best allot the intervals for their trial. The sorts may be the Acton Scot and Bellegarde Peaches, and the Violette Hâtive Nectarine. If you plant them on a prepared bottom, and so as their roots may be above the general level of your garden, they ought to succeed. The Green-gage and the Purple-gage will prove more suitable than the Imperatrice Plum for your south-east aspect.

An Amateur.—The rule about colours is this:—There are two series, one called xanthic, or yellow, and the other cyanic, or blue; and if a species belongs to one it will not vary to the other. To the xanthic belong all flowers in which yellow exists, either pure or mixed with other colours; a Dahlia is of that nature, and therefore a blue Dahlia is not to be expected. On the other hand, the Hyacinth being of the cyanic series, a yellow Hyacinth will not occur, for the so-called yellow Hyacinths are bad greens, a colour to be found in most flowering plants. Sometimes whole genera will belong to one or other of such series; and the Hyacinth and Squill are of that nature. The Iris, however, comprehends both series in different species. I. germanica and that race is of the cyanic series; while Pseudacorus and halophila are of the xanthic.

H. C.—Waxy, or what are termed wet Potatoes, generally become so by being grown in soil with a cold retentive subsoil; and there is little chance of growing them better in such situations. This seems to be the case with yours, as by salting the ground your Potatoes became worse, salt always having a great affinity for moisture. The only remedy which is at all likely to effect your purpose (for although your top soil may be tolerably free, the subsoil must be damp and cold) is to add a large portion of lime-rubbish or fine sand or road-drift, in a dry state, to lighten the subsoil. Potatoes grown in light sandy land are always mealy.

Cadwallader.—Gather the Holly berries when ripe; bruise and mix them with double their bulk of fine sand; then dig a hole about three feet deep, and as large as you may require, to hold sufficient berries when placed from nine to twelve inches thick; then put a piece of old mat over them, to prevent the soil from mixing with them, and afterwards fill up the hole, and lay some long litter over the top, to prevent the wet from penetrating. In February or March take the berries out and sow them either in drills or broadcast, in any good loamy soil, covering them about half an inch deep; they will then require no further care, except keeping clean, until the second season, when the largest may be transplanted. Afterwards transplant every year while in the nursery.

A Subscriber.—The fruit of Cucumbers generally becomes deformed for want of sufficient bottom-heat, and particularly if freely watered in dull or cold weather; it also often occurs if a few cold or wet days succeed very warm ones in the early part of summer, when the heat of the bed has become exhausted; not unfrequently the bad effects may be observed for some time after the check, or rather the chill, has happened. It is also caused by their not being properly impregnated. Keeping them warm and vigorous, and from sudden checks, is the best preventive; but insufficient light or water, and improper soil, cause deformity in the early part of the year. Cucumbers require a rich soil, plenty of heat and moisture at all seasons, particularly the long-fruited kinds.

R. M.—We are sorry to have been so slow. The following list contains some of the best varieties of Ranunculus in cultivation. They have been carefully selected as to colour, in order to form a pleasing variety:—

Carmine Perfection
Aust's Diana
" Victoria
" Adeline
" Mirabelle
" Milo
" Nelson
" Wonder
Alexander's Phenomenon
" Aurora
" Duke of Wellington
" Unique
" Rienzi
Lightbody's Demosthenes
" Emancipator
" Marmion
" Lord Durham
" Rob Roy
" Ten Pounder
" William Penn
" Neptune
" Triton
" Talisman
" Mrs. Hemans
" Sir J. Moore
" Euripides
" Antiquary
" Clansman
" Huron
" Sir John de Graeme
Lightbody's Herald
" Challenger
" Demosthenes
" Spheroid
" Bonny Jean
" James Watt
" Conqueror
" Gem
" Conquering Hero
" Achilles
" Dazzler
" Nelson
" Marshal Soult
" Coriolanus
Andrews' Mary
" Maggie
Waterton's Robert Burns
" Barry
" Tam O'Shanter
" Sir H. Raeburn
" Apelles
" Gainsborough
" Wallace
" Shakespeare
Tyso's Herbert
" Luna
" Dr. Horner
" Felix
" Pauline
" Selectus

The following are some of the finest of the old varieties:—

Viola de Vrai Noir
Naxara
Œil Noir
Quixos
Nonpareil
Dion
Charbonnier
Dr. Franklin
Grand Bravura
Trajan
Newton
Fontenoy
Garicola
Cora
Pass Niobe
Gun's Crimson
Nonpareil
Othello
Beroth
Marmara
Domitian
Hannibal
La Favorite
Ma Délice, or la Singulière.

C. F. W.—The Whitethorn described in the last two Numbers is the common Quickset.

Olitor Stocktonensis next week.

H. A. and M. next week; if possible personally.

Litoralis.—Callistégia Soldanella is the Convolvulus of that name. Much obliged, but want of room prevents our accepting your obliging offer. We shall do what we can with the local horticultural shows.

J. G.—Nitrate of soda and of potash act much in the same way; the latter will not go further than the former. The practice about prizes is various; most commonly they go to the gardeners, be they what they may; sometimes the master takes them to himself; if medals, the master sometimes give their value to his gardener, and keeps the medals himself. Such things are always matters of private arrangement.

An Amateur at Mile-end is unreasonable; both are good books, and we sometimes recommend the one, sometimes the other.

Merlin.—Much depends upon the strength of your Vines and the state of the soil they are now growing in; if it is hard or exhausted; shift the Vines, before putting them into heat, first into the smaller-sized pots you mention, and afterwards repot them into larger pots. Water them freely with diluted manure-water, which will never injure the Vines if the pots are well drained.

J. T., Plymouth.—When Orchidaceous plants are received from abroad, a little experience is necessary to enable you to know whether they will do best in pots or on blocks of wood. Cattleyas generally do best in pots; Stanhopeas will do well in either way: he strong-growing Dendrobiums should be potted; the weaker pendent kinds, such as pulchellum and cucullatum, suspended on blocks or in baskets. We prefer baskets and forked blocks to pots with holes in them. It is not advisable to remove the back bulbs too soon, unless you are anxious to propagate; as soon, however, as they begin to decay, remove them immediately. In some cases it may be advisable to thin the bulbs, but only when there is not room for the young shoots. They must be shaded from the direct rays of the sun during summer, and require very little air, because this dries the atmosphere rapidly. There is no book on the cultivation of Orchidaceous plants.

K. Π. Σ.—It would be difficult to give you any advice upon preserving your bank without actual inspection; you had better consult some respectable architect. You will find various lists of ornamental shrubs and evergreens in our former Numbers which will suit you, but for winter or early spring flowering we recommend the following:—Garrya elliptica; the different varieties of Laurustinus; the common Strawberry-tree (Arbutus unedo), the fruit of which is extremely beautiful; Pyrus japonica, both varieties; Daphne Mezereon, Chimonanthus fragrans and grandiflora, if you can give them a wall; Erica carnea and hibernica; and if you are near the sea you might also try E. australis and mediterranea. It is beyond our means to assist you in laying out your ground; you will, however, find some remarks on this subject in the "Amateur's Garden" of to-day.

M. B.—Before commencing the propagation of the hardy shrubs which you mention, it is requisite to procure a few large handglasses, and some fine sand; then, if your ground is not shaded, either with a wall or wooden fence, you must make a temporary screen, so that you can have the north side of it for planting your cuttings on. It is troublesome to have to water and shade the cuttings every day, which they require if not planted in a north aspect. When once put in in a good situation, they require no more trouble except watering during very dry weather. Having provided a suitable situation, dig the ground, and, if it is stiff, mix a good portion of either sandy peat or bank-sand with it, and about the end of July or beginning of August, when the wood is half-ripe, that is, when the current year's shoots begin to harden, select some of the weaker or small side-shoots, cut them at a joint, and insert them in the usual way; then give them a copious watering, and, if they require it, place the handglass over them. This is only necessary for those kinds you mention that do not strike freely, such as Cistuses, Phillyreas, Clematises, and Hydrangeas; the others will do very well without a handglass, if properly shaded, for more depends on selecting the cutting in a fit state, and on shading, than on anything else. The cuttings will then require little trouble beyond watering in very dry weather, until the following spring, when they will be ready for planting out. Some of the kinds that you mention, such as Junipers, Arbor-vitæ, Cypress, and Escallonias, will not strike from cuttings without artificial heat; and some of the others, such as Broom, Privet, and Gorse, seed so freely that it is not worth while to strike them.

The observation alluded to by *Justus* is of course applicable only to legitimate Vineries, in which the Vines have been kept perfectly dormant up to the time of applying artificial heat, and then brought forward by slow degrees, as advised in the Calendar. Under such circumstances, the buds will not usually break in less time than three weeks; although Vines that have been forced at an early period for several successive years, and through that treatment have acquired an early habit of vegetating, may probably begin to grow partially in a fortnight in a temperature of 55 degrees. When a Vinery is made a general receptacle for all kinds of plants, by which practice a necessity will be incurred for its being kept much warmer than is proper for the Vines during their state of rest, no dependence whatever can be placed upon their breaking regularly; they will, in fact, break at all times.—If *Justus* has a fair crop of fruit in his house, it ought to be a matter of little importance to him whether the shoots have grown one foot or one yard in length.—*J. B. Whiting.*

C. B—t.—The Botanic Garden, Edinburgh. What *can* we do? We can only recommend plants; if the possessors will not advertise them, they must be content to go without their sale.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE new Session of Parliament was opened on Thursday by her Majesty in person. The Speech, which was more than usually explanatory, commenced with an expression of her Majesty's desire to make a public acknowledgment of her gratitude to Divine Providence for the birth of an heir-apparent, which had completed the measure of her domestic happiness. After a complimentary allusion to the visit of the King of Prussia, it proceeded to take a general review of our foreign relations. It announced that all Princes and States manifest an earnest desire to maintain a friendly understanding with this country; that diplomatic relations with Persia have been re-established, and that treaties have been concluded with the great Continental Powers for the more effectual suppression of the Slave-trade, and for the settlement of the Turkish empire. It also expressed confidence that the differences with China will be brought to an early termination. It then proceeded to call attention to the financial condition of the country; and after adverting to the excess of expenditure over income, it condensed into a few sentences an intimation of several specific measures of reform which will be introduced during the present session. The principal of these are the alteration of the Corn Laws, the amendment of the law of bankruptcy, the improvement of the jurisdiction of the Ecclesiastical Courts, and the revision of the Registration laws. The Speech next contained an expression of deep regret at the continued distress in the manufacturing districts, and concluded by expressing a conviction that the deliberations of the Legislature will be directed by a comprehensive regard for the interests and permanent welfare of all classes of her Majesty's subjects. The delivery of the speech was followed by the usual Ministerial announcements, the most important of which was the notice given by Sir Robert Peel that the development of the Government measure for the alteration of the Corn Laws will take place on Wednesday next. In the subsequent debate, the Address was agreed to by both Houses without opposition; in the Lords, the only point in the discussion which calls for special remark was the explanation given by the Duke of Buckingham in regard to his retirement from office, which was caused, he said, solely by his difference of opinion with the other members of the Cabinet on their proposed measure for the alteration of the Corn Laws, and that on all other points they would have his cordial support.—The King of Prussia took his departure last evening for Berlin. During his brief sojourn in this country all classes in the Metropolis seem to have been influenced with a unanimous desire to do honour to his visit; and his Majesty will no doubt long remember the respectful cordiality of his truly English welcome.

Our Foreign News presents many points of interest.—In France, the debates on the Address have terminated in favour of Ministers by a large majority, although the enforcement of the census and the recent prosecutions of the Press were the subjects of much angry discussion.—In Spain, the Legislature has also been occupied with the consideration of the Address; the Senate agreed to the proposed measure without a division, but the debates in the Chamber of Deputies were prolonged for several successive days, and it is believed that the Opposition will succeed in introducing a clause condemnatory of Government in declaring Barcelona in a state of siege, in which case a prorogation or dissolution is anticipated. The new law for regulating the disputes with Rome has been submitted to the Chamber; it directly asserts the independence of Spain, and prohibits all correspondence with the Holy See for the purpose of procuring indulgences, dispensations, or other Ecclesiastical concessions. Great excitement appears to have been occasioned by this measure, which is expected to compromise the Ministry more than a Parliamentary defeat.—Letters from the Levant announce that the Greek Government has finally acceded to the demands of the Porte, as embodied in the note addressed by it to the Five Great Powers, and there is therefore no longer any doubt that the questions at issue between the two countries will be satisfactorily adjusted.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal, continue well. The Queen left Windsor and arrived at Buckingham Palace on Wednesday, on which day her Majesty held a Privy Council, and afterwards paid a visit to the Queen Dowager at Marlborough House. On Thursday, her Majesty opened both Houses of Parliament in person, with a speech from the throne. Their Royal Highnesses the Prince of Wales and the Princess Royal did not accompany the Queen to town, but remained at Windsor Castle under the superintendence of the Dowager Lady Lyttelton and Lady Isabella Wemyss, during her Majesty's absence. The Court is expected to return to Windsor this day; and on Tuesday, it is stated, her Majesty, with Prince Albert, the Prince of Wales, and the Princess Royal, will proceed to Brighton. His Majesty the King of Prussia, whose movements during the week will be found in another part of our Paper, took his leave of Windsor on Monday, and during the remainder of the week occupied apartments, prepared for his reception, in Buckingham Palace. His Majesty accompanied the Queen in state to the Houses of Parliament on Thursday, and embarked yesterday afternoon at Woolwich for Ostend, on his return to his own dominions.

The Queen Dowager.—According to the latest accounts, the answer to inquiries at Marlborough House is, that her Majesty the Queen Dowager continues to improve in health and spirits. On Wednesday, her Majesty received a visit from the Queen and Prince Albert, who partook of a *déjeûné* at Marlborough House.

Ministerial Movements.—At the Privy Council held by the Queen at Buckingham Palace on Wednesday, the Duke of Buckingham resigned to her Majesty the Privy Seal, which her Majesty was pleased to deliver to the custody of the Duke of Buccleuch.

Official Appointments.—The Ministerial papers announce that Mr. Backhouse, Under Secretary of State for Foreign Affairs, has resigned his situation on account of the impaired state of his health. The Marquis of Salisbury has been appointed Lord Lieutenant of the county of Middlesex; and the Marquis of Exeter, Lord-Lieutenant of the county of Northampton.

Order of the Garter.—Two blue ribands having lately become vacant by the deaths of the Duke of Cleveland and the Earl of Westmoreland, one of them has been conferred on the Duke of Buckingham, and the other, it is stated, will be presented to the Duke of Beaufort.

Parliamentary Movements.—The City of Dublin election terminated on Saturday, by the return of Mr. Gregory by a majority of 390; the numbers at the close of the poll being for Mr. Gregory 3,825, and for Lord Morpeth 3,435. Sir Howard Douglas is now positively announced as the Conservative Candidate for the representation of Liverpool; Colonel Torrens has offered himself on the Liberal interest. Mr. Bainbridge has retired from the representation of Taunton; Sir Edward Colebrooke, Bart., has offered himself as the Liberal candidate; and it is announced that he will be opposed by Mr. Hall, on the Conservative interest.

Foreign.

France.—*The Chambers.*—The journals are still exclusively occupied with the proceedings in the Chamber of Deputies. After the decision of the Chamber on the subject of the Spanish question, a long debate ensued on the ninth paragraph of the address, relative to the financial bills; upon which an amendment had been moved, conveying a censure on the Cabinet for its conduct in respect to the census. M. Humann, the Minister of Finance, defended the acts of his department at great length, and was answered by several members of the opposition. The most important speech, however, at this stage of the debate was that of M. Dupin, who, though a member of the Commission of the Address, stated that he did not altogether approve of the Minister's conduct. An uproar ensued, and endeavours were made, but in vain, to prevent M. Dupin being heard. He persisted in declaring that he would never be the blind and obsequious follower of any Government, that he would vote against the amendment, but that when the question came before the Chamber in the shape of a new law, he would then speak his mind fully. The amendment was then rejected. The last paragraph of the address being read, an animated debate ensued on the conduct of Government with respect to the press, the jury, and the encroachment of the Peers. M. Martin (du Nord), the Minister of Justice, defended the acts of his administration, contending that it had kept strictly within the pale of the law. He also stated, that his circular of Sept. 22 last year, to induce magistrates to cause the law to be respected, was highly necessary, in order that the constitution should be respected. He protested against the attacks on the Court of Peers, and explained that the charge brought against the Cabinet of packing juries to insure convictions was unfounded. This called up M. Isambert, who stated, that as Counsellor at the Court of Cassation, he had accidentally become acquainted with a letter, addressed by the Procureur-Général of the Royal Court of Riom, to the Minister of Justice, in which the former recommended the postponement of the trial of the rioters engaged in the Clermont Férrand *émeutes*, till the month of Feb., as the Prefect would then guarantee that the jury should be composed in such a manner as to insure a conviction. This statement caused the greatest astonishment and excitement in the Chamber, and for the rest of the sitting no other subject occupied it. The Minister of Justice charged M. Isambert with calumny, and declared that if he had seen the letter he would have suppressed it. M. Isambert limited his statement to his having seen the letter. Several members spoke on the subject; and the debate was again warmly resumed the following day, when the Minister of Justice gave the fullest contradiction to the existence of the letter which M. Isambert had spoken of, and denied that the letter was written on the occasion referred to. He also denied the words of it as they had been cited; and said, that he had consulted the judge and the lawyer on the occasion, and neither recollected anything about such a letter. He concluded by saying, that another letter had been written, and he would not say how M. Isambert had procured it. The debate on this question gave rise to a scene of unusual uproar and tumult, at the conclusion of which the Chamber proceeded to the vote on the *ensemble* of the address, when the result was as follows:—Number of votes, 396. For the address, 240; against it, 156: majority for the address, 84. This termination of the debate is said to have given much satisfaction in ministerial circles. On Monday the Deputies met in their monthly bureaux to examine three propositions of importance, the first of which was to increase the number of disqualifications for Deputies sitting in the Chamber; the second, to add a second jury-list to the electoral colleges; and the third, to have a journal printed by the Chamber itself, containing an authentic report of its proceedings—this journal to be edited by the secretaries of the permanent or sessional bureau, the object of which is said to be to prevent the practice of Ministers and Deputies correcting, or rather altering, their speeches in the official "Moniteur," as it is stated is now the custom. The Ministers, in their respective committees, declared that they would not oppose the reading of these propositions at the tribune, but that they would reserve their opposition for the public debates. This declaration insures, therefore, the hearing of these three motions, the first two of which are regarded as of vital importance.

The King's Reply to the Address.—On Sunday M. Sauzet, the President, and a deputation of the Chamber of Deputies, waited on his Majesty to present the address of the Chamber in answer to the speech from the throne. The King's reply was as follows:—"It is very agreeable to me to hear a testimonial like this, and it is with pleasure that I receive it. Yes, gentlemen, it is to the happy concordance of all the powers of the State that we owe the preservation of public order, and that of our national liberties, protected by the vigour and wisdom of our institutions. With your loyal concurrence, France will assume more and more confidence in her future destinies. This confidence will dry up in their source the insensate projects which you have so well defined. It will discourage the boldness of those men who are plotting secret machinations, and will keep away from them those who may have been drawn in to associate themselves with such schemes from illusions as to the chances of success, and the system of terror by which they are surrounded. I am profoundly touched by the sentiments which the Chamber of Deputies has just expressed to me in this address."

Budget for 1843.—On Monday, M. Humann, Minister of Finance, presented to the Chamber of Deputies his budget for the year 1843. He commenced by stating, that although all political complications had been arranged, and the peace of Europe consolidated, the equilibrium in the finances of the country which had been deranged could not be immediately restored, but that the present appearance was favourable for that purpose. He then stated that at the close of the last session the sum to be provided for by the country amounted to 896,000,000f. of which 395,000,000f. was a deficiency created during the years 1840, 1841, and 1842, and 501,000,000f., the amount of credits voted for public works. The army estimates were provided for to the amount of 480,000,000f. He then proceeded to state, that the excess of expenditure over the receipts was reduced at the conclusion of the last session, as far as regarded those departments, to 395,000,000f.; and he was in expectation that before the end of the year 1842 the deficit would be provided for.

Political Trials.—The journals state that great activity prevails at Riom in making preparations for the approaching assizes, to try the persons accused of opposing the taking the census at Clermont. The greater number of the prisoners had arrived in cellular carriages, escorted by a strong military and police force, and the trial was expected to last 12 days. The category of Chauriat would follow next, and then St. Germain. The assizes would terminate by the trial of the editor of the "Gazette d'Auvergne," accused of a libellous publication relative to the events which occurred in Sept. Private letters state, that M. Berryer, who is counsel for this journal, after Friday's sitting in the Chamber of Deputies, addressed a formal application to the Court of Cassation, founded on the minutes of the Chamber of Deputies to remove the *venue* into another department after the statement of the Riom Procureur-Général as to the packing of the juries in Puy de Dôme. This motion is expected to come before the Court for discussion in a few days.—M. Dupoty, editor of the "Journal du Peuple," lately tried and convicted by the Court of Peers, has been re-elected Lieutenant of one of the companies of the third legion of National Guards. It seems he obtained 53 votes out of 86, being 20 more than his opponent, and 10 more than when he was formerly elected. The consequence of this has been, that this company of the National Guard has been dissolved by a Royal ordinance.—The responsible publisher and the printer of the Royalist publication called the "Mode," the seizure of which was noticed in our last, were tried before the Seine Court of Assizes on Monday. The indictment was against three articles, which appeared in the number of Jan. 22; the first of which was an invitation to the Royalists, as the last hope of the country, to stick to each other. The second was a violent attack on Louis-Philippe, as the son of Philippe Egalité, upon the Dukes of Orleans and Nemours, the Duke d'Aumale, for inheriting the Condé property, and the Queen and the Duchess of Orleans. This article alluded also to the celebrated letters of the Duke of Orleans (now King), in 1808 and 1809. The third article was a defence of the insurrection in La Vendée by the Duchess de Berry for her son, Henri Cinq. The jury found both the publisher and printer guilty on all the counts, and the Court sentenced the former to two years' imprisonment and a fine of 6000f. (240*l.*), and the latter to three months' confinement and a fine of 2000f. (80*l.*) The destruction of the copies of the "Mode" containing the libels, and the insertion of the judgment in its columns, were also ordered, and the defendants condemned to the costs. In default of the fines being paid, two years' additional imprisonment was imposed.

Algeria.—The journals inform us that despatches have been received from Africa by the Minister of War, announcing that several more tribes of the west made their submission on the approach of the expedition on that quarter, and that if the route had not become impracticable from the heavy rains which had fallen, Clemcen would have been again occupied. The entry of the troops into that place, however, would not, it was supposed, be long delayed, and the Arab chief who had been chosen to command that baylick was expected to be soon installed. Abd-el-Kader, who was said to have taken refuge in the territory of the Emperor of Morocco, was, on the contrary, shut up in Clemcen, with only 600 of his regular troops, and, convinced of the danger of his position, had, it is stated, sent his family and his most valuable property under escort to some more secure spot.

Spain.—The address in reply to the speech of the Regent has passed the Senate, and was presented to the Regent by the deputation on the 21st ult. The Senate had subsequently been occupied discussing their standing orders. On the 20th ult. the discussion on the Address began in the Chamber of Deputies, and was opened by Count de las Navas, who opposed the Cabinet, and who was followed on the same side by Señor Munoz Bueno. Señor Gonzalez, the Prime Minister, spoke at great length in vindication of the foreign and domestic policy of ministers, and warmly defended the Cabinet from the charge of having been taken by surprise at the moment of the insurrection at Madrid in Oct. He likewise declared it was falsely asserted that Great Britain had demanded the emancipation of the slaves in the Spanish colonies. The Minister of War then followed, and defended the army, reproaching the committee who prepared the address for not having done them justice. M. Olozaga, late Spanish ambassador at Paris, and one of the committee on the Address, then rose amidst the most profound silence, and stated that he had not intended to speak at so early a period of the debate, but that he felt himself called upon to repel an unjust attack. He considered Government ought to be satisfied with defending itself, and not attack others. Speaking of the army, he said the troops were loyal, and the officers alone were traitors. The Minister of War retracted the expression relative to the committee. The debate continued with considerable warmth up to the 24th ult., when M. Gonzalea Bravo admitted the patriotism, probity, and intelligence of Government, but opposed its political system. He complained of the declaration of the Ministry at the opening of the session, that it had taken steps to solicit the recognition of the Queen by certain powers; and reproached the Cabinet with having wanted foresight in the events of Oct., for which he considered it responsible. The Minister of the Interior replied in defence of the Government, and nothing else of interest had occurred during the debate, which still continued. It was reported that M. Olozaga would speak on the 25th ult. In public the greatest impatience appeared to prevail for the termination of the discussion, which was expected to last several days longer. It was still thought that ministers would have a small majority: and though some of the journals seem to consider that the moral victory will be to the opposition, a prorogation or dissolution is regarded by them as the most probable event, and not the retirement of the Cabinet.—In the sitting of the Chamber on the 23rd ult. the Minister of Grace and of Justice presented a project of law relative to the differences between Spain and the Holy See. It consists of three articles. The first, in the name of the Spanish people, refuses to acknowledge the attributes claimed by the Apostolic See relative to the power of the bishops. The second, in consequence, prohibits any correspondence with intent to obtain from Rome indulgences and dispensations, or ecclesiastical concessions of any kind: defaulters to be liable to the penalties specified by law. The third prohibits the observance of any bulls or ordinances obtained from Rome without the direct concurrence of Spain: and those who have thus obtained them are not to keep them in their possession longer than twenty-four hours. It was reported at Madrid that the Archbishop of Toledo, a prelate of liberal opinions, had protested against this bill, declaring that he would emigrate rather than act in opposition to the Court of Rome: and it appeared by many to be thought that the measure would do Government more injury than even a Parliamentary check. Numerous addresses from various provincial municipalities had been received, approving of the conduct of the Cortes, and of the Regent, in respect to the recent affair of M. de Salvandy's credentials. Mr. Aston, the British Minister at Madrid, gave his first ball for the season on the 20th ult., which was attended by all the rank and fashion in the capital. The Duke of Victoria was prevented from being present by indisposition, but the Duchess of Victoria and other distinguished ladies graced the assembly with their presence. The Duke de Ossuna, and several of the most distinguished political characters, with a large number of diplomatists, were among the guests. An ordonnance had been issued, dated the 12th ult., granting to the two daughters of the late Gen. Don Diego Leon the pay of lieut.-col. of Lancers, which their late father enjoyed, as a special favour granted by the Cortes by a decree of the 31st March, 1837.—Private letters from Barcelona dated the 21st ult. state that the members who composed the junta of vigilance during the late disturbances, had returned to that city on the 19th, and had addressed a petition to the municipality to be permitted to render an account of their acts, and of the sums received by them during the existence of the junta. The society of operatives who had been dissolved had remonstrated against the measure, and had addressed a representation to the Regent on the subject. Abdon Terradas, the principal leader of the republican party at Barcelona, who had been elected first magistrate of the city of Figineres, has been arrested and committed to prison by order of the Political Chief of Girona, as author of a pamphlet derogatory to Espartero's Regency. According to the author of the pamphlet, the constituent Cortes alone were privileged to elect Espartero as Regent; and as that form was not complied with, the writer announced that he would not obey the existing Government.

Portugal.—We have received intelligence from Lisbon by the Braganza steamer to the 24th ult. The principal news thus brought is the excitement which appeared to exist in favour of the Charter at Oporto, which according to some letters might be expected soon to be proclaimed, and according to other accounts had actually been proclaimed on the 21st ult. It appears, however, from the most authentic statements to be no more than a petition from the Municipal Chamber to the Queen in favour of the Charter—the military authorities and garrison refusing to take any part till the Queen's pleasure should be known through her responsible ministers. The conduct of Senhor Costa Cabral, the Minister of Justice, who was at Oporto, is regarded as suspicious by some of the journals, who denounce him as an accomplice, and call for his dismissal. The Government press, with the exception of an Oporto journal, had declared its sentiments as decidedly opposed to any change of the Constitution effected in such a way as a popular or military movement. The new laws respecting shipping came into effect on the 19th ult., and as our Orders in Council had not yet been repealed, it was expected that British shipping would be immediately liable to additional duties of 20 per cent., which Lord Howard de Walden had, however, endeavoured to prevent. Monsignor Capuccini, the Papal nuncio, had not yet been presented to the Queen.

Germany.—The papers and letters received from Vienna, though of recent date, contain little intelligence of interest. It is stated that Count Colloredo, the Austrian Ambassador at the Court of Munich, is destined to replace at London Prince Paul Esterhazy. It is reported that the Archduke Frederick will in the course of the spring visit France and England, for the purpose of improving himself in naval tactics. Private letters from Vienna state that Prince Leopold, the youngest son of the Duke Ferdinand of Saxe Coburg, who with his father is at present in London, having attended the christening of the Prince of Wales, has for the last six months applied himself with great ardour to the study of the Spanish language, being designed as a rival to the son of the Infante Don Francisco de Paula for the hand of the young Queen of Spain. It appears that the preparatory works for the railroad between Warsaw and the Austrian frontiers are in rapid progress, government, it is said, having advanced 4,000,000 Polish florins for that purpose. It seems also by letters from Stuttgard, that the works for a series o railroads in Wurtemberg are soon about to be commenced. —From Berlin we learn that Count Maltzahn is so far recovered from his dangerous illness, that the physicians do not issue any more bulletins. The journals seem to consider it uncertain on what day the King may be expected to return to his capital from his visit to London; but it was thought probable that his Majesty would be induced to accede to the wish of Queen Victoria to be present at the opening of Parliament and the first sitting, in which case his Majesty, they expected, would not set out on his return till the 8th inst., and not arrive at Berlin before the 15th. After the King's return, the papers state that their Majesties will remain at Berlin till July, when the King and some of the Princes will go to Petersburg, to be present at the celebration of the 25th anniversary of the marriage of the Emperor and Empress of Russia. After this family *féte*, their Majesties will visit the Rhenish provinces, where they will remain till Nov. During this time, it is said, there will be a grand review of the 7th and 8th corps of the army, at which many princes and other persons of distinction will be present.—We are informed that Lieut. Col. Eberle, who had been to Frankfort to confer with the Federal Military Commission as to the fortifications of Rastadt, had returned on the 23rd ult. from his mission, specially charged with the direction of the works; and as the Grand Duke had appointed the officers to assist him, it was thought they would soon be commenced. This announcement is regarded as of some importance, as it had been asserted that the Germanic Confederation had abandoned the notion of fortifying Rastadt, which is the chief town in the circle of the *Mittel Rhein* in the Grand Duchy of Baden; and which had been chosen as the preferable spot to strengthen against French invasion. Other accounts state that Col. de Radowitz had gone to Vienna to receive fresh instructions relative to these fortifications, and that from thence he would proceed to Munich, Stuttgard, and Carlsruhe.

Belgium.—Accounts from Brussels of the 27th ult. state that the affair of the late plot will not come before the Court of Assize till some time in the month of March. The papers inform us that the owner of the Hôtel des Bains, at Ostend, charged the King of Prussia, while on his journey to London, for stopping one night, and breakfasting, with his suite of 20 persons, in that house, 5,000f. (200*l.*) They add, that the King could not, of course, stoop to bargain about the matter, and therefore submitted to the extortion.

Holland.—Intelligence has been received from the Hague, dated the 24th ult., stating that the King will again visit Luxemburg in March. The ostensible motive of this journey is said to be the King's desire to open in person the first assembly of the Estate of the Grand Duchy; and it is thought that his intention is to examine more accurately than he was able to do on his first visit into the real wants of the country; for which reason no definitive resolution with regard to the commercial and other relations of the Grand Duchy will be taken till after this second visit. Other accounts state that the purpose of the King's journey is to instal Prince Alexander at Luxemburg, as his Lieutenant-general; but in well-informed circles, it is reported that the young Prince manifests great reluctance to leave the Hague. The British Minister, Sir Cromwell Disbrowe, gave a splendid ball in honour of the baptism of the Prince of Wales. Their Majesties the King and Queen, and all the members of the Royal Family, honoured the Ambassador with their presence on the occasion.

Hanover.—Accounts to the 27th ult. inform us that government has addressed a circular to the local authorities, announcing that the second resolution of the Germanic Diet, dated the 30th July, 1832, against political assemblies, applies likewise to meetings of electors, when they tend to disturb public tranquillity, and to violate the fourth article of the electoral law. It also states that all assemblies of electors should confine themselves within the terms of this article, and abstain from any act not connected with the election. The electors are forbidden to assemble either before or after the electoral operations. Private letters state that there has been a general meeting at the Exchange of the merchants of the capital, to consider whether a petition should be presented to the Cabinet, expressing their wishes for or against an accession to the German Customs Union. Of 140 persons present, only two, it is said, were in favour of the accession; all the others voting for a petition against it; which has already been forwarded to government.

Switzerland.—A letter from Locarno, of the 18th ult., states that the Grand Council of Tessino has decreed, almost unanimously, the revision of the existing constitution, and granted an amnesty to several citizens who were compromised in the recent political events, and who had not been included in the preceding amnesties.—Reports have appeared in some of the journals, stating that the monastery of the Great St. Bernard was lately attacked during the night by 14 brigands; and that the monks defended themselves with great courage, let loose their dogs, and killed five of their assailants. They suffered, however, according to these accounts, the loss of their prior, with three of their servants, and several dogs.

Russia.—The ukase of the Emperor for reducing the army now on active service is dated the 5th ult., and orders the following corps to be disbanded:—In the infantry, one battalion of each regiment; in the cavalry, 52 squadrons of reserve; in the gendarmes, one division and one company. In the artillery, all the unmounted batteries of the guard, the grenadiers, and six corps of infantry, and all the batteries of horse artillery; and in the sappers and miners, one battalion of reserve.—Private letters from St. Petersburg state that a dancing-master in that capital, by origin a Dutchman, has given notice that he will give a ball in the snow, intending to take advantage of the first snow which falls for that purpose; that he has proposed to bet with any lady or gentleman he will dance out in the snow their names at full, in legible characters; that he will not once miss time; and that each of his steps shall form part of a regular dance. Several persons of distinction, it is added, have accepted the bet.

Denmark.—We learn from Copenhagen that some rioting took place in that city, on the 19th and 20th ult., in consequence of the trial and condemnation of a M. Lehmann, who it seems, had been prosecuted for having endeavoured, in a speech made by him at a meeting of the electors of the eighteenth district, to excite dissatisfaction and hatred at the Constitution. He was sentenced to pay 500 dollars to the fund of the poor at Copenhagen, and all the costs, and to three months' imprisonment. He was conveyed to prison on the 21st ult., when a notice was issued by the police, warning the people against taking any part in tumultuous asssemblages. It does not appear from the accounts that the populace did anything but make a great noise, and assemble in considerable numbers, vociferating "Lehmann for ever!" even before the Royal Palace of Amalienburg. By subsequent accounts, to the evening of the 22nd ult., no further disturbance had taken place.

Italy.—Intelligence has been received from Naples, announcing that the king has issued a decree, declaring that the proprietors of any *coupons* of Government stock which may have been destroyed will be permitted to demand payment of them on depositing Government stocks to the amount of 50 per cent. more than that claimed, which deposit will be returned to them in five years. The Duke de Montebello, the French ambassador at Naples, had, it is stated, for some time demanded this favour on the part of a French merchant, who lost a large sum by *coupons*, which were burned in the port of Naples in the year 1834. This decision is regarded as likely to give increased value to Neapolitan Government Stock.

Greece.—Sir Stratford Canning arrived at Athens on the 1st ult., and was expected to remain until the 16th. Accounts to the 10th ult. state that his Excellency's presence in that capital continued to excite much curiosity; and hopes appeared to be entertained by many, that the report which it was understood he intended to make to the three protecting Powers on the situation of the country would induce the latter to insist on the introduction of some changes in the Government, which is said at present to have no other rule than the caprice of the Sovereign. Private letters state, that Government had placed at the disposal of the Ottoman Porte sufficient funds to indemnify the Mussulman subjects who owned lands in the Greek territory, and who had been dispossessed of them. Four French ships of the line had been in sight for some days, but, on being informed that Admiral Lassusse was still at Smyrna, they stood off for that harbour.

Turkey.—By the arrival of the Levant mail we have intelligence from Constantinople to the 8th ult. The news thus brought is of some importance. It is stated that the Porte had been informed by Mr. Bankhead, the British Chargé d'Affaires, that he had received from Sir E. Lyons, our Minister at Athens, intimation that the Greek Government had formally acceded to the demands of the Porte, as embodied in the note addressed by it to the European Powers. The Sultan was to be present on the 8th ult. at a grand council at the Porte, the object of which was reported to be to substitute a new ordinance, in lieu of the hatti scheriff of Gulhane. Mustapha Pacha had landed in Syria, the condition of which was much improved, according to the official reports received at Constantinople. Mustapha had been well received at Beyrout, and it was expected the mountain tribes would soon obey his mandate to lay down their arms. The weather had been very bad at Constantinople, and some losses had occurred in the Black Sea.

Egypt.—The Levant mail brings no intelligence of interest from Alexandria. The dates of our accounts are to the 6th ult. Various changes were making in the currency, which were enforced with rigour, to the great inconvenience and loss of the merchants. Public health appeared to be improving, and the daily mortality had lessened. The total of burials for 1841 was, it seems, above seven thousand among a population at no time exceeding 70,000 souls. Some changes in the public service at Cairo are reported, of which reduction of expenditure appears to be the object. It is stated that the Pacha proposes procuring negroes to fill up the want of Arab sailors in his navy; a resolution which is regarded as an infraction of the promises made by him to Dr. Bowring and Col. Campbell of his purposing to put a stop to the slave-trade in those parts. The excuse given for this determination on the part of the Pacha is that the time has not yet come, that the Egyptians are not civilised sufficiently to permit such an act being carried into force, and that he must first ask the pleasure of his master the Sultan.

United States.—By the packet-ships Roscoe and North Carolina, which arrived at Liverpool, the former on Saturday, and the latter on Tuesday, we have papers six days later than those last received by the Columbia. The proceedings in Congress reported in the journals come down to the 6th ult. The Senate had been engaged during six days in debating the President's plan of finance, and the debate was expected to occupy several days more. The House of Representatives had not closed the debate on the new tariff, which had already extended over 14 days, and was expected to continue some time longer. The messages of the Governors of the states of New York and Pennsylvania occupy a large portion of the papers. The message of the former is long and verbose, and its topics have a local rather than a general interest. That of the latter contains matter of more general interest, from the doubts which have been entertained as to the inability or the unwillingness of that state to meet the interest on its public debt. It gives a comprehensive view of the actual condition of the finances of the commonwealth. So far as the "indebtedness" of the state is concerned, the Governor emphatically declares that "the time for concealment, evasion, and deception on this point is at an end; the contract has been made; the faith of the state is pledged, and every consideration of duty and of honour requires of us to know our true condition, and to provide adequate means to meet our obligations, and to redeem our plighted faith." The message states that the funded debt of the state is 36,426,239 dollars, 78 cents. The means for the payment of the interest due on the 1st inst. were already in the Treasury. The resources of the state are stated to be very great, and the people have evinced a willingness to submit to whatever taxes may be necessary to meet its engagements. Of canals and railroads there are already completed 768 miles, besides which canals of the aggregate length of 165 miles are in progress. His Excellency recommends the sale of the Columbia railroad and the Delaware division of the Pennsylvania Canal. He also recommends a repeal of the "Relief Law," passed at the last session, and a return of the money which, agreeably to its provisions, was furnished to the state by sundry banks. This being done, he would take away from them the privilege granted by the said act to issue a certain amount of bills, redeemable only in state stocks, and require them, one and all, to resume specie payments. The interest due on the 1st ult. on state stocks had been paid in every case except Maryland, Indiana, Illinois, and Michigan.—On the 6th ult., Messrs. Biddle, Jaudon, Cowperthwaite, Andrews, and Dunlop, were arrested on a charge of conspiracy to defraud the stockholders of the United States Bank, and carried before the Recorder of Philadelphia for examination. On the 13th, this extraordinary examination took place, and they were liberated on a bail of 10,000 dollars each.—The deficiency in the Treasury of the United States was increasing. Its amount was estimated at 14,000,000 dollars, between two and three millions sterling. A bill was before Congress for supplying the deficiency.—The New York papers give an account of the Massachusetts Abolition Fair, at which Lord Morpeth was present. They add, that his lordship expressed himself highly pleased with the exhibition, attended frequently, made some presents to the fair, and purchased several articles. He conversed freely on the subject of anti-slavery, and in reply to some questions respecting the case of the Creole, is reported to have said, "There cannot be the slightest probability that Great Britain would be so inconsistent with herself as to restore those slaves to bondage; even with regard to the nineteen concerned in the mutiny, it is my opinion that England would not be required to surrender them by the law of nations: and certain it is, she would have no disposition to do so." Sir C. Bagot had arrived at Albany, on his way to the seat of his government in Canada. Intelligence had been received at New York, announcing that the port of Carthagena was no longer blockaded.

Brazils.—By the arrival at Liverpool on Wednesday of the *Rosalie* packet-ship, which sailed from Paraiba on the 28th Dec., we learn that a steamer had arrived at that port on the 20th of that month from the northern provinces, bringing intelligence that the province of Ceara was in a state of rebellion, that the rebels had assassinated the Vice-President in his own house, and that all those provinces were in a disturbed state.

Cape of Good Hope.—An arrival from the Cape of Good Hope brings us news from that colony to the 8th Dec. The chief feature of interest in the intelligence thus brought, is a proclamation which had been issued by Sir George Napier, refusing, in the name of her Majesty, to recognise the independence of Port Natal. From the detached accounts which have appeared in the late Cape papers, it appears that for some months past, communications have been made between the two Governments, with a view to bring about amicable relations; but that these have been unavailing, in consequence of the determination of the emigrant farmers of Natal not to be recognised but as a distinct and independent state. It had been proposed by our Government to put it on the footing of a trading port of a British possession. The proclamation of Sir G. Napier alluded to, and which was published on the 3d Dec., directs an immediate military occupation of the new settlement, declaring that the emigrant farmers have no right or claim to be recognised as an independent state or people. The issuing of this proclamation had caused various opinions to be expressed as to the course the emigrant farmers would now pursue. By some this declaration is held to be the most politic course to bring the "boers," as they are termed, to allegiance, it being stated that there has long existed in the Volksroad a decision as to the necessity of subjecting themselves to British government and legislation. It is also said, that the Kafir tribes in the neighbourhood have been very cruelly treated by these new-comers, and that they have been unceremoniously expelled the land which they have been allowed to occupy beyond the bounds of British territory, and assigned by Government for their use. For these reasons it is not thought probable that the emigrants will obtain succour from those quarters. On the other hand, it is alleged that the Kafir tribes, who have at all times proved troublesome and dangerous allies, would be the first to take advantage of any struggle that might follow; and hence it is inferred, that the measure adopted by Government to reduce the pretensions of the Volksroad of Natal will eventually lead to a fresh outbreak among the aborigines, to the discomfiture of the colonists in general. The thefts on the frontier had decreased for the present, and no lives had been lost in the attempted recovery of property. Trade in the colony was better, and gradually improving.

Parliament.

HOUSE OF LORDS.

Thursday.—The business of the present Session of Parliament commenced on Thursday, in the presence of a greater assemblage of Peers than has been seen in the House since the trial of Queen Caroline. As soon as her Majesty had taken her place on the throne, on the right of which was a vacant chair of state, of crimson velvet, richly embroidered with the Prince of Wales's plume in silver, her Majesty desired the Peers to be seated, and Sir Augustus Clifford, Usher of the Black Rod, summoned the Commons to the bar. Her Majesty then read the following speech:—

My Lords and Gentlemen,

I cannot meet you in Parliament assembled without making a public acknowledgment of my gratitude to Almighty God, on account of the birth of the Prince, my son—an event which has completed the measure of my domestic happiness, and has been hailed with every demonstration of affectionate attachment to my person and Government, by my faithful and loyal people.

I am confident that you will participate in the satisfaction which I have derived from the presence in this country of my good brother and ally the King of Prussia, who, at my request, undertook the office of sponsor at the christening of the Prince of Wales.

I receive from all Princes and States the continued assurance of their earnest desire to maintain the most friendly relations with this country. It is with great satisfaction I inform you that I have concluded, with the Emperor of Austria, the King of the French, the King of Prussia, and the Emperor of Russia, a treaty for the more effectual suppression of the Slave-trade, which, when the ratifications shall have been exchanged, will be communicated to Parliament.* There shall also be laid before you a Treaty which I have concluded with the same Powers, together with the Sultan, having for its object the security of the Turkish Empire, and the maintenance of the general tranquillity. The restoration of my diplomatic and friendly intercourse with the Court of Teheran has been followed by the completion of a Commercial Treaty with the King of Persia, which I have directed to be laid before you. I am engaged in negotiations with several Powers, which, I trust, by leading to conventions, founded on the just principle of mutual advantage, may extend the trade and commerce of the country. I regret that I am not enabled to announce to you the re-establishment of peaceful relations with the Government of China. The uniform success which has attended the hostile operations against that Power, and my confidence in the skill and gallantry of my Naval and Military Forces, encourage the hope on my part that our differences with the Government of China will be brought to an early termination, and our commercial relations with that country placed on a satisfactory basis.

Gentlemen of the House of Commons,

The estimates of the year have been prepared, and will be laid before you. I rely, with entire confidence, on your disposition, while you enforce the principles of a wise economy, to make that provision for the service of the country which the public exigencies require. You will have seen with regret that, for several years past, the annual income has been inadequate to bear the public charges; and I feel confident that, fully sensible of the evil which must result from a continued deficiency of this nature during peace, you will carefully consider the best means of averting it.

My Lords and Gentlemen,

I recommend to your immediate attention the state o the Finances and of the Expenditure of the country. I recommend also to your consideration the state of the Laws which affect the Import of Corn, and of other Articles, the produce of foreign countries. Measures will be submitted for your consideration for the amendment of the Law of Bankruptcy, and for the improvement of the jurisdiction exercised by the Ecclesiastical Courts in England and Wales. It will also be desirable that you should consider, with a view to their revision, the Laws which regulate the Registration of Electors of Members to serve in Parliament. I have observed with deep regret the continued distress in the manufacturing districts of the country. The sufferings and privations which have resulted from it have been borne with exemplary patience and fortitude. I feel assured that your deliberations on the various important matters which will occupy your attention, will be directed by a comprehensive regard for the interests and permanent welfare of all classes of my subjects; and I fervently pray that they may tend in their result to improve the national resources, and to encourage the industry and promote the happiness of my people.

The House having adjourned on the departure of her Majesty, resumed at five o'clock, and after the usual preliminary business, the Marquis of Abercorn moved the Address. After alluding to the first topic in the Royal Speech, the birth of the Prince of Wales, the noble Lord reviewed the state of our relations with Foreign Powers, and then adverted to the subject of the Corn-laws. It was most desirable, he said, that such a question should be approached with caution, and that no experiment should be hazarded which had not received full consideration. He did not consider that the due protection of the farmer was incompatible with the interests of the manufacturer. The distress which prevailed in the manufacturing districts was a subject of sincere regret; and if anything were required to increase the desire to alleviate the sufferings of the people, it would be found in the exemplary patience with which those sufferings had been borne. But he hoped that no ill-considered changes, no rash and hazardous experiments, would be ventured on, in any measures which might be adopted for the relief of the country.

The Earl of Dalhousie seconded the Address.

Lord Melbourne was glad to find that her Majesty's Ministers were now disposed to take a different view of the state of the country from what they expressed on 24th of Aug. last. The promise held out in the Speech with respect to the Corn-laws was similar to that contained in the Speech made at the opening of the new Parliament; and he hoped that Ministers would give the sliding scale some attention. The Conservative party had committed the folly of pledging themselves to the sliding scale. Now, no mending of the sliding scale would be worth anything in the way of improvement—nothing could be done with it but to get rid of it. He did not, however, consider that an alteration of the Corn-laws would cure all the evils which afflicted the country, neither could he advocate any scheme which affected to be a permanent cure for all distress. He did not think that the existence of distress was to be used as a plea for organic changes in the constitution of the country. Great disappointment had followed extravagant expectations from such great changes as those of the Catholic Relief Bill and the Reform Bill; and he hoped, whatever other changes might now be made, that no extravagant expectations would be indulged, as otherwise similar disappointment would follow.

Earl Beaumont denied that anything more than a slight modification of the present Corn-laws was required.

Lord Brougham, after adverting to the distress which prevailed in the country, gave it as his opinion, in common with a noble friend (Lord Spencer), who was absent from illness, that the best thing that could be done with the Corn-laws was to repeal them. He then touched on the subject of the capture of the American ship Creole, and the carrying it into the Bahamas; and from thence proceeded to review the present state of our own country as compared with former periods; and contended that that could not be a safe state of things which appeared to place all the owners of property on one side, and all the rest of the people on the other.
